Introduction &
Essay on 15
Lessons of History

Unit 1. Prehistory & the rise of early civilization

1.1 BIOLOGICAL, CULTURAL & TECHNOLOGICAL EVOLUTION IN HISTORY

Color Key:
 White line indicates natural events or processes.
 Yellow line indicates technological developments.
 Blue line indicates cultural developments.
 Red line indicates political/military developments.
 If categories overlap, the color that seems most appropriate and/or best distinguishes it from other items is used.

All dates are BCE. The earlier the date, the more open to dispute it is. Hopefully this gives some idea of the sequence of developments in our past.

| | | |
|------------------|------|---|
| c.300,000 | | Stone tools |
| c.300,000-50,000 | | Likely controlled use of fire Earliest Religion |
| c.100,000 | | Homo Sapiens |
| c.30,000 | | Art |
| c.12,000 | | End of last Ice Age |
| c.8000 | | Agriculture Domest. of sheep |
| c.7000 | | Domest. of Pigs Domest. of Cattle |
| c.6500 | | Irrigation |
| c.5800 | | Smelting Copper |
| c.4000-3500 | | Cities in Mesopotamia |
| c.3000-2500 | | 1st Hydraulic Civ's Warfare |
| c.3000 | | Ideographic writing |
| c.3000 | | Bronze tech. |
| c.3000-2900 | | Domest. of horses Ziggurats, 1st monumental architecture |
| c.2800 | | Great Pyramid Rebus writing |
| c.2100 | | 1st written literature, <i>Epic of Gilgamesh</i> |
| c.2000 | | Phonetic Alphabet |
| c.1050 | | Iron tech. |

BIOLOGICAL EVOLUTION
 Where nature very slowly adapts us to changing environment

Humans distinguished by 5 major biological features:

| | | | | |
|--------------------------|-------------------------------|-----------------------------|----------------------------|----------------------|
| Binocular & color vision | Upright posture → frees hands | Hands with opposable thumbs | Large well organized brain | Speech → share ideas |
|--------------------------|-------------------------------|-----------------------------|----------------------------|----------------------|

CULTURAL EVOLUTION
 People adapt behavior to envir. → Much faster than biol. evol.

"RUBBER BAND" THEORY
 If 1 part of a culture changes → it affects the rest of the culture

TECHNOLOGICAL EVOLUTION
 People adapt envir. to their needs → progressively the fastest evol.

Biol. & cult. evol. can't keep up with spiraling tech. growth

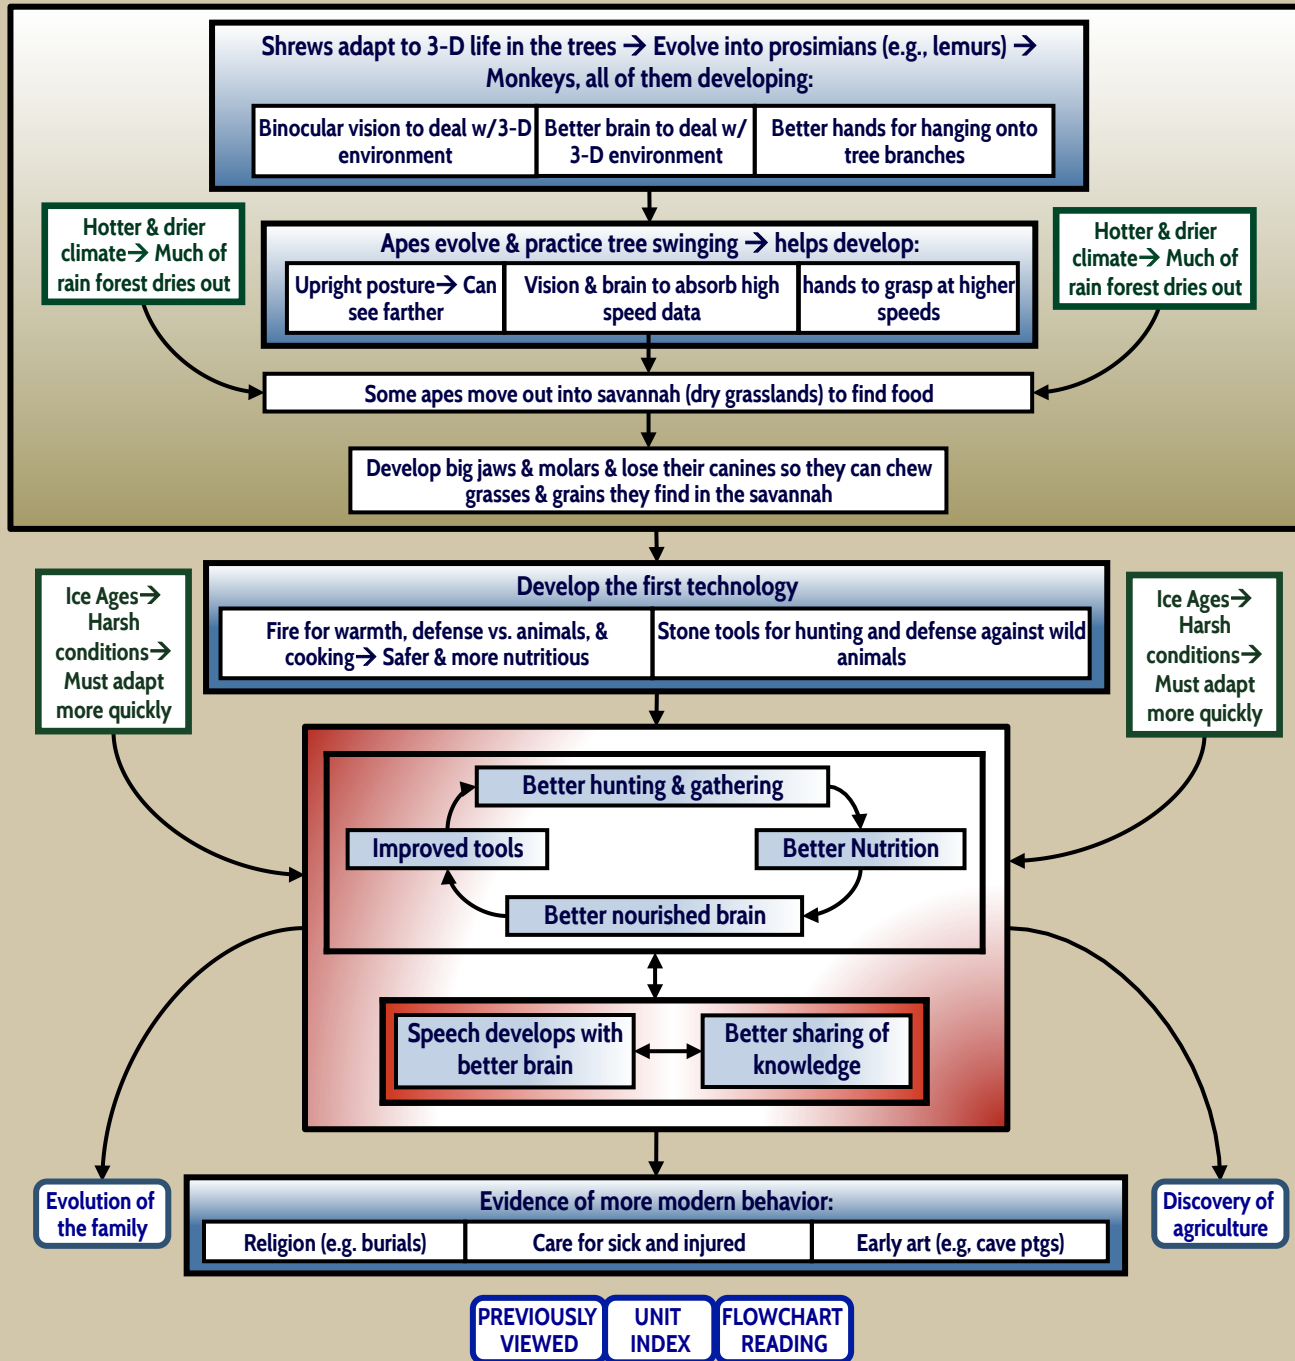

Much more wealth, but also major problems:

| | | |
|---|---|--|
| Society & culture can't change as quickly | Tech. of destruction grows even faster than tech. of production → Total war is obsolete | Environment can't support unlt'd. growth |
|---|---|--|

1.2 A POSSIBLE SCENARIO FOR HUMAN EVOLUTION

Color Key:
 White line indicates natural events or processes.
 Yellow line indicates technological developments.
 Blue line indicates cultural developments.
 Red line indicates political/military developments.
 If categories overlap, the color that seems most appropriate and/or best distinguishes it from other items is used.

All dates are BCE. The earlier the date, the more open to dispute it is. Hopefully this gives some idea of the sequence of developments in our past.

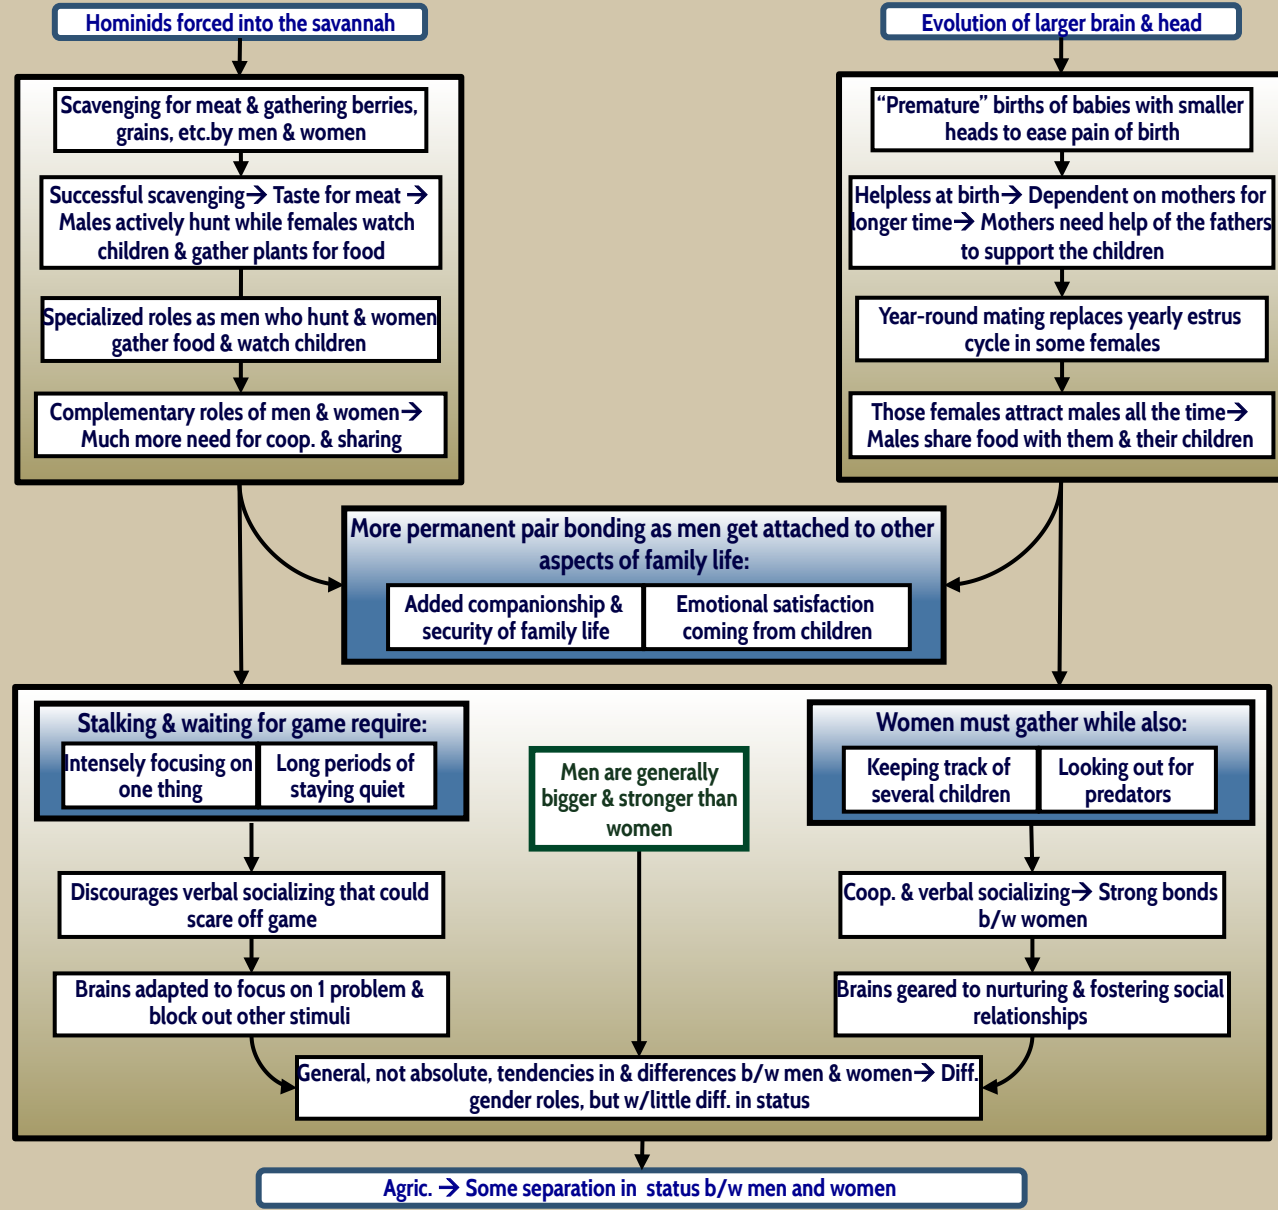

Color Key:

White line indicates natural events or processes.
 Yellow line indicates technological developments.
 Blue line indicates cultural developments.
 Red line indicates political/military developments.

All dates are BCE. The earlier the date, the more open to dispute it is. Hopefully this gives some idea of the sequence of developments in our past.

| | | |
|------------------|--|--|
| | | Stone tools |
| c.300,000 | | Likely controlled use of fire |
| c.300,000-50,000 | | Earliest Religion |
| c.100,000 | | Homo Sapiens |
| c.30,000 | | Art |
| c.12,000 | | End of last Ice Age |
| c.8000 | | Agriculture |
| c.8000 | | Domest. of sheep |
| c.7000 | | Domest. of Pigs |
| c.7000 | | Domest. of Cattle |
| c.6500 | | Irrigation |
| c.5800 | | Smelting Copper |
| c.4000 | | Cities in Mesopotamia |
| c.4000-3500 | | Pictographic writing |
| c.3500 | | Hydraulic Civ's |
| c.3000-2500 | | Warfare |
| c.3000 | | Ideographic writing |
| c.3000 | | Bronze tech. |
| c.3000 | | Domest. of horses |
| c.2900 | | Ziggurats, 1st monumental architecture |
| c.2800 | | Great Pyramid |
| c.2100 | | Rebus writing |
| c.2000 | | 1st written literature, <i>Epic of Gilgamesh</i> |
| c.1000 | | Phonetic Alphabet |
| c.1050 | | Iron tech. |

1.3 A POSSIBLE SCENARIO FOR THE EVOLUTION OF THE FAMILY & GENDER ROLES

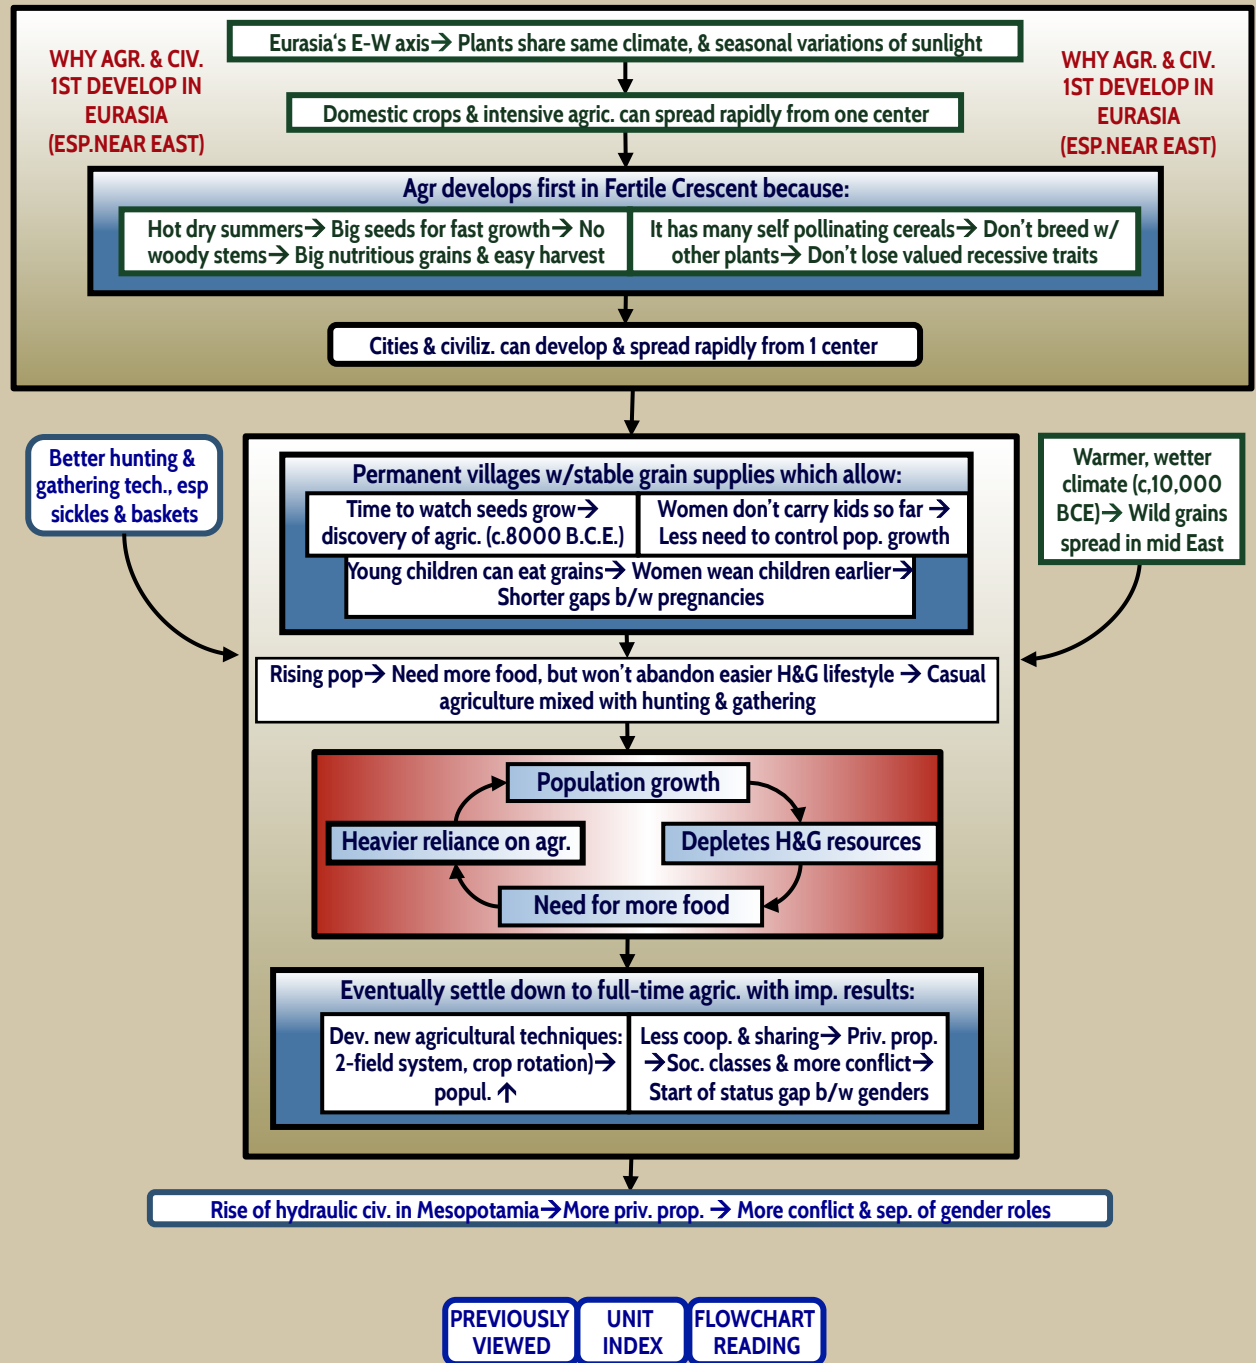

1.4 THE BIRTH OF AGRICULTURE & ITS EFFECTS

Color Key:
 White line indicates natural events or processes.
 Yellow line indicates technological developments.
 Blue line indicates cultural developments.
 Red line indicates political/military developments.
 If categories overlap, the color that seems most appropriate and/or best distinguishes it from other items is used.

All dates are BCE. The earlier the date, the more open to dispute it is. Hopefully this gives some idea of the sequence of developments in our past.

| | | |
|------------------|--|--|
| c.300,000 | | Stone tools |
| c.300,000-50,000 | | Likely controlled use of fire |
| c.100,000 | | Homo Sapiens |
| c.30,000 | | Sapiens |
| c.12,000 | | Art |
| c.8000 | | End of last Ice Age |
| c.8000 | | Agriculture |
| c.8000 | | Domest. of sheep |
| c.7000 | | Domest. of Pigs |
| c.7000 | | Domest. of Cattle |
| c.6500 | | Irrigation |
| c.5800 | | Smelting Copper |
| c.4000 | | Cities in Mesopotamia |
| c.4000-3500 | | Pictographic writing |
| c.3500 | | Hydraulic Civ's |
| c.3000-2500 | | Warfare |
| c.3000 | | Ideographic writing |
| c.3000 | | Bronze tech. |
| c.3000 | | Domest. of horses |
| c.3000 | | Ziggurats, 1st monumental architecture |
| c.2900 | | Great Pyramid |
| c.2800 | | Rebus writing |
| c.2100 | | 1st written literature, <i>Epic of Gilgamesh</i> |
| c.2000 | | Phonetic Alphabet |
| c.1050 | | Iron tech. |

1.5 ANIMAL DOMESTICATION AND ITS EFFECTS

Better hunting & gathering → More settled lifestyle

Ability to keep & domesticate animals that are:

| | | |
|---|---|--------------------------------------|
| Herbivorous & fast growing → Need less food | Live in herds w/strict soc. hierarchy that humans can take over | Tame & willing to breed in captivity |
|---|---|--------------------------------------|

Most animals suitable for domestication were found exclusively in Eurasia & esp. the Fertile Crescent

Sheep & goats (c.8000 B.C.E.) that are easily tamed →

| | | |
|----------------------|--------------------------------------|-------------------|
| Meat & milk for food | Digest cellulose → Hilly land useful | Wool for clothing |
|----------------------|--------------------------------------|-------------------|

Pigs (c.7000 B.C.E.) that scavenge → :

| | | |
|--------------|-----------------------|---------------|
| Reduce waste | Need less supervision | Cheap to keep |
|--------------|-----------------------|---------------|

Cows (c.6500 B.C.E.) - hard to tame but can:

| | | |
|------------------|-----------------------------|-------------------------|
| Digest cellulose | Pull plows → Farm more land | Give meat, milk & hides |
|------------------|-----------------------------|-------------------------|

Horses (c.3000 B.C.E.) when tamed & bred up in size →

| | | |
|-------------------|------------------------------|--------------------|
| New energy source | Faster comm's → Bigger emp's | More mobile armies |
|-------------------|------------------------------|--------------------|

Chronic clashes throughout history b/w nomads grazing their herds in dry grasslands & settled farmers in well watered areas

Herd animals' diseases often infect humans → Eurasian civ's adapt → Advantage vs. cultures not previously exposed

UNIT INDEX

FLOWCHART READING

Color Key:

White line indicates natural events or processes.
 Yellow line indicates technological developments.
 Blue line indicates cultural developments.
 Red line indicates political/military developments.
 If categories overlap, the color that seems most appropriate and/or best distinguishes it from other items is used.

All dates are BCE. The earlier the date, the more open to dispute it is. Hopefully this gives some idea of the sequence of developments in our past.

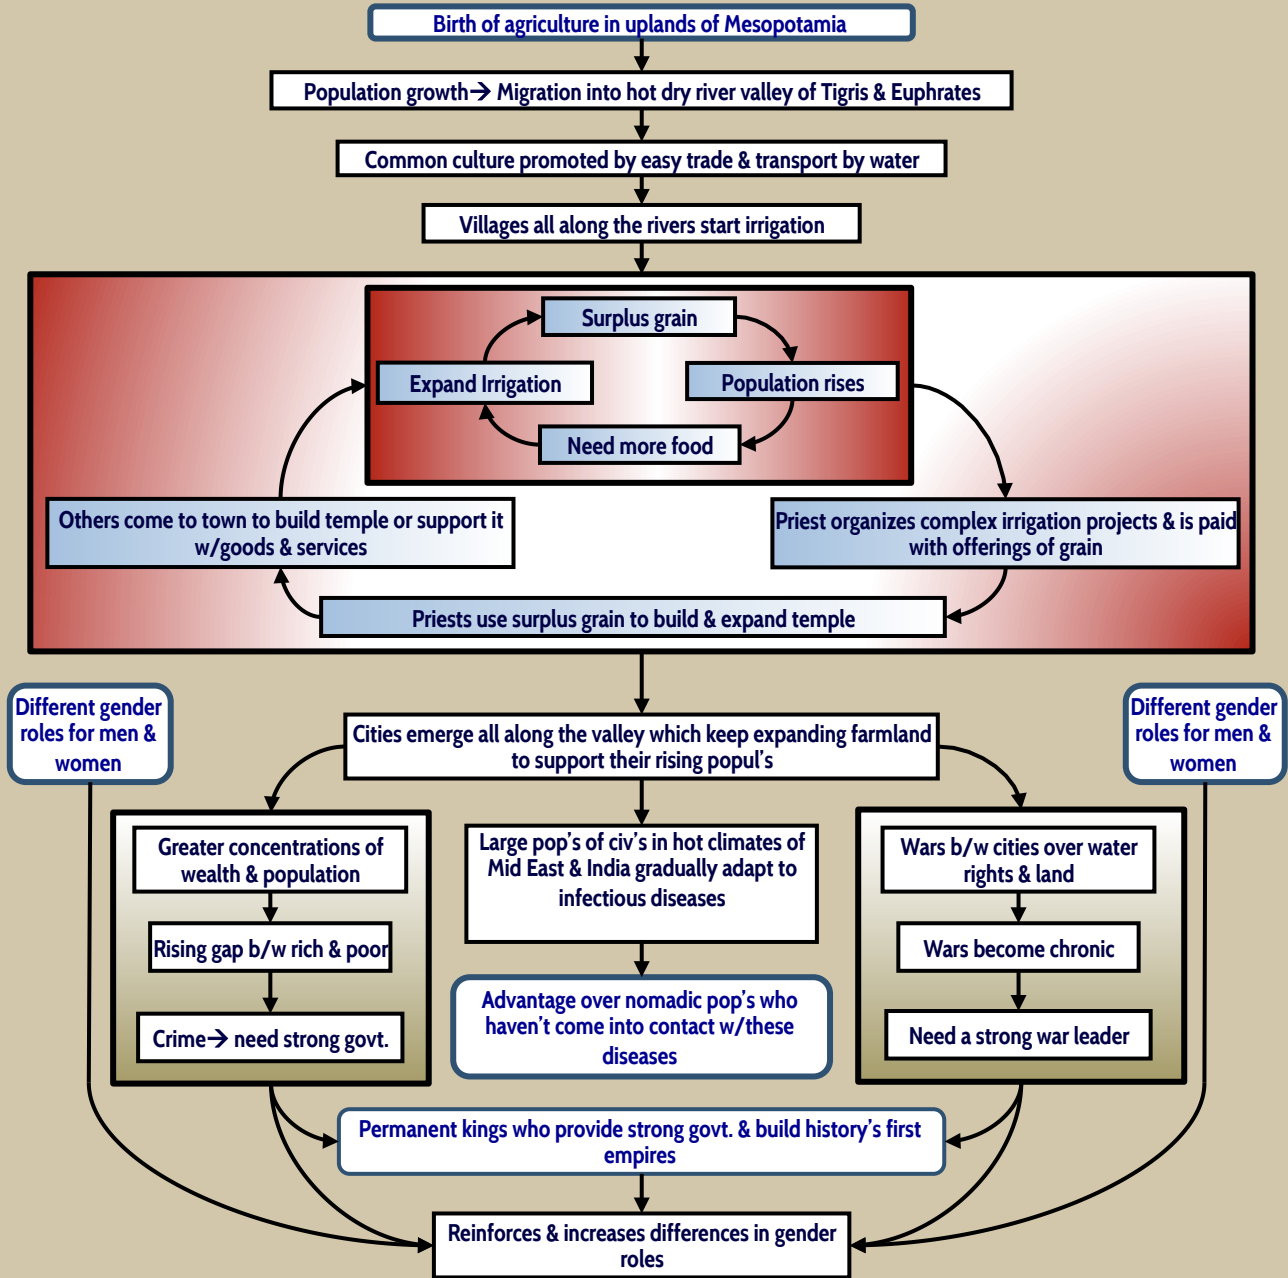

1.6 THE RISE OF HYDRAULIC CIVILIZATIONS & THEIR IMPACT

Color Key:
 White line indicates natural events or processes.
 Yellow line indicates technological developments.
 Blue line indicates cultural developments.
 Red line indicates political/military developments.
 If categories overlap, the color that seems most appropriate and/or best distinguishes it from other items is used.

All dates are BCE. The earlier the date, the more open to dispute it is. Hopefully this gives some idea of the sequence of developments in our past.

| | | |
|------------------|--|--|
| c.300,000 | | Stone tools |
| c.300,000-50,000 | | Likely controlled use of fire |
| c.100,000 | | Homo Sapiens |
| c.30,000 | | Earliest Religion |
| c.12,000 | | Art |
| c.8000 | | End of last Ice Age |
| c.8000 | | Agriculture |
| c.8000 | | Domest. of sheep |
| c.7000 | | Domest. of Pigs |
| c.7000 | | Domest. of Cattle |
| c.6500 | | Irrigation |
| c.5800 | | Smelting Copper |
| c.4000-3500 | | Cities in Mesopotamia |
| c.3500 | | Pictographic writing |
| c.3000-2500 | | Hydraulic Civ's |
| c.3000 | | Warfare |
| c.3000 | | Ideographic writing |
| c.3000 | | Bronze tech. |
| c.3000 | | Domest. of horses |
| c.2900 | | Ziggurats, 1st monumental architecture |
| c.2800 | | Great Pyramid |
| c.2100 | | Rebus writing |
| c.2000 | | 1st written literature, <i>Epic of Gilgamesh</i> |
| c.1000 | | Phonetic Alphabet |
| c.1050 | | Iron tech. |

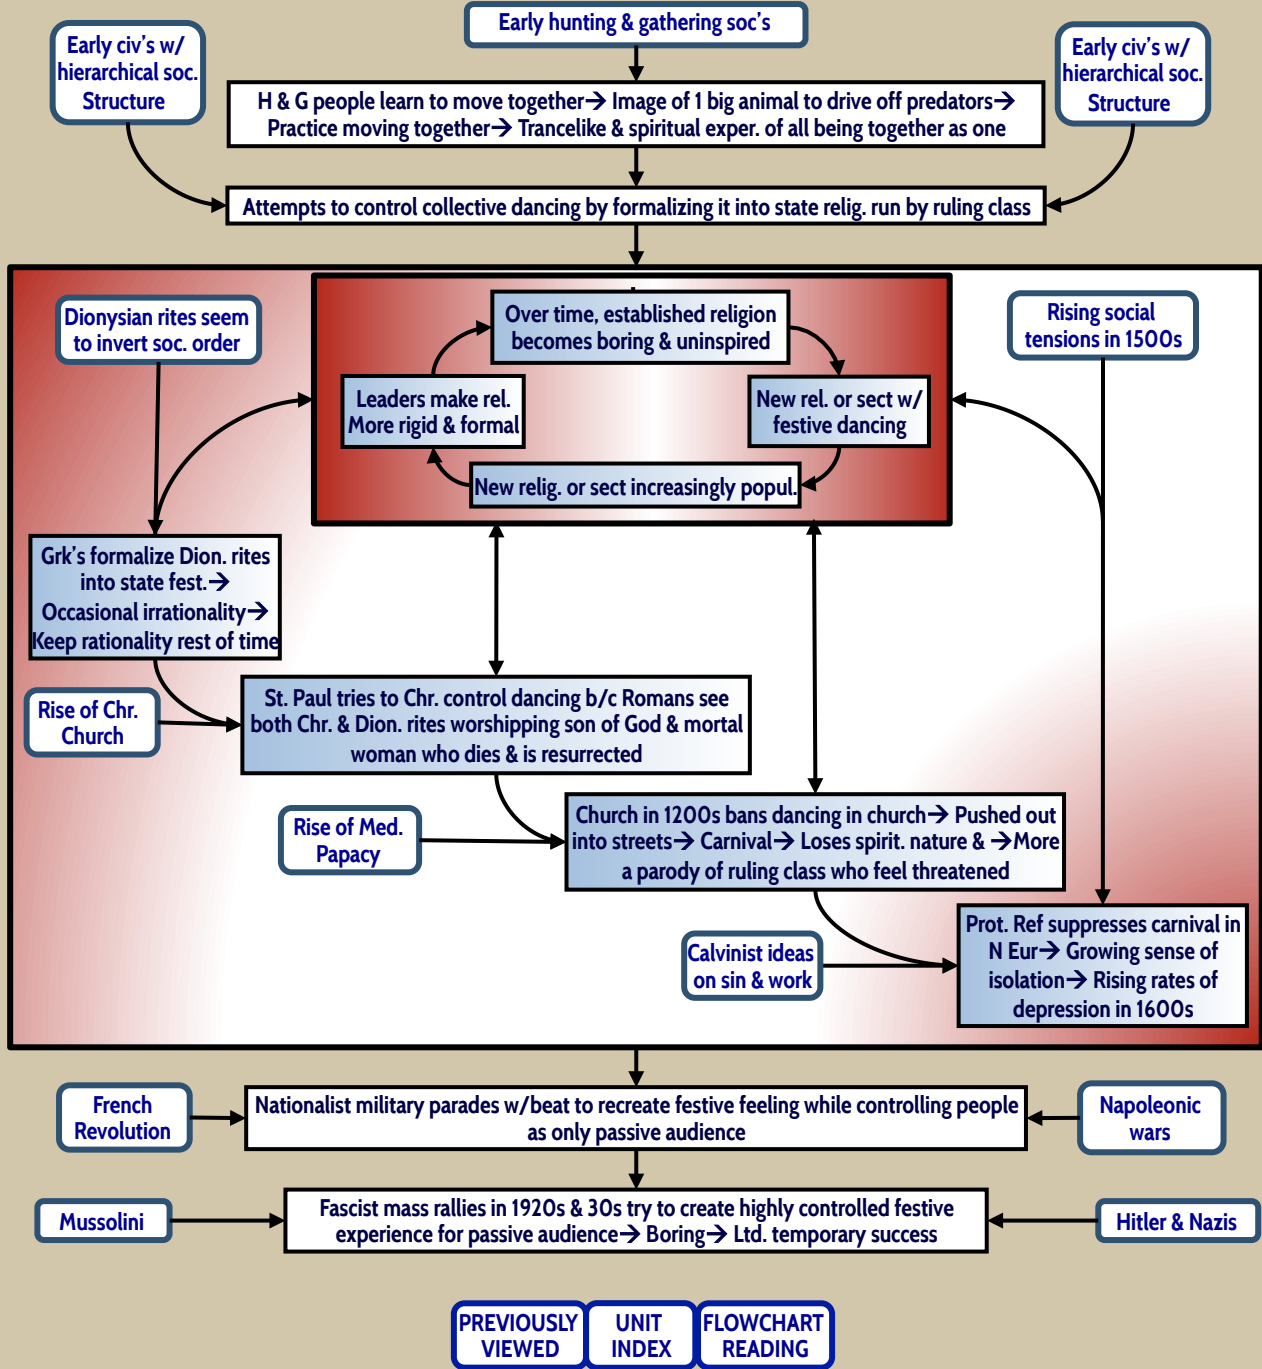

1.6A FESTIVE DANCING AND ITS IMPORTANCE IN HISTORY

Color Key:
 White line indicates natural events or processes.
 Yellow line indicates technological developments.
 Blue line indicates cultural developments.
 Red line indicates political/military developments.
 If categories overlap, the color that seems most appropriate and/or best distinguishes it from other items is used.

All dates are BCE. The earlier the date, the more open to dispute it is. Hopefully this gives some idea of the sequence of developments in our past.

| | | |
|------------------|--|--|
| c.300,000 | | Stone tools |
| c.300,000-50,000 | | Likely controlled use of fire |
| c.100,000 | | Homo Sapiens |
| c.30,000 | | Art |
| c.12,000 | | End of last Ice Age |
| c.8000 | | Agriculture |
| c.8000 | | Domest. of sheep |
| c.7000 | | Domest. of Pigs |
| c.7000 | | Domest. of Cattle |
| c.6500 | | Irrigation |
| c.5800 | | Smelting Copper |
| c.4000-3500 | | Cities in Mesopotamia |
| c.3500 | | Pictographic writing |
| c.3000-2500 | | 1st Hydraulic Civ's |
| c.3000 | | Warfare |
| c.3000 | | Ideographic writing |
| c.3000 | | Bronze tech. |
| c.3000 | | Domest. of horses |
| c.2900 | | Ziggurats, 1st monumental architecture |
| c.2800 | | Great Pyramid |
| c.2100 | | Rebus writing |
| c.2100 | | 1st written literature, <i>Epic of Gilgamesh</i> |
| c.2000 | | Phonetic Alphabet |
| c.1000 | | Iron tech. |

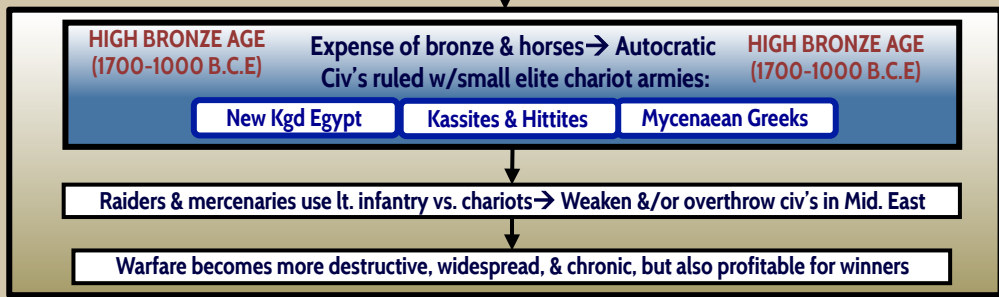

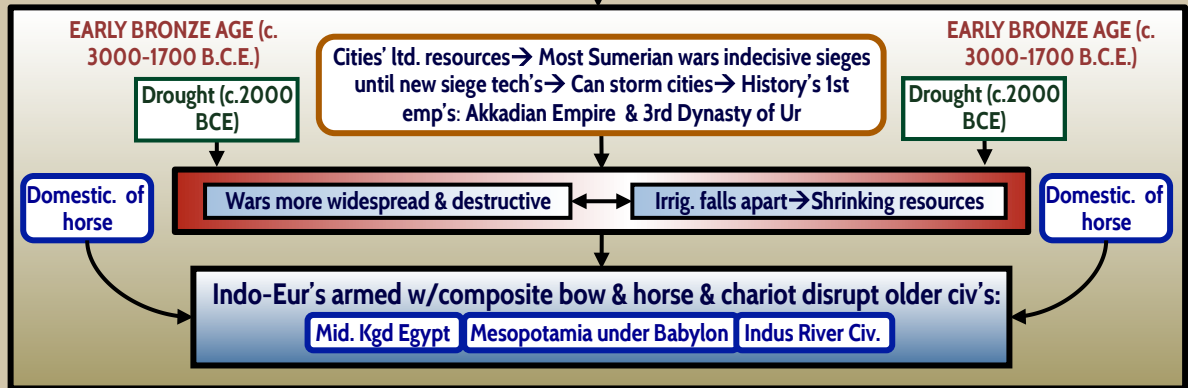

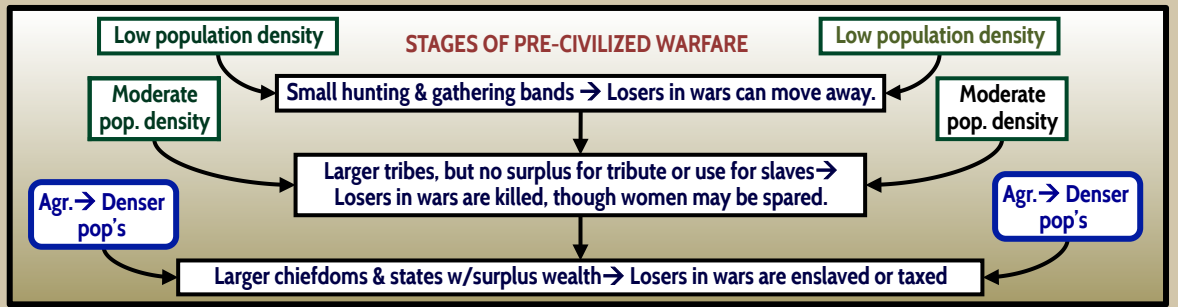

1.6B THE EVOLUTION OF EARLY WARFARE TO c.500 B.C.E.

Color Key:
 White line indicates natural events or processes.
 Yellow line indicates technological developments.
 Blue line indicates cultural developments.
 Red line indicates political/military developments.
 If categories overlap, the color that seems most appropriate and/or best distinguishes it from other items is used.

All dates are BCE. The earlier the date, the more open to dispute it is. Hopefully this gives some idea of the sequence of developments in our past.

Timeline of Key Events:

- c.300,000: Stone tools
- c.300,000-50,000: Likely controlled use of fire
- c.300,000-50,000: Earliest Religion
- c.100,000: Homo Sapiens
- c.30,000: Art
- c.12,000: End of last Ice Age
- c.8000: Agriculture, Domest. of sheep
- c.7000: Domest. of Pigs, Domest. of Cattle
- c.6500: Irrigation
- c.5800: Smelting Copper
- c.4000-3500: Pictographic writing, Cities in Mesopotamia
- c.3000-2500: 1st Hydraulic Civ's, Warfare
- c.3000: Ideographic writing
- c.3000: Bronze tech.
- c.3000-2900: Domest. of horses, Ziggurats, 1st monumental architecture
- c.2800: Great Pyramid
- c.2100: Rebus writing
- c.2000: 1st written literature, *Epic of Gilgamesh*
- c.1050: Phonetic Alphabet, Iron tech.

Iron-equipped Greek phalanxes help → Democ.

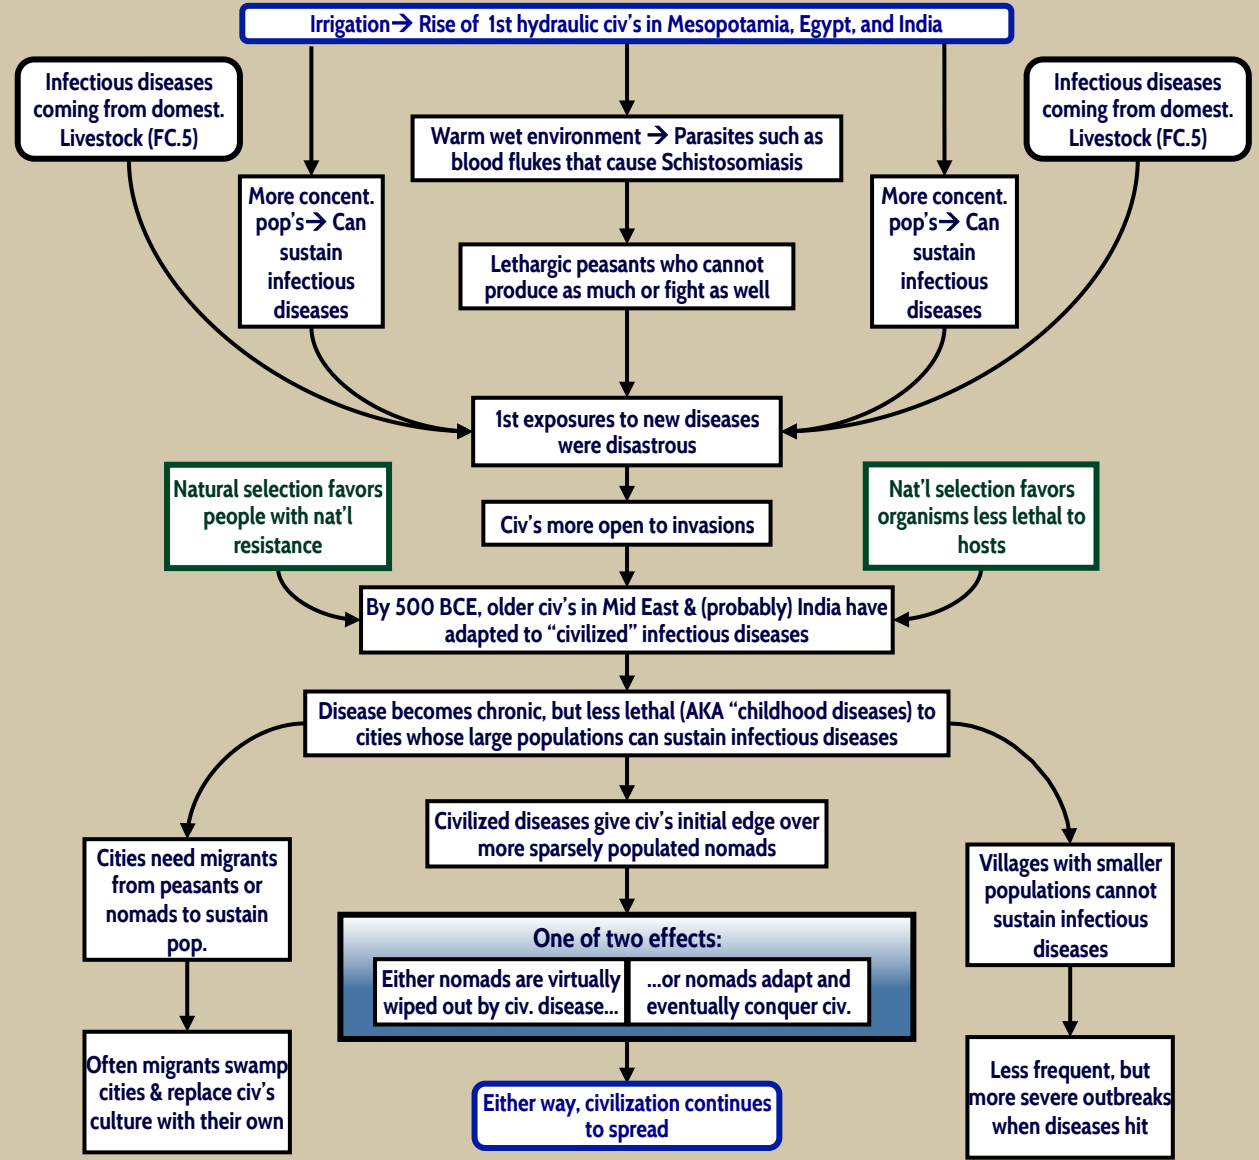

1.6C THE IMPACT OF DISEASE ON EARLY CIVILIZATIONS

Color Key:
 White line indicates natural events or processes.
 Yellow line indicates technological developments.
 Blue line indicates cultural developments.
 Red line indicates political/military developments.
 If categories overlap, the color that seems most appropriate and/or best distinguishes it from other items is used.

All dates are BCE. The earlier the date, the more open to dispute it is. Hopefully this gives some idea of the sequence of developments in our past.

Timeline of Key Developments:

- c.300,000: Stone tools
- c.300,000-50,000: Likely controlled use of fire; Earliest Religion
- c.100,000: Homo Sapiens; Sapiens
- c.30,000: Art
- c.12,000: End of last Ice Age
- c.8000: Agriculture; Domest. of sheep
- c.7000: Domest. of Pigs; Domest. of Cattle
- c.6500: Irrigation
- c.5800: Smelting Copper
- c.4000-3500: Pictographic writing; Cities in Mesopotamia
- c.3000-2500: Warfare; 1st Hydraulic Civ's
- c.3000: Ideographic writing
- c.3000: Bronze tech.
- c.3000: Domest. of horses; Ziggurats, 1st monumental architecture
- c.2900: Great Pyramid; Rebus writing
- c.2800: Rebus writing
- c.2100: 1st written literature, *Epic of Gilgamesh*
- c.2000: 1st written literature, *Epic of Gilgamesh*
- c.1000: Phonetic Alphabet
- c.1050: Iron tech.

1.7 THE BIRTH OF WRITING AND ITS IMPACT

Color Key:
 White line indicates natural events or processes.
 Yellow line indicates technological developments.
 Blue line indicates cultural developments.
 Red line indicates political/military developments.
 If categories overlap, the color that seems most appropriate and/or best distinguishes it from other items is used.

All dates are BCE. The earlier the date, the more open to dispute it is. Hopefully this gives some idea of the sequence of developments in our past.

Timeline of Key Events:

- c.300,000: Stone tools
- c.300,000-50,000: Likely controlled use of fire; Earliest Religion
- c.100,000: Homo Sapiens Sapiens; Art
- c.30,000: End of last Ice Age
- c.12,000: Agriculture; Domest. of sheep
- c.8000: Domest. of Pigs; Domest. of Cattle
- c.7000: Irrigation
- c.6500: Smelting Copper
- c.5800: Pictographic writing; Cities in Mesopotamia
- c.4000-3500: Warfare; Hydraulic Civ's
- c.3000: Ideographic writing
- c.3000: Bronze tech.
- c.3000: Domest. of horses; Ziggurats, 1st monumental architecture
- c.2900: Great Pyramid; Rebus writing
- c.2800: 1st written literature, *Epic of Gilgamesh*
- c.2100: Rebus writing
- c.2000: 1st written literature, *Epic of Gilgamesh*
- c.1000: Phonetic Alphabet
- c.1050: Iron tech.

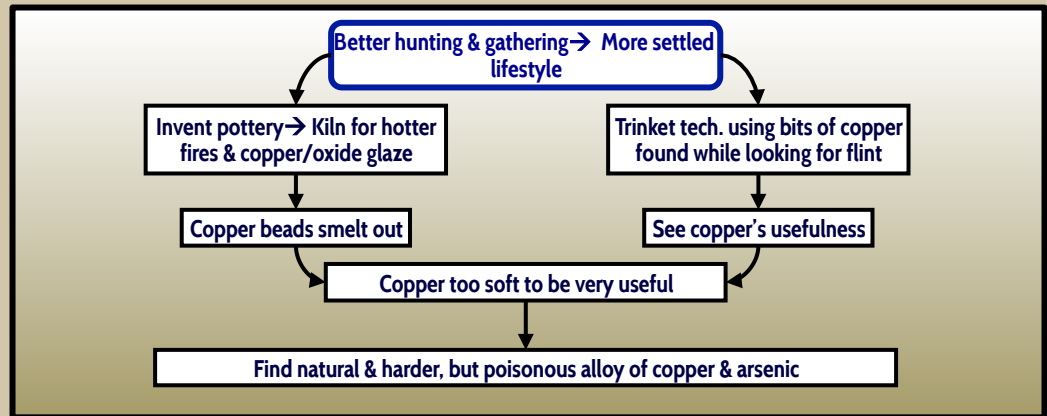

1.8 THE RISE OF METALLURGY & ITS IMPACT

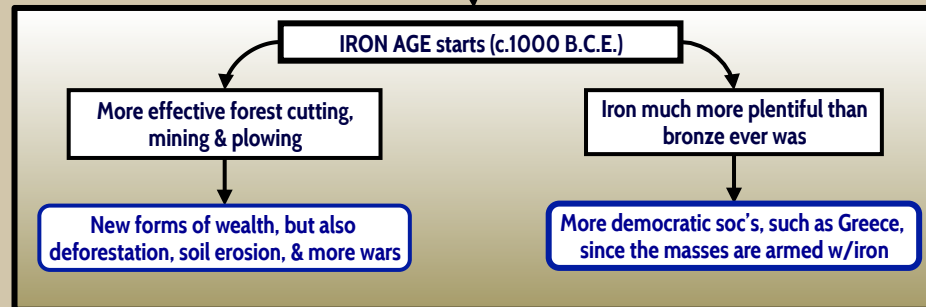

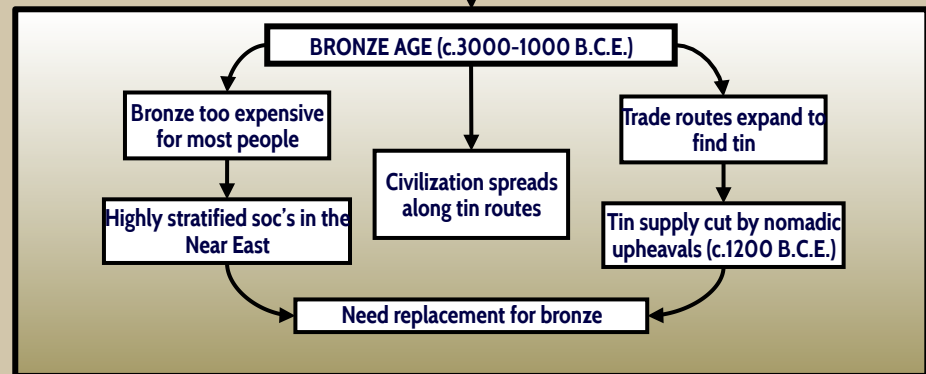

Color Key:
 White line indicates natural events or processes.
 Yellow line indicates technological developments.
 Blue line indicates cultural developments.
 Red line indicates political/military developments.
 If categories overlap, the color that seems most appropriate and/or best distinguishes it from other items is used.

All dates are BCE. The earlier the date, the more open to dispute it is. Hopefully this gives some idea of the sequence of developments in our past.

| | | |
|------------------|--|--|
| c.300,000 | | Stone tools |
| c.300,000-50,000 | | Likely controlled use of fire |
| | | Earliest Religion |
| c.100,000 | | Homo Sapiens |
| c.30,000 | | Art |
| c.12,000 | | End of last Ice Age |
| c.8000 | | Agriculture |
| c.8000 | | Domest. of sheep |
| c.7000 | | Domest. of Pigs |
| c.7000 | | Domest. of Cattle |
| c.6500 | | Irrigation |
| c.5800 | | Smelting Copper |
| c.4000-3500 | | Cities in Mesopotamia |
| c.3500 | | Pictographic writing |
| c.3000-2500 | | 1st Hydraulic Civ's |
| c.3000 | | Warfare |
| c.3000 | | Ideographic writing |
| c.3000 | | Bronze tech. |
| c.3000 | | Domest. of horses |
| c.2900 | | Ziggurats, 1st monumental architecture |
| c.2800 | | Great Pyramid |
| c.2100 | | Rebus writing |
| c.2100 | | 1st written literature, <i>Epic of Gilgamesh</i> |
| c.2000 | | Phonetic Alphabet |
| c.1050 | | Iron tech. |

Search for & find safer alloy of copper & tin

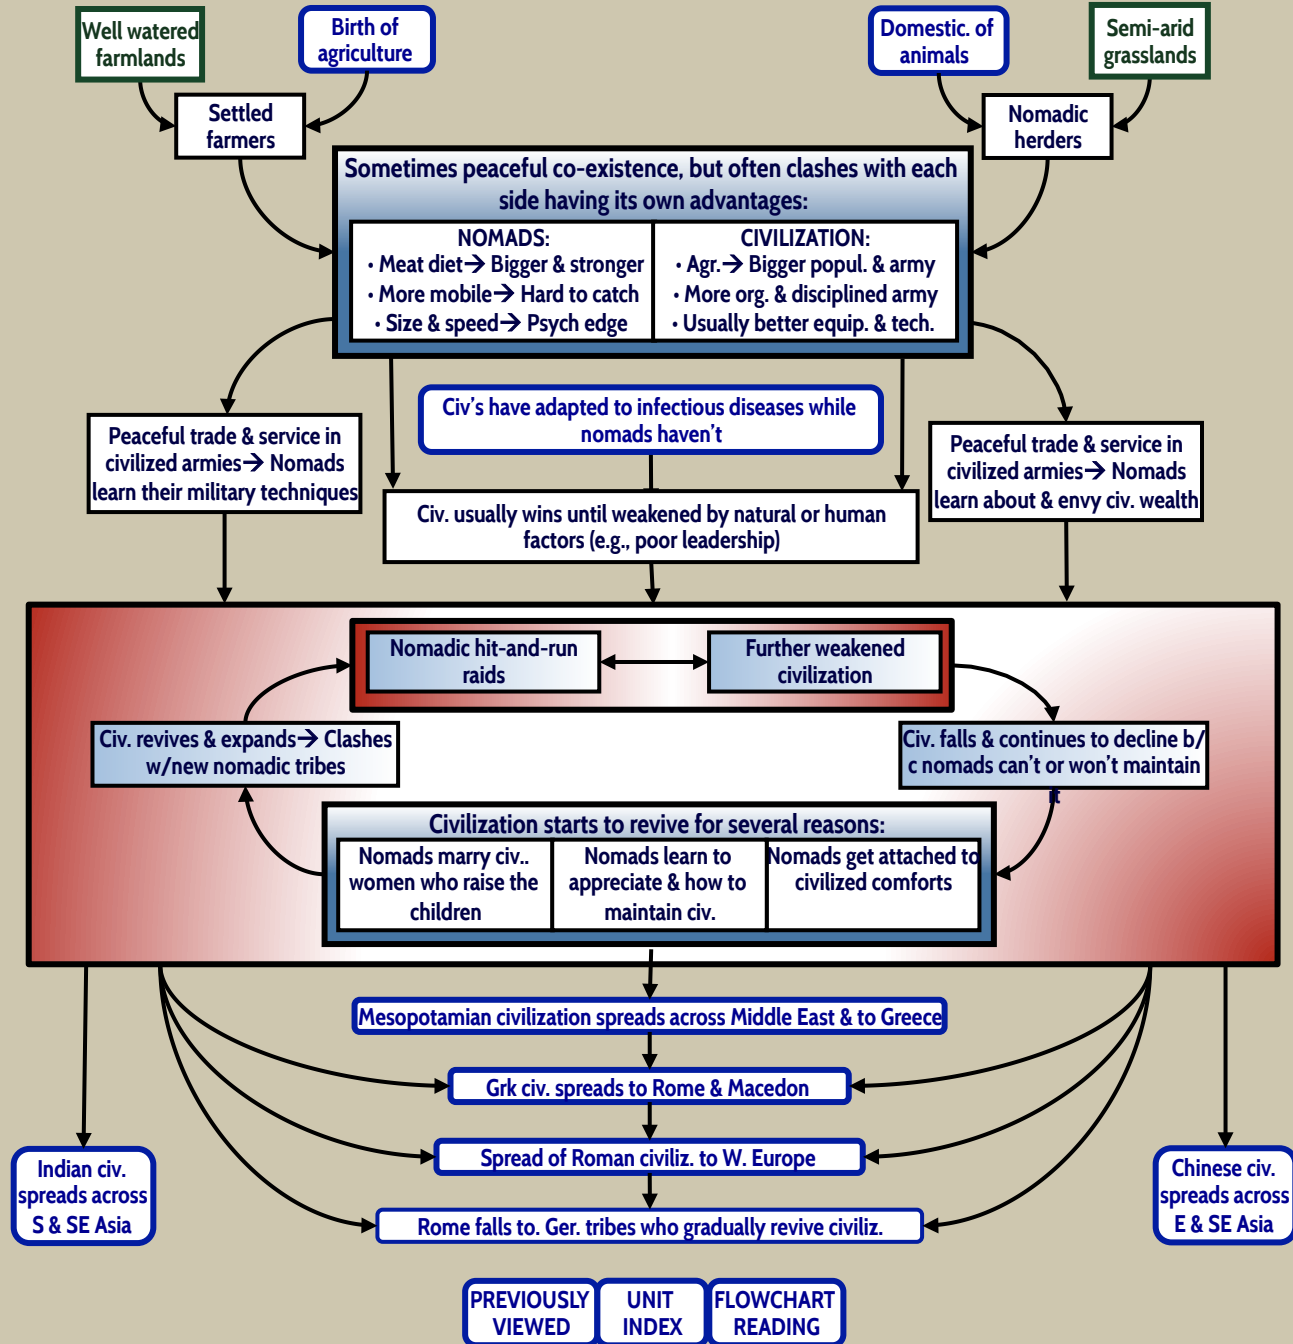

1.9 FARMERS, NOMADS, AND THE SPREAD OF CIVILIZATION

Color Key:
 White line indicates natural events or processes.
 Yellow line indicates technological developments.
 Blue line indicates cultural developments.
 Red line indicates political/military developments.
 If categories overlap, the color that seems most appropriate and/or best distinguishes it from other items is used.

All dates are BCE. The earlier the date, the more open to dispute it is. Hopefully this gives some idea of the sequence of developments in our past.

| | | |
|------------------|--|--|
| c.300,000 | | Stone tools |
| c.300,000-50,000 | | Likely controlled use of fire |
| c.100,000 | | Homo Sapiens |
| c.30,000 | | Sapiens |
| c.12,000 | | Art |
| c.8000 | | End of last Ice Age |
| c.8000 | | Agriculture |
| c.8000 | | Domest. of sheep |
| c.7000 | | Domest. of Pigs |
| c.7000 | | Domest. of Cattle |
| c.6500 | | Irrigation |
| c.5800 | | Smelting Copper |
| c.4000-3500 | | Cities in Mesopotamia |
| c.3500 | | Pictographic writing |
| c.3000-2500 | | Hydraulic Civ's |
| c.3000 | | Warfare |
| c.3000 | | Ideographic writing |
| c.3000 | | Bronze tech. |
| c.3000 | | Domest. of horses |
| c.2900 | | Ziggurats, 1st monumental architecture |
| c.2800 | | Great Pyramid |
| c.2100 | | Rebus writing |
| c.2000 | | 1st written literature, <i>Epic of Gilgamesh</i> |
| c.1000 | | Phonetic Alphabet |
| c.1050 | | Iron tech. |

Unit 2. Early Pre-Classical Civilization

 = Related link outside the unit

Timeline of World History (c.3000-2350 B.C.E. to c.1100-1536 C.E.)

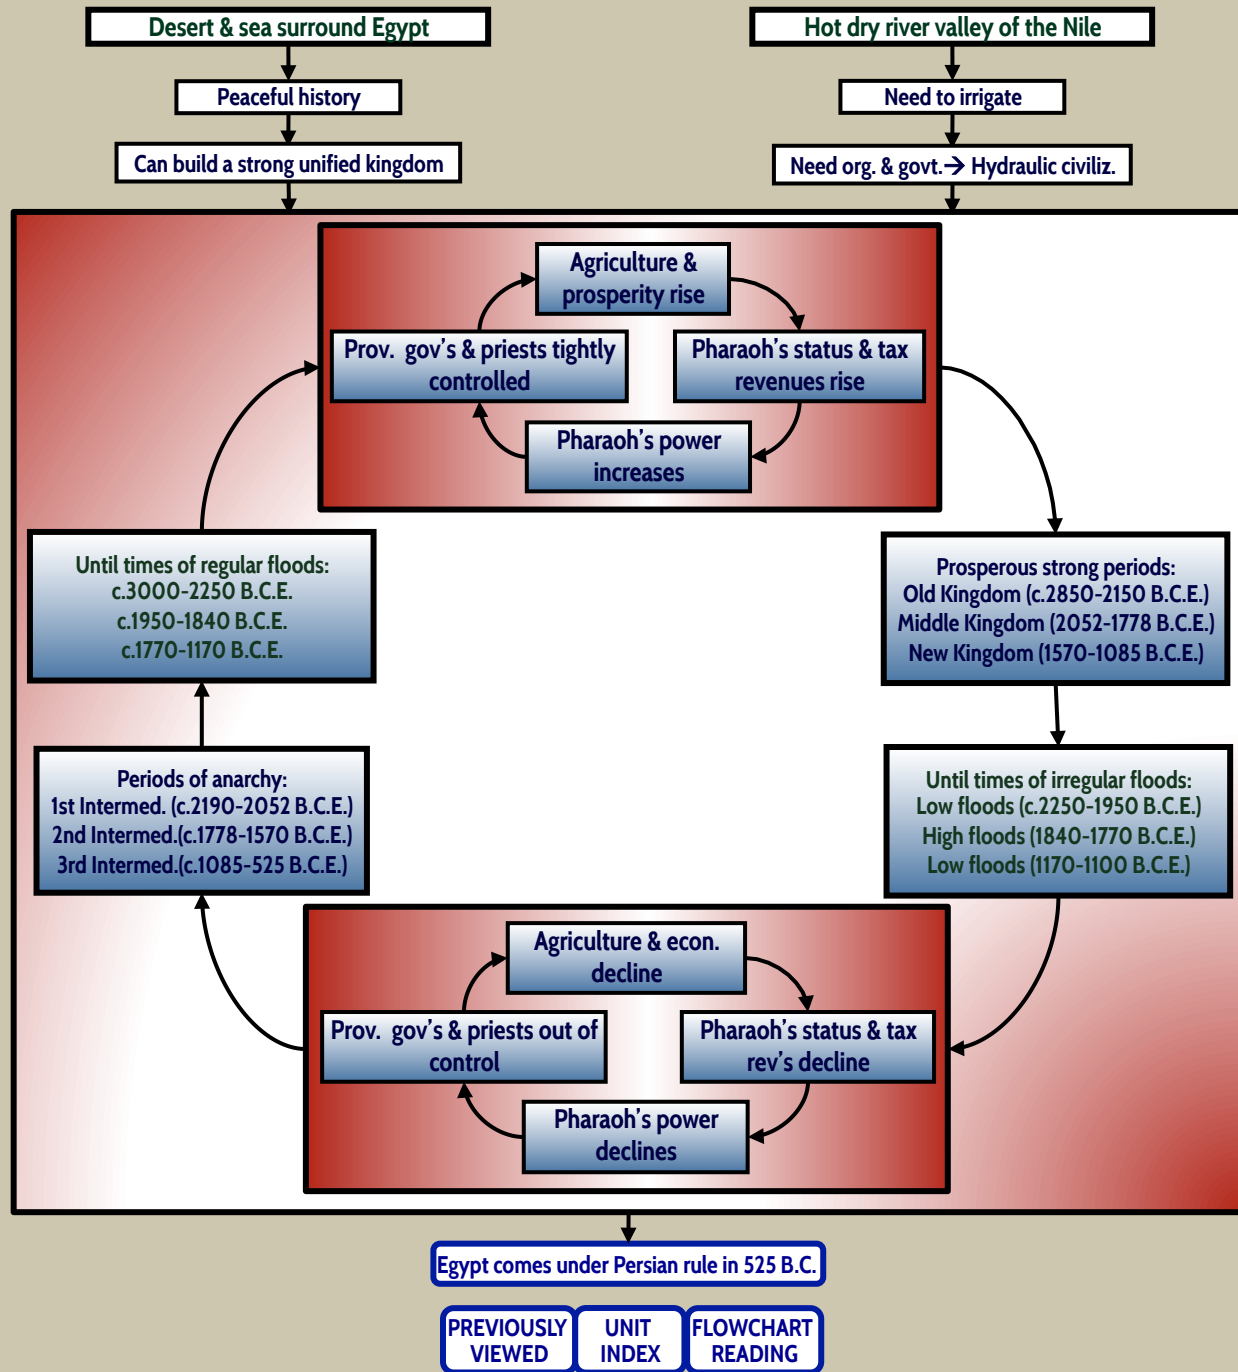

- c.3000-2350: Sumerian city-states
- c.2850-2150: Old Kgd Egypt, Indus River Civ.
- c.2500-1700: 3rd Dyn. of Ur, Akkadian Emp.
- c.2350-2250: Middle Kgd Egypt
- c.2100-2000: New Kgd. Egypt, Babyl. Emp.
- c.1531-1155: Aryans enter India, Kassite Emp.
- c.1500: Height of Hittite Empire
- c.1430-1180: Traditional rabbinic date for Exodus
- c.1313: Sea Peoples -> Period of turmoil -> End of Bronze Age
- c.1200: Spread of iron tech., Phoenicians
- c.1200-539: Egypt's final decline
- c.1085-525: Phoenician alphabet
- c.1050: Kingdom of Israel
- 1030-931: Assyrian Emp.
- 911-612: Assyrians conquer N. Kgd of Israel
- c.814: Phoenicians found Carthage.
- 722: Chaldean Emp.
- 612-539: Phoenicians circumnavigate Africa
- c.600: Sack of Jerusalem
- 586
- c.550-330: Pre-classical Maya, Persian Empire
- c.250
- BC (BCE): Classical Maya, Post-classical Meso-America
- c.250-900
- c.900-1521: Aztecs, Inca civ. In Peru
- 1428-1521
- c.1100-1536

2.1 THE SWEEP OF MESOPOTAMIA'S HISTORY (c.3000-539 B.C.E.)

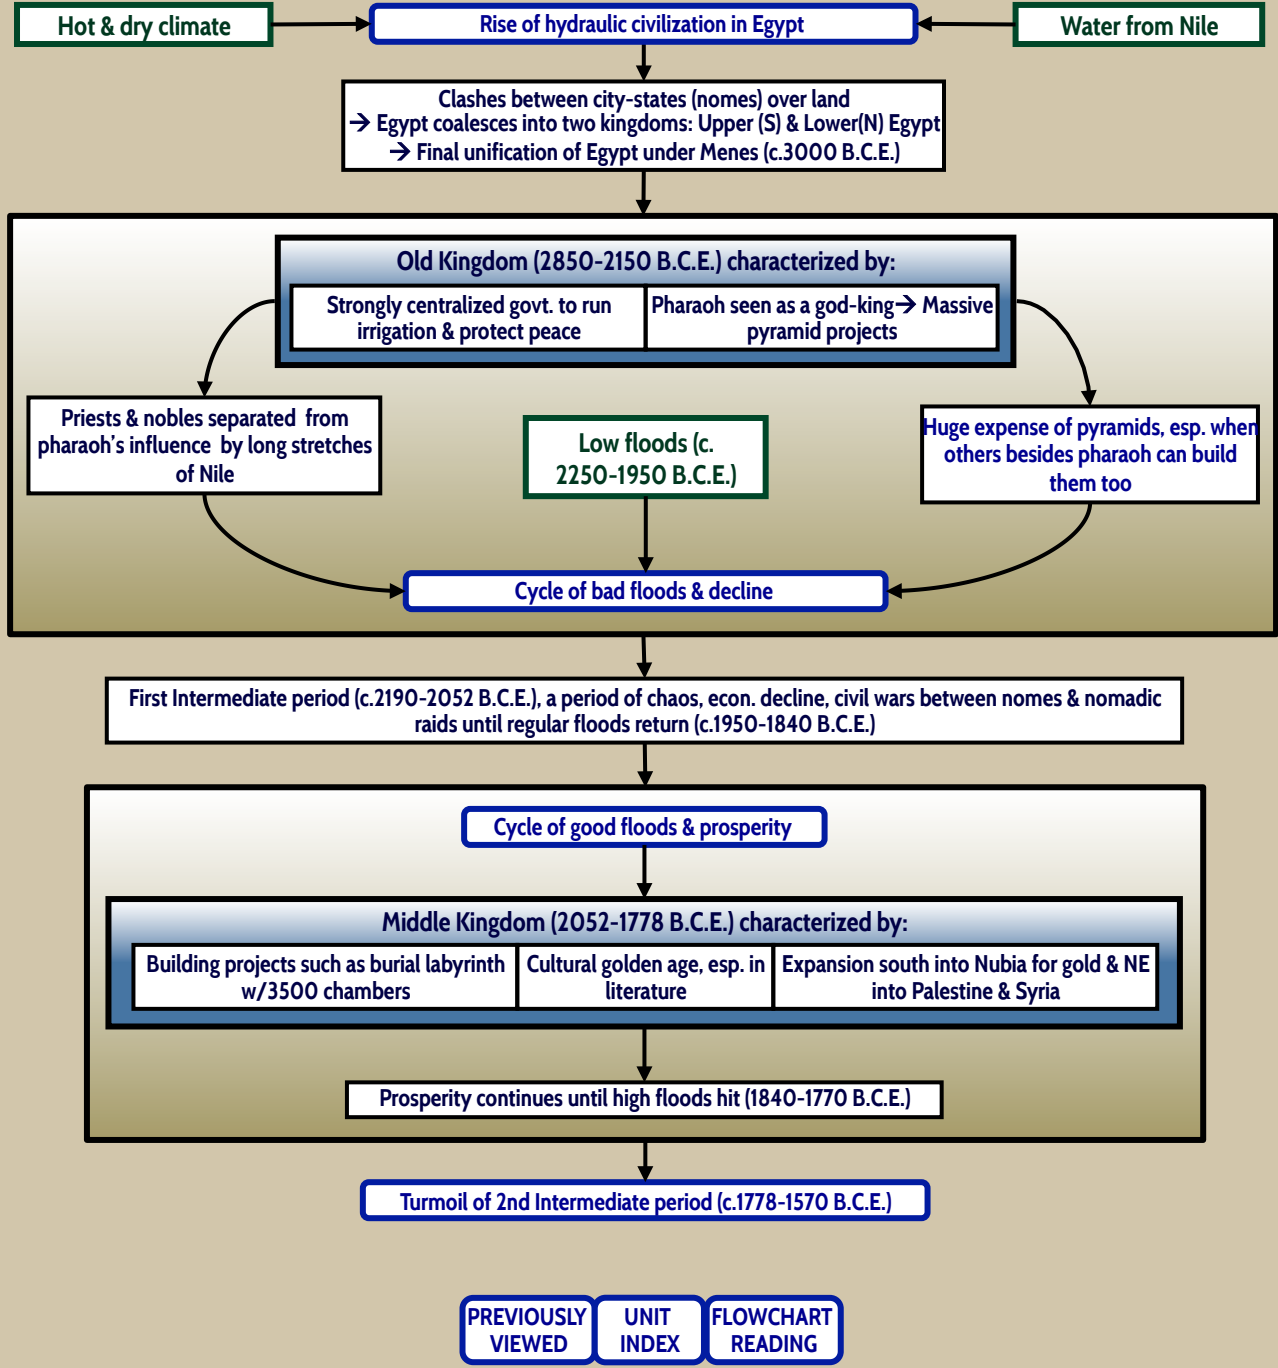

| | | |
|-------------|--|---|
| c.3000-2350 | | Sumerian city-states |
| c.2850-2150 | | Old Kgd Egypt |
| c.2500-1700 | | Indus River Civ. |
| c.2350-2250 | | 3rd Dyn. of Ur |
| c.2100-2000 | | Akkadian Emp. |
| c.2850-2150 | | Middle Kgd Egypt |
| c.1750-1600 | | Babyl. Emp. |
| c.1570-1085 | | New Kgd. Egypt |
| c.1531-1155 | | Kassite Emp. |
| c.1500 | | Aryans enter India |
| c.1430-1180 | | Height of Hittite Empire |
| c.1313 | | Traditional rabbinic date for Exodus |
| c.1200 | | Sea Peoples -> Period of turmoil -> End of Bronze Age |
| c.1200 | | Phoenicians |
| c.1200-539 | | Egypt's final decline |
| c.1085-525 | | Phoenician alphabet |
| c.1050 | | Kingdom of Israel |
| 1030-931 | | Assyrian Emp. |
| 911-612 | | Assyrians conquer N. Kgd of Israel |
| c.814 | | Phoenicians found Carthage. |
| 722 | | Chaldean Emp. |
| 612-539 | | Phoenicians circumnavigate Africa |
| c.600 | | Sack of Jerusalem |
| 586 | | Persian Empire |
| c.550-330 | | Pre-classical Maya |
| c.250 | | Classical Maya |
| BC (BCE) | | Post-classical Meso-America |
| c.250-900 | | Aztecs |
| c.900-1521 | | Inca civ. In Peru |
| 1428-1521 | | Aztecs |
| c.1100-1536 | | Inca civ. In Peru |

2.2 THE CYCLES OF THE NILE & EGYPTIAN HISTORY

| | | |
|-------------|--|---|
| c.3000-2350 | | Sumerian city-states |
| c.2850-2150 | | Old Kgd Egypt |
| c.2500-1700 | | Indus River Civ. |
| c.2350-2250 | | 3rd Dyn. of Ur |
| c.2100-2000 | | Akkadian Emp. |
| c.2850-2150 | | Middle Kgd Egypt |
| c.1750-1600 | | Babyl. Emp. |
| c.1570-1085 | | New Kgd. Egypt |
| c.1531-1155 | | Kassite Emp. |
| c.1500 | | Aryans enter India |
| c.1430-1180 | | Height of Hittite Empire |
| c.1313 | | Traditional rabbinic date for Exodus |
| c.1200 | | Sea Peoples -> Period of turmoil -> End of Bronze Age |
| c.1200 | | Spread of iron tech. |
| c.1200-539 | | Phoenicians |
| c.1085-525 | | Egypt's final decline |
| c.1050 | | Phoenician alphabet |
| 1030-931 | | Kingdom of Israel |
| 911-612 | | Assyrian Emp. |
| c.814 | | Assyrians conquer N. Kgd of Israel |
| 722 | | Phoenicians found Carthage. |
| 612-539 | | Chaldean Emp. |
| c.600 | | Phoenicians circumnavigate Africa |
| 586 | | Sack of Jerusalem |
| c.550-330 | | Pre-classical Maya |
| c.250 | | Persian Empire |
| BC (BCE) | | |
| AD (CE) | | |
| c.250-900 | | Classical Maya |
| c.900-1521 | | Post-classical Meso-America |
| 1428-1521 | | Aztecs |
| c.1100-1536 | | Inca civ. In Peru |

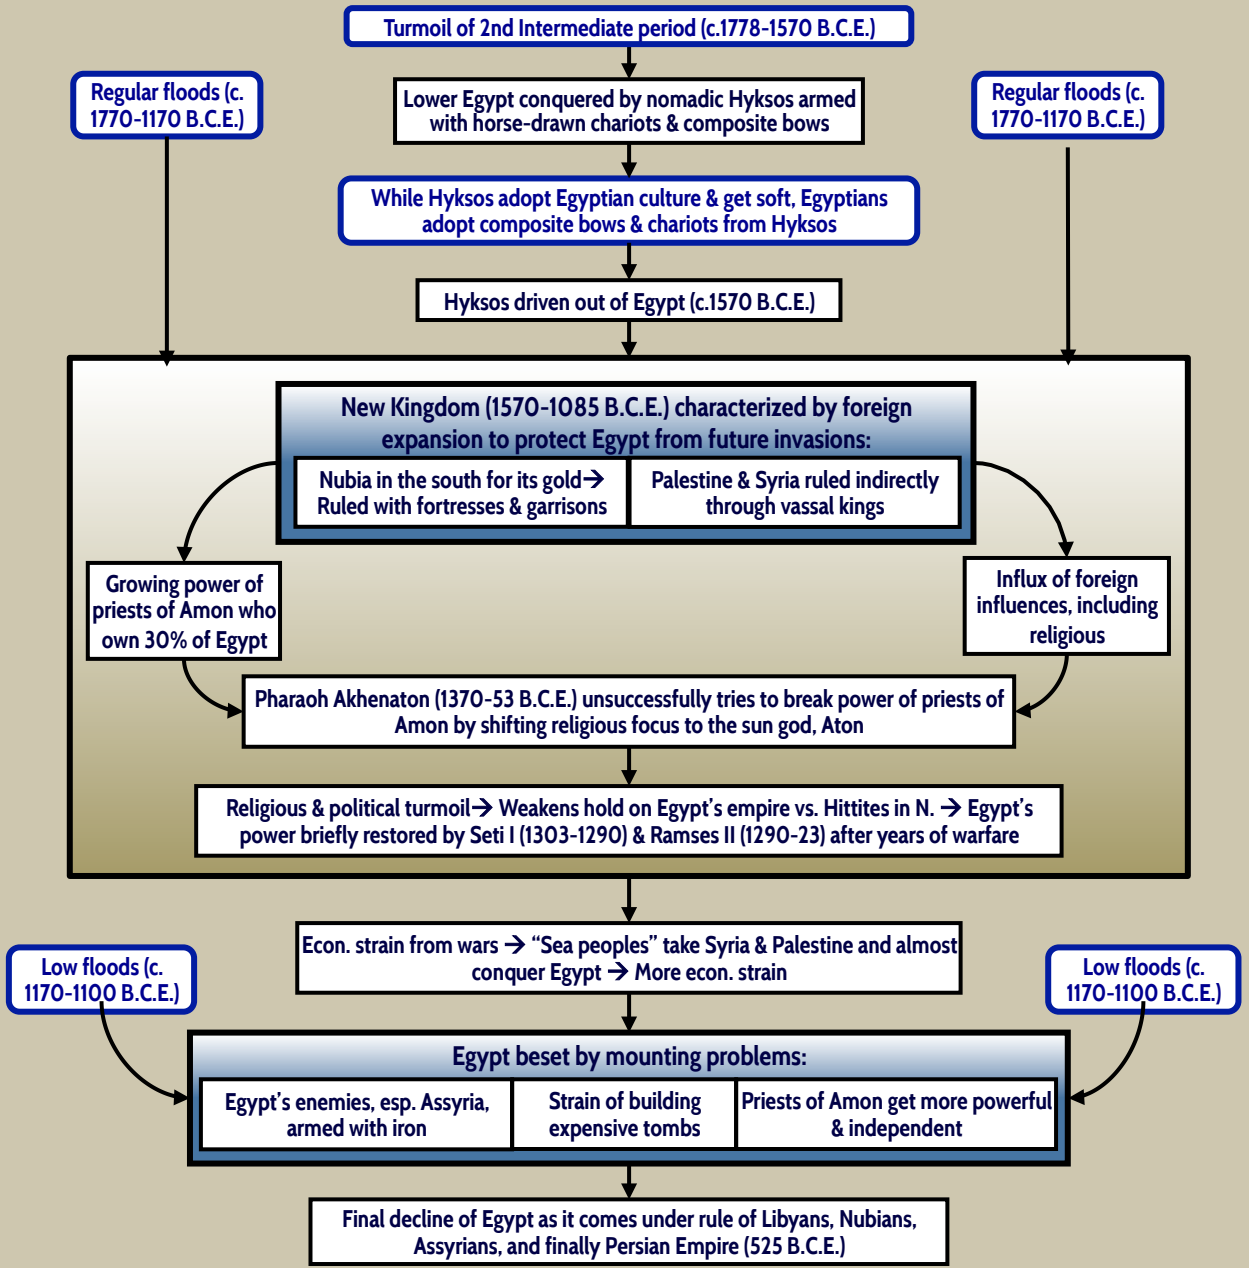

2.2A EGYPT'S OLD AND MIDDLE KINGDOMS (c.3000-1778 B.C.E.)

Timeline of World History (c.3000-2350 to c.1100-1536):

- c.3000-2350: Sumerian city-states
- c.2850-2150: Old Kgd Egypt
- c.2500-1700: Indus River Civ.
- c.2350-2250: Akkadian Emp.
- c.2100-2000: 3rd Dyn. of Ur
- c.2850-2150: Middle Kgd Egypt
- c.1750-1600: New Kgd. Egypt
- c.1570-1085: Babyl. Emp.

- 1428-1521: Inca civ. In Peru
- c.1100-1536

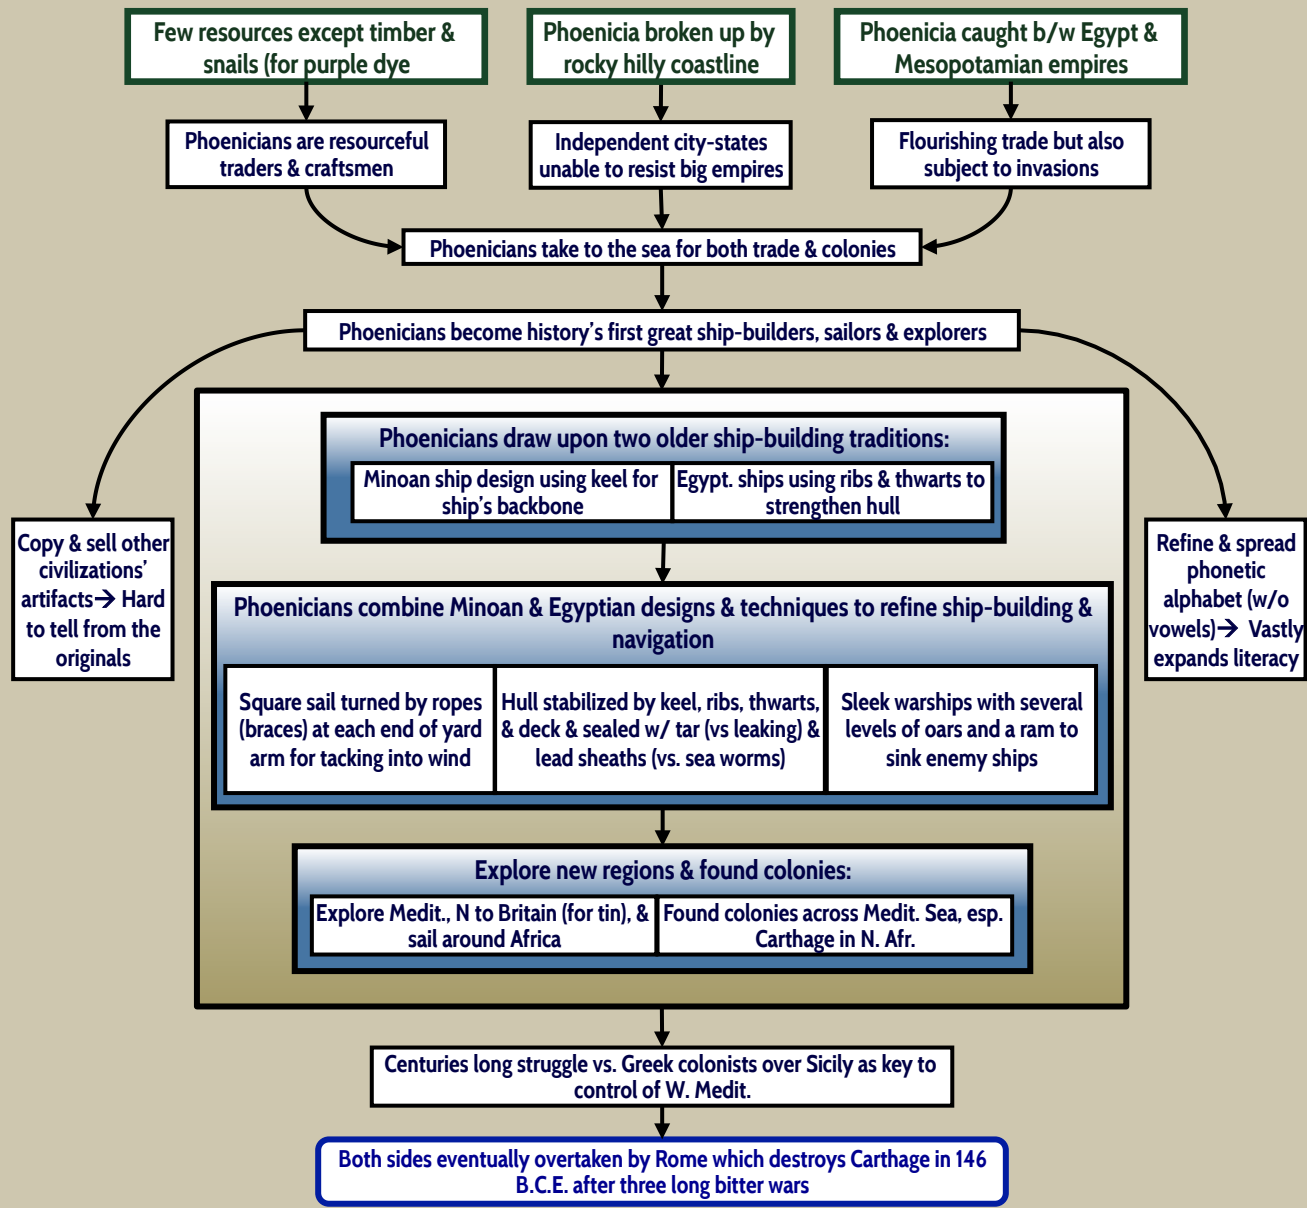

2.3 THE INDUS RIVER CIVILIZATION & PATTERN OF INDIAN HISTORY

Timeline of World Civilizations:

- c.3000-2350: Sumerian city-states
- c.2850-2150: Old Kgd Egypt
- c.2500-1700: Indus River Civ.
- c.2350-2250: 3rd Dyn. of Ur
- c.2100-2000: Akkadian Emp.
- c.2850-2150: Middle Kgd Egypt
- c.1750-1600: New Kgd. Egypt
- c.1570-1085: Babyl. Emp.
- c.1531-1155: Kassite Emp.
- c.1500: Aryans enter India
- c.1430-1180: Height of Hittite Empire
- c.1313: Traditional rabbinic date for Exodus
- c.1200: Sea Peoples → Period of turmoil → End of Bronze Age
- c.1200: Spread of iron tech.
- c.1200-539: Phoenicians
- c.1085-525: Egypt's final decline
- c.1050: Phoenician alphabet (aleph, beth, gimel)
- 1030-931: Kingdom of Israel
- 911-612: Assyrian Emp.
- c.814: Phoenicians found Carthage.
- 722: Assyrians conquer N. Kgd of Israel
- 612-539: Chaldean Emp.
- 612-539: Phoenicians circumnavigate Africa
- c.600: Sack of Jerusalem
- 586: Sack of Jerusalem
- c.550-330: Pre-classical Maya
- c.250: Persian Empire
- BC (BCE): Pre-classical Maya
- AD (CE) c.250-900: Classical Maya
- c.250-900: Post-classical Meso-America
- c.900-1521: Aztecs
- 1428-1521: Inca civ. In Peru
- c.1100-1536: Inca civ. In Peru

2.4 THE PHOENICIANS AND THE ART OF SEAFARING

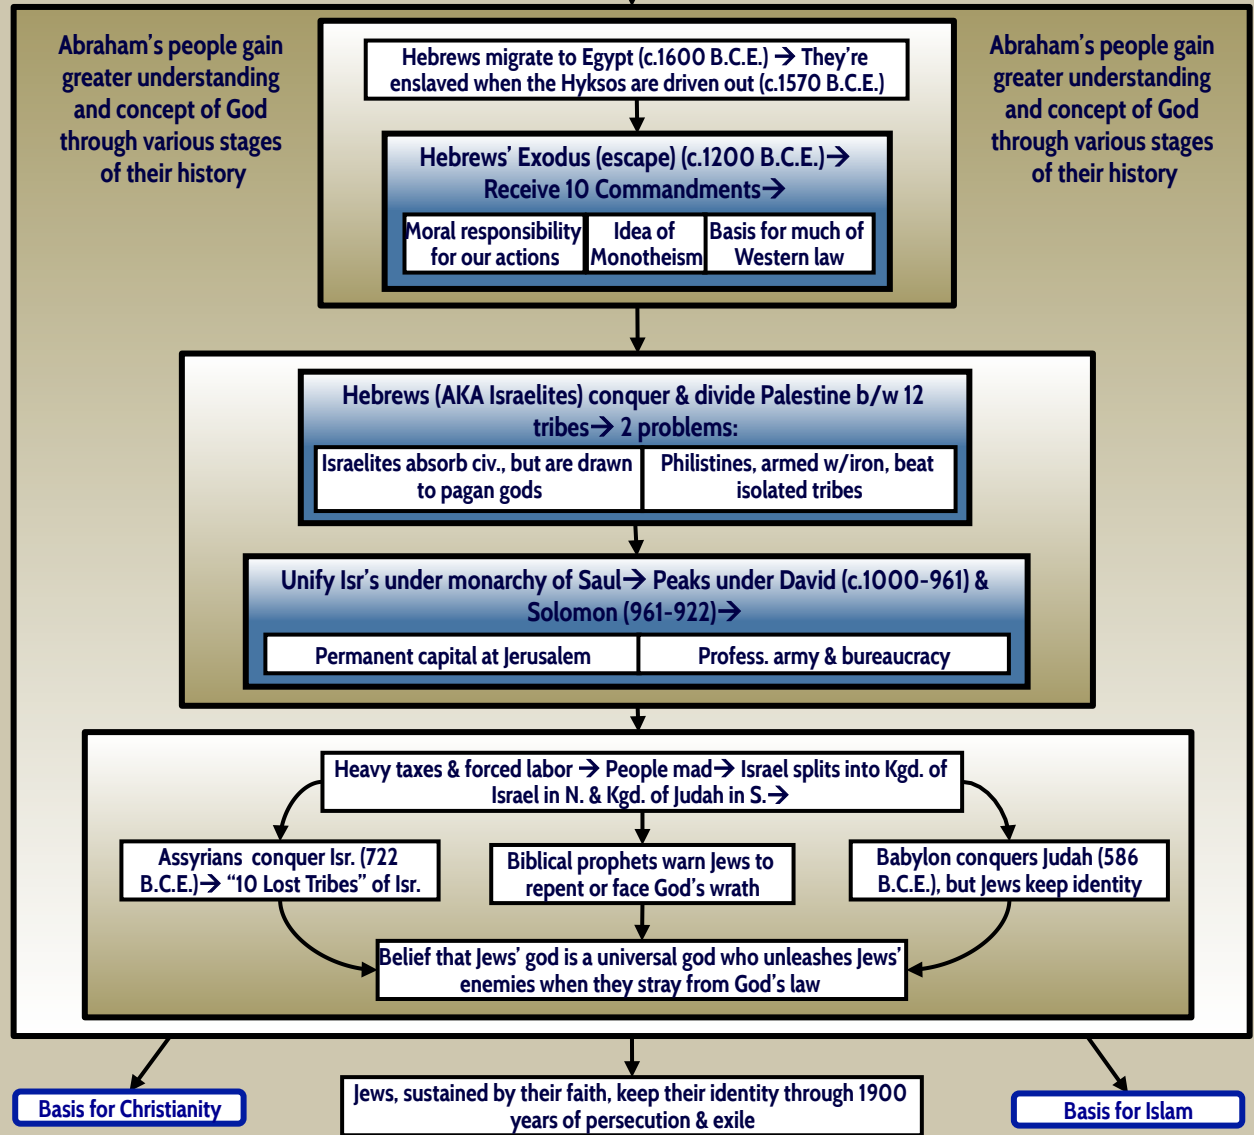

Timeline of ancient civilizations:

- c.3000-2350: Sumerian city-states
- c.2850-2150: Old Kgd Egypt, Indus River Civ.
- c.2500-1700: 3rd Dyn. of Ur, Akkadian Emp.
- c.2350-2250: Middle Kgd Egypt
- c.2100-2000: New Kgd. Egypt, Babyl. Emp.
- c.2850-2150: Kassite Emp.
- c.1750-1600: Aryans enter India, Height of Hittite Empire
- c.1570-1085: Traditional rabbinic date for Exodus
- c.1531-1155: Sea Peoples -> Period of turmoil -> End of Bronze Age
- c.1500: Spread of iron tech., Phoenicians
- c.1430-1180: Egypt's final decline
- c.1313: Phoenician alphabet (aleph, beth, gimel)
- c.1200: Kingdom of Israel
- c.1200-539: Assyrian Emp., Assyrians conquer N. Kgd of Israel
- c.1085-525: Phoenicians found Carthage.
- c.1050: Chaldean Emp.
- 1030-931: Phoenicians circumnavigate Africa
- 911-612: Sack of Jerusalem
- c.814: Assyrians conquer N. Kgd of Israel
- 722: Assyrians conquer Isr. (722 B.C.E.) -> "10 Lost Tribes" of Isr.
- 722: Biblical prophets warn Jews to repent or face God's wrath
- 722: Babylon conquers Judah (586 B.C.E.), but Jews keep identity
- 612-539: Belief that Jews' god is a universal god who unleashes Jews' enemies when they stray from God's law
- 612-539: Persians conquer N. Kgd of Israel
- c.600: Sack of Jerusalem
- 586: Persians conquer N. Kgd of Israel
- c.550-330: Pre-classical Maya, Persian Empire
- c.250: Classical Maya, Post-classical Meso-America
- BC (BCE) AD (CE)
- c.250-900: Aztecs, Inca civ. In Peru
- c.900-1521: Aztecs, Inca civ. In Peru
- 1428-1521: Aztecs, Inca civ. In Peru
- c.1100-1536: Aztecs, Inca civ. In Peru

2.5 THE ISRAELITES AND THE BIRTH OF MONOTHEISM

Hebrews live near Mesopotamia as seen in shared stories (e.g., Great Flood) until one group under Abraham (c.1800 B.C.E.) migrate to Canaan (Palestine) -> Abraham's personal covenant to worship only his god

Timeline of Ancient Civilizations:

- c.3000-2350: Sumerian city-states
- c.2850-2150: Old Kgd Egypt
- c.2500-1700: Indus River Civ.
- c.2350-2250: 3rd Dyn. of Ur
- c.2100-2000: Akkadian Emp.
- c.2850-2150: Middle Kgd Egypt
- c.1750-1600: New Kgd. Egypt
- c.1570-1085: Babyl. Emp.
- c.1531-1155: Kassite Emp.
- c.1500: Aryans enter India
- c.1430-1180: Height of Hittite Empire
- c.1313: Traditional rabbinic date for Exodus
- c.1200: Sea Peoples -> Period of turmoil -> End of Bronze Age
- c.1200: Spread of iron tech.
- c.1200-539: Phoenicians
- c.1085-525: Egypt's final decline
- c.1050: Phoenician alphabet (aleph, beth, gimel)
- 1030-931: Kingdom of Israel
- 911-612: Assyrian Emp.
- c.814: Phoenicians found Carthage.
- 722: Assyrians conquer N. Kgd of Israel
- 612-539: Chaldean Emp.
- 612-539: Phoenicians circumnavigate Africa
- c.600: Sack of Jerusalem
- 586: Sack of Jerusalem
- c.550-330: Pre-classical Maya
- c.250: Persian Empire
- BC (BCE): Classical Maya
- c.250-900: Post-classical Meso-America
- c.900-1521: Aztecs
- 1428-1521: Inca civ. In Peru
- c.1100-1536: Inca civ. In Peru

2.6 THE PERSIAN EMPIRE (c.550-330 B.C.E.)

Closely related Indo-European speaking Persians & Aryans split (c. 2000 B.C.E.), the Persians going west and the Aryans SE into India

Persian king, Cyrus the Great, frees Persians from Medes, takes Babylon (539 B.C.E) and establishes history's greatest empire up to that time

Cambyses, Cyrus' successor, further extends Persian Empire by conquering Egypt in 525 B.C.E.

Darius I "The Great" (522-486 B.C.E.) helps establish stable & peaceful empire through tolerant rule & several other measures:

| | | |
|--|---|---|
| Ensures news and communications by an empire-wide system of roads & relay riders | Creates 20 large & powerful provinces (satrapies) whose governors could resist invasions, but also rebel vs. king | Local garrisons, officials, & royal spies ("King's Ears") answer directly to king to help prevent revolts |
|--|---|---|

Still requires strong ruler to keep peace & order

Weak kings succeed Xerxes I after 464 B.C.E.

Internal Struggles:

- Civil wars, revolts (esp. in Egypt), & powerful independent satraps
- Kings raise taxes while hoarding gold & silver -> Less \$ in circulation
- Hurts kings & economy

Persia falls to Macedonian king, Alexander the Great in 330 B.C.E.

Persians revive under Sassanid Dynasty (c.220-650 C.E.) which preserves Mesopotamian culture and passes it on through Arab Muslims

Another resurgence of Persian power & culture under Safavid Dynasty (1502-1736)

Persians re-emerge in 20th century as modern nation of Iran

Timeline of World History (c.3000-2350 to c.1100-1536)

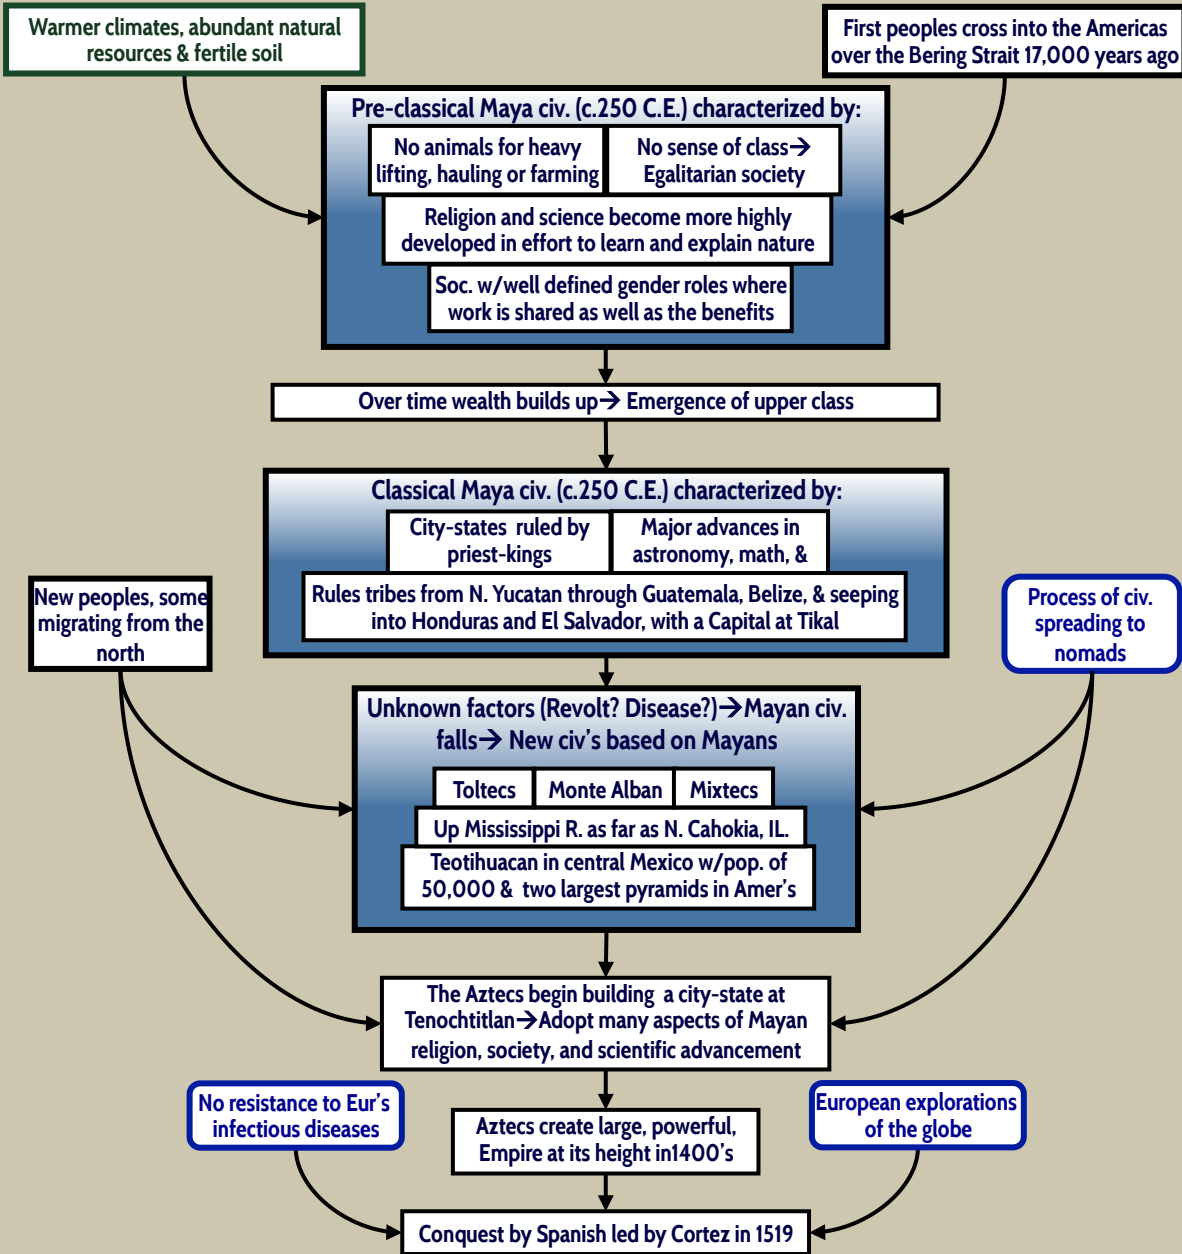

- c.3000-2350: Sumerian city-states
- c.2850-2150: Old Kgd Egypt, Indus River Civ.
- c.2500-1700: 3rd Dyn. of Ur, Akkadian Emp.
- c.2350-2250: Middle Kgd Egypt

2.7B THE CIVILIZATIONS OF THE PRE-COLUMBIAN ANDES

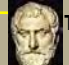

Unit 3. The Greeks

c.1900-1425 **MINOAN CIV.**  **MYCENAEAN CIV** 

c.1600-1100 **DARK AGE**  **ARCHAIC AGE**  **"Fall of Troy"** 

c.1100-800 **Age of colonization**  **Homer** 

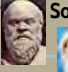

c.750-550 **Thales of Miletus**  **Age of tyrants** 

c.700 **Hoplite Phalanx**  **Age of tyrants** 

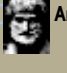

c.624-546 **Coinage**  **Lycurgan reforms in Sparta** 

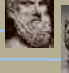

c.650-500 **Cleisthenes' democ. Reforms at Athens**  **Persian Wars** 

c.600 **CLASSICAL ERA**  **Delian League -> Ath. Emp.** 

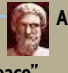

c.600 **Pericles & Athens' Golden Age**  **Socrates** 

508 **Plato** 

510-478 **Aristotle** 

c.500-323 **Parthenon**  **Aeschylus**  **Sophocles** 

478-465 **Euripides** 

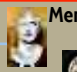

460-430 **Aristophanes** 

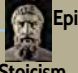

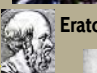

470-399 **Peloponnesian War**  **"King's Peace"** 

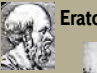

428-347 **Philip of Macedon conquers Greece** 

384-322 **Alexander the Great**  **Alexandria** 

447-432 **HELLENISTIC ERA** 

525-456 **Menander & New Comedy**  **Wars of Alexander's successors** 

496-406 **Epicurus**  **Stoicism** 

480-406 **Eratosthenes** 

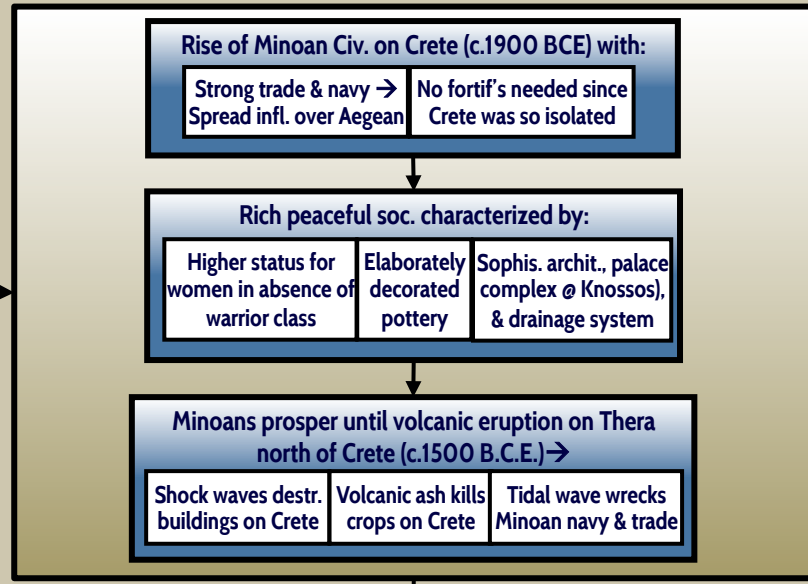

448-380 **Rome annexes Egypt**  **Rome annexes Greece** 

431-404 **387** **338** **336-323** **330** **323-31** **323-c.275** **342-291** **341-270** **334-262** **276-194** **146** **31**

3.1 BRONZE AGE GREECE: THE MINOANS & MYCENAEANS

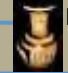

Influence of Mesop. via Syria & Cycladic Islands

Egyptian infl. in archit. (columns) & art (profiles)

Myc's fall → Greek Dark Age

c.1900-1425 **MINOAN CIV.**   **MYCENAEAN CIV**

c.1600-1100 **1184** **DARK AGE**  **ARCHAIC AGE**  **"Fall of Troy"** 

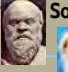

c.1100-800 **c. 800-500** **Age of colonization**  **Homer** 

c.750-550 **c.700** **c.624-546**  **Thales of Miletus**  **Age of tyrants** 

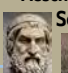

c.650 **Hoplite Phalanx** **c.650-500** **Coinage**  **Lycurgan reforms in Sparta** 

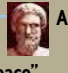

c.600 **c.600** **508** **Cleisthenes' democ. Reforms at Athens**  **Persian Wars** 

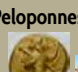

510-478 **c.500-323** **478-465** **CLASSICAL ERA** **Delian League -> Ath. Emp.** 

460-430 **Pericles & Athens' Golden Age** **Socrates**  **Plato** 

470-399 **428-347** **384-322** **Aristotle** 

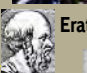

447-432 **Parthenon** **Aeschylus**  **Sophocles** 

525-456 **496-406** **480-406** **448-380** **Aristophanes** 

431-404 **Peloponnesian War** **"King's Peace"**  **Philip of Macedon conquers Greece** 

387 **338** **336-323** **Alexander the Great** **Alexandria** 

330 **323-31** **323-c.275** **HELLENISTIC ERA** **Menander & New Comedy** **Wars of Alexander's successors** 

342-291 **341-270** **334-262** **Stoicism** **Eratosthenes** 

276-194 **146** **31** **Rome annexes Egypt**  **Rome annexes Greece** 

3.2 DARK AGE GREECE & THE RISE OF THE POLIS (c.1100-750 B.C.E.)

c.1900-1425 MINOAN CIV. MYCENAEAN CIV

c.1600-1100 1184 "Fall of Troy"

c.1100-800 DARK AGE ARCHAIC AGE

c. 800-500 Age of colonization Homer

c.750-550 Thales of Miletus

c.624-546 Hoplite Phalanx Age of tyrants

c.650 Coinage Lycurgan reforms in Sparta

c.600 Cleisthenes' democ. Reforms at Athens Persian Wars

508 510-478

c.500-323 CLASSICAL ERA

478-465 Delian League-> Ath. Emp.

460-430 Pericles & Athens' Golden Age Socrates

470-399 Plato

428-347 Aristotle

384-322 Parthenon Aeschylus Sophocles Euripides

447-432 Aristophanes

425-406 Peloponnesian War "King's Peace"

480-406 Philip of Macedon conquers Greece

448-380 Alexander the Great Alexandria

431-404 HELLENISTIC ERA

387 338

336-323 Menander & New Comedy Wars of Alexander's successors

323-31 Epicurus

323-c.275 Stoicism Eratosthenes

342-291 Rome annexes Egypt

341-270 Rome annexes Greece

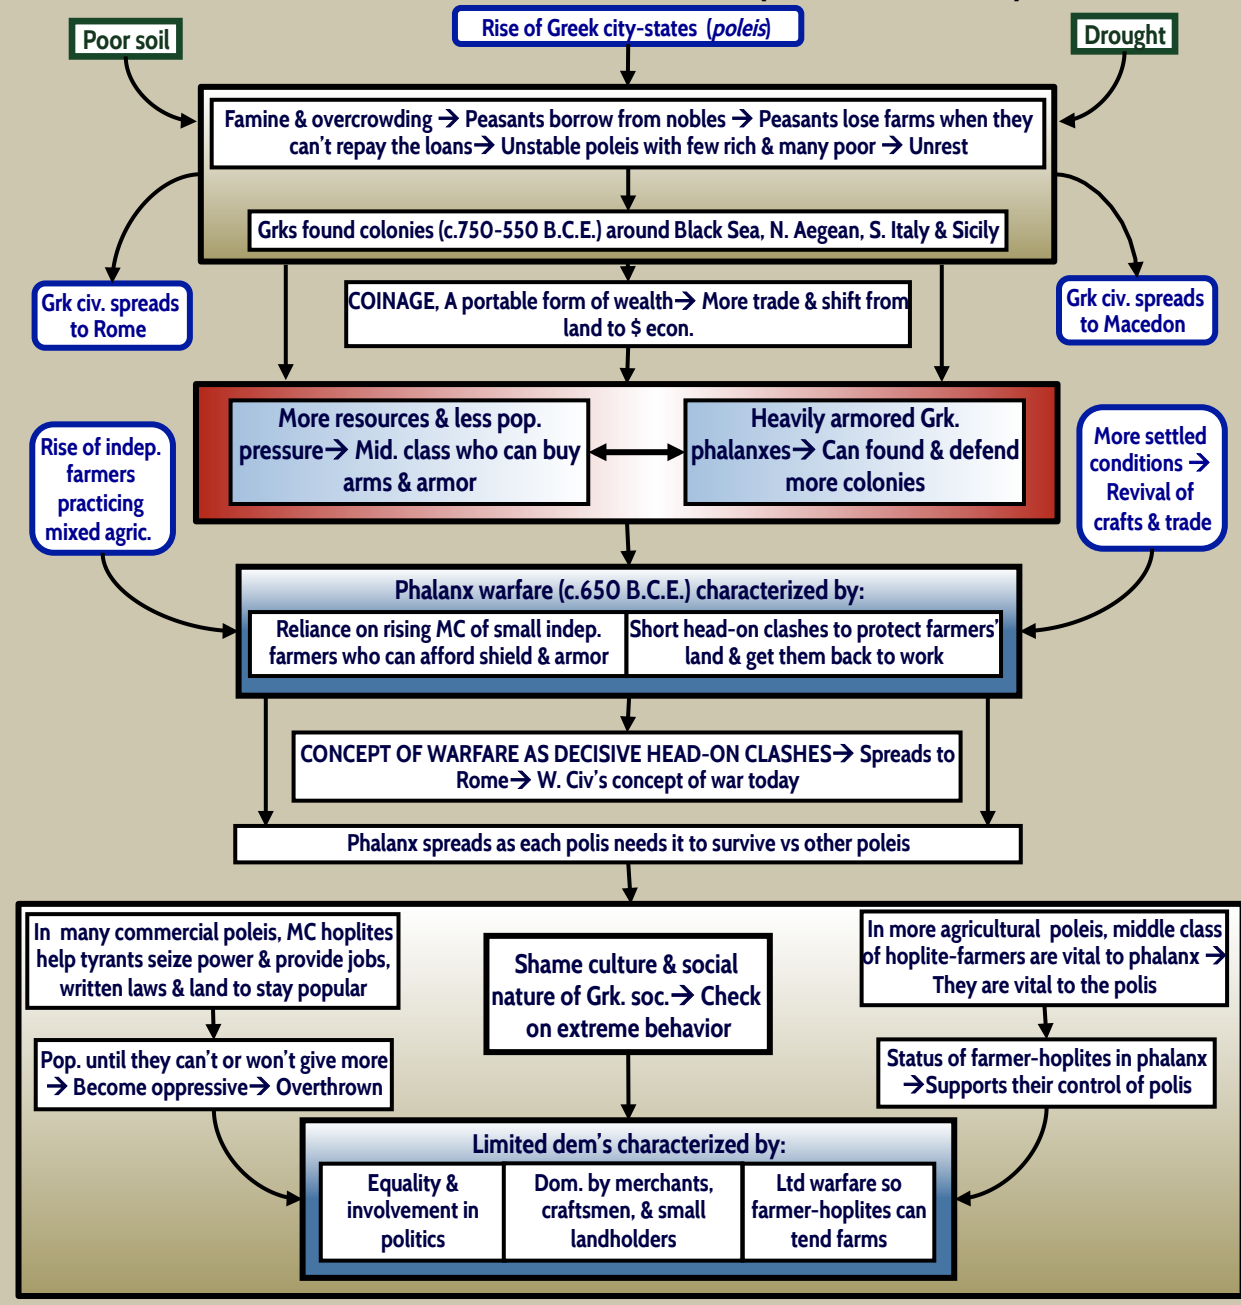

334-262

276-194

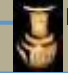

146

3.8 THE DELIAN LEAGUE & ATHENIAN EMPIRE (c.500-431 B.C.E.)

Greeks, esp. Athens, defeat Persian invasions

Greeks form Delian League, led by Athens w/ its large navy to guard Greeks from future Persian invasions, free Ionian Grks, & drives Persians from the Aegean Sea

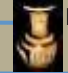

Athens tries to expand across Greece & vs. Persia in Aegean → Athens is defeated → Peace w/Persia (448) & Sparta (445)

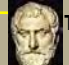

Peace & prosperity continue until war breaks out w/Sparta

Basis for West. Civ. carried on by Rome & re-emerging in Renaissance

| 58-50 | 49-45 | Caesar wins 2nd Roman civil War Caesar killed -> 3rd Civil War |
| 44 | 31 | Augustus est. Pax Romana |
| 27 | 19 | Octavian wins 4th civil war vs. Ant. & Cleop. Vergil's <i>Aeneid</i> |
| BCE | 117 | Empire reaches greatest extent under Trajan |
| CE | 126 | Pantheon |
| 160s | 212 | Epidemic & invasions end Pax Rom. All freemen given Citizenship |
| 235-84 | 285-305 | Anarchy nearly destroys emp. Diocletian restores order -> empire survives 200 yrs |
| 313 | 378 | Constantine legalizes Christianity Battle of Adrianople |
| 410 | 453 | Goths sack Rome Attila dies -> Unleashes former subjects vs. Rome |
| 480 | | Julius Nepos, last emp. of West, dies in exile |

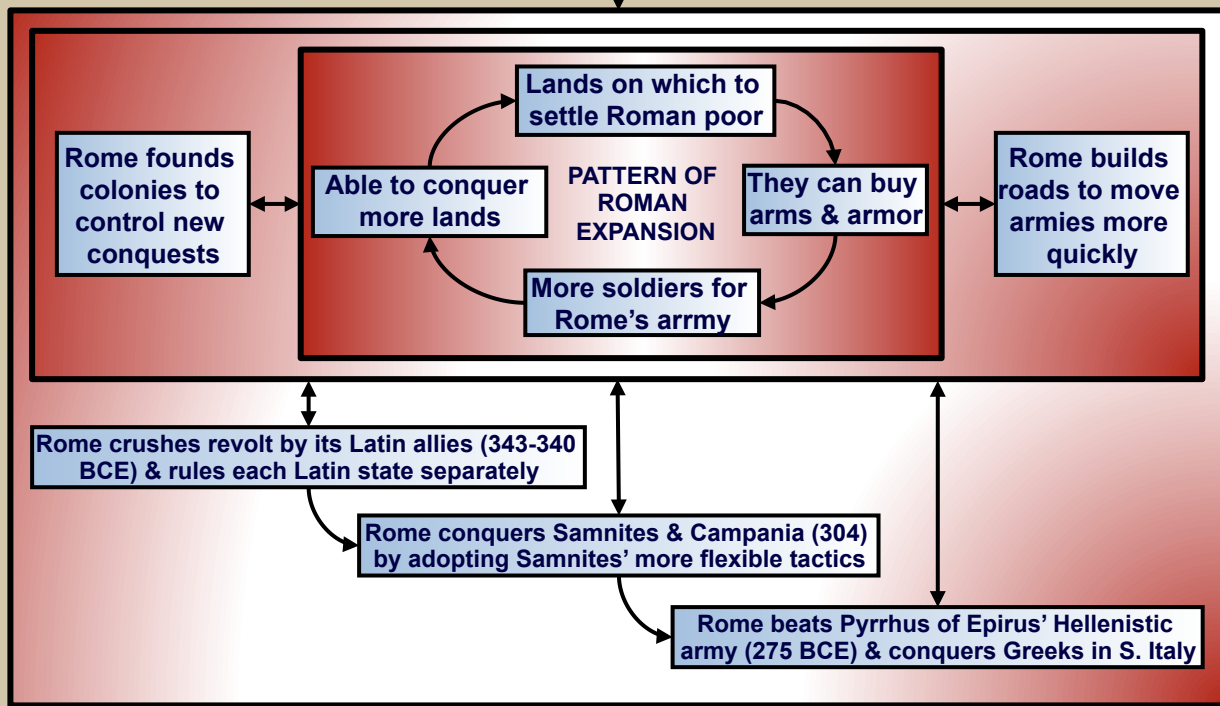

4.3 ROME'S CONQUEST OF ITALY (c.500-265 B.C.E.)

Rome establishes its indep. from Etruscans & neighboring hill tribes

Rome conquers Etruscan Veii w/o any help from Latins → Rome dominates central Italy

Gauls sack Rome (387 BCE), but then return to N. Italy → Temporary setback for Rome, but Romans have deep fear of N. barbarians

Rome recovers from Gallic disaster & resumes expansion

Rome crushes revolt by its Latin allies (343-340 BCE) & rules each Latin state separately

Rome conquers Samnites & Campania (304) by adopting Samnites' more flexible tactics

Rome beats Pyrrhus of Epirus' Hellenistic army (275 BCE) & conquers Greeks in S. Italy

Romans rule Italy through:

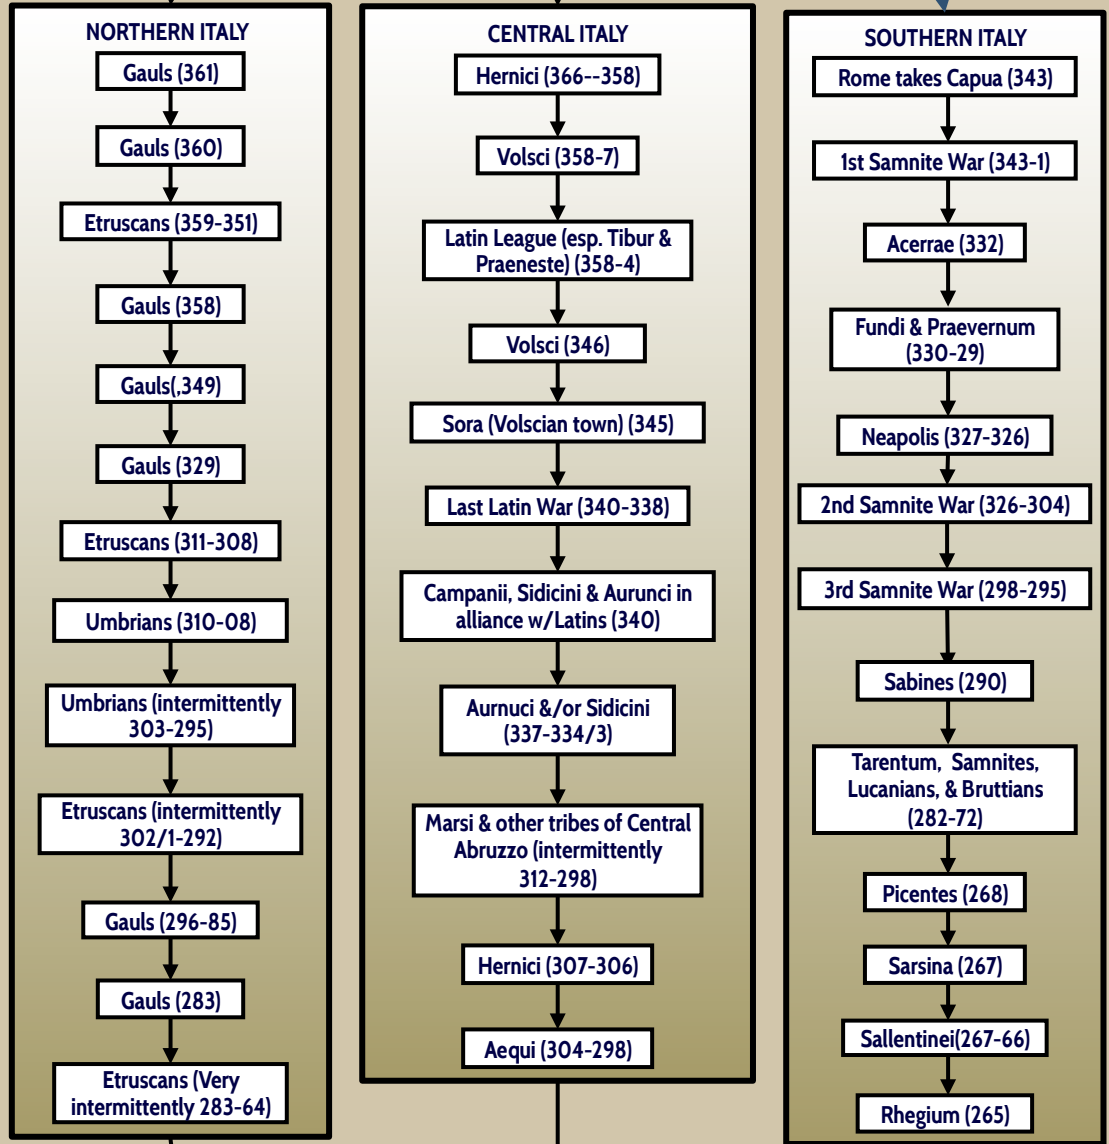

| | | |
|--|--|--|
| Colonies → guard vs. revolt & reward loyalty w/citizenship | Rewarding subjects with various grades of citizenship as they show loyalty to Rome | Roads that promote trade & prosperity during peace |
|--|--|--|

Rome ready to expand into the Mediterranean

| | | |
|---------|--|--|
| 753 | | Rome founded |
| c.650 | | Etruscans rule Rome |
| "509" | | Rome free of Etruscans |
| 396 | | Romans conquer Veii |
| 387 | | Gauls sack Rome |
| 343-290 | | Samnite Wars |
| c.315 | | Manipular reform of army |
| c.312 | | Appian Way & 1st Roman aqueduct |
| 280-275 | | Pyrrhic War & final domination of Italy |
| 264-200 | | Punic Wars -> Rome dominates W. Medit. |
| c.240 | | Roman Theater |
| 200-133 | | Influx of Greek culture |
| 200-133 | | Rome rules E. Med. |
| 133-121 | | Gracchi reforms -> era of turmoil |
| 107 | | Marius' milit. Reforms |
| 106-43 | | Cicero |
| 105 | | Soc. War -> It's gain citizenship |
| 91-88 | | Gladiatorial games |
| 83-82 | | Spartacus' slave revolt |
| 73-71 | | Caesar conquers Gaul |
| 58-50 | | Caesar wins 2nd Roman civil War |
| 49-45 | | Caesar killed -> 3rd Civil War |
| 44 | | Augustus est. Pax Romana |
| 31 | | Octavian wins 4th civil war vs. Ant. & Cleop. |
| 27 | | Vergil's <i>Aeneid</i> |
| 19 | | |
| BCE | | |
| CE | | |
| 117 | | Empire reaches greatest extent under Trajan |
| 126 | | Pantheon |
| 160s | | Epidemic & invasions end Pax Rom. |
| 212 | | All freemen given Citizenship |
| 235-84 | | Anarchy nearly destroys emp. |
| 285-305 | | Diocletian restores order -> empire survives 200 yrs |
| 313 | | Constantine legalizes Christianity |
| 378 | | Battle of Adrianople |
| 410 | | Goths sack Rome |
| 453 | | Attila dies -> Unleashes former subjects vs. Rome |
| 480 | | Julius Nepos, last emp. of West, dies in exile |

4.3A ROME'S WARS OF CONQUEST IN ITALY (366-265 B.C.E.)

After Gallic disaster Rome recovers & resumes expansion

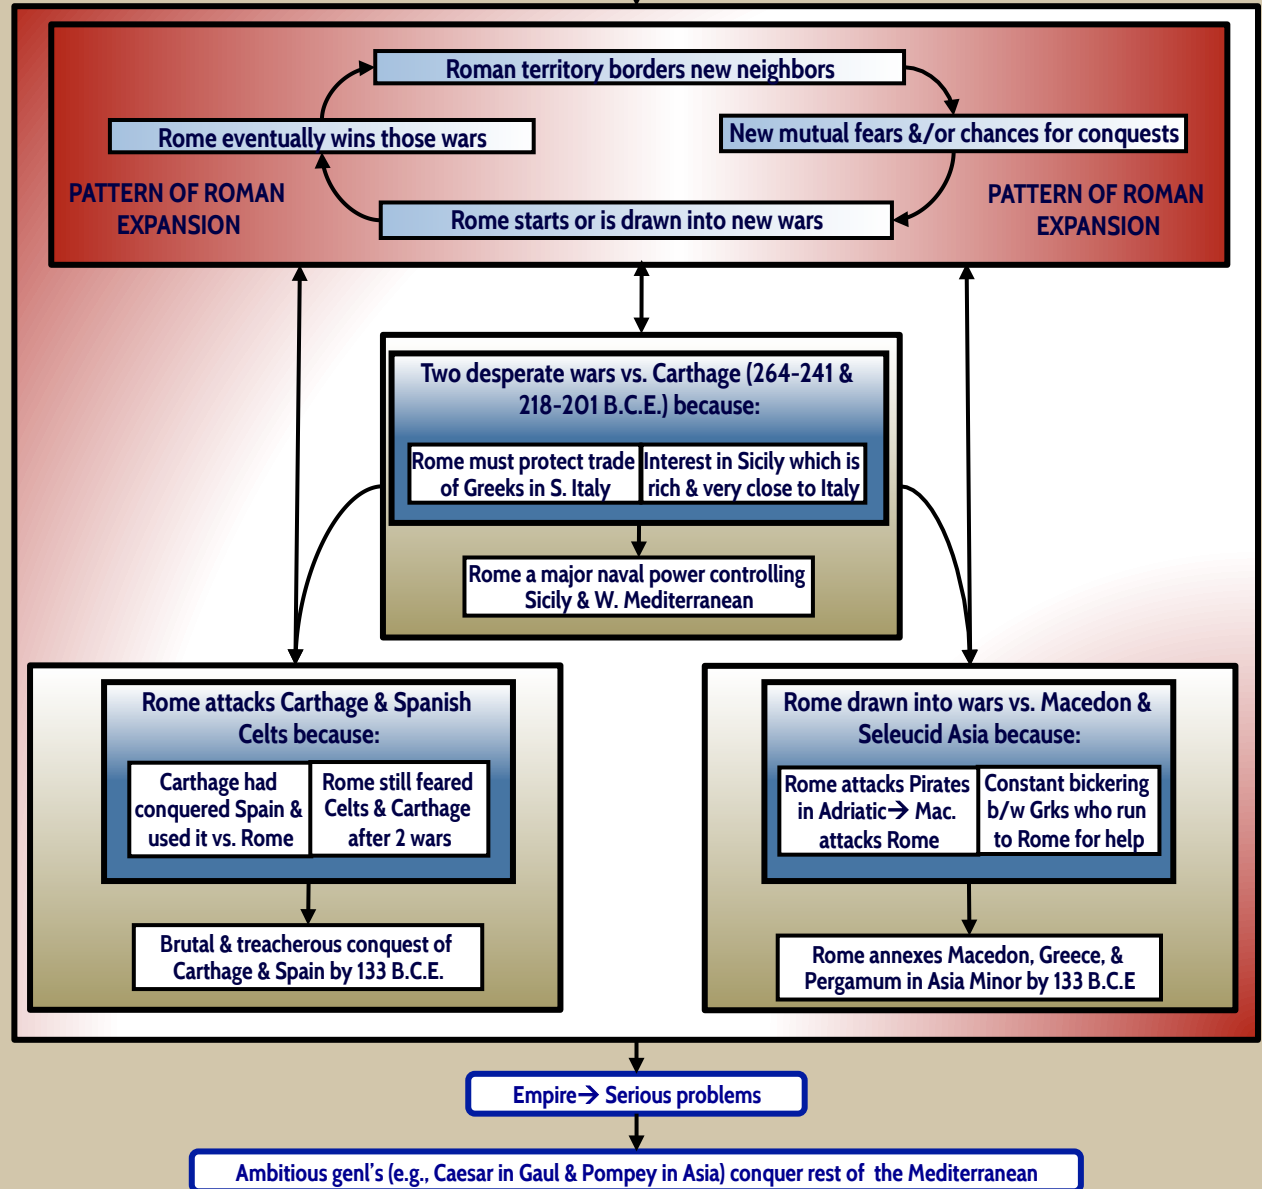

Rome ready to expand into the Mediterranean

| | | |
|---------|--|--|
| 753 | | Rome founded |
| c.650 | | Etruscans rule Rome |
| "509" | | Rome free of Etruscans Romans conquer Veii |
| 396 | | |

| 44 | | Octavian wins 4th civil war vs. Ant. & Cleop. |
| 31 | | Augustus est. Pax Romana |
| 27 | | Vergil's <i>Aeneid</i> |
| 19 | | |
| BCE | | |
| CE | | |
| 117 | | Empire reaches greatest extent under Trajan |
| 126 | | Pantheon |
| 160s | | Epidemic & invasions end Pax Rom. |
| 212 | | All freemen given Citizenship |
| 235-84 | | Anarchy nearly destroys emp. Diocletian restores order -> empire survives 200 yrs |
| 285-305 | | Constantine legalizes Christianity |
| 313 | | Battle of Adrianople |
| 378 | | Goths sack Rome |
| 410 | | Attila dies -> Unleashes former subjects vs. Rome |
| 453 | | |
| 480 | | Julius Nepos, last emp. of West, dies in exile |

4.4A ROME VS CARTHAGE (264-201 BCE)

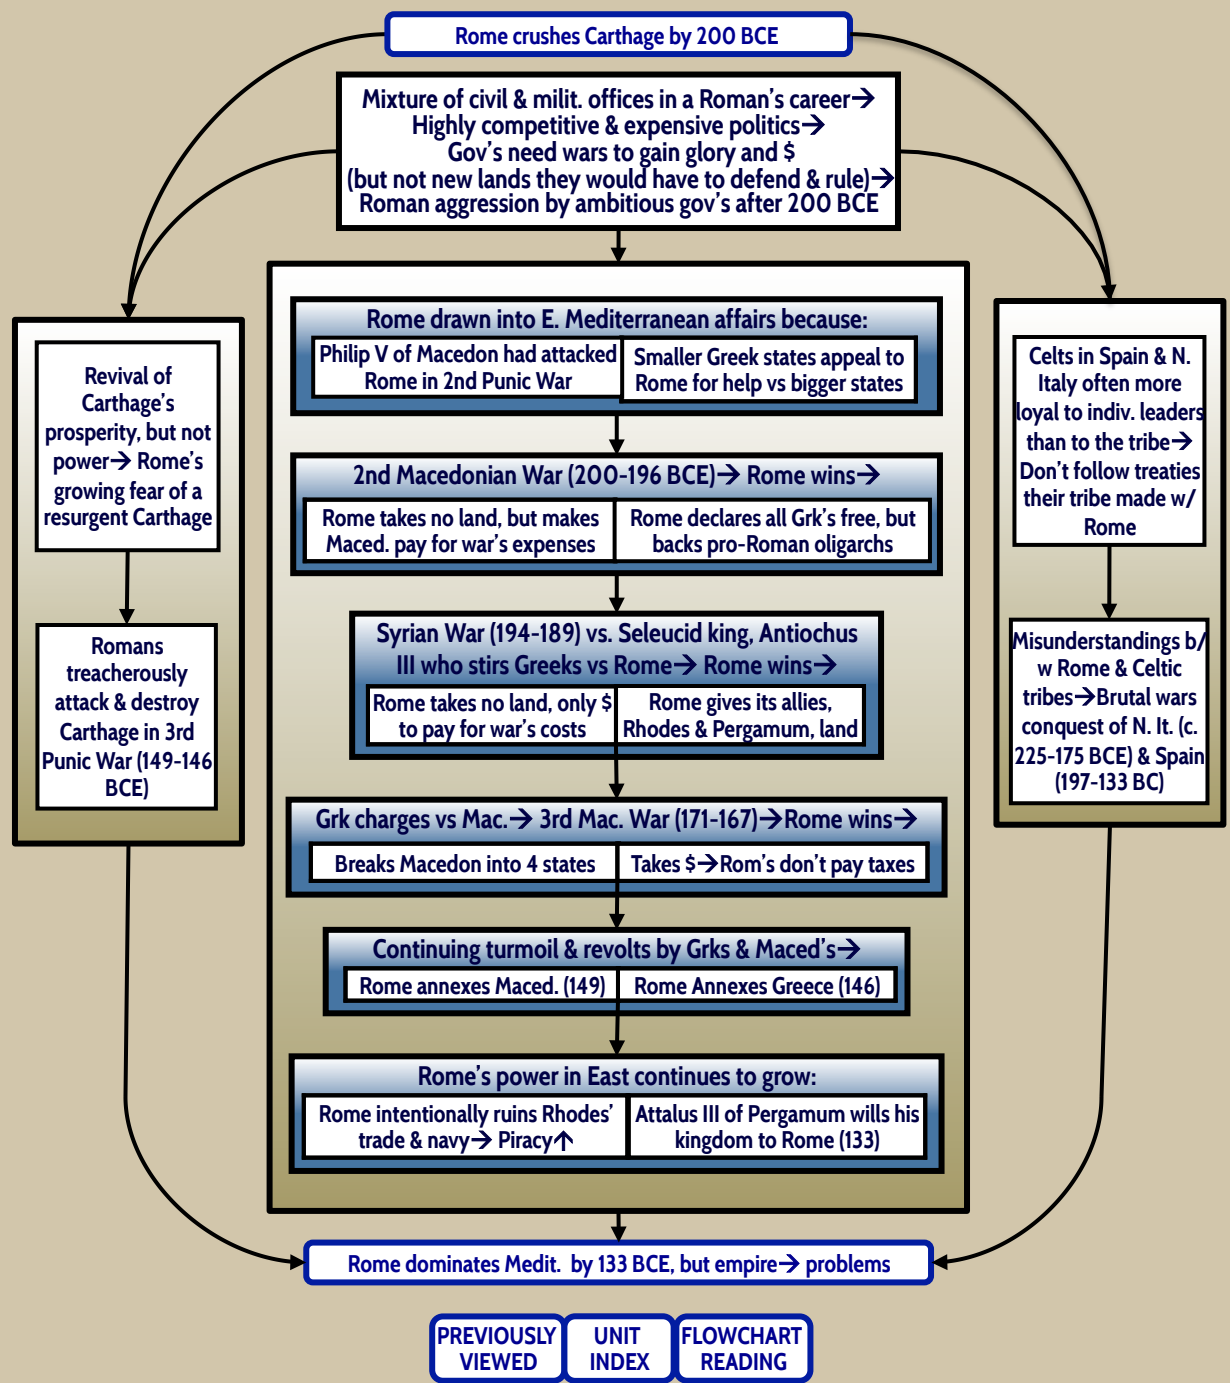

Timeline of Roman history from 753 BCE to 480 CE:

- 753 c.650: Rome founded
- 509: Etruscans rule Rome; Rome free of Etruscans; Romans conquer Veii
- 396: Gauls sack Rome
- 387: Samnite Wars
- 343-290: Manipular reform of army
- c.315: Appian Way & 1st Roman aqueduct
- c.312: Pyrrhic War & final domination of Italy
- 280-275: Punic Wars -> Rome dominates W. Medit.
- 264-200: Rome rules E. Med.
- c.240: Roman Theater
- 200-133: Influx of Greek culture
- 133-121: Gracchi reforms -> era of turmoil; Marius' milit. Reforms
- 107: Cicero
- 106-43: Gladiatorial games; Soc. War -> It's gain citizenship
- 105: Sulla wins 1st Roman civil war
- 83-82: Spartacus' slave revolt; Caesar conquers Gaul
- 73-71: Caesar wins 2nd Roman civil War
- 58-50: Caesar killed -> 3rd Civil War
- 49-45: Augustus est. Pax Romana
- 44: Octavian wins 4th civil war vs. Ant. & Cleop.
- 31: Vergil's *Aeneid*
- 117: Empire reaches greatest extent under Trajan; Pantheon
- 126: Epidemic & invasions end Pax Rom.
- 160s: All freemen given Citizenship
- 212: Anarchy nearly destroys emp.
- 235-84: Diocletian restores order -> empire survives 200 yrs
- 285-305: Constantine legalizes Christianity; Battle of Adrianople
- 313: Goths sack Rome
- 378: Attila dies -> Unleashes former subjects vs. Rome
- 410: Julius Nepos, last emp. of West, dies in exile
- 453
- 480

| 133-121 | | Gracchi reforms -> era of turmoil |
| 107 | | Marius' milit. Reforms- |
| 106-43 | | Cicero |
| 105 | | Gladiatorial games |
| 91-88 | | Soc. War -> It's gain citizenship |
| 83-82 | | Spartacus' slave revolt |
| 73-71 | | Caesar conquers Gaul |
| 58-50 | | Caesar wins 2nd Roman civil War |
| 49-45 | | Caesar killed -> 3rd Civil War |
| 44 | | Caesar killed -> 3rd Civil War |
| 31 | | Octavian wins 4th civil war vs. Ant. & Cleop. |
| 27 | | Augustus est. Pax Romana |
| 19 | | Vergil's Aeneid |
| BCE | | |
| CE | | |
| 117 | | Empire reaches greatest extent under Trajan |
| 126 | | Pantheon |
| 160s | | Epidemic & invasions end Pax Rom. |
| 212 | | All freemen given Citizenship |
| 235-84 | | Anarchy nearly destroys emp. |
| 285-305 | | Diocletian restores order -> empire survives 200 yrs |
| 313 | | Constantine legalizes Christianity |
| 378 | | Battle of Adrianople |
| 410 | | Goths sack Rome |
| 453 | | Attila dies -> Unleashes former subjects vs. Rome |
| 480 | | Julius Nepos, last emp. of West, dies in exile |

4.5 THE BITTER FRUITS OF ROME'S EMPIRE

Rome, still with only a city-state gov., now has to rule an empire

Period of turmoil & civil wars

| | | |
|---------|--|---|
| c.753 | | Rome founded |
| "509" | | Etruscans rule Rome |
| 396 | | Rome free of Etruscans |
| 387 | | Romans conquer Veii |
| 343-290 | | Gauls sack Rome |
| c.315 | | Manipular reform of army |
| c.312 | | Appian Way & 1st Roman aqueduct |
| 280-275 | | Pyrrhic War & final domination of Italy |
| 264-200 | | Punic Wars → Rome dominates W. Medit. |
| c.240 | | Roman Theater |
| 200-133 | | Rome rules E. Med. |
| 200-133 | | Influx of Greek culture |
| 133-121 | | Gracchi reforms → era of turmoil |
| 107 | | Marius' milit. Reforms |
| 106-43 | | Cicero |
| 105 | | Gladiatorial games |
| 91-88 | | Soc. War → It's gain citizenship |
| 83-82 | | Spartacus' slave revolt |
| 73-71 | | Caesar conquers Gaul |
| 58-50 | | Caesar wins 2nd Roman civil War |
| 49-45 | | Caesar killed → 3rd Civil War |
| 44 | | Octavian wins 4th civil war vs. Ant. & Cleop. |
| 31 | | Augustus est. Pax Romana |
| 27 | | Vergil's <i>Aeneid</i> |
| 19 | | |
| BCE | | |
| CE | | |
| 117 | | Empire reaches greatest extent under Trajan |
| 126 | | Pantheon |
| 160s | | Epidemic & invasions end Pax Rom. |
| 212 | | All freemen given Citizenship |
| 235-84 | | Anarchy nearly destroys emp. |
| 285-305 | | Diocletian restores order → empire survives 200 yrs |
| 313 | | Constantine legalizes Christianity |
| 378 | | Battle of Adrianople |
| 410 | | Goths sack Rome |
| 453 | | Attila dies → Unleashes former subjects vs. Rome |
| 480 | | Julius Nepos, last emp. of West, dies in exile |

4.5A THE FLOW OF POWER IN THE ROMAN REPUBLIC

Problems of ruling an empire w/city-state govt. & army of short-term amateur officials & militia

SENATE: Advisory body of 300 ex-office holders whose decrees (*senatus consulta*) are not technically laws but have virtual force of law to:

| | | |
|---|---|---|
| Rule on technical legality of treaties & laws | Assign magistrates' tasks (e.g., which proconsul rules which province & for how long) | Assign budgets to governors & officials |
|---|---|---|

Senate's works to maintain its power as a body w/o any of its individual members getting too much power

Senate controls popular assemblies through:

| | |
|---|---|
| COMITIA TRIBUTA Votes on laws that only officials (who are also senators) can propose • Open ballots → Control votes of their clientes (poor dependants) | COMITIA CENTURIATA • Votes on war & peace • Weighted bloc voting to favor those who bear the brunt of the fighting (which used to be the rich) |
|---|---|

Senate controls officials who return to Senate after 1-yr terms:

| | |
|---|--|
| CONSULS & PRAETORS (who are also members of Senate) • Control what laws are proposed to the assemblies, their text, & who can discuss them | TRIBUNES (who are also members of Senate) • Supposedly protect the poor, can propose laws & veto any act of state they or the senate want |
|---|--|

Senate controls various traditional and religious procedures:

| | | |
|--|---|--|
| PRIESTS (who are also senators) that can declare bad omens & postpone govt. business for that day | CURSUS HONORUM: The minimum age, number of times, & order one can hold offices: Military tribune → quaestor → aedile or tribune → praetor → consul | CENSORS: 2 officials elected every 5 yrs to choose worthy men to fill the Senate to 300 & expel unworthy senators |
|--|---|--|

| | |
|---------|--|
| 753 | Rome founded |
| c.650 | Etruscans rule Rome |
| "509" | Rome free of Etruscans |
| 396 | Romans conquer Veii |
| 387 | Gauls sack Rome |
| 343-290 | Samnite Wars |
| c.315 | Manipular reform of army |
| c.312 | Appian Way & 1st Roman aqueduct |
| 280-275 | Pyrrhic War & final domination of Italy |
| 264-200 | Punic Wars → Rome dominates W. Medit. |
| c.240 | Roman Theater |
| 200-133 | Rome rules E. Med. |
| 200-133 | Influx of Greek culture |
| 133-121 | Gracchi reforms → era of turmoil |
| 107 | Marius' milit. Reforms |
| 106-43 | Cicero |
| 105 | Gladiatorial games |
| 91-88 | Soc. War → It's gain citizenship |
| 83-82 | Spartacus' slave revolt |
| 73-71 | Sulla wins 1st Roman civil war |
| 58-50 | Caesar conquers Gaul |
| 49-45 | Caesar wins 2nd Roman civil War |
| 44 | Caesar killed → 3rd Civil War |
| 31 | Augustus est. Pax Romana |
| 27 | Octavian wins 4th civil war vs. Ant. & Cleop. |
| 19 | Vergil's <i>Aeneid</i> |
| BCE | |
| CE | |
| 117 | Empire reaches greatest extent under Trajan |
| 126 | Pantheon |
| 160s | Epidemic & invasions end Pax Rom. |
| 212 | All freemen given Citizenship |
| 235-84 | Anarchy nearly destroys emp. Diocletian restores order → empire survives 200 yrs |
| 285-305 | |
| 313 | Constantine legalizes Christianity |
| 378 | Battle of Adrianople |
| 410 | Goths sack Rome |
| 453 | Attila dies → Unleashes former subjects vs. Rome |
| 480 | Julius Nepos, last emp. of West, dies in exile |

4.6 FALL OF THE ROMAN REPUBLIC (133-31 B.C.E.)

| | | |
|---------|-------|--|
| 753 | c.650 | Rome founded |
| "509" | | Etruscans rule Rome Romans conquer Veii |
| 396 | | Gauls sack Rome |
| 387 | | Samnite Wars |
| 343-290 | | Manipular reform of army |
| c.315 | | Appian Way & 1st Roman aqueduct |
| 280-275 | | Pyrrhic War & final domination of Italy |
| 264-200 | | Punic Wars -> Rome dominates W. Medit. |
| c.240 | | Roman Theater |
| 200-133 | | Influx of Greek culture |
| 200-133 | | Rome rules E. Med. |
| 133-121 | | Gracchi reforms -> era of turmoil Marius' milit. Reforms- |
| 107 | | |
| 106-43 | | Soc. War -> It's gain citizenship |
| 105 | | Cicero |
| 91-88 | | Gladiatorial games |
| 83-82 | | Spartacus' slave revolt |
| 73-71 | | Caesar conquers Gaul |
| 58-50 | | Caesar wins 2nd Roman civil War |
| 49-45 | | Caesar killed -> 3rd Civil War |
| 44 | | |
| 31 | | Octavian wins 4th civil war vs. Ant. & Cleop. |
| 27 | | Augustus est. Pax Romana |
| 19 | | Vergil's Aeneid |
| BCE | | |
| 117 | | Empire reaches greatest extent under Trajan |
| 126 | | Pantheon |
| 160s | | Epidemic & invasions end Pax Rom. All freemen given Citizenship |
| 212 | | |
| 235-84 | | Anarchy nearly destroys emp. Diocletian restores order -> empire survives 200 yrs |
| 285-305 | | |
| 313 | | Constantine legalizes Christianity |
| 378 | | Battle of Adrianople |
| 410 | | Goths sack Rome |
| 453 | | Attila dies -> Unleashes former subjects vs. Rome |
| 480 | | Julius Nepos, last emp. of West, dies in exile |

4.7 THE AUGUSTAN PRINCIPATE & PAX ROMANA (31 B.C.E.-180 C.E.)

Civil wars & turmoil of the late republic Romans' traditional & conservative nature

Octavian must create a strong one-man rule while making it look like good old days of the Republic

Augustan Principate where Octavian (aka Augustus) kept only harmless sounding republican powers that still gave him control of armies & making laws:

- Tribune's powers to propose & veto laws while posing as the champion of the common people
- Proconsul's powers to control milit. prov's & army while leaving non-milit. provs to the Senate

Succession ensured by giving chosen successor tribunician & proconsular powers before Augustus died

Still need reliable army, governors, & bureaucrats for provinces

Bureaucr. reforms

- Regularly paid & trained officials
- Equites trained for mid-level jobs

Honest, efficient, & stable government in the provinces

Works to get more reliable provincial governors through:

- Regular pay → No need for corruption
- Procurators, Augustus' agents who watch gov's
- Using old Rep's offices to train them

Efficient, loyal & honest provincial gov's

Military reforms

- Aug. gave army its pay & pensions
- Cut army from 60 to 28 legions

Cheap, but highly trained & loyal army guarding frontiers

Few outside threats for 200 yrs.

Medit's centr. position → fast comm's

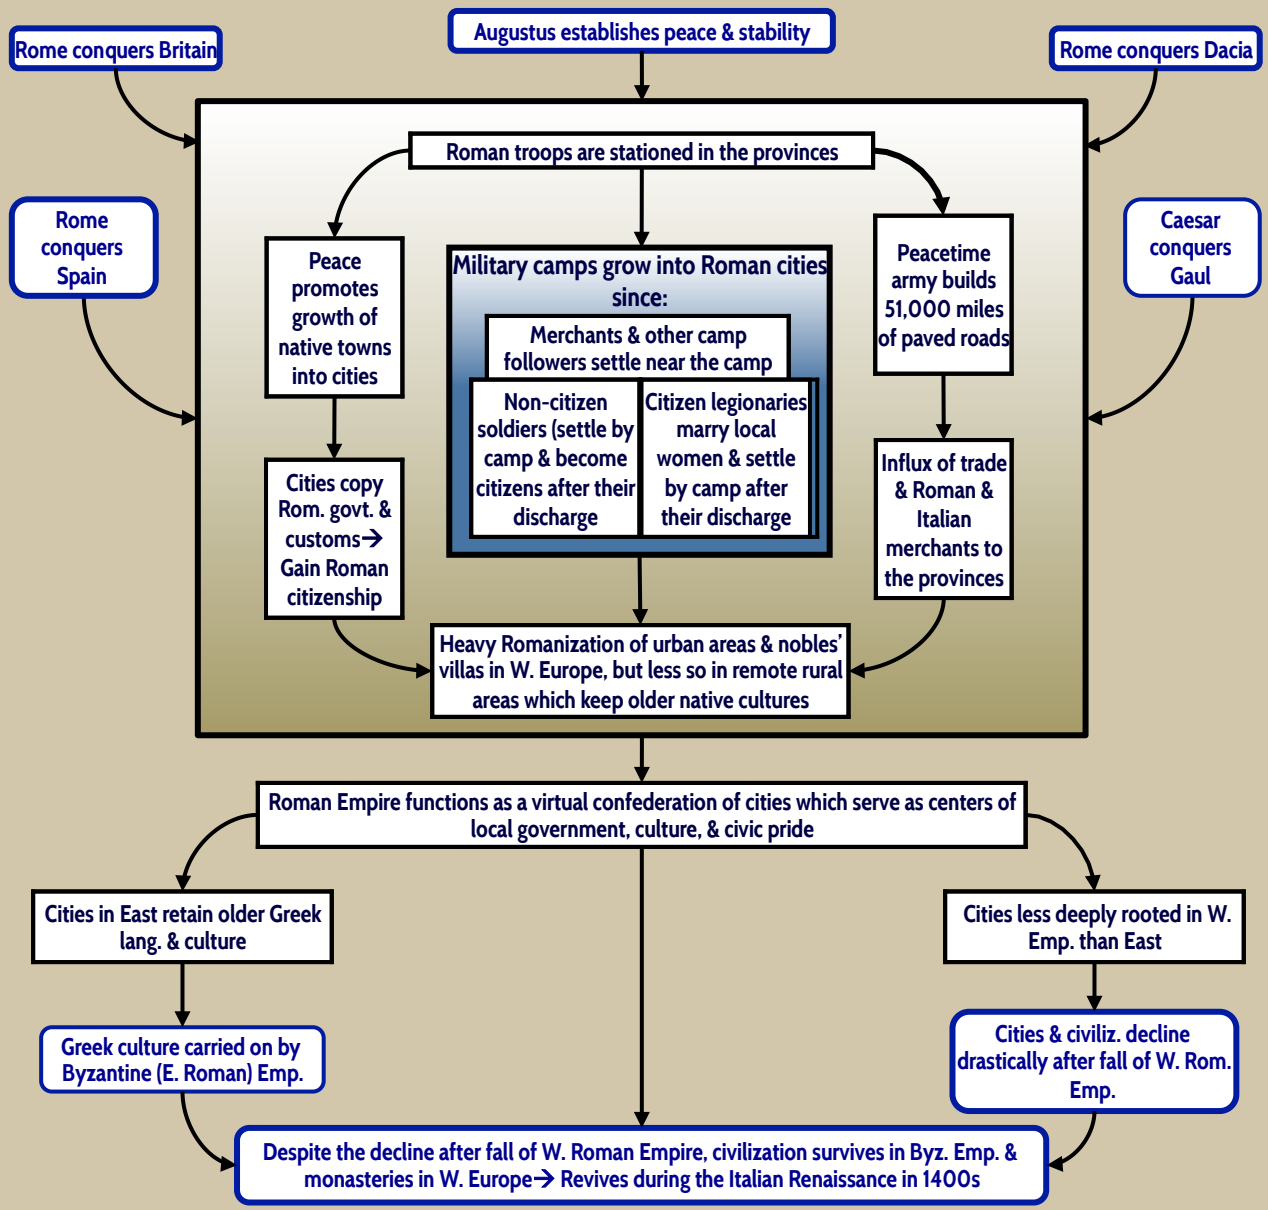

Pax Romana: Except for conquering Britain & Dacia, 200 years of nearly unbroken peace & prosperity throughout the Mediterranean, with trade routes extending to China & India

Timeline of Roman history from 753 B.C.E. to 480 C.E.

- 753 B.C.E. Rome founded
- 509 B.C.E. Etruscans rule Rome; Rome free of Etruscans; Romans conquer Veii
- 396 B.C.E. Gauls sack Rome
- 387 B.C.E. Samnite Wars
- 343-290 B.C.E. Manipular reform of army
- c.315 Appian Way & 1st Roman aqueduct
- c.312 Pyrrhic War & final domination of Italy
- 280-275 B.C.E. Punic Wars → Rome dominates W. Medit.
- 264-200 B.C.E. Roman Theater; Rome rules E. Med.
- c.240 Influx of Greek culture
- 200-133 B.C.E. Gracchi reforms → era of turmoil; Marius' milit. Reforms
- 107 B.C.E. Cicero; Gladiatorial games; Soc. War → It's gain citizenship
- 91-88 B.C.E. Sulla wins 1st Roman civil war; Spartacus' slave revolt; Caesar conquers Gaul
- 83-82 B.C.E. Caesar wins 2nd Roman civil War; Caesar killed → 3rd Civil War
- 73-71 B.C.E. Caesar killed → 3rd Civil War
- 58-50 B.C.E. Octavian wins 4th civil war vs. Ant. & Cleop.; Augustus est. Pax Romana
- 49-45 B.C.E. Vergil's Aeneid
- 44 B.C.E. Augustus est. Pax Romana
- 31 B.C.E. Empire reaches greatest extent under Trajan; Pantheon
- 27 B.C.E. Epidemic & invasions end Pax Rom.; All freemen given Citizenship
- 19 B.C.E. Anarchy nearly destroys emp.; Diocletian restores order → empire survives 200 yrs
- 117 C.E. Constantine legalizes Christianity; Battle of Adrianople
- 126 C.E. Goths sack Rome; Attila dies → Unleashes former subjects vs. Rome
- 160s C.E. Julius Nepos, last emp. of West, dies in exile
- 212 C.E.
- 235-84 C.E.
- 285-305 C.E.
- 313 C.E.
- 378 C.E.
- 410 C.E.
- 453 C.E.
- 480 C.E.

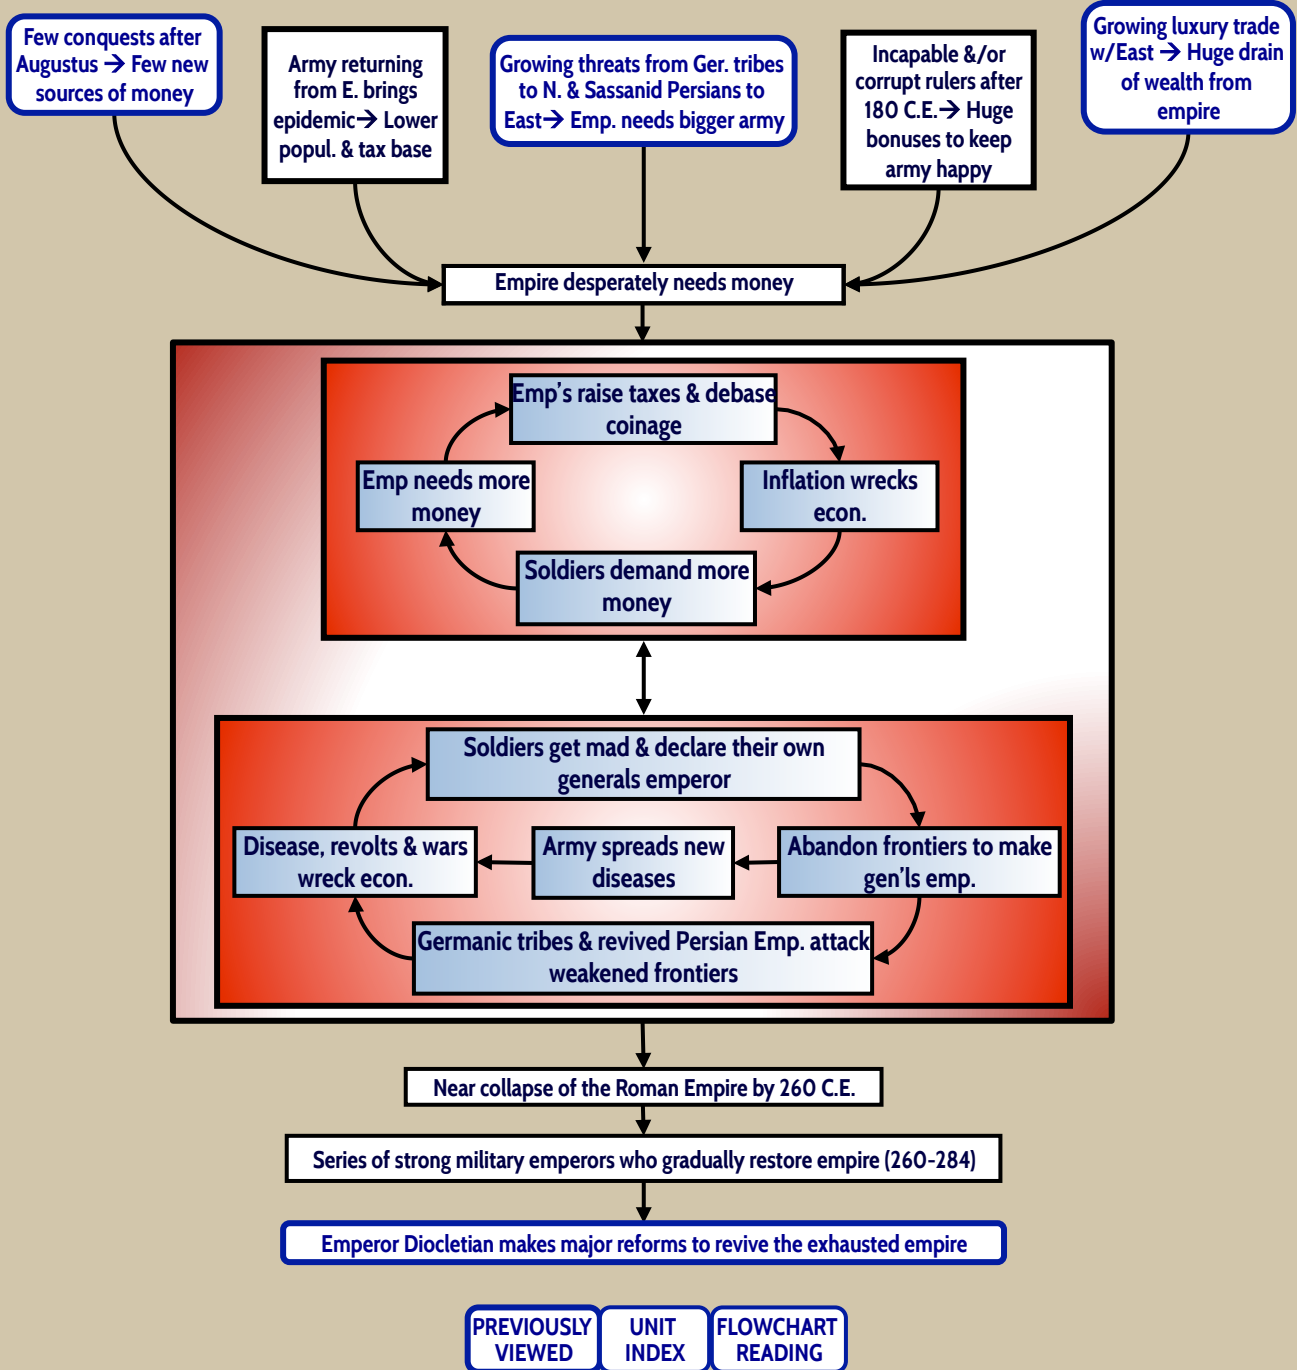

4.8 THE SPREAD OF ROMAN CIVILIZATION IN WESTERN EUROPE DURING THE PAX ROMANA (31 B.C.E.-180 C.E.)

| | | |
|---------|--|--|
| 753 | | Rome founded |
| c.650 | | Etruscans rule Rome |
| "509" | | Rome free of Etruscans |
| 396 | | Romans conquer Veii |
| 387 | | Gauls sack Rome |
| 343-290 | | Samnite Wars |
| c.315 | | Manipular reform of army |

| 212 | | |
| 235-84 | | Anarchy nearly destroys emp. Diocletian restores order -> empire survives 200 yrs |
| 285-305 | | |
| 313 | | Constantine legalizes Christianity |
| 378 | | Battle of Adrianople |
| 410 | | Goths sack Rome |
| | | Attila dies -> Unleashes former subjects vs. Rome |
| 453 | | |
| 480 | | Julius Nepos, last emp. of West, dies in exile |

4.9A THE CONSOLIDATION OF THE GERMANIC THREAT (c.100-300 C.E.)

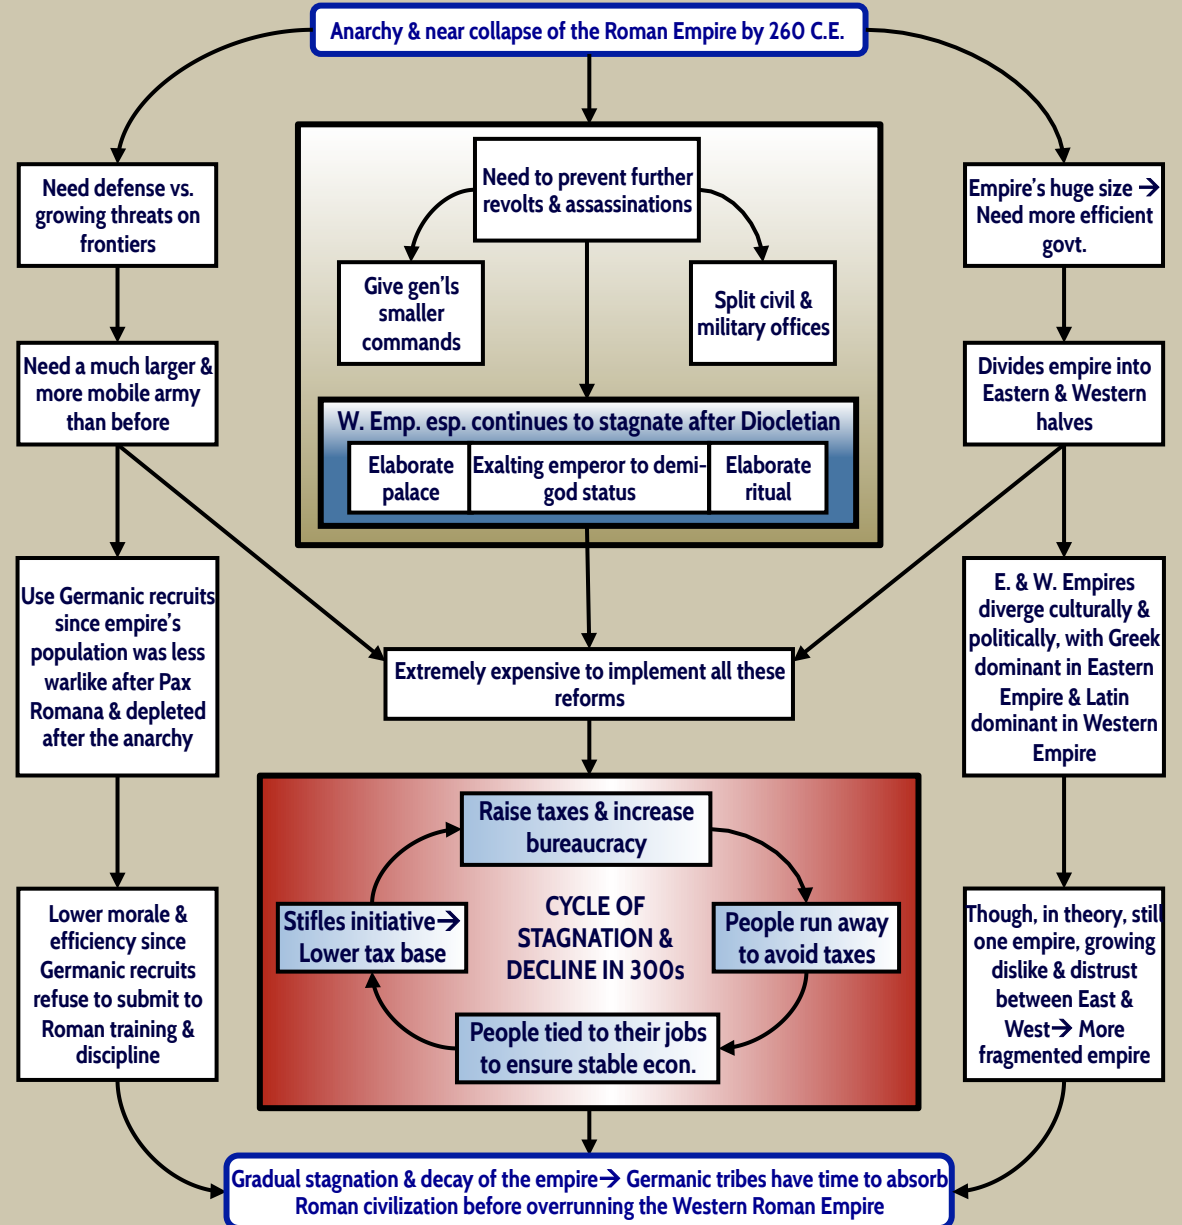

| | | | |
|---------|-------|--|--|
| 753 | c.650 | | Rome founded |
| 509 | | | Etruscans rule Rome |
| 396 | | | Rome free of Etruscans |
| 387 | | | Romans conquer Veii |
| 343-290 | | | Gauls sack Rome |
| c.315 | | | Samnite Wars |
| c.312 | | | Manipular reform of army |
| 280-275 | | | Appian Way & 1st Roman aqueduct |
| 264-200 | | | Pyrrhic War & final domination of Italy |
| c.240 | | | Punic Wars -> Rome dominates W. Medit. |
| 200-133 | | | Roman Theater |
| 200-133 | | | Rome rules E. Med. |
| 133-121 | | | Influx of Greek culture |
| 107 | | | Gracchi reforms -> era of turmoil |
| 106-43 | | | Marius' milit. Reforms |
| 105 | | | Cicero |
| 91-88 | | | Gladiatorial games |
| 83-82 | | | Spartacus' slave revolt |
| 73-71 | | | Sulla wins 1st Roman civil war |
| 58-50 | | | Caesar wins 2nd Roman civil War |
| 49-45 | | | Caesar killed -> 3rd Civil War |
| 44 | | | Augustus est. Pax Romana |
| 31 | | | Octavian wins 4th civil war vs. Ant. & Cleop. |
| 27 | | | Vergil's <i>Aeneid</i> |
| 19 | | | |
| BCE | | | |
| CE | | | |
| 117 | | | Empire reaches greatest extent under Trajan |
| 126 | | | Pantheon |
| 160s | | | Epidemic & invasions end Pax Rom. |
| 212 | | | All freemen given Citizenship |
| 235-84 | | | Anarchy nearly destroys emp. |
| 285-305 | | | Diocletian restores order -> empire survives 200 yrs |
| 313 | | | Constantine legalizes Christianity |
| 378 | | | Battle of Adrianople |
| 410 | | | Goths sack Rome |
| 453 | | | Attila dies -> Unleashes former subjects vs. Rome |
| 480 | | | Julius Nepos, last emp. of West, dies in exile |

4.10 DIOCLETIAN'S REFORMS & ROME'S CONTINUING DECLINE (284-c.400 C.E.)

Timeline of Roman history from 753 BCE to 480 CE:

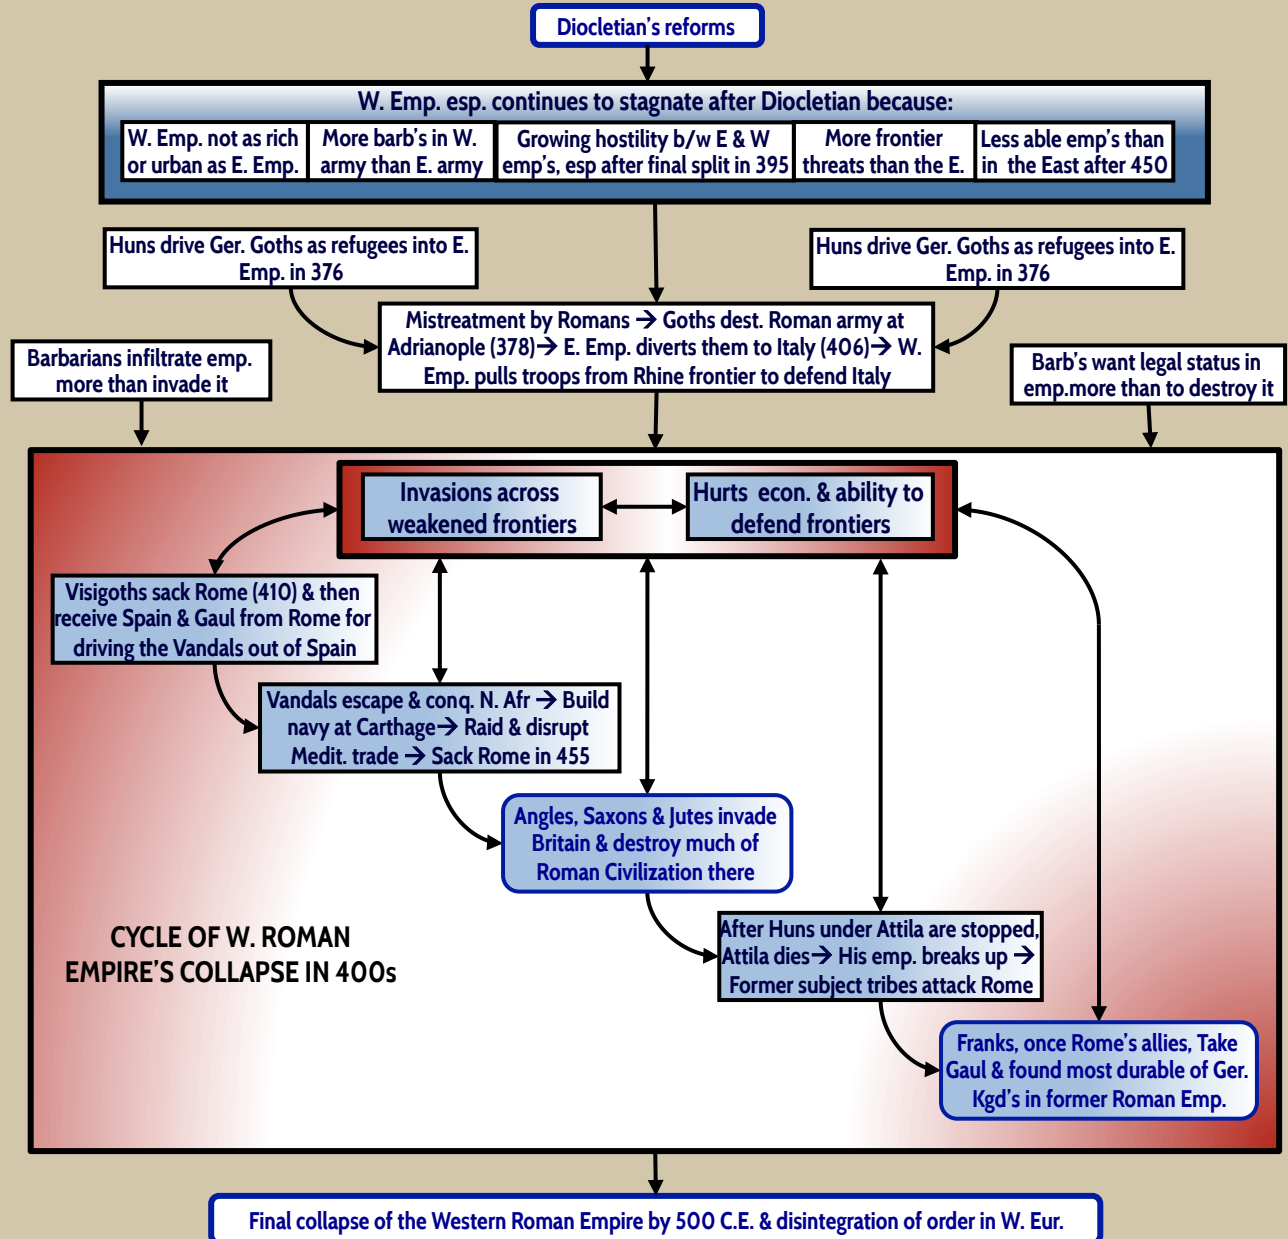

- 753 c.650: Rome founded
- 509: Rome free of Etruscans; Etruscans rule Rome; Romans conquer Veii
- 396: Gauls sack Rome
- 387: Samnite Wars
- 343-290: Manipular reform of army
- c.315: Appian Way & 1st Roman aqueduct
- c.312: Pyrrhic War & final domination of Italy
- 280-275: Punic Wars -> Rome dominates W. Medit.
- 264-200: Roman Theater; Rome rules E. Med.
- c.240: Influenza of Greek culture
- 200-133: Gracchi reforms -> era of turmoil; Marius' milit. Reforms
- 133-121: Cicero; Gladiatorial games
- 107-106-43: Sulla wins 1st Roman civil war; Spartacus' slave revolt
- 83-82: Caesar wins 2nd Roman civil War
- 73-71: Caesar killed -> 3rd Civil War
- 58-50: Octavian wins 4th civil war vs. Ant. & Cleop.
- 49-45: Augustus est. Pax Romana
- 44: Vergil's *Aeneid*
- 31: Empire reaches greatest extent under Trajan
- 117: Pantheon
- 126: Epidemic & invasions end Pax Rom.
- 160s: All freemen given Citizenship
- 212: Diocletian restores order -> empire survives 200 yrs
- 235-84: Anarchy nearly destroys emp.
- 285-305: Constantine legalizes Christianity
- 313: Battle of Adrianople
- 378: Goths sack Rome
- 410: Attila dies -> Unleashes former subjects vs. Rome
- 453: Julius Nepos, last emp. of West, dies in exile
- 480

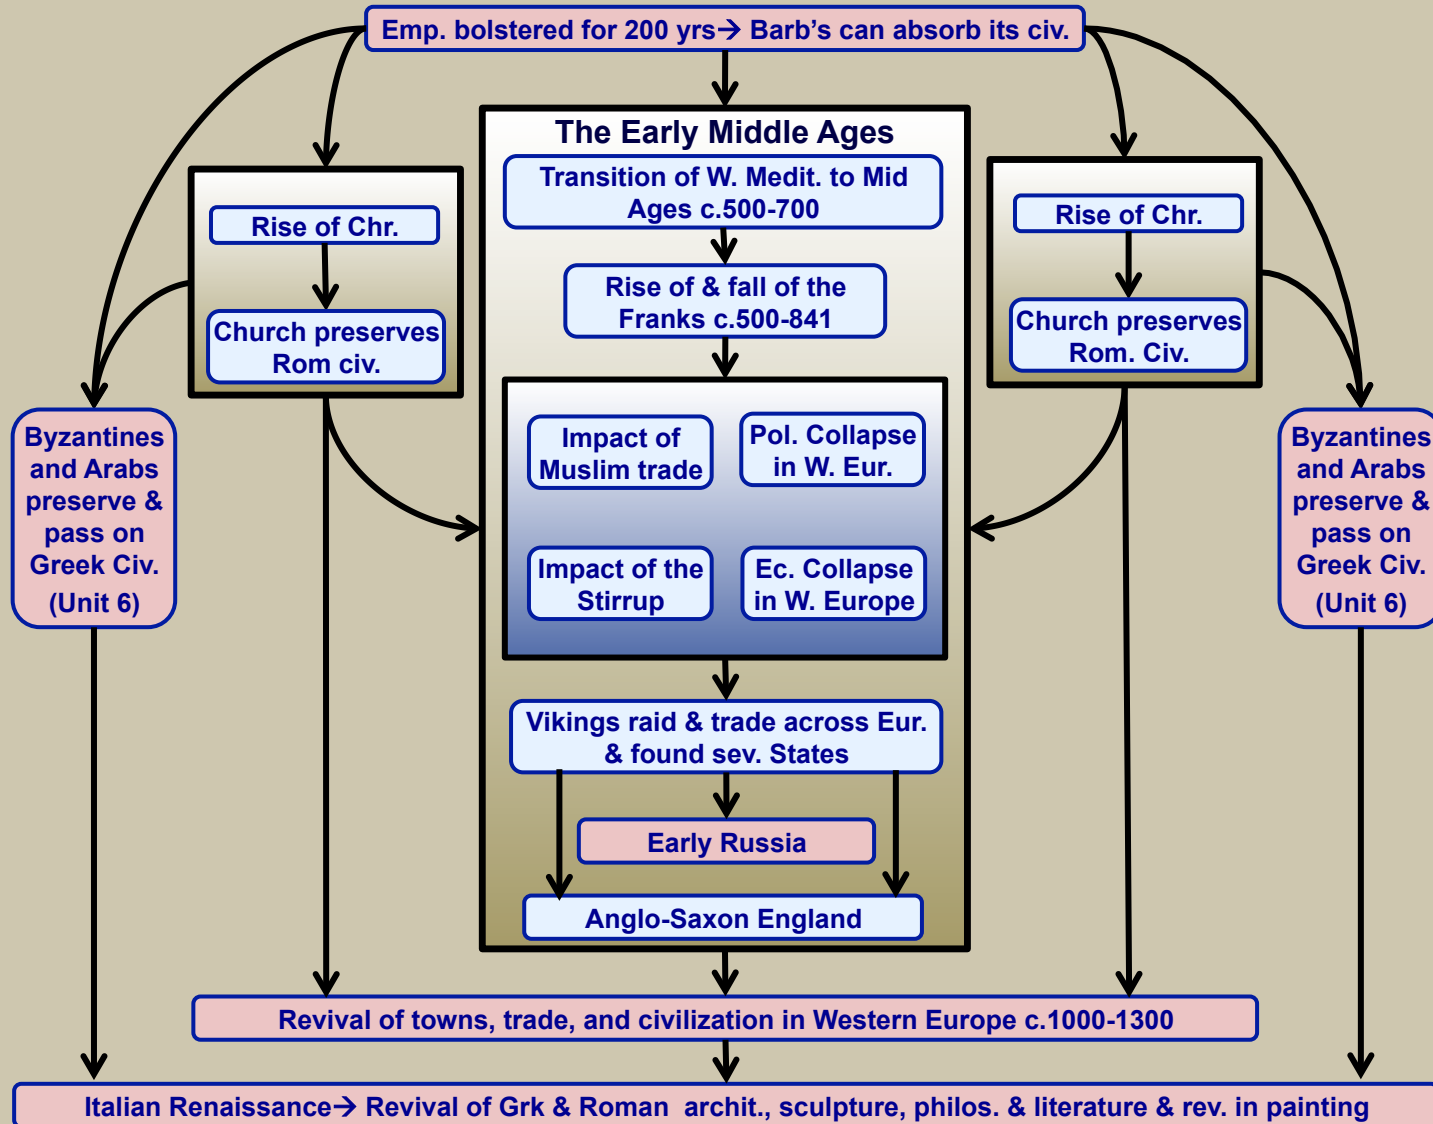

4.11 THE COLLAPSE OF THE WESTERN ROMAN EMPIRE (395-c.500)

Timeline of Roman history from 753 BCE to 480 CE:

- 753: Rome founded
- 509: Rome free of Etruscans
- 396: Gauls sack Rome
- 387: Samnite Wars
- 343-290: Manipular reform of army
- c.315: Appian Way & 1st Roman aqueduct
- c.312: Pyrrhic War & final domination of Italy
- 280-275: Punic Wars -> Rome dominates W. Medit.
- 264-200: Roman Theater
- c.240: Roman Theater
- 200-133: Influx of Greek culture
- 200-133: Rome rules E. Med.
- 133-121: Gracchi reforms -> era of turmoil
- 107: Marius' milit. Reforms
- 106-43: Cicero
- 105: Gladiatorial games
- 91-88: Sulla wins 1st Roman civil war
- 83-82: Spartacus' slave revolt
- 73-71: Caesar wins 2nd Roman civil War
- 58-50: Caesar killed -> 3rd Civil War
- 49-45: Caesar killed -> 3rd Civil War
- 44: Caesar killed -> 3rd Civil War
- 31: Octavian wins 4th civil war vs. Ant. & Cleop.
- 27: Augustus est. Pax Romana
- 19: Vergil's Aeneid
- BCE
- CE
- 117: Empire reaches greatest extent under Trajan
- 126: Pantheon
- 160s: Epidemic & invasions end Pax Rom.
- All freemen given Citizenship
- 212: Diocletian restores order -> empire survives 200 yrs
- 235-84: Anarchy nearly destroys emp.
- 285-305: Constantine legalizes Christianity
- 313: Battle of Adrianople
- 378: Battle of Adrianople
- 410: Goths sack Rome
- Attila dies -> Unleashes former subjects vs. Rome
- 453: Attila dies -> Unleashes former subjects vs. Rome
- 480: Julius Nepos, last emp. of West, dies in exile

Unit 5. Early Middle Ages & rise of Christianity

5.1 THE RISE OF THE CHRISTIAN CHURCH (c.30-330 C.E.)

c.35-67 St. Paul's ministry

303-13 The Great persecutions

313 Council of Nicaea

325 Constantine's edict of toleration

c.310-83 Ulfilas converts Goths to Arian Chr.

380 Chr. the Emp's official religion

410 Goths sack Rome

413-26 St. Augustine writes *City of God*

432 St. Patrick's mission to Ireland

496 Clovis & Franks convert to Catholic Chr. Odovacer deposes Romulus Augustulus

476 Clovis expands Frankish kgd.

482-511 Ostrogoths conquer Italy

490-3 St. Benedict founds Monte Cassino

c.529 Justinian's conquest of Italy.

535-554 Lombards invade Italy -> not reunified until 1871

568 Aethelbert of Kent converts to Chr.

601 Stirrup introd. in W. Eur.

600s St. Boniface's mission to Central Eur.

718 Battle of Tours

733 Papal States created

756 Charlemagne's conq. & forced conversion of Saxony

772-804 Vikings sack Mon. of Lindisfarne

793 Book of Kells & Carolingian Ren

c.800 Charlemagne crowned emperor

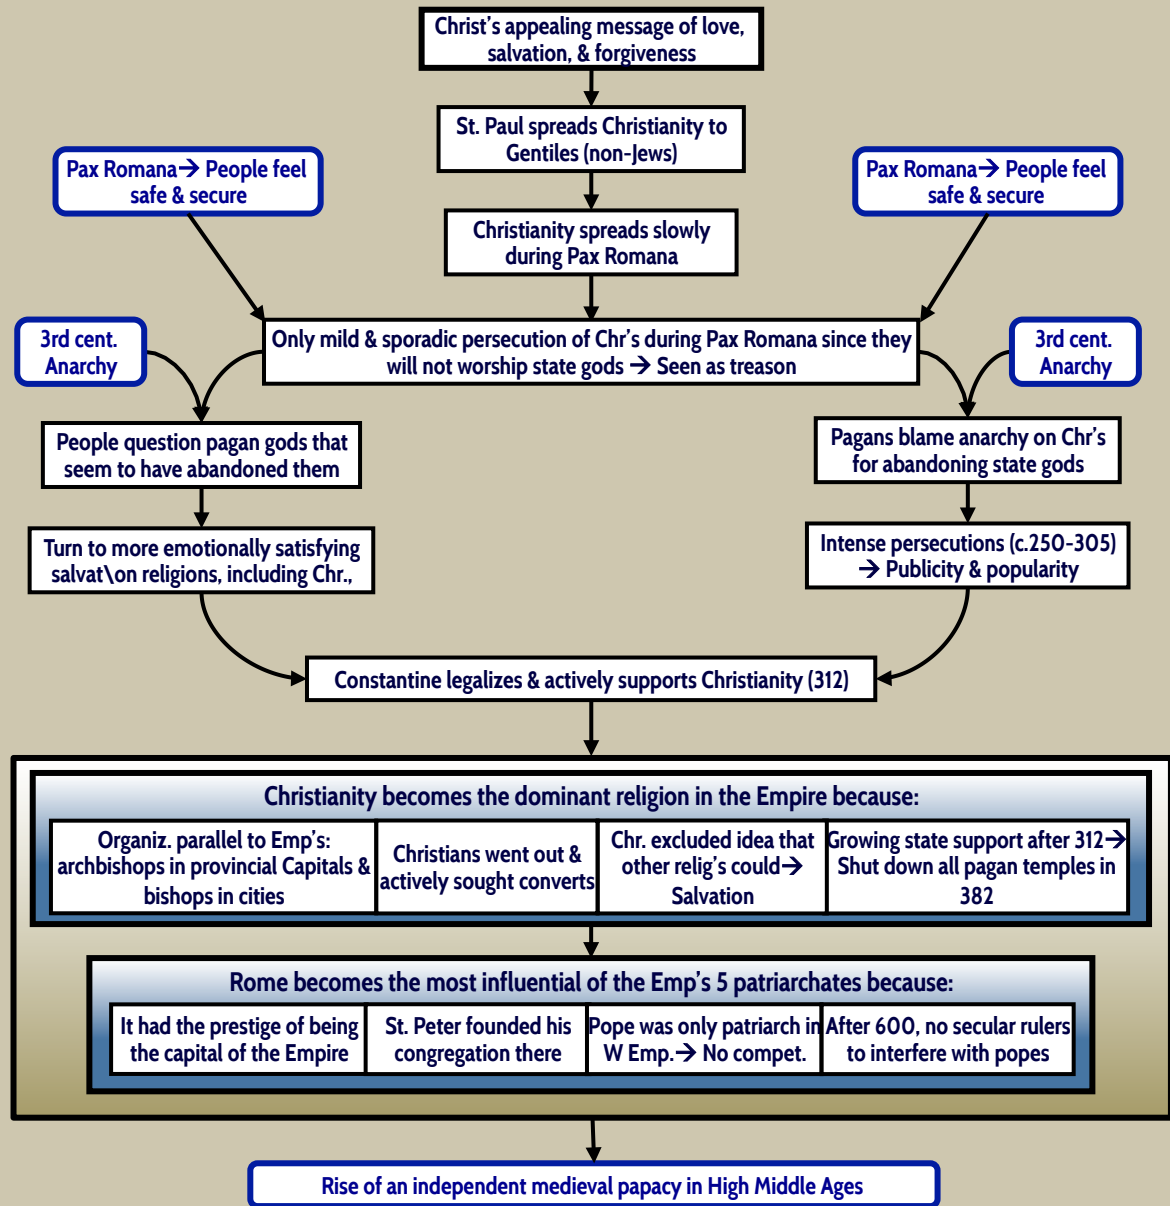

800 Tr. of Verdun splits Frank. Emp -> Fr. & Ger.

843 Anarchy & invasions across W. Eur. -> Rise of feudalism

c.800-1000 Monast. of Cluny starts reform movement

911 Otto I of Ger. crowned Holy Roman Emp.

961

5.2 THE IMPACT OF CHRISTIANITY'S TRIUMPH (c.330-500)

c.35-67 St. Paul's ministry

303-13 The Great persecutions

313 Constantine's edict of toleration

325 Council of Nicaea

c.310-83 Ulfilas converts Goths to Arian Chr.

380

410 Goths sack Rome

413-26 St. Augustine writes *City of God*

432 St. Patrick's mission to Ireland

496 Clovis & Franks convert to Catholic Chr. Odovacer deposes Romulus Augustulus

476 Clovis expands Frankish kgd.

482-511 Ostrogoths conquer Italy

c.529 St. Benedict founds Monte Cassino

535-554 Justinian's conquest of Italy. Lombards invade Italy -> not reunified until 1871

568

601 Stirrup introd. in W. Eur.

600s St. Boniface's mission to Central Eur.

718 Aethelbert of Kent converts to Chr.

733 Battle of Tours

756 Papal States created

772-804 Charlemagne's conq. & forced conversion of Saxony

793 Vikings sack Mon. of Lindisfarne

c.800 Book of Kells & Carolingian Ren

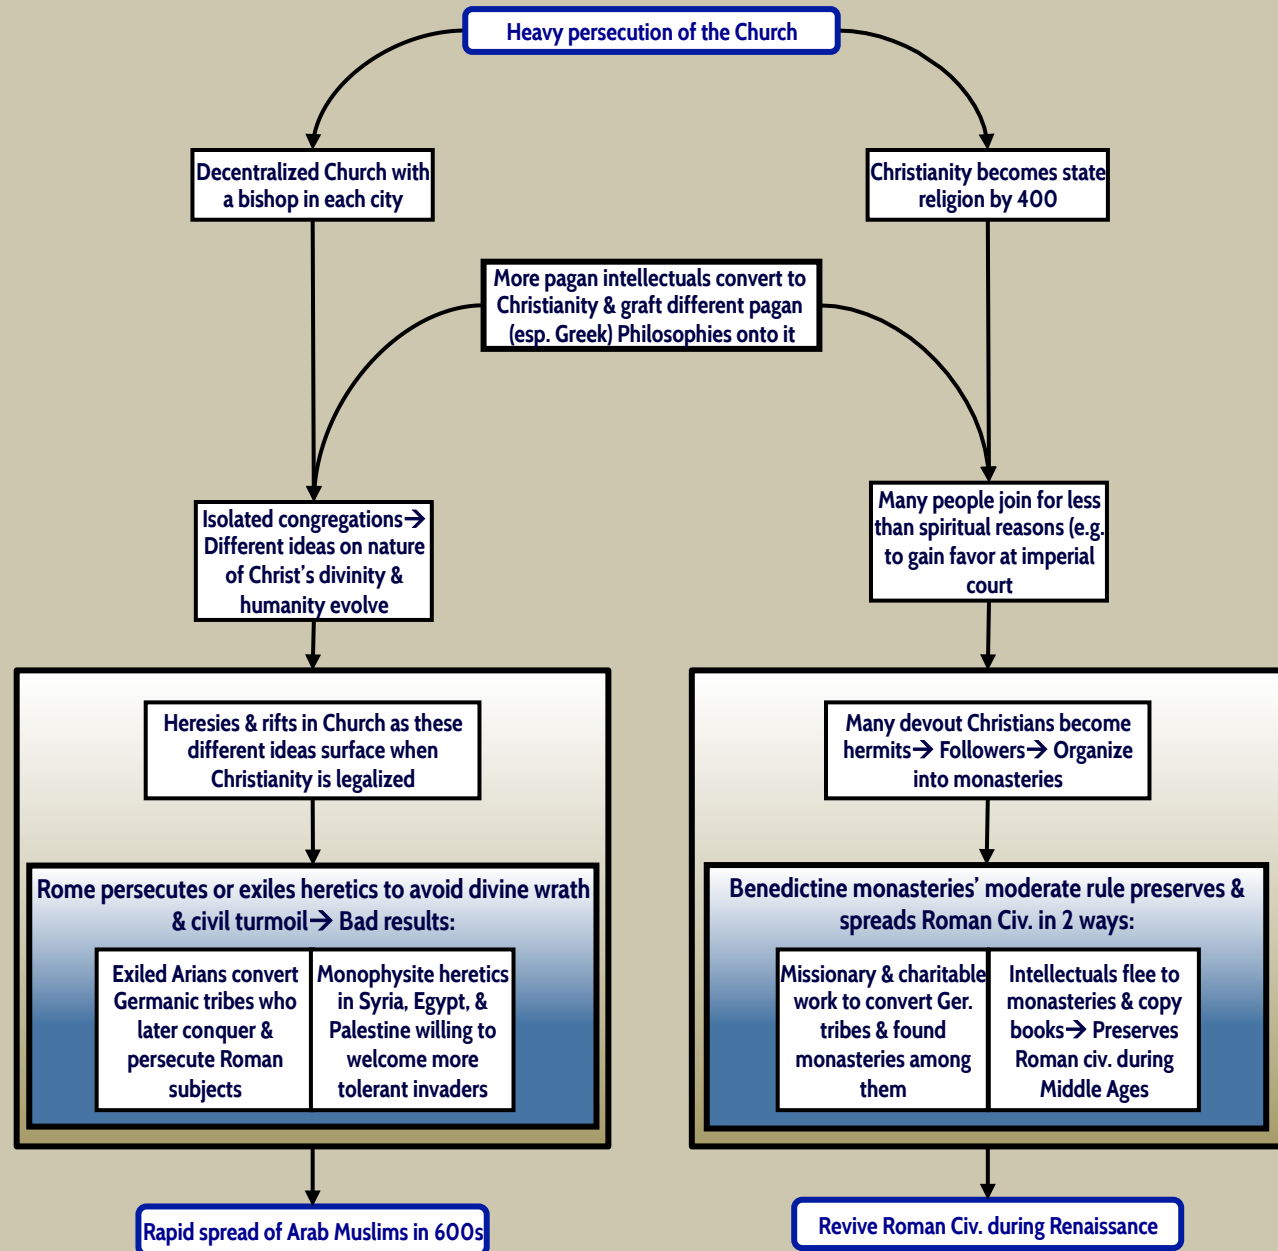

800 Charlemagne crowned emperor

843 Tr. of Verdun splits Frank. Emp -> Fr. & Ger.

c.800-1000 Anarchy & invasions across W. Eur. -> Rise of feudalism

911 Monast. of Cluny starts reform movement

961 Otto I of Ger. crowned Holy Roman Emp.

5.3 TRANSITION TO THE MIDDLE AGES IN THE W. MEDITERRANEAN (500-700)

c.35-67 St. Paul's ministry

303-13 The Great persecutions

313 Council of Nicaea

325 Constantine's edict of toleration

c.310-83 Ulfilas converts Goths to Arian Chr.

380 Goths sack Rome

410 St. Augustine writes *City of God*

413-26 St. Patrick's mission to Ireland

432 Clovis & Franks convert to Catholic Chr. Odovacer deposes Romulus Augustulus

496 Clovis expands Frankish kgd.

476 Ostrogoths conquer Italy

482-511 St. Benedict founds Monte Cassino

c.529 Justinian's conquest of Italy.

535-554 Lombards invade Italy -> not reunified until 1871

568 Aethelbert of Kent converts to Chr.

601 Stirrup introd. in W. Eur.

600s St. Boniface's mission to Central Eur.

718 Battle of Tours

733 Papal States created

756 Charlemagne's conq. & forced conversion of Saxony

772-804 Vikings sack Mon. of Lindisfarne

793 Book of Kells & Carolingian Ren

c.800 Tr. of Verdun splits Frank. Emp -> Fr. & Ger.

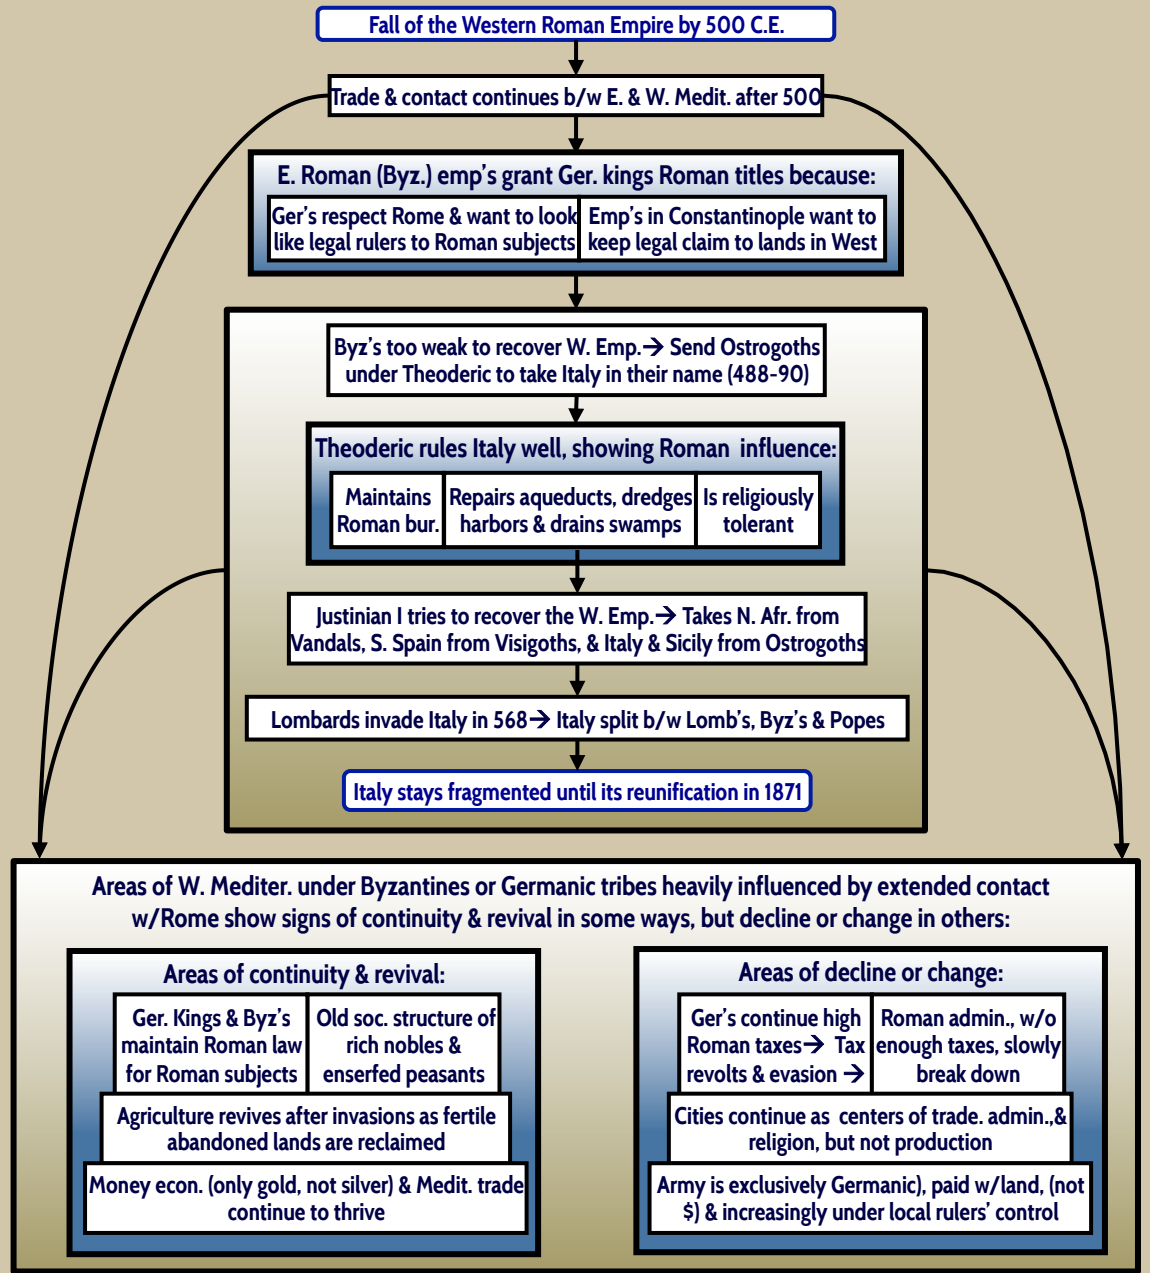

800 Charlemagne crowned emperor

843 Anarchy & invasions across W. Eur. -> Rise of feudalism

c.800-1000 Monast. of Cluny starts reform movement

911 Otto I of Ger. crowned Holy Roman Emp.

961

5.6A THE STIRRUP AND ITS EFFECT

Invention & spread of the stirrup westward to Europe

Shock cavalry where a warrior, bracing himself with the stirrup, uses the impetus of the horse's charge to drive home a lance couched under his arm

Shock cavalry using stirrup gives its users edge in battle

Opponents adapt the use of stirrup in order to survive

More effective warfare requiring:

Warriors who can afford to train full-time

War horses bred large enough for this new type of warfare

Helmet, armor, & shield to withstand shock of impact in battle

Collapse of economy → land the only practical form of wealth left

Collapse of Frankish Emp. → Viking, Arab, and Magyar attacks

Adopting this type of warfare is expensive but necessary

Give nobles land for military service

Have to tie peasants to the land in service to nobles free them as full-time warriors

Stratified social structure divided into 3 main classes:
1) Those who pray (clergy)
2) Those who fight (nobles)
3) Those who work (peasants)

Feudalism the dominant political order until the revival of towns and trade in the High Middle Ages

6.3 THE RISE OF THE ARAB MUSLIMS & THEIR IMPACT (632-c.1000)

Timeline of events from 33 to 1697:

- 33: Constantinople founded
- 527-65: Justinian's reign
- 532: Bubonic Plague, Hagia Sophia
- 542: Life of Mohammed
- 570-632: Hegira
- 622: Definitive written version of Quran
- 650: 4 Orthodox Caliphs
- 632-61, 632-c.800: Arab conquests
- 661-750: Umayyad Dynasty
- 680: Sunni-Shi'ite split
- 727-842: Iconoclasm
- 750: Abbasid Dynasty Baghdad founded
- 756: Umayyad Dyn. in Spain
- 762: Bulgars convert to Chr.
- 863: al-Rhazi, Arab physician
- 863: Macedonian Dyn. → Height of Byz. Emp..
- 865-923: Russia converts to Chr.
- 988: Ibn Sina, Arab physician
- 980-1037: Schism b/w Roman & Grk Churches
- 1054: Battle of Manzikert → Byz. decline & rise of Seljuk Turks
- 1071: Omar Khayyam
- 1048-1131: Ibn Rushd, philosopher
- 1126-98: Crusaders sack Const.
- 1204: Mongols dest. Kiev
- 1237: Mongols crush Seljuks → Rise of Ottomans
- 1243: Ibn Khaldun, philosopher & historian
- 1332-1406: Ottomans expand into Europe
- 1345: Ivan III drives Mongols from Muscovy
- 1390: Ottomans take Constantinople
- 1453: Moors driven from Spain
- 1492: Ottomans conquer Hungary
- 1526: Ivan IV of Russia
- 1533-84: Battle of Zenta → Ottoman decline
- 1697: Ottoman decline

6.4 THE SUNNI-SHI'ITE SPLIT IN ISLAM

Islam's theocratic nature Islam combining religion & politics

Conquest of emp for Islam. → Riches & power

Split over who should succeed Moh. as Kalifa (deputy) b/w followers of:
 Abu Bakr, 1 of Moh's 1st converts Ali, Moh's cousin & son-in-law

Conquest of emp for Islam → Contact w/ other civ's

Corruption & injustice → Suppress lower status Arabs & non-Arab converts to Islam

Abu Bakr (632-4), Umar, (634-44), & Uthmann (644-56) all chosen over Ali

Contact with & infl. of Zoroastrianism, Chr., & Judaism, all w/ beliefs in a future messiah

Followers of Ali (Shi'atu Ali → Shi'ites) see these events as sacrilege

Sunni-Shi'ite split in Islam, which is given more religious edge by 2 events:

| | |
|---|---|
| 680- rev. by Husayn, son of Ali & Fatima (Moh's daughter) → 70 members of Ali's family massacred at Karbala → Only 1 son of Husayn, Ali, survives | 685-7- Unsucc. Rev. in favor of another son of Ali, Mohammed, as Imam, Islam's true & rightful leader → Belief he's still alive & hidden by God |
|---|---|

Theme of suffering & expiation makes Shi'a even more of a religious movement

He will return as *Mahdi* ("rightfully guided one") to restore just rule → Messianic theme in Shi'a Islam

Long pattern of relig rev's centered around Imam, sometimes called *Mahdi*, & *da'i*, who preaches & sometimes fashions imam's message & leads followers to victory or martyrdom

More radical groups' beliefs often far removed from mainstream Islam's beliefs:

| | | |
|---|--|--|
| Fuse w/ local rel's → Beliefs such as reincarnation | Belief in imam's miraculous powers → Deification | Rejection of all laws → Justifies murder & assass. |
|---|--|--|

The Assassins in 12th & 13th centuries who targeted Sunni Muslims more than Christian Crusaders

Hezbollah in present day Lebanon who carry out attacks on Israel, but also provide soc. Services to Lebanese Shi'ites

330 Constantinople founded

527-65 Justinian's reign

532 Hagia Sophia

542 Bubonic Plague

570-632 Hegira

622

650 Definitive written version of Quran

632-61 4 Orthodox Caliphs

632-c.800 Arab conquests

661-750 Umayyad Dynasty

680 Sunni-Shi'ite split

727-842 Umayyad Dyn. in Spain

750 Abbasid Dynasty Baghdad founded

762 Bulgars convert to Chr.

863 al-Rhazi, Arab physician

865-923 Macedonia Dyn. → Height of Byz. Emp..

867-1025 Russia converts to Chr.

988 Ibn Sina, Arab physician

980-1037 Schism b/w Roman & Grk Churches

1054 Battle of Manzikert → Byz. decline & rise of Seljuk Turks

1071

1048-1131 Omar Khayyam

1126-98 Ibn Rushd, philosopher

1204 Crusaders sack Const.

1237 Mongols dest. Kiev

1243 Mongols crush Seljuks → Rise of Ottomans

1332-1406 Ibn Khaldun, philosopher & historian

1345 Ottomans expand into Europe

1390 Ivan III drives Mongols from Muscovy

1453 Ottomans take Constantinople

1492 Moors driven from Spain

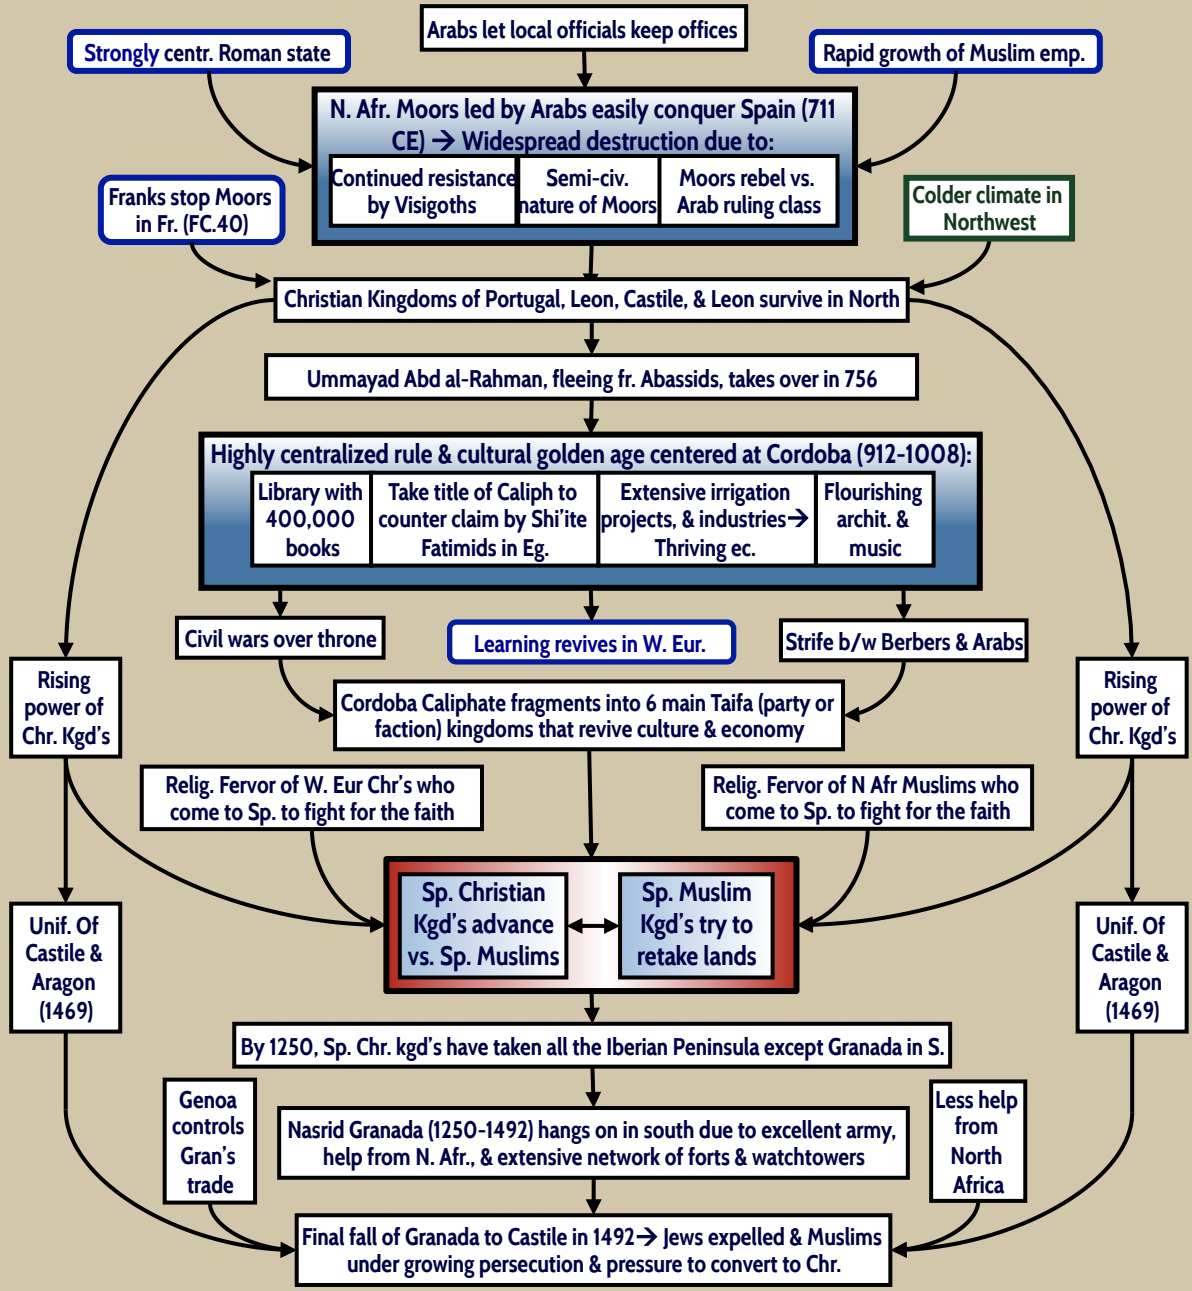

1526 Ottomans conquer Hungary

Ivan IV of Russia

1533-84 Battle of Zenta → Ottoman decline

1697

6.5 MUSLIM RULE IN SPAIN AND ITS IMPACT (711-1492)

- 330 Constantinople founded
- Justinian's reign
- 527-655 Bubonic Plague
- 532 Hagia Sophia
- 542
- 570-632 Hegira
- 622
- 650 Definitive written version of Quran
- 4 Orthodox Caliphs
- 632-61 Arab conquests
- 632-c.800
- 661-750 Sunni-Shi'ite split
- Umayyad Dynasty
- 680
- 727-842 Umayyad Dyn. in Spain
- 750 Abbasid Dynasty Baghdad founded
- 756
- 762 Bulgars convert to Chr.
- 863
- 865-923 al-Rhazi, Arab physician
- Macedonian Dyn -> Height of Byz. Emp..
- 867-1025
- Russia converts to Chr.
- 988 Ibn Sina, Arab physician
- Schism b/w Roman & Grk Churches
- 980-1037
- 1054 Battle of Manzikert -> Byz. decline & rise of Seljuk Turks
- 1071
- 1048-1131 Omar Khayyam
- Ibn Rushd, philosopher
- Crusaders sack Const.
- 1126-98
- 1204
- 1237 Mongols dest. Kiev
- Mongols crush Seljuks -> Rise of Ottomans
- 1243
- 1332-1406 Ibn Khaldun, philosopher & historian
- Ottomans expand into Europe
- 1345
- 1390 Ivan III drives Mongols from Muscovy
- Ottomans take Constantinople
- 1453
- 1492 Moors driven from Spain
- Ottomans conquer Hungary
- Ivan IV of Russia
- 1526
- 1533-84 Battle of Zenta -> Ottoman decline
- 1697

6.6 ARAB SCIENCE AND ITS LEGACY (c.750-1000 C.E.)

Islamic belief there is no conflict between reason & faith

Contact with Byz. & Persian civiliz's

Arabs willing & able to provide accurate versions of ancient texts thanks to:

Excellent translators since new converts must read *Koran* in the orig. Arabic

Extensive funding through religious foundations (*waqfs*) & caliph's "House of Wisdom"

Get copies of Greek works through conquests, raids, or negotiations w/Byz's

Arabs take Greek math & science & do their own original work

Physics & optics:
 • Calculated earth's size
 • Proved light goes fr. object to eye
 • Formulae for specific & absolute weights

Math:
 • Fused Indian place value digits w/Grk math → Algebra & trigonometry w/sine, cosine, & cotangent functions

Medicine:
 • Advanced w/o microscope
 • Suturing w/animal gut
 • Mercury ointments for eye & skin diseases

Peak of Muslim science, civilization and empire (c.1000 C.E.)

Ulama: conserv. Sunni scholars

Arabs soft & open to attack

Sufis: charismatic Sunni mystics

Invasions by Seljuk Turks

Mongol invasions devastate Muslim world

Invasions by Crusaders

Arabs become resistant to new & foreign ideas → Arab science stagnates

Arab science passed on to W. Eur. via Muslim Spain

Basis for birth of modern science in Europe during Enlightenment

1390 Ivan III drives Mongols from Muscovy

1453 Ottomans take Constantinople

1492 Moors driven from Spain

1526 Ottomans conquer Hungary

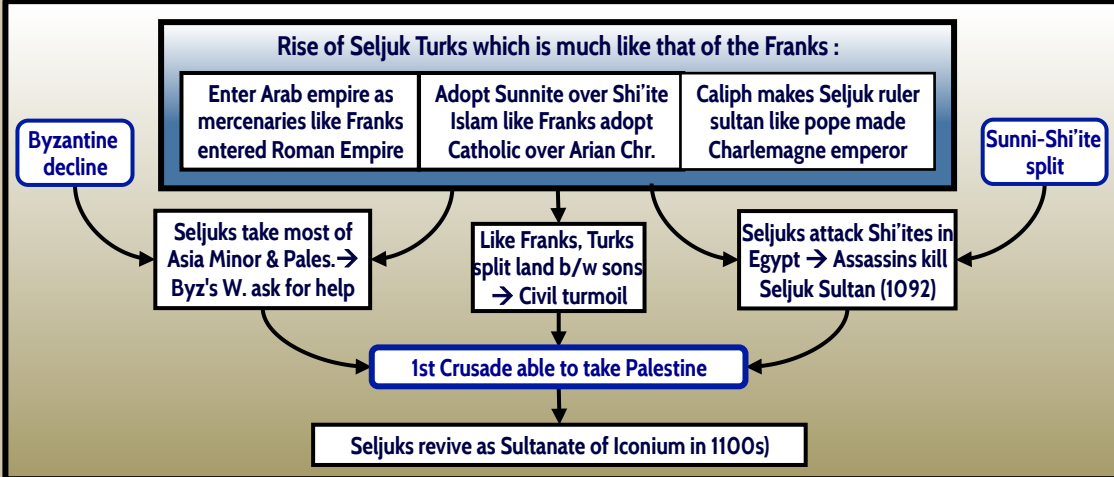

1526 Ivan IV of Russia

1533-84 Battle of Zenta → Ottoman decline

1697

6.7 THE SELJUK AND OTTOMAN TURKS (c.1000-1565 C.E.)

Arabs settle down & become more civilized, but also less warlike

Until Mongol invasion (1245) unleashes wild Turkish *ghazis* (holy warriors) → Raid both Byz. & Seljuk lands

RISE OF OTTOMAN STATE IN ASIA MINOR UNDER GHAZI LEADER, OSMAN (1326-1565)

Ottoman Emp. controls Middle East, N. Africa, Balkans, & Constantinople (Modern Istanbul)

Long decline after Suleiman the Magnificent's death in 1565

33 Constantinople founded

527-65 Justinian's reign

532 Hagia Sophia

542 Bubonic Plague

570-632 Hegira

622 4 Orthodox Caliphs

650 Definitive written version of Quran

632-c.800 Arab conquests

661-750 Umayyad Dynasty

680 Sunni-Shi'ite split

727-842 Umayyad Dyn. in Spain

750 Abbasid Dynasty Baghdad founded

762 Bulgars convert to Chr.

863 al-Rhazi, Arab physician

865-923 Macedonian Dyn. → Height of Byz. Emp..

867-1025 Russia converts to Chr.

988 Ibn Sina, Arab physician

980-1037 Schism b/w Roman & Grk Churches

1054 Battle of Manzikert → Byz. decline & rise of Seljuk Turks

1071 Omar Khayyam

1048-1131 Ibn Rushd, philosopher

1126-98 Crusaders sack Const.

1204 Mongols dest. Kiev

1237 Mongols crush Seljuks → Rise of Ottomans

1243 Ibn Khaldun, philosopher & historian

1332-1406 Ottomans expand into Europe

1345 Ivan III drives Mongols from Muscovy

1390 Ottomans take Constantinople

1453 Moors driven from Spain

1492 Ottomans conquer Hungary

1526 Ivan IV of Russia

1533-84 Battle of Zenta → Ottoman decline

1697

6.8 THE TURCO MONGOL EMPIRES (c.1500-1800 C.E.)

Turk. Tribes recover & revive after devastation of Mongols & Timur

Uzbek Emp. In Cent. Asia of loosely ruled tribes & caravan cities

Ibn Khaldun's theory on the rise & decline of Muslim empires

Turks from Afghan establish Mughal Empire in India

OTTOMAN TURKS

Osman I (1281-1324) & his descendant unite & lead Turkish tribes in Anatolia a ghazis (holy warriors)

Invasion by Timur the Lame (1402) temporarily interrupts expansion

Ottomans start relying on slave soldiers (Janissaries) and bur's (ghulams or devshirme) to expand and stabilize their rule

Ottomans resume advance & take Anatolia, Balkans, Syria, Palestine, Egypt, Arabia, much of N. Africa

Suleiman I (1520-65) takes emp. to its height but starts shifting emphasis of power from relig. to bur.

Persecutes more rad. Sufis

Conserv. Qadis handle most bur. duties

Confines potential heirs to harem → Poor rulers

Ottomans fail to keep up w/West in milit. Tech. → series of milit. defeats & revolts

Long slow decline until Ottomans fall after WWI

SAFAVID IRAN

Ismail I (1501-24) orig. a quasi messianic Sunni Sufi who veers to Shiism in 1400s, takes Iran & founds Safavid Dyn. at Tabriz in 1501

Mixture of Shiite & Sufi elements appeals to diff. tribes

Ismail begins imposing Shiism on predominantly Sunni Iran → Persian scholars emigrate to India & influence Mughal civ.

Ottomans defeat Ismail at Chaldiran (1514) → Hurt Ismail's relig. Prestige among tribes → Safavid decline

Abbas I (1587-1629) takes emp. to its height but starts shifting emphasis of power from relig. to bur

Uses slave soldiers & bur's

Replaces mystic role w/trad. Iranian govt.

Confines potential heirs to harem → Poor rulers

Rift w/Shiite leaders who say only descendants of Ali can know Koran & be imams

Safavids fall to Afghan tribes (1722) → Era of instability

8.2A THE PARALLEL IMPACTS OF DISEASE ON CHINA AND ROME

By 500 BCE, older civilizations in Mid East & (probably) India have adapted to "civilized" infectious diseases

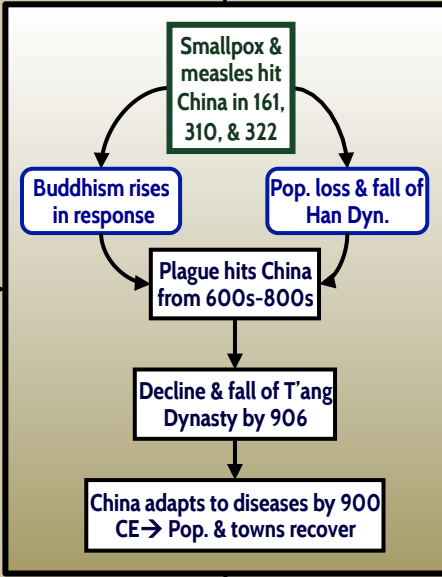

Spread of civiliz. to Mediterranean

Spread of civiliz. to China

"Relatively free of disease because:
 Wheat & barley → Little biological disruption
 Cooler & drier climate
 Little irrigation → No parasitic diseases

In 2nd cent C.E. Rome & China establish trade links across Eurasia & encounter diseases of older civ's

Civ. diseases of Mid-East & India spread to fringe of Eurasia

Bubonic Plague originating in India or Africa

Revived civ's vulnerable to return of plague in 1300s

- 1368-1644:** MING DYNASTY. 1405-34: Zheng He's voyages.
- 1644-1911:** QING DYNASTY. 1516: 1st contact w/ Portuguese.

8.4 THE SUNG DYNASTY (960-1279) & MONGOL RULE (1279-1368)

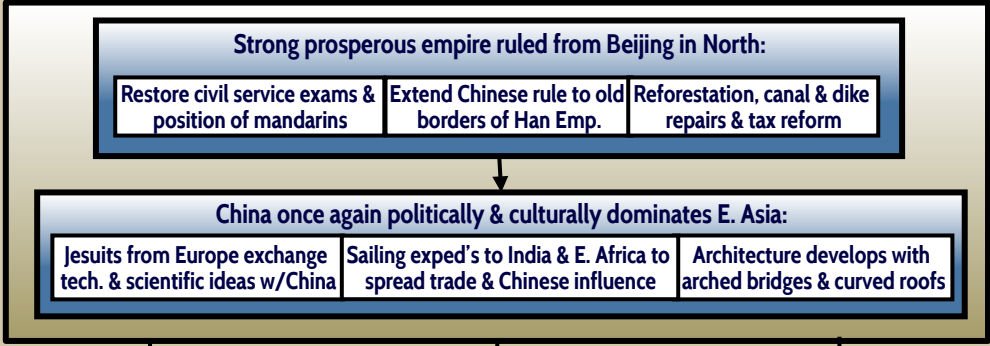

Timeline of Chinese Dynasties and Key Events:

- SHANG DYNASTY (1500-1028):** c.2200 Bronze tech; c.1200 Oracle bone script.
- ZHOU DYN. (1028-256):** b.604? Lao Tze; Confucius.
- Age of Warring States (551-479):** c.500 Iron plow.
- QIN DYN. (221-206):** 220 Great Wall; Burning of the Classics.
- HAN DYN. (206-220 CE):** 213 Confucianism adopted at court; 140 Wheelbarrow.
- AD (CE):** 68 1st Buddhist temple in China.
- JIN DYNASTY (265-420):** 322 1st accurate depiction of stirrups.
- SUI DYN. (581-618):** 605 Civil service exams; 609 Grand Canal.
- TANG DYN. (618-907):** c.850 Gunpowder invented.
- SONG DYN. (960-1279):** c.1000 Navig. compass; 1041 Bi Sheng's movable type; 1094 Su Song's Mech. clock tower.
- YUAN DYNASTY (1279-1368):** 1233-79 Mongols conquer China.
- MING DYNASTY (1368-1644):** 1351-68 Red Turban Rebellion; 1405-34 Zheng He's voyages.
- QING DYNASTY (1644-1911):** 1516 1st contact w/ Portuguese.

8.5 THE MING & EARLY QING DYNASTIES (1368-c.1800)

Mongols overthrown & replaced by Ming Dyn.

Nomadic raids from North & pirate raids from Japan → Decline of Ming Dynasty

Semi-nomadic Manchu from Manchuria rule China as Qing Dynasty (1644-1911) while maintaining Chinese govt. & scholarship

Greatest expansion of China's borders & contact with outside world in China's history

Import new crops from Amer's: sweet potatoes, corn, & better strains of rice

Chinese agr. expands to uplands of some of its rivers

Franciscans & dominicans preach vs. Confucianist ideas & practices

Population grows to 350m. by 1800 → Serious economic & environmental strains

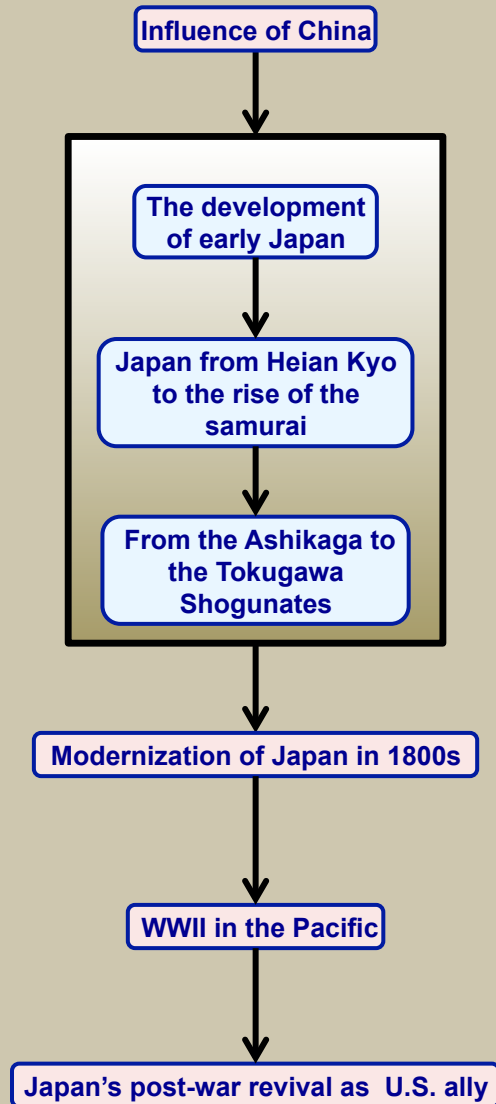

Soil erosion & deforestation → Disastrous floods downstream

China cuts off most contact with Europe → Chinese technology starts to stagnate

China open to aggression from W. Eur. In 1800s

Unit 9. Classical Japan

The Godzilla
History
of Japan

 = Related link outside the unit

9.1 THE DEVELOPMENT OF EARLY JAPAN

Yayoi Culture (c.300 B.C.E.) importing tech. from Asia

Yamato Culture (c.300 C.E.) from Asia with horses & better iron tech.:
Shintoism which reveres cleanliness, nature, & head of Yamato clan as its religious leader | Clans (Uji) who gradually absorb each other through marriage, relig. ties & diplomacy as well as war

Yamato Clan unifies Most of Japan by 400 C.E. → Japan more open to Chinese influence:
 Confucianism → Respect authority & strict hierarchy | Buddh. scriptures → Use writing to keep govt. records

Growing centralization of the state despite resistance

Taika Reforms (645 C.E.) to adapt Chinese govt. techniques to Japan:

| | | | |
|----------------------------|---|---|---------------------|
| Permanent capital at Kyoto | Turn hereditary nobles into appointed officials | Census & redistribution of land to peasants | Systematic taxation |
|----------------------------|---|---|---------------------|

Taiho Law Code (702), based on Chinese code, organized govt. w/strong emphasis on court ceremony & ritual rather than military strength

Increased power of emperor & court, but with Japanese modifications:

| | | |
|-------------------------------|------------------------------------|---------------------------------|
| Omission of Mandate of Heaven | Officials & monasteries tax exempt | Birth still basis for promotion |
|-------------------------------|------------------------------------|---------------------------------|

Even bad emp's ran little risk of revolution | Narrower tax base & greater burden on the poor | Hereditary nobles kept status in Japan

Still a step forward in the development of Japanese state

PREVIOUSLY VIEWED | UNIT INDEX | FLOWCHART READING

660-585 BC (BCE) Yayoi Culture → Rice agr, iron, weaving. Trad. dates for reign of Jimmu Tenno. Japan's 1st emp.,

10.13 THE HUNDRED YEARS WAR (1337-1453)

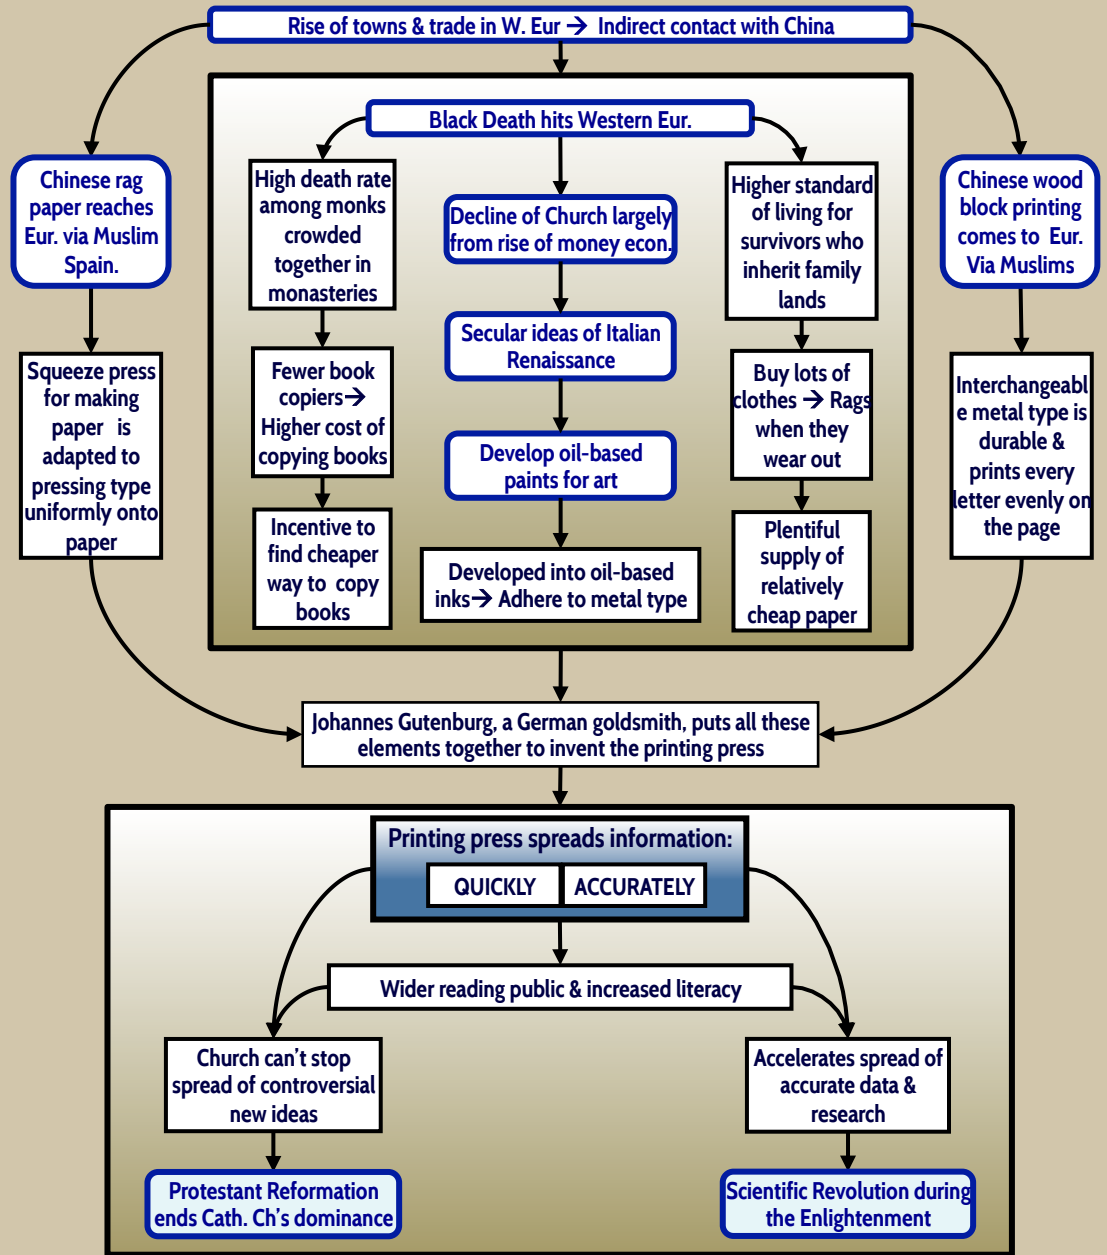

11. Renaissance, Exploration, & Reformation

Timeline of events from 1267-1337 to 1564-1616:

- 1267-1337: Petrarch, Giotto
- 1304-74: 100 Yrs War
- 1337-1453: Black Death, Jan van Eyck
- 1347-50: Black Death
- 1390-1441: Perspective, Sta. Maria del Fiore
- c.1425: Perspective
- 1436: Lorenzo de Medici
- 1449-92: Hieronymus Bosch
- 1450-1516: Printing Press
- 1451: Leonardo da Vinci
- 1452-1519: Leonardo da Vinci, Fall of Constantinople
- 1453: Wars of the Roses
- 1455-85: Erasmus of Rotterdam
- 1466-1536: Oil-based paints reach Italy
- c.1475: Michelangelo
- 1475-1564: Unification of Spain, French invade Italy
- 1492: The Last Supper
- 1494: Marriage alliance of Spain & Austria → Hapsburg Emp.
- 1495-8: 1st pocketbook, Mona Lisa
- 1496: Sistine Chapel
- 1501: Machiavelli's *The Prince*
- 1503-06: Pieter Brueghel the Elder
- 1508-12: El Greco
- 1513: *The Prince*
- 1525-69: End of the Italian Wars, William Shakespeare
- 1541-1614: End of the Italian Wars
- 1559: William Shakespeare
- 1564-1616: William Shakespeare

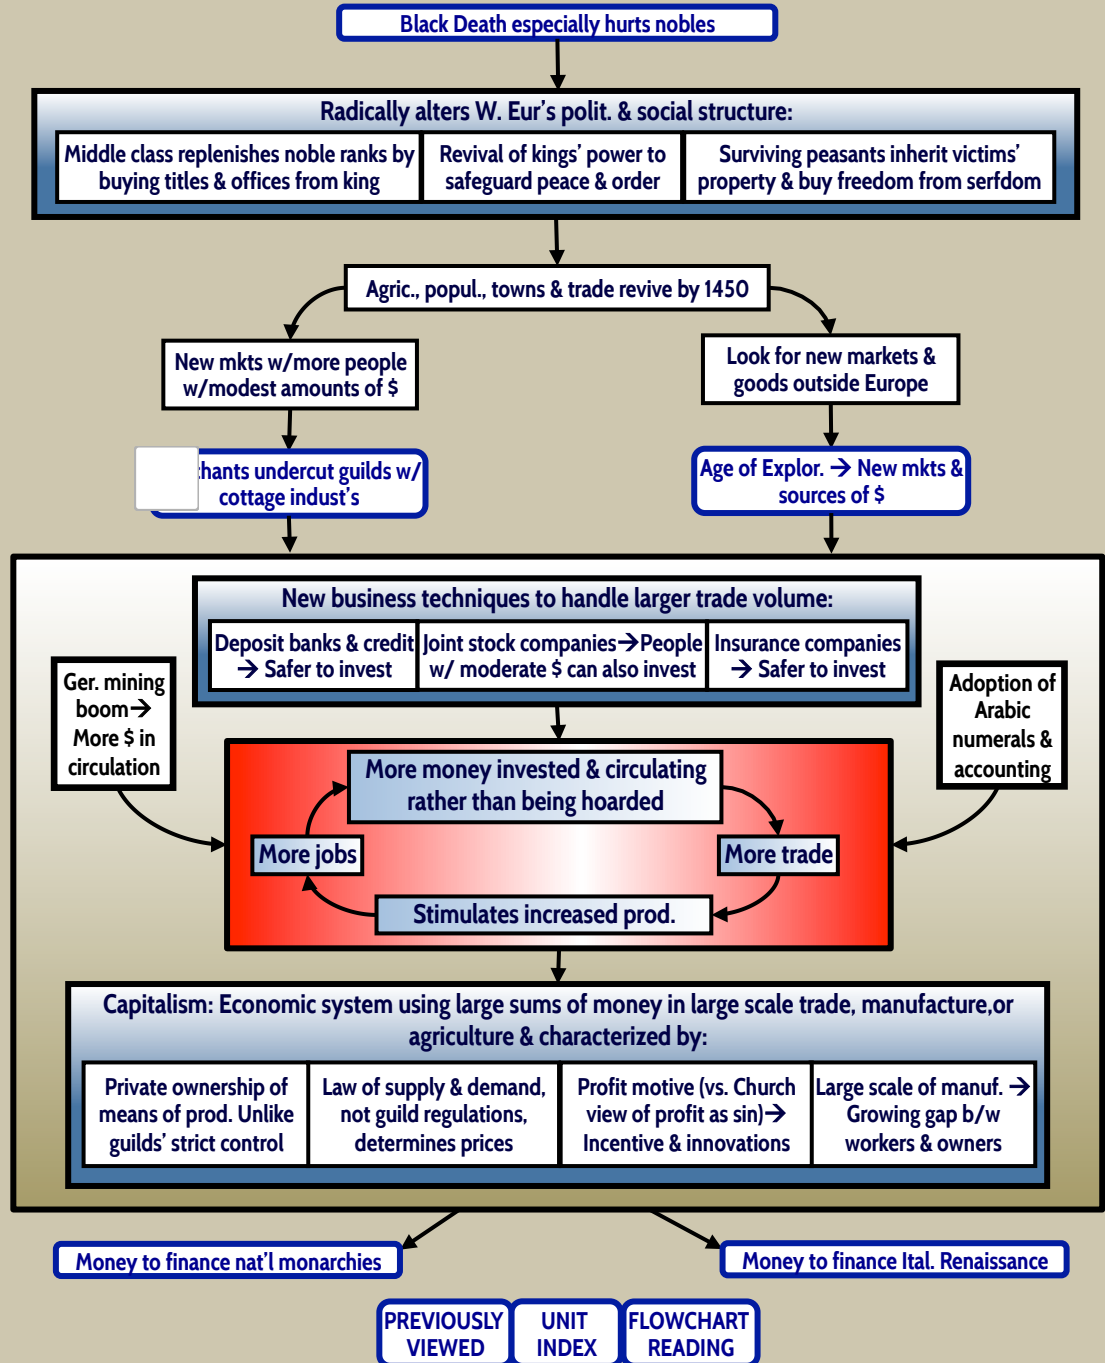

11.1 THE INVENTION OF THE PRINTING PRESS (c.1450) & ITS IMPACT

11.2 THE ECONOMIC RECOVERY OF EUROPE (c.1450-1600)

Timeline of key events and figures:

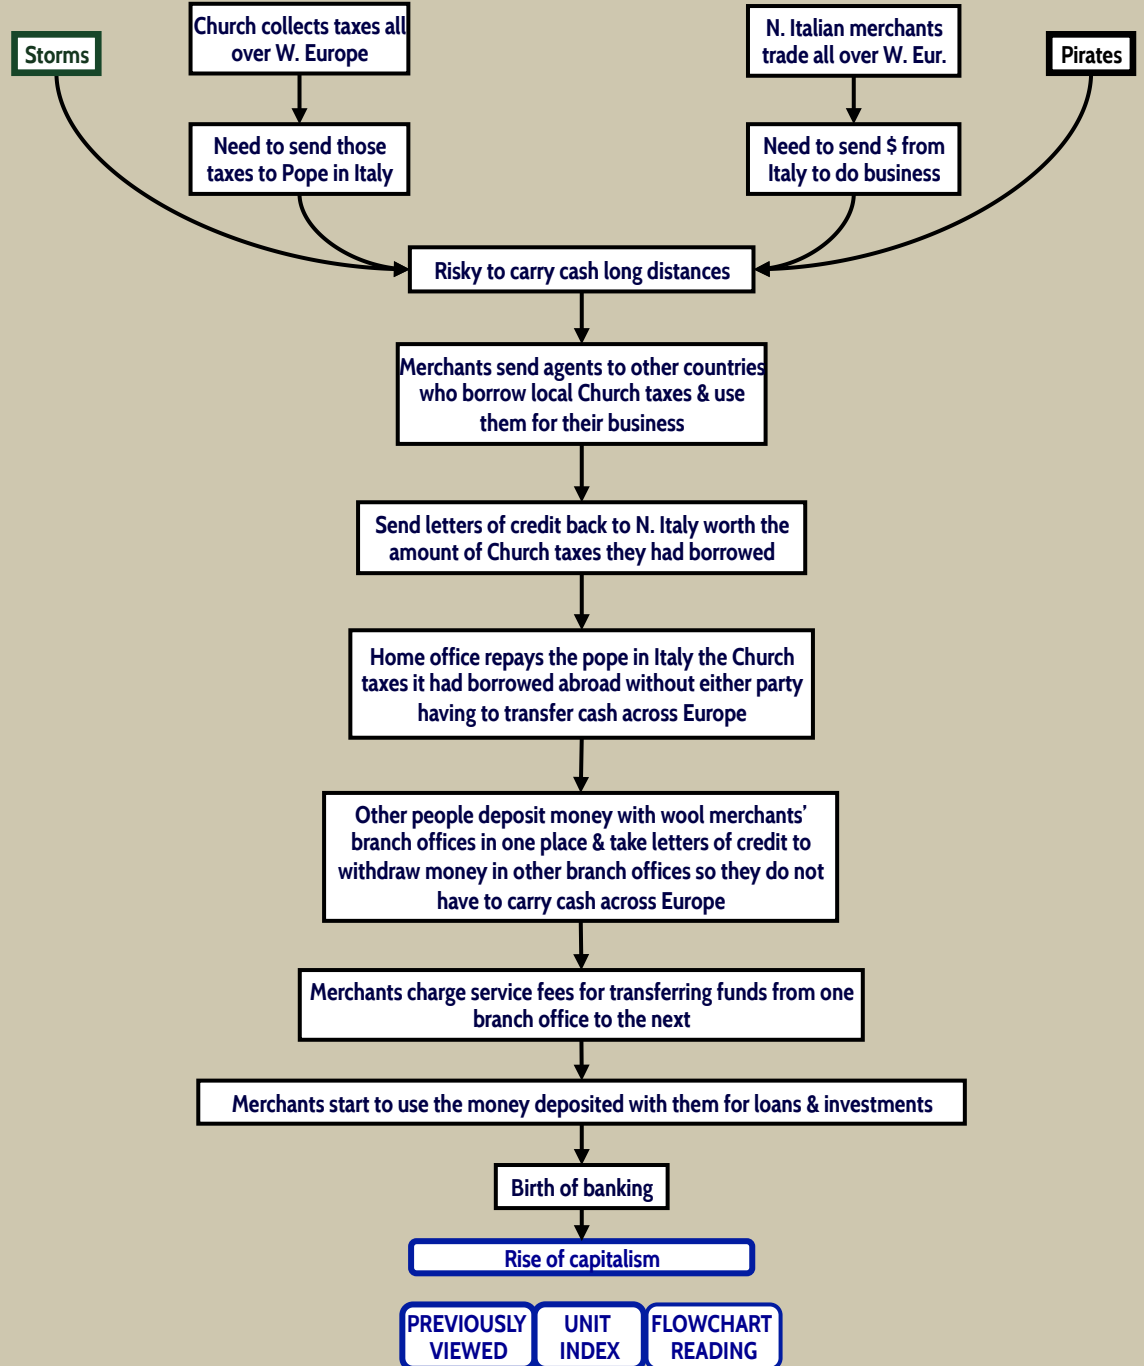

- 1267-1337: Petrarch, Giotto
- 1304-74: 100 Yrs War
- 1337-1453: Black Death
- 1347-50: Jan van Eyck
- 1390-1441: Perspective, Sta. Maria del Fiore
- c.1425: Lorenzo de Medici
- 1436: Hieronymus Bosch
- 1449-92: Printing Press
- 1450-1516: Leonardo da Vinci, Fall of Constantinople
- 1451: Wars of the Roses
- 1452-1519: Erasmus of Rotterdam, Oil-based paints reach Italy
- 1453: Michelangelo
- 1455-85: Unification of Spain, French invade Italy
- 1466-1536: The Last Supper
- 1492: Marriage alliance of Spain & Austria → Hapsburg Emp.
- 1494: 1st pocketbook, Mona Lisa
- 1495-8: Machiavelli's *The Prince*
- 1496: Pieter Brueghel the Elder, El Greco
- 1501: End of the Italian Wars, William Shakespeare
- 1503-06: William Shakespeare
- 1508-12: William Shakespeare
- 1513: William Shakespeare
- 1525-69: William Shakespeare
- 1541-1614: William Shakespeare
- 1559: William Shakespeare
- 1564-1616: William Shakespeare

Timeline of events from 1267-1337 to 1564-1616:

- 1267-1337: Petrarch, Giotto
- 1304-74: 100 Yrs War
- 1337-1453: Black Death

11.6 THE RISE OF THE NATION STATE (c.1450-1500)

c.600 BC  Phoenicians circumnavigate Africa, but thanks to Herodotus, no one believes them

c.240 BC  Greek mathematician, Eratosthenes correctly calculates earth's circumference. Luckily, no one believes it could be that big.

c.150 CE  Ptolemy's Geography introduces latitudinal & longitudinal coordinates

c.1000  Chinese navigational compass

c.1400  Ptolemy's Geog. reaches Eur.

c.1430  Prince Henry of Portugal starts sending exped's down Afr. Coast.

1434  Gil Eanes finally sails past Cape Bojador ("Gates of Hell").-> other Portug. explorers dare to continue exploring Afr's coast.

1484  Diego Cao explores 1500 miles of Afr's coast

1488  Diaz rounds Cape of Good Hope

1492  Columbus reaches America

1494  Tr. of Tordesillas divides world b/w Sp. & Port.

1498  Da Gama sails round Africa to India

1513  Balboa & Serrao discover Pacific from opposite ends & call it the "Pacific Sea" since the planet can't be big enough to hold an entire ocean.

1519-21  Cortez conquers the Aztecs

1519-22  Magellan's expedition accidentally circles globe thinking the Pacific Sea a faster way to Asia than going around Africa. They're wrong, so people assume no one will ever try *THAT* again.

1532-34  Pizarro conquers the Incas

1497-1610  Various Eng. & Fr. Explorers seek NW Passage to Asia, but N. America won't get out of their way.

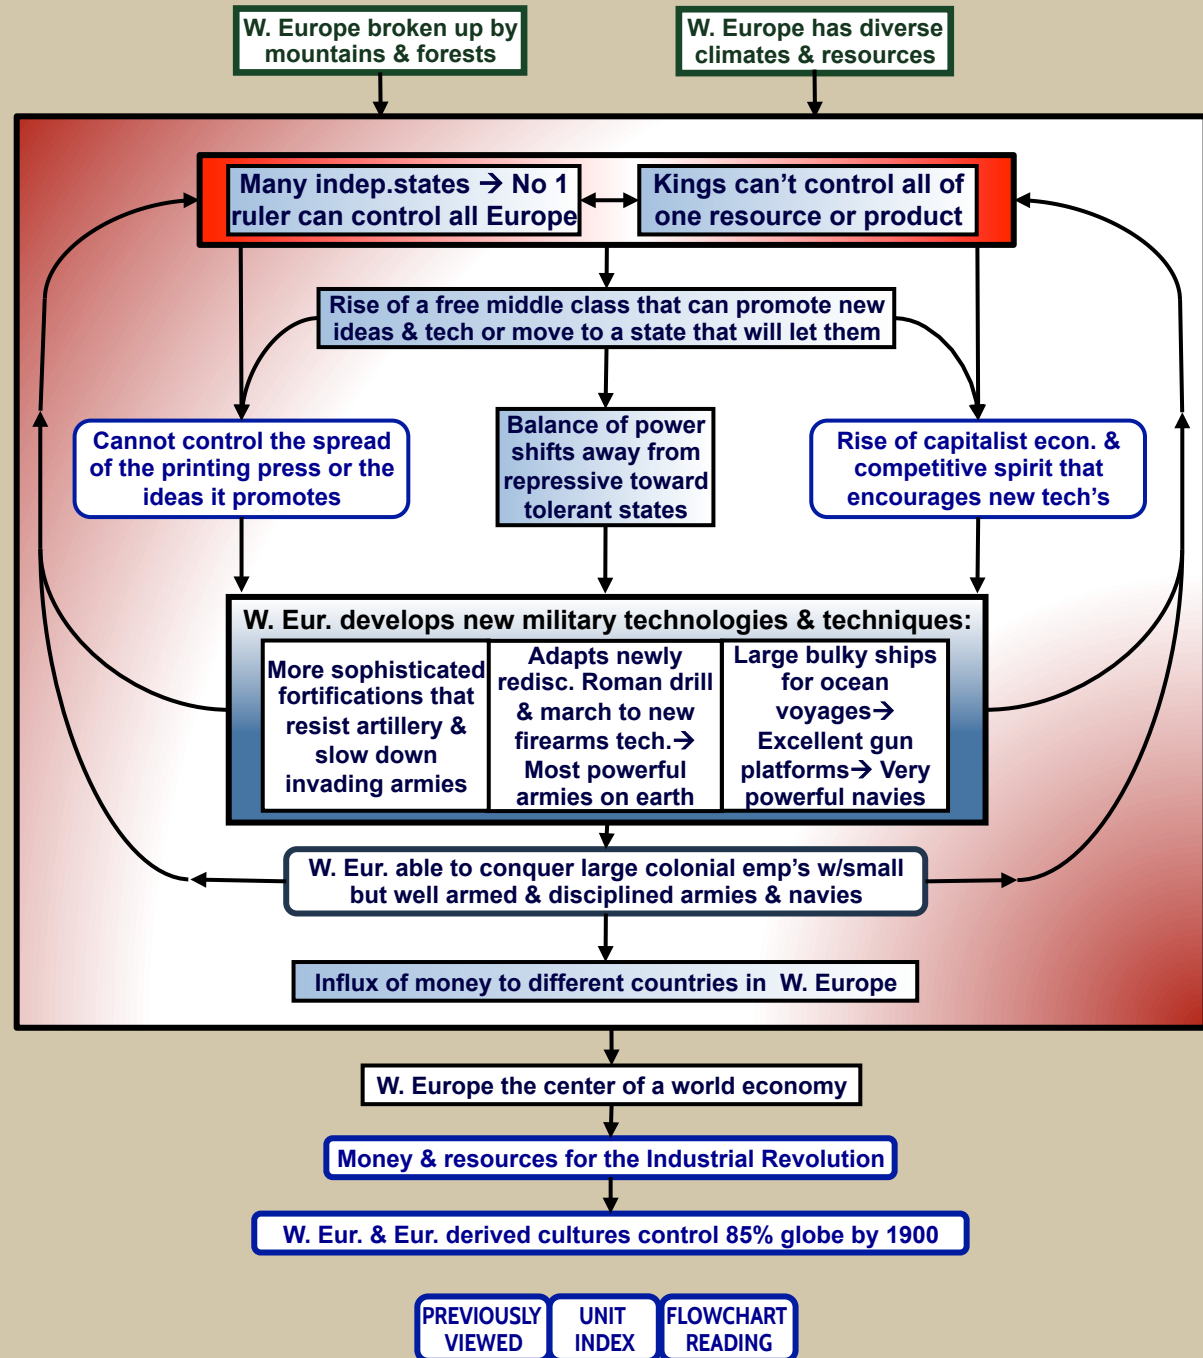

1577-80  Drake is the 2nd to circle the globe, but only b/c the Sp. navy is chasing him & he has no way back.

1599-1601 

1606  Dutch discover Australia, but decide it's not worth colonizing

1824  Nathaniel Palmer reaches Antarctica

11.7 GEOPOLITICAL FACTORS IN THE RISE OF W. EUROPE (c.1500-1900)

11.8 THE AGE OF EXPLORATION (c.1400-1550)

c.600 BC  Phoenicians circumnavigate Africa, but thanks to Herodotus, no one believes them

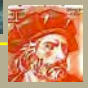

c.240 BC  Greek mathematician, Eratosthenes correctly calculates earth's circumference. Luckily, no one believes it could be that big.

c.150 CE  Ptolemy's Geography introduces latitudinal & longitudinal coordinates

c.1000  Ptolemy's Geog. reaches Eur.  Chinese navigational compass

c.1400  Prince Henry of Portugal starts sending exped's down Afr. Coast.

c.1430  Gil Eanes finally sails past Cape Bojador ("Gates of Hell"). -> other Portug. explorers dare to continue exploring Afr's coast.

1642-48 Treaty of Westphalia ending 30 Yrs. War & Treaty of Munster granting Dutch indep.

1648 Charles I of England beheaded

1649 Oliver Cromwell's dictatorship

1652-58

11.12B THE FRAGMENTATION OF THE REFORMATION: CALVINISM

Fragmentation of the Reformation

John Calvin's religion which believed in *predestination*, the idea that god is so all powerful that he has predetermined whether we will be saved or not

This raised several questions:

| | | |
|--|---|--|
| <p>IS THERE FREE WILL IF GOD IS OMNIPOTENT? Not if we have been predestined since before creation</p> | <p>CAN WE KNOW WE ARE SAVED? No, but there are signs we <i>might</i> be: 1) Living an upright life 2) Profession of faith 3) Participation in the sacraments</p> | <p>WHY DOES AN ALL POWERFUL GOD ALLOW EVIL? That is a mystery of god beyond our understanding</p> |
|--|---|--|

Calvin makes Geneva, Switzerland a model community where all members must exhibit behavior needed to be saved:

| | | |
|------------------------------|---|--|
| Must attend church 3-4X/week | Banned gambling, dancing, swearing, heavy drinking etc. | No fancy clothing, jewelry, hair, etc. |
|------------------------------|---|--|

Idea that Calvinist merchants are predestined to pursue profits for the good of the religious community

Decentralized Calvinist Church → Can't crush by attacking just 1 leader or city

God's abs. power + equality of all believers discredits Div. Rt. of Kings → Justifies rev. on relig. grounds

Later some feel justified in pursuing profits for themselves

Calvinism spreads across W. Eur.

Justifies polit. rev. since religion & politics are so intertwined

Rise of capit. MC in Eng.

Religious wars (1560-1648) → People sick of anarchy

English Rev. in 1600's

John Locke's *Two Treatises on Government* defines king's obligations to his subjects much as in a MC business contract

Justifies revolution by the people on political grounds if the king breaks the contract

French Revolution (1789) starts the age of political revolutions

| | | |
|-----------|--|---|
| 1517 | Zwingli starts Swiss Ref. | Luther posts the 95 Theses |
| 1518 | | |
| 1521 | | Diet of Worms |
| 1523 | Luther's translation of New Testament Into German | |
| 1524-5 | | German Peasants' Revolt |
| 1534 | Henry VIII's final break with Rome | Anabaptist rising in Munster |
| 1534 | | |
| 1540 | Society of Jesus (Jesuits) ordained | |
| 1545-63 | | Council of Trent |
| 1555-6 | | Peace of Augsburg: Haps. Emp. split b/w Span. & Austr. branches |
| 1562-98 | | French Wars of Religion |
| 1566-1648 | | Dutch revolt vs. Spain |
| 1588 | | England defeats Spanish Armada |
| 1598 | Henry IV's Edict of Nantes grants religious toleration in France | |
| 1618-48 | | 30 Years War |

| 1649 | Charles I of England beheaded | Oliver Cromwell's dictatorship |
| 1652-58 | | |

11.13 THE REFORMATION'S IMPACT ON POLITICAL & ECONOMIC IDEAS

Italian Renaissance largely defined by four new ideas

| | | | |
|---|--|--|---|
| Secularism: Belief this world & life are worth studying & living for now, not just as preparation for afterlife | Humanism: Belief that humans are not helpless pawns in the divine plan, but capable of their own great accomplishments | Individualism: Belief that the individual alone, not just groups of people, can accomplish great things on their own | Skepticism: Belief we should challenge authorities views, not blindly accept them |
|---|--|--|---|

N. Ren. combines Ital. Ren's secular ideas with its own greater Religious fervor

Luther starts Protestant Reformation

God sees all useful jobs as equal | God sees all believers as equal

Women seen as spiritually, if not socially, equal to men

Calvinist idea that merchants are predestined to pursue profits for the good of relig. Commun.

Later generations feel justified pursuing profits for themselves

Equality of all believers discredits Div. Rt. of Kings → Justifies rev. on relig. grounds

Justifies polit. rev. since religion & politics are so intertwined

Suffrage movement in late 1800s and early 1900s gains women more equality

Rise of capit. MC in Eng.

Eng. Rev. in 1600's

Concern over both anarchy from religious turmoil & tyranny of absolute monarchy → John Locke's *Two Treatises on Government* advocating constitutional monarchy which defines king's obligations to his subjects much as in a MC business contract

Justifies rev. on polit. grounds if king breaks contract

French Revolution (1789) starts the age of political revolutions

1652-58 1st Anglo-Dutch Naval War

1652-4 N. War b/w Sweden, Poland, & Prussia

1655-60 Jan Vermeer

1632-75 Louis XIV begins active rule & Stuart monarchy restored in Eng.

1661 Plague hits London

1665 Great London Fire

1666 2nd Anglo-Dutch Naval War

1665-7 3rd Anglo-Dutch Naval War (ends 1674) & Dutch War w/Louis XIV

1672-8 William III of Holland marries Mary Stuart

1674 Louis XIV makes Versailles his official residence

1682 Turks besiege Vienna -> War of Holy League

1683 Louis XIV revokes Edict of Nantes

1685 Glorious Rev. in Britain

1688 Nine Years War

1688-97 Peter I's Great Embassy to the West

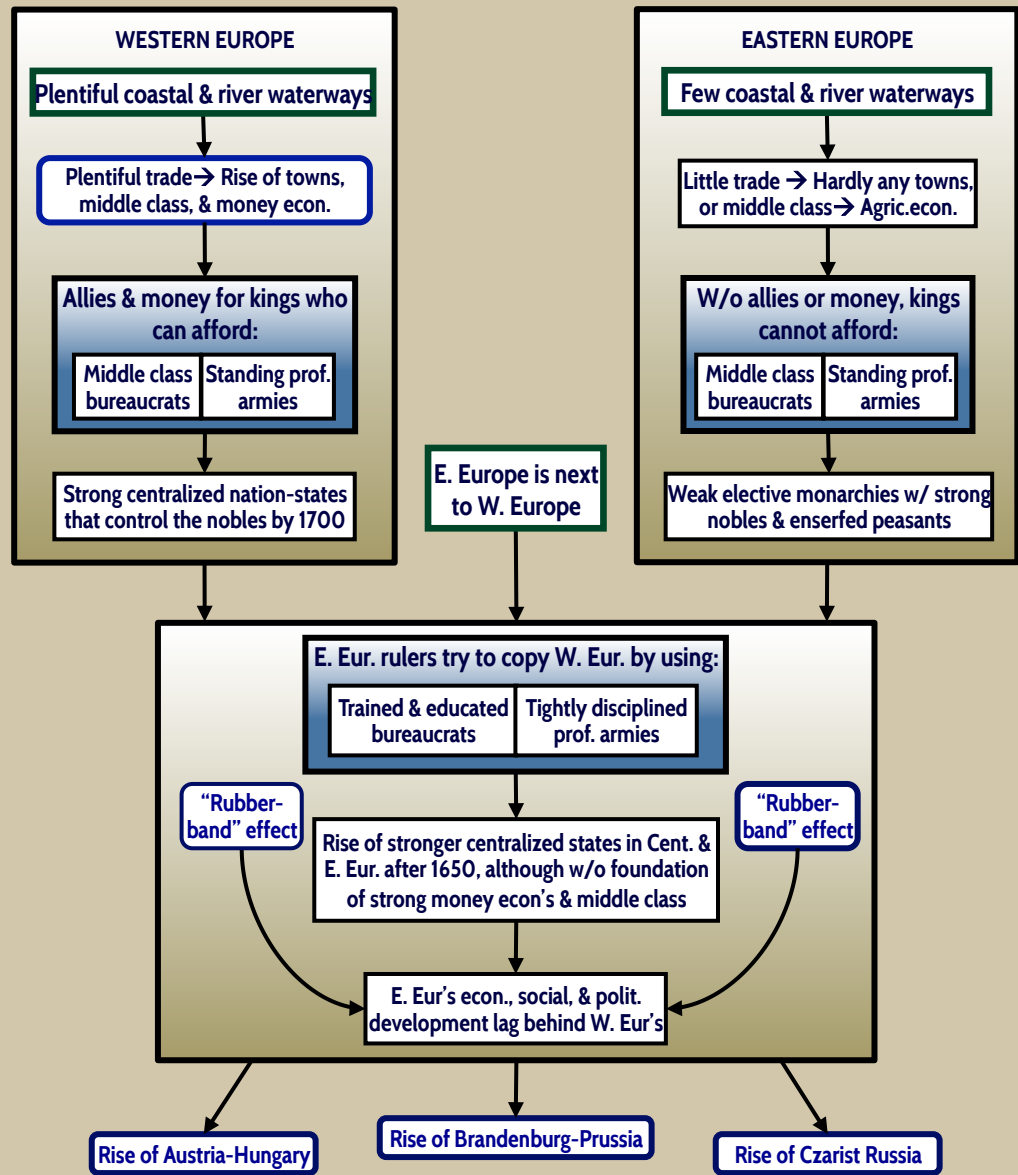

1697 War of the Spanish Succession

1700-13 Great N. War b/w Russia & Sweden

1700-21 Death of Louis XIV

1715 Peter the Great dies

1725

12.2 THE RESURGENCE OF HAPSBURG AUSTRIA (c.1650-1800)

1598-1613 "Time of Troubles" in Russia
Bernini

1598-1680 Frederick-William the Great
Elector of Prussia's reign

1640-88 English Civil Wars
Caravaggio

1642-48 Cardinal Mazarin's regency for Louis XIV

1643-61 Dutch indep. & end of 30 Yrs. War

1648 Fronde vs. Mazarin's rule

1648-53 Charles I of England beheaded

1649 Rembrandt

1606-69 Cromwell's dictatorship

1652-58 1st Anglo-Dutch Naval War

1652-4 N. War b/w Sweden, Poland, & Prussia

1655-60 Jan Vermeer

1632-75 Louis XIV begins active rule & Stuart monarchy restored in Eng.

1661 Plague hits London

1665 Great London Fire

1666 2nd Anglo-Dutch Naval War

1665-7 3rd Anglo-Dutch Naval War (ends 1674) & Dutch War w/Louis XIV

1672-8 Louis XIV makes Versailles his official residence

1674 Turks besiege Vienna -> War of Holy League

1682 Louis XIV revokes Edict of Nantes

1683 Louis XIV revokes Edict of Nantes

1685 Glorious Rev. in Britain

1688 Nine Years War

1688-97 Peter I's Great Embassy to the West

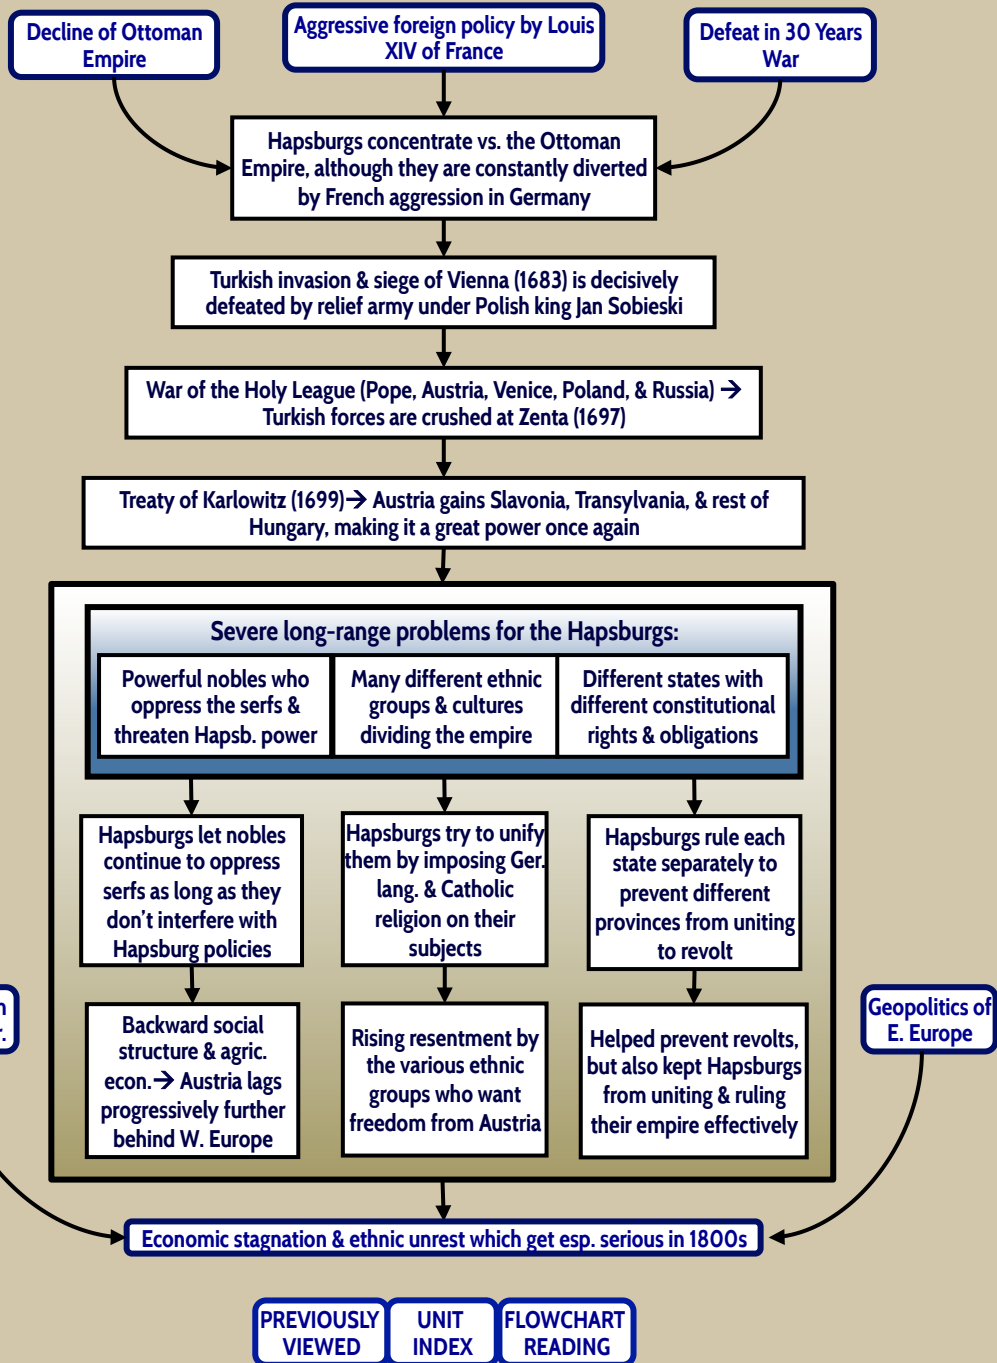

1697 War of the Spanish Succession

1700-13 Great N. War b/w Russia & Sweden

1700-21 Death of Louis XIV

1715 Peter the Great dies

1725

12.3 THE RISE OF BRANDENBURG-PRUSSIA (1640-88)

1598-1613 "Time of Troubles" in Russia Bernini

1598-1680 Frederick-William the Great Elector of Prussia's reign

1640-88 English Civil Wars Caravaggio

1642-48 Cardinal Mazarin's regency for Louis XIV

1643-61 Dutch indep. & end of 30 Yrs. War

1648 Fronde vs. Mazarin's rule

1648-53 Charles I of England beheaded

1649 Rembrandt

1606-69 Cromwell's dictatorship

1652-58 1st Anglo-Dutch Naval War

1652-4 N. War b/w Sweden, Poland, & Prussia

1655-60 Jan Vermeer

1632-75 Louis XIV begins active rule & Stuart monarchy restored in Eng.

1661 Great London Fire

1665 Plague hits London

1666 2nd Anglo-Dutch Naval War

1665-7 3rd Anglo-Dutch Naval War (ends 1674) & Dutch War w/Louis XIV

1672-8 Louis XIV makes Versailles his official residence

1674 Turks besiege Vienna -> War of Holy League

1682 Louis XIV revokes Edict of Nantes

1685 Glorious Rev. in Britain

1688-97 Nine Years War

1697 Peter I's Great Embassy to the West

1700-13 War of the Spanish Succession

1700-21 Great N. War b/w Russia & Sweden

1715 Death of Louis XIV

1725 Peter the Great dies

Thirty Years War devastates Ger., esp. Brandenburg-Prussia which lost up to 60% of its population

Frederick-William Hohenzollern, "The Great Elector" (1640-88) faces many problems:

| | | | | |
|---|-----------------------------------|---|---------------------------------|-----------------------------------|
| Brand. & Pruss. separated by Polish territory | Destruction from Thirty Years War | Strong neighbors using Brand-Pr as a battleground | Unruly & powerful nobles & army | Poor soil & few natural resources |
|---|-----------------------------------|---|---------------------------------|-----------------------------------|

Fr-Wm concentrates on building his army using:

| | |
|---|---|
| Nobles as officers & bur's, giving them pay, status, & power over serfs | Mercenaries, but also peasant recruits -> Cheap & loyal trained reserve |
|---|---|

Tradition of efficient milit. & govt. run by nobles w/strong civic spirit

Br-Pr the only Eur. state to ally w/its nobles & use them in service to state

Use bureaucracy & army to enforce its will

State demands taxes to increase mil. & bureauc.

Measures to unify & defend Br-Pr:

| | |
|--|---|
| Postal system to connect his lands & make \$ | Opportunistic foreign policy of switching sides |
|--|---|

By 1688 Br-Pr has preserved & even expanded its borders

Foundations of absolutism in Br-Prussia

Measures to build Br-Pr's econ.

| | |
|---|---|
| Peacetime army builds roads, canals, etc. | Encourages new crops, ag. tech's & immigration. |
|---|---|

By 1688 Br-Pr's pop. has recovered & its tax rev has grown 25X

Basis for Prussia's eventual unification of Germany

1598-1613 "Time of Troubles" in Russia

1598-1680 Bernini

1640-88 Frederick-William the Great Elector of Prussia's reign

1642-48 English Civil Wars

1571-1610 Caravaggio

1643-61 Cardinal Mazarin's regency for Louis XIV

1648 Dutch indep. & end of 30 Yrs. War

1648-53 Fronde vs. Mazarin's rule

1649 Charles I of England beheaded

1606-69 Rembrandt

1652-58 Cromwell's dictatorship

1652-4 1st Anglo-Dutch Naval War

1655-60 N. War b/w Sweden, Poland, & Prussia

1632-75 Jan Vermeer

1661 Louis XIV begins active rule & Stuart monarchy restored in Eng.

1665 Plague hits London

1666 Great London Fire

1665-7 2nd Anglo-Dutch Naval War

1672-8 3rd Anglo-Dutch Naval War (ends 1674) & Dutch War w/Louis XIV

1674 Louis XIV makes Versailles his official residence

1682 Louis XIV makes Versailles his official residence

1683 Turks besiege Vienna -> War of Holy League

1685 Louis XIV revokes Edict of Nantes

1688 Glorious Rev. in Britain

1688-97 Nine Years War

1697 Peter I's Great Embassy to the West

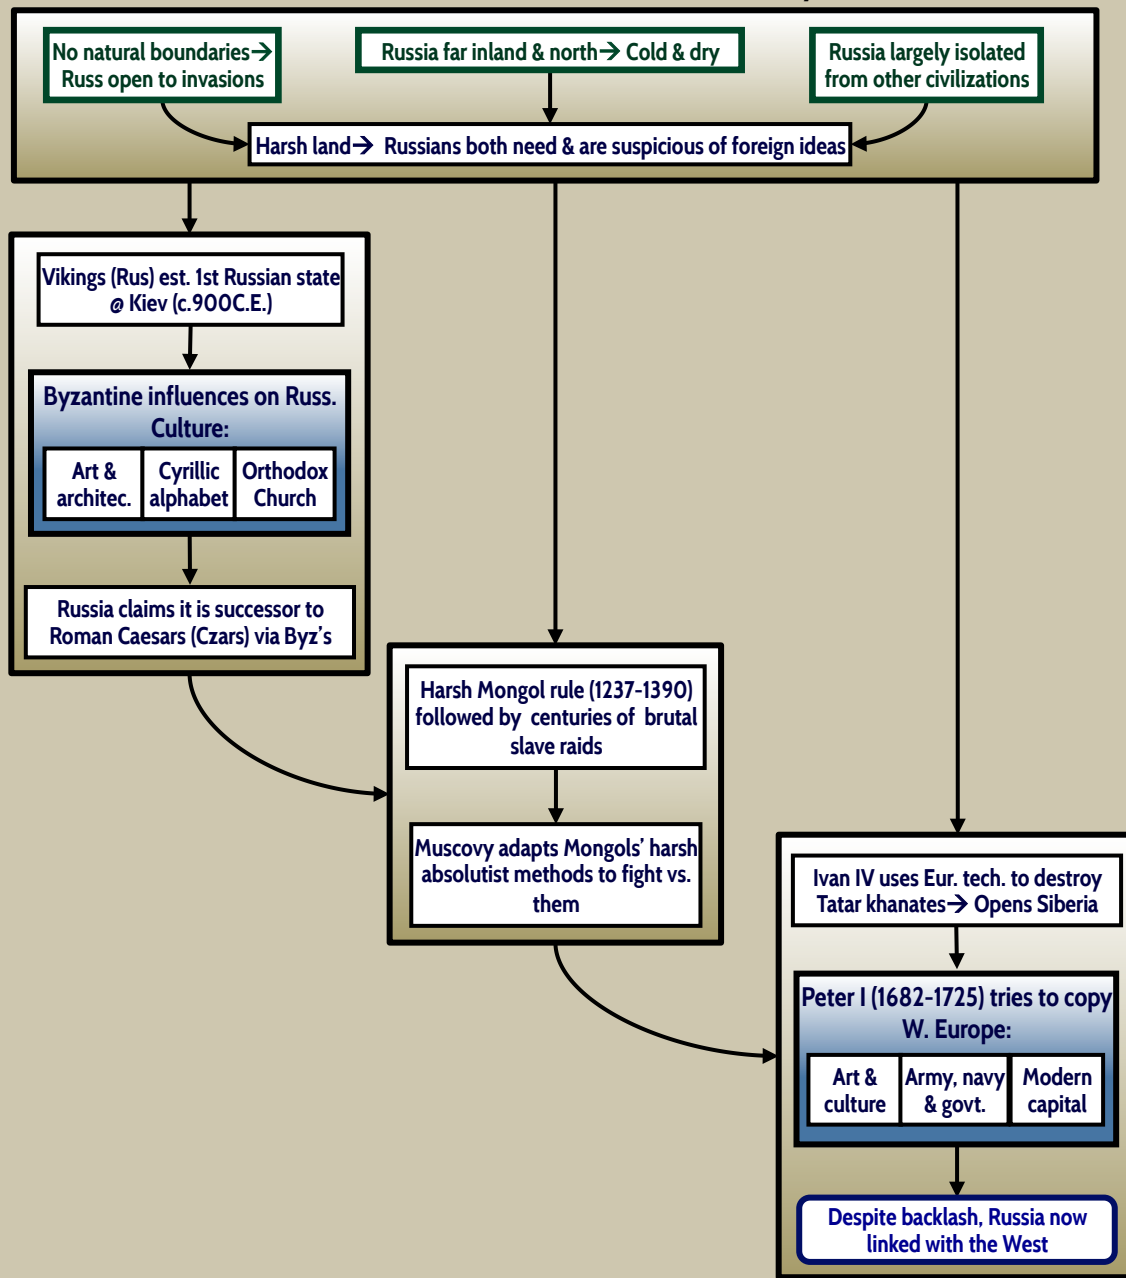

1700-13 War of the Spanish Succession

1700-21 Great N. War b/w Russia & Sweden

1715 Death of Louis XV

1725 Peter the Great dies

12.4 THE THE RISE OF RUSSIA TO 1725)

12.4A THE RISE OF RUSSIA (c.900-1725)

Russia's harsh geog → Harsh history

Vikings (Rus) conquer Slavic settlers & est. 1st Russian state at Kiev (c.900) → Launch raids vs. Byz's

Vikings (Rus) conquer Slavic settlers & est. 1st Rus. state at Kiev (c.900) → Raids vs. Byz's → Byz. missionaries follow them back & influence Rus. Civ.:

Cyrillic alphabet | Greek (later Russian) Orthodox Church | Art & architecture

Rus. civiliz. thrives until Mongols conquer Kiev (1237) & instill harsh absolutist strain in Russian govt.:

Regular censuses & taxation | Use of secret police & terror

Rise of Muscovy which adopts Mongols' absolutist practices to drive out Mongols (1390) & exert control over Russia

Claims it is the "3rd Rome" & its rulers are Tsars (Caesars) after Constantinople falls (1453) & head of Rus. Orth. Church moves to Moscow

Reign of Ivan IV "The Terrible" (1533-84) → Rising infl. from W. both helps & stresses Rus. soc.:

Uses W. artillery to dest. 2 Tatar (Mongol) khanates → Opens Siberia for settlement

Growing fear of encroachment by Cath. Church backed by Eur. scholarship

Tries to replace boyars (Rus. nobles) w/new nobility of service (*dvoriane*) paid w/land

Peasants run away to Siberia to avoid serving nobles → State enserfs peasants → Time of Troubles (1598-1613) marked by rebellions, plague, & Polish invasions

Orthodox Church thwarts efforts of Romanov Dyn. & other reformers to modernize (i.e., Westernize) Russia until Peter I "The Great" (1682-1725) who devotes reign to

Eur. style capital & "Window to West" at St. Petersburg (1703)

Eur. style army, navy, & merchant marine

Eur. style econ: mining, textiles, shoes, etc.

Eur. Style govt. but no educ. MC to provide bur's

Eur. style schools, art, arch., music, theater, libraries, fashions, etc

Despite backlash, Peter's efforts permanently link Russia with the West

1725

12.6 THE FOUNDATIONS OF ABSOLUTISM IN FRANCE (1598-1661)

Monarchy cannot stop chaos of relig. wars in Fr. → People want strong king to ensure the peace

Sully and Richelieu (ministers for Henry IV and Louis XIII) expand royal power at expense of nobles:

| | |
|--|-------------------------------------|
| Repudiate or pay loans at lower interest | Paulette: tax on hereditary offices |
| Ban duels | Exclude nobles from royal councils |
| Crush any plots & conspiracies | Burn castles |

MERCANTILISM: Econ policy & theory that sees gold & silver as sole measures of wealth → State develops & supports ind's, roads, merch. marine, colonies, etc. to cut imports & raise exports

Mercantilism is both good news & bad news:

| | |
|--|--|
| GOOD b/c kings are showing interest in state's economy by developing roads, industries, etc. | BAD b/c kings are showing <i>too much</i> interest in state's econ. W/heavy handed absolutist rule that stifles initiative |
|--|--|

France feels strong enough to enter Thirty Years War → Pay for it by selling "tax farms"

Create royal *intendants* (1633) who report corruption & ensure tax farmers get their \$

Law suits → Go to royal, not local courts, b/c intendants are royal officials w/no precedent of going anywhere but royal ct's → Intendants (& king) always win

Gradually increase duties & powers of intendants & create parallel structure of non-feudal provinces (*generalites*) overlapping old feudal prov's

Royal intendants take over many of old feudal officials' duties & powers w/o actually replacing them → Further decline of nobles

Intendants become the most reliable element in royal gov't until French Revolution

Basis for Louis XIV's abs. monarchy

12.9 THE BIRTH OF MODERN PHYSICS AND ASTRONOMY (c.1500-1687)

Timeline of Key Events (1500-1800):

- c.1590:** Invention of microscope
- 1608:** Galileo's telescope
- 1622:** Harvey's *De Motu Cordis* on circulatory system
- 1632:** Galileo's *Dialogue on the Great World Systems*
- 1651:** John Hobbes' *Leviathan*
- 1688:** John Locke's *Two Treatises on Government*
- 1687:** Newton's *Principia Mathematica*
- 1690:** Frederick the Great of Prussia's reign
- 1740-48:** War of Austrian Succession
- 1740-88:** Montesquieu's *Spirit of the Laws*
- 1751-65:** Diderot's *Encyclopedia*
- 1756-63:** Seven Years War
- 1759:** Voltaire publishes *Candide* in reaction to Lisbon earthquake
- 1762:** Rousseau's *Social Contract* on liberty & *Emile* on education
- 1762-96:** Catherine the Great's reign
- 1775-83:** American Revolution
- 1776:** Adam Smith's *Wealth of Nations*
- 1773-95:** Partitions of Poland
- 1780-90:** Joseph II of Austria's reign
- 1784:** David's *Oath of the Horatii* marks start of Neo-Classicism
- 1789:** French Rev.

Aristotle's interlocking theories → Must attack whole system in order to attack just 1 part

Isaac Newton fuses these ideas w/calculus into theory of universal gravity → Same laws apply on earth as in heavens

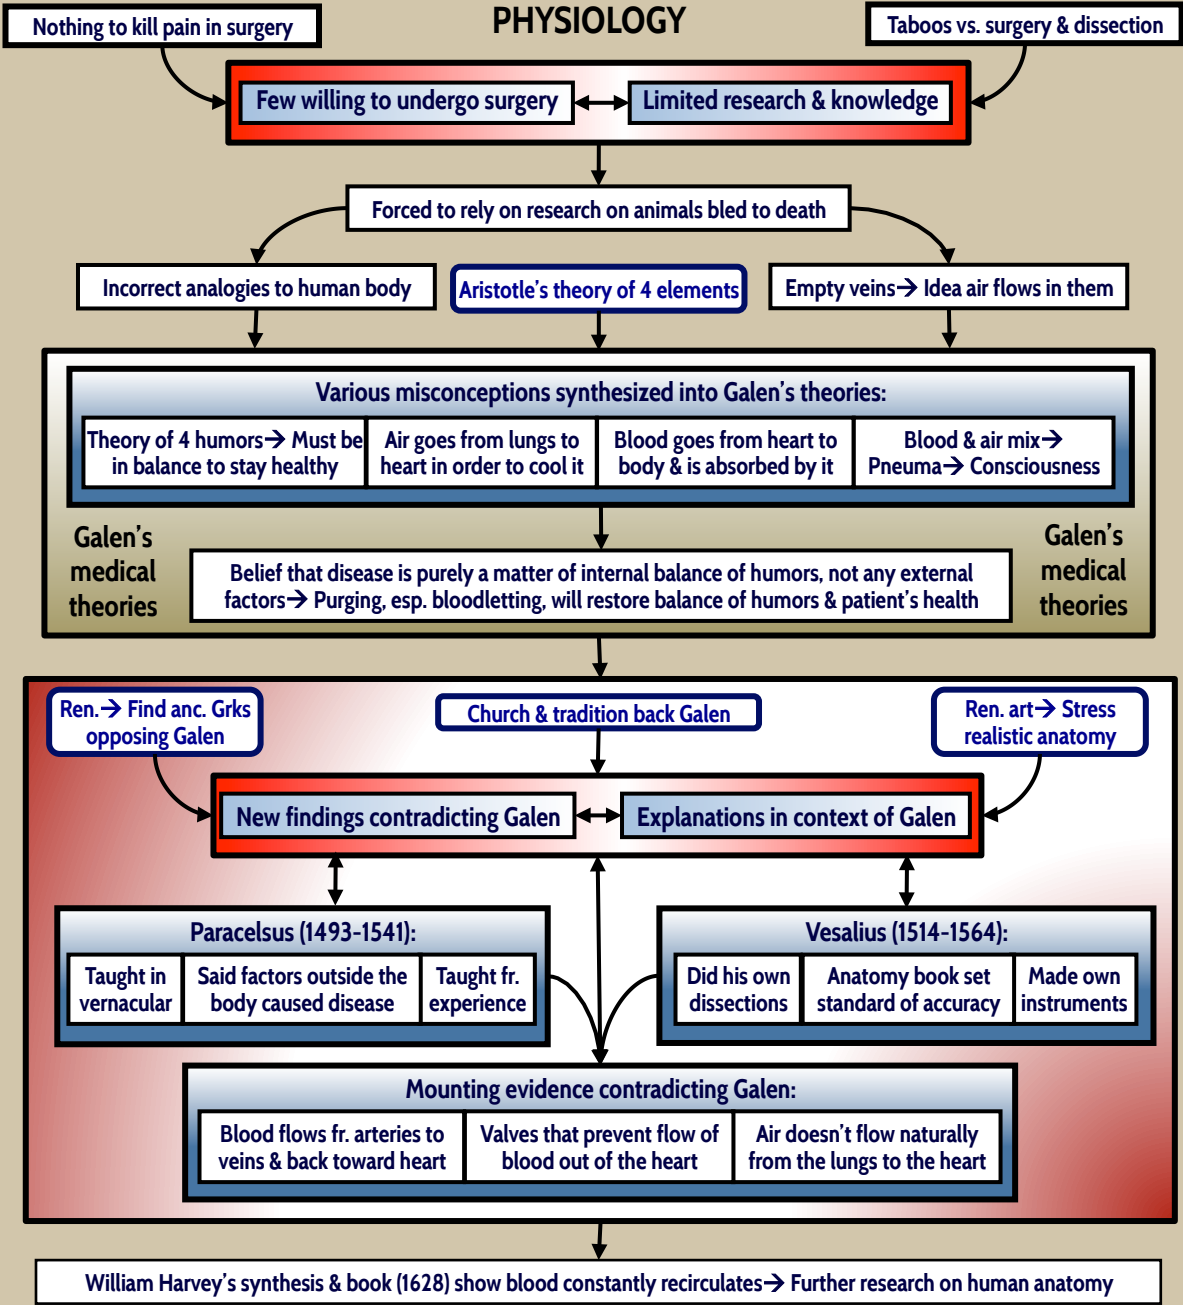

Scientific method fusing math, experiment & Aristotelian logic → Belief we can understand, predict & manipulate laws of nature

Scientific basis for rapid progress of Industrial Rev. in 1800s

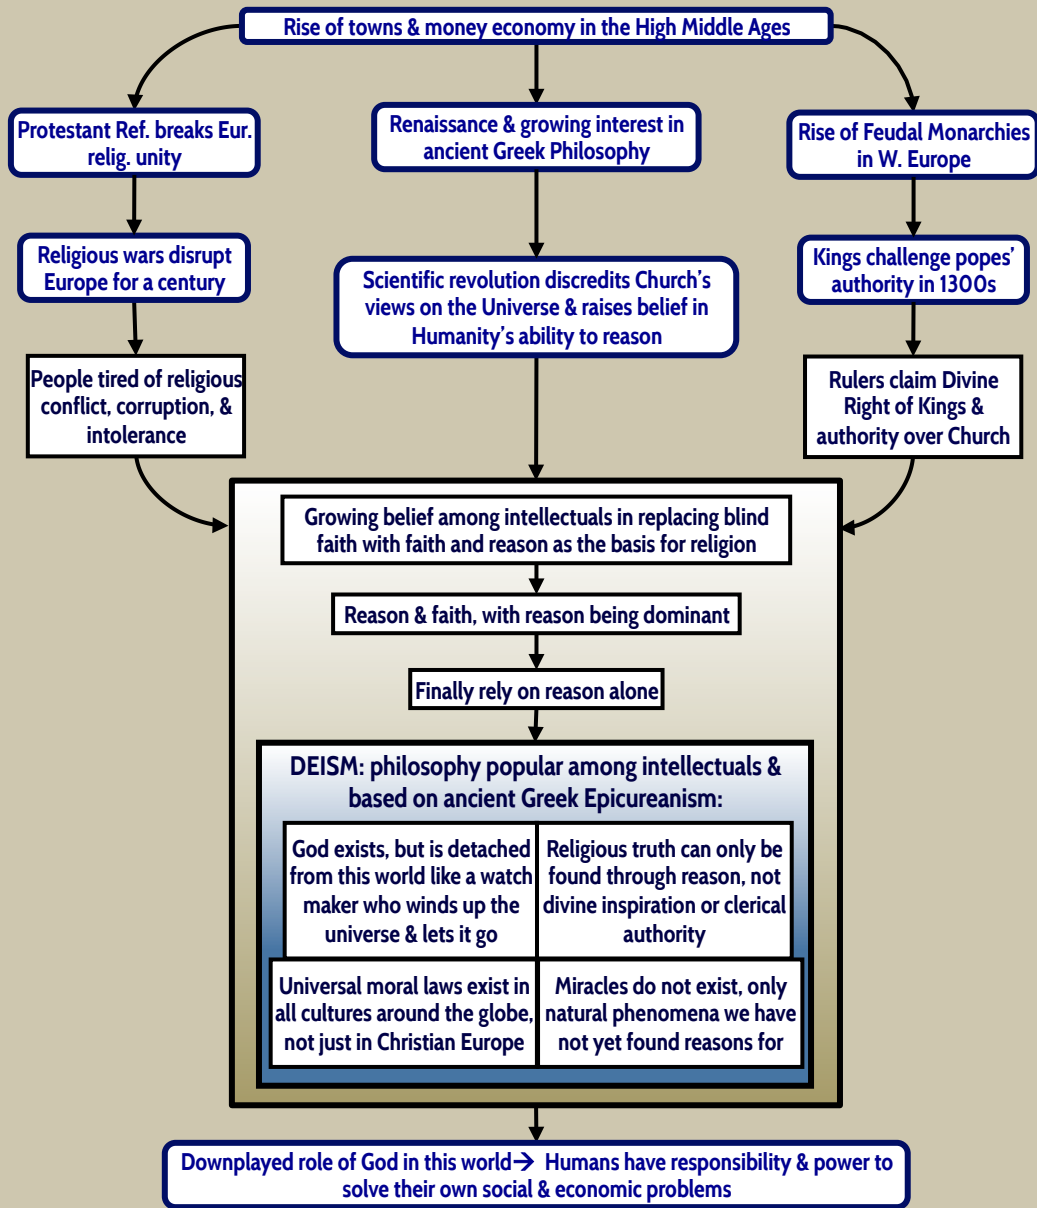

Timeline of Key Historical Events (1590-1789):

- c.1590:** Invention of microscope

13.2 THE COURSE OF THE FRENCH REVOLUTION (1789-1871)

c.1780 Neoclassical Art  Start of French Rev. 

1789  Moderate Const. Monarchy  Internal problems mount

1790

1791

1792  Start of quarter century of wars; Mon. overthrown → 1st Rep.

1793-4 "Whiff of Grapeshot" → Rise of Nap.  Reign of Terror 

1795

1799  Napoleon declares 1st Emp.  Napoleon overthrows 1st Rep.

1804

1807  Height of Nap's emp

1808-15  Nap's final defeat → Cong. of Vienna → Bourbon Mon. restored

c.1815  Rev. in Spain → Latin Am. Rev's  Romantic art movement

1820

1821  Greek Rev

1830  July Rev. in Paris 

1830  Russ. crushes Polish revolt  Belgian Rev. → Indep.

1830

1832  Reform Bill in Britain

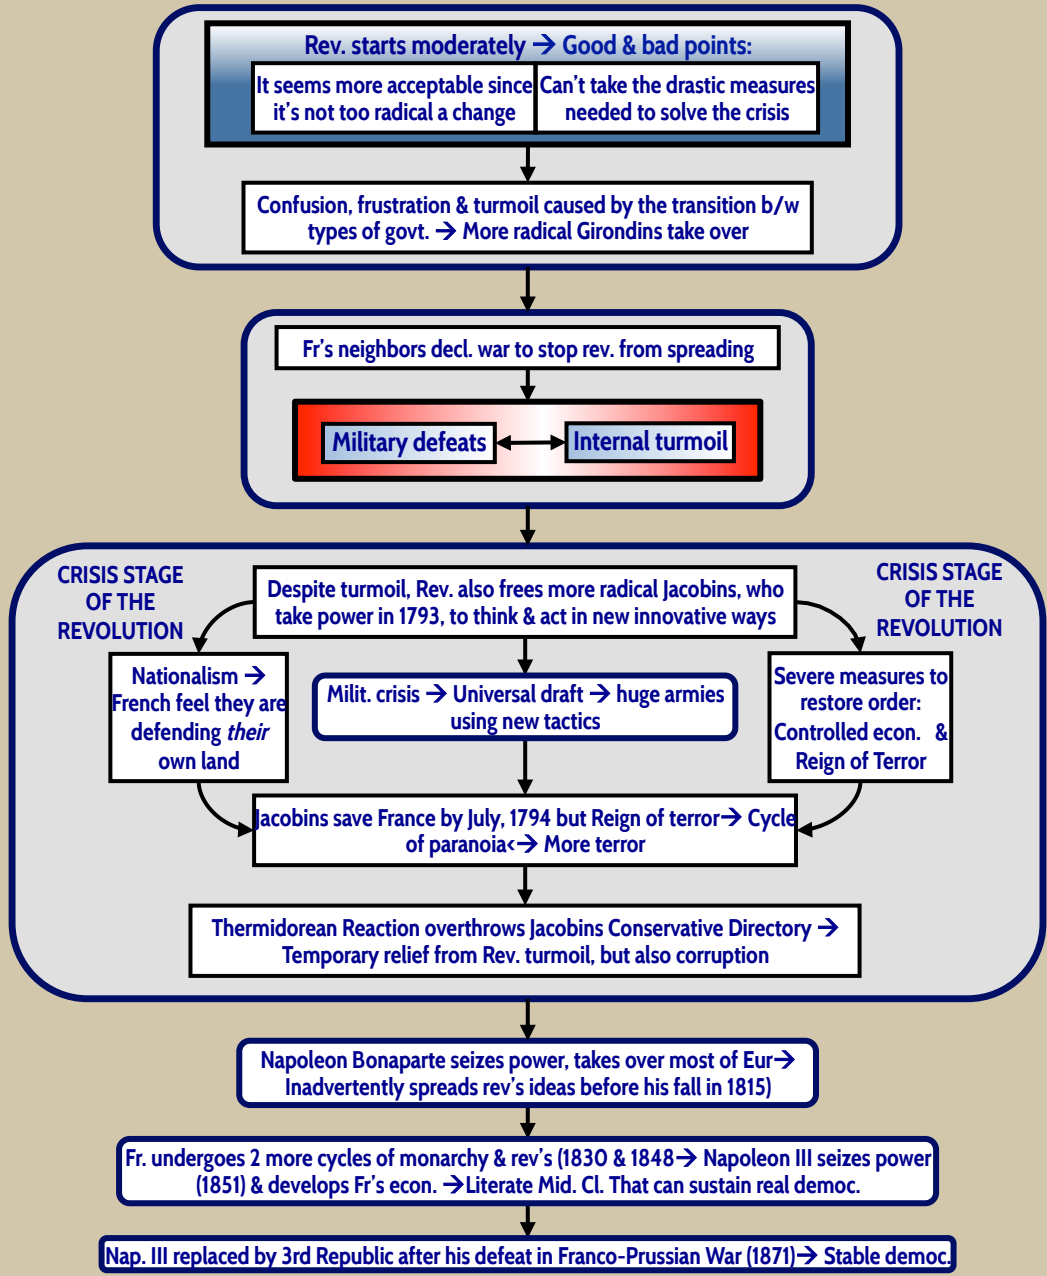

1848  Louis Napoleon overthrows 2nd Rep. & declares 2nd Emp.  Rev's of 1848

1851

c.1850  Realism school of art

1851-70  Louis Nap's econ. reforms → politically conscious Mid. Cl.

1871  3rd Rep. in Fr. → Stable Dem.

13.2A THE START OF THE FRENCH REVOLUTION (JULY, 1789-JULY, 1790)

Huge royal debt → Louis XVI calls Estates General in 1789 to get more taxes

Dispute over voting procedure:

Clergy & nobles want 1 bloc vote/estate | 3rd estate wants 1 vote for each delegate

Louis gives in when 3rd estate withdraws & declares itself the National Assembly

Paris Mob storms the Bastille (7/14/1789) when Louis posts troops around Paris

Violence known as "The Great Fear" across France → several results:

| | | |
|--|---|--|
| Nobles & clergy in Nat'l Assem. give up feudal rights (8/4/1789) | Nervous MC create Nat'l Guard units → 2 competing armies (royal & revol.) | Many nobles leave France & stir foreign fears vs. the Revolution |
|--|---|--|

Paris mob drag Louis & Nat'l Assem. from Versailles back to Paris → Rev. at their mercy

Constitutional monarchy est. (7/1791) w/several reforms:

| | | | |
|--|----------------------------------|--------------------------------------|-----------------------------------|
| Jury trials & the abolition of torture | King's power ltd. to a weak veto | Fr. reorg. into 83 non-feudal prov's | Standard metric system across Fr. |
|--|----------------------------------|--------------------------------------|-----------------------------------|

Govt. still needs \$ to pay off royal debt

Govt. paid in assignats rather than gold or silver

Take Church lands to back up bonds (assignats)

Assignats seen as money & used to pay taxes

Rampant inflation wrecks econ.

Growing anger & turmoil over econ. & Nat'l Assembly's Church policies

| 1871 | | Louis Nap's econ. reforms → politically conscious Mid. Cl. | | |
| | | 3 rd Rep. in Fr. → Stable Dem. | | |

13.3A THE RISE OF NAPOLEON TO 1804

Chaos of Fr. Rev. → Forces French to thinking radical new ways

Early life & influences on Napoleon:

| | | |
|--|--|------------------------------------|
| Born on Corsica (1769), Ital. island under Fr. | Small stature + isolation at Fr. Milit school → An intensely ambitious loner | Admired history's great conquerors |
|--|--|------------------------------------|

Military reforms & New tactics

New officers w/innovative ideas

Series of opportunities for Napoleon:

| | | |
|-------------------------------|--|----------------------------------|
| Retakes Toulon fr. Br. (1793) | Saves Directory vs. royalist rev. (1795) | Defeats Aust's in Italy (1796-7) |
|-------------------------------|--|----------------------------------|

Fr's cont. mil. Vict's → War of 2nd Coalition

Directory's corruption → internal turmoil

Nap. invades Egypt to threaten Br. India (1798)

Br. Navy traps his army there → Nap. deserts his army → Returns to Fr, overthrows govt. (1799) → Consulate, a sham dem. system of meaningless indirect elections

Nap. defeats Austrians in N. Italy (1800) & makes peace w/Br. (1801) → End of war of 2nd Coalition → Nap. eliminates Ger. Cath. States & free cities & gives their lands to Ger. princes → Pop. with Ger. princes

Has himself made emperor of France (1804):

| | | |
|---|---|---|
| Built up to it w/series of elections to make him consul for 10 yrs, consul for life, then emperor | Ensures election w/fake assassination plot vs. his life & falsifying the vote | Adds to its luster by tricking pope to come & watch & by giving generals & officials noble titles |
|---|---|---|

The Napoleonic State: Strict police state while trying to maintain illusion of Rev. ideals:

| | |
|--|---|
| EQUALITY: Nap's civil law codes keep equality of men before the law, but under state (i.e., Nap.) | LIBERTY: Relig. Lib. under "police reg's of State" Other lib's suppressed by censors & police; |
|--|---|

NATIONALISM: Strengthened w/more cent. govt., tax system & Bank of Fr.; Exploited by using public educ. w/clergy as teachers to promote loyalty to Fr. → equates loyalty to himself w/loyalty to France

Other rulers in Eur. refuse to accept Nap. as emperor

13.3B THE HEIGHT OF NAPOLEON'S POWER AND HIS FALL (1804-15)

Other rulers won't accept Nap. as emperor esp after he replaces the Italian Republic w/the Kgd of Italy under his brother

War of the Third Coalition (1805-8) consisting of Britain, Austria, & Russia when Napoleon turns Italian Republic into Kingdom of Italy ruled by his brother

| | | |
|---|--|--|
| Lord Nelson foils Nap's plan to invade Br. By defeating Fr & Sp fleets at Trafalgar (10/1805) → | Nap. crushes combined Austrian & Russian Armies at Austerlitz (12/2/1805) → Aust. surrenders → | Nap. declares HREmp defunct & forms Confed. of Rhine (1806) → Prussia declares war & loses → |
|---|--|--|

Nap. defeats Russia → Tr. of Tilsit (1807) dividing Eur. b/w Fr. & Rus. Spheres of influence

Napoleon's empire at its height included most of continental Europe west of Russia under varying degrees of control:

| | | |
|--|---|---|
| States under direct Fr. admin. (Holland & some Ital. States) | States dependant on Fr. (Gr. Duchy of Warsaw, Conf. Of Rhine) | States ruled by Nap's relatives (Naples, Spain, N. Italy) |
|--|---|---|

Allies expected to follow Napoleon in war (Austria & Prussia)

Nap. uses (& spreads) ideas of Fr. Rev. to rule Eur. :

| | |
|--|---|
| LIBERALISM: belief in social & political equality | NATIONALISM: belief in each nation's rts & freedom |
|--|---|

Other rulers (e.g., Prussia) adopt Fr. & mil. reforms

Subject peoples also want nat'lism & liberalism

Nap. overestimates his power → Tries to impose the Continental System a Eur.-wide embargo on Br. goods to bring Br. to its knees

Portugal won't cooperate → Nap. takes Spain on way to Port. (1808)

Nap. invades Rus. w/ huge army when it resumes trade w/Br. (1812)

Spain rebels → Long costly war (1808-13) → Nap. Driven out

Rus. scorched earth policy → Disastrous Fr. Retreat from Rus.

4th Coalition forms vs Nap. → Drives him from Ger. (1813) → Forces his abdication (1814) → He makes a brief comeback to power → His final defeat at Waterloo (1815)

| | | | | |

1871 3rd Rep. in Fr. → Stable Dem.

13.5 REVOLUTION & REACTION IN EUROPE (1815-48)

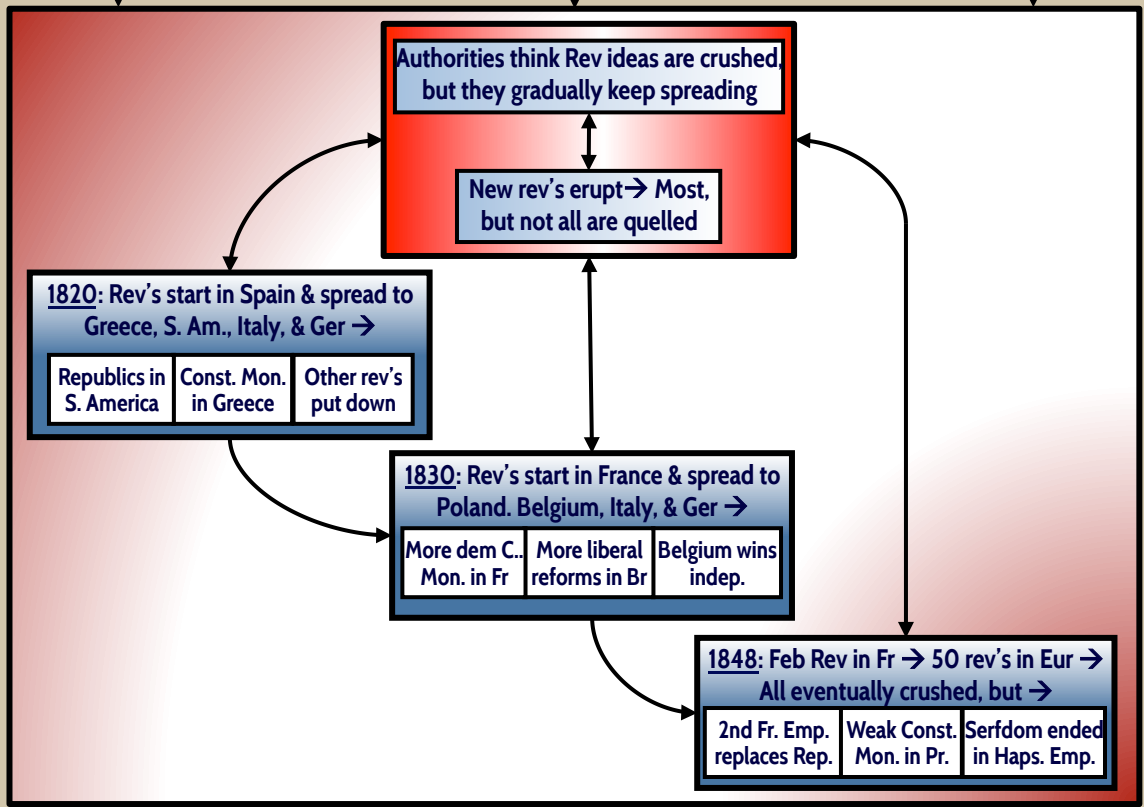

Napoleon finally defeated at Waterloo & sent into exile in 1815

Victorious allies meet at Congress of Vienna in 1815 & try to restore the old order, but there are changes:

| | | |
|---|---|---------------------------------------|
| Const., not absolute, Mon. est. in France | Polish kgd. revived, but under Russian rule | Dutch take over Aus. Neth's (Belgium) |
|---|---|---------------------------------------|

Spread idea of liberalism, esp. in W & Cent Eur

Spread idea of Nat'lism, esp. in E & Cent Eur.

Some gains despite failure of most rev's:

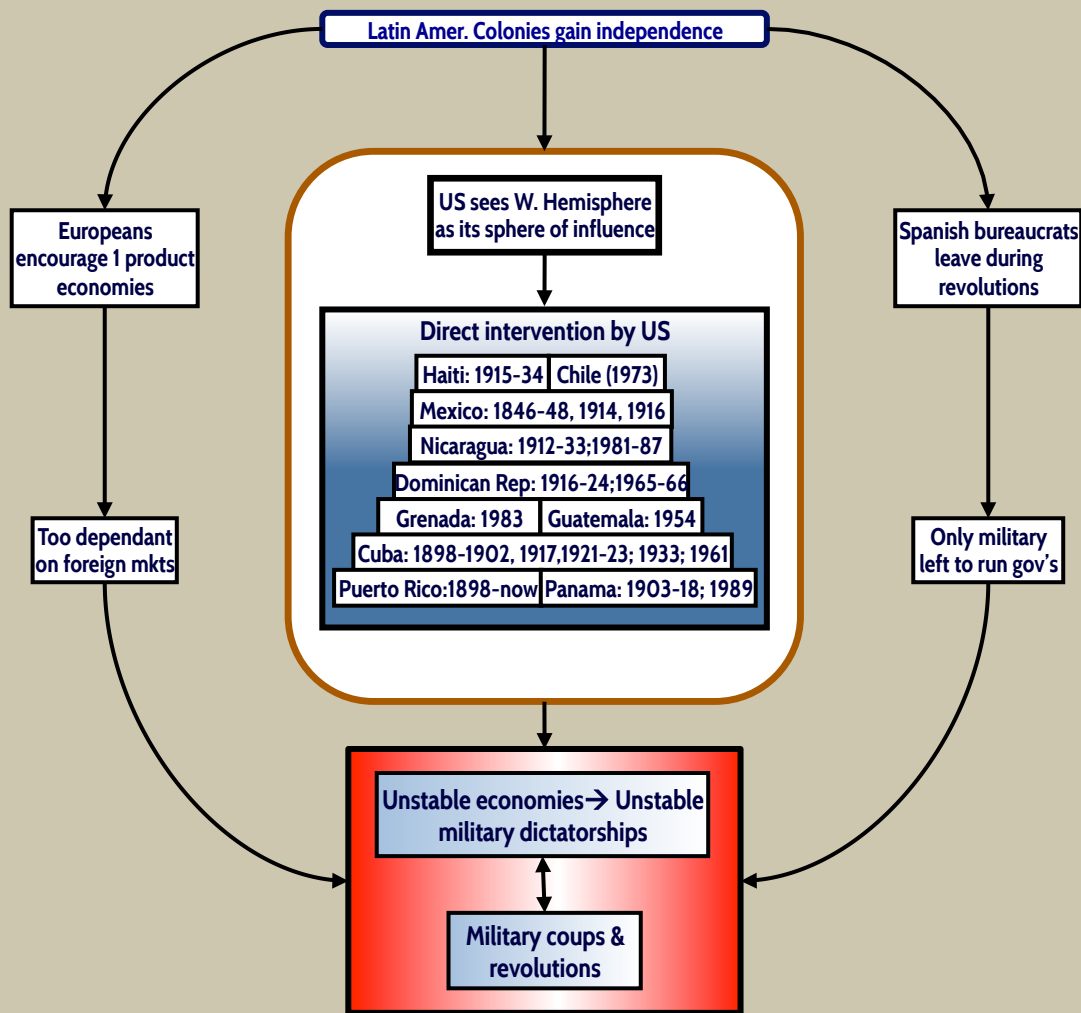

| | | |
|---|---|---|
| Some reforms in Britain, Hapsburg Emp & Prussia | Independence & cons. mon's in Greece, Belg., & S. Am. | Reformers set more realistic goals & strategies |
|---|---|---|

Unification of Italy & Germany

1901 Powered flight

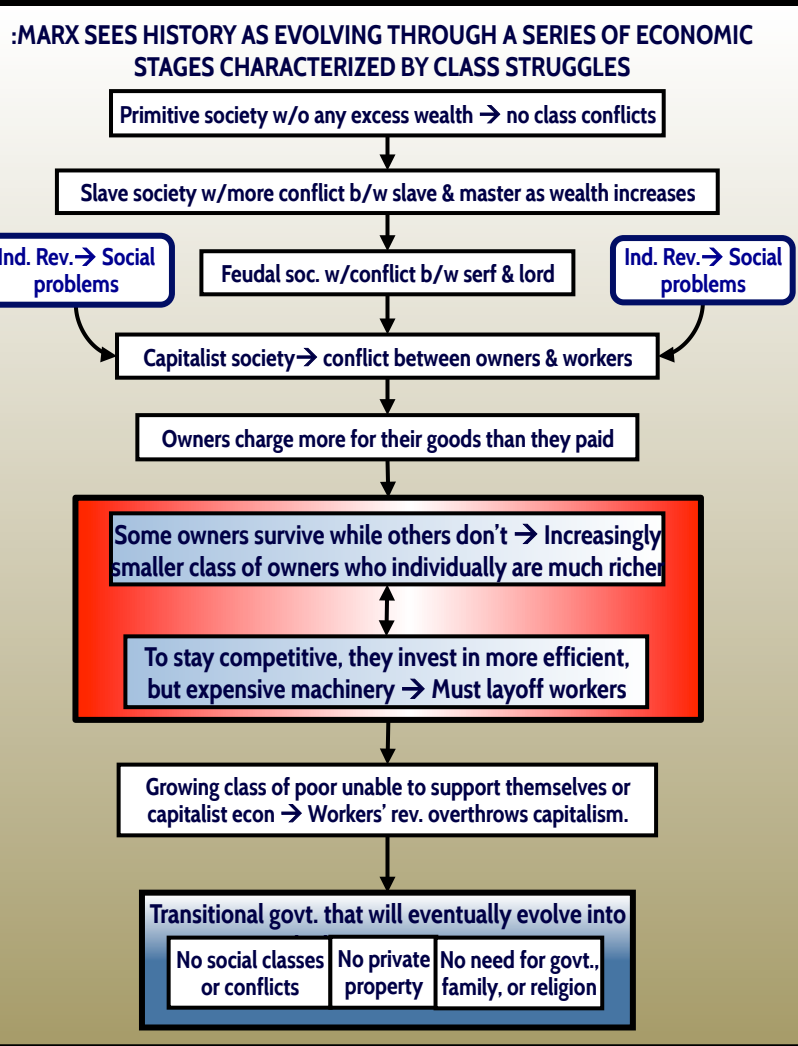

1903 Ford assembly line to mass produce cars

1908 Panama Canal

1914

14.7 THE MARXIST VIEW OF HISTORY & ITS IMPACT

Marxism successful in some ways but not in others:

| | | | |
|---|---|---|--|
| Indiv. genius, greed, stupidity, etc. not accounted for | Caused many gov't. reforms both for & vs. Marxism | Pointed out the role of economics & class struggle in history | Marxist rev's happened in pre-indus., not ind. soc's |
|---|---|---|--|

| | | |
|-------|--|--|
| 1709 | | Abraham Darby smelts iron with coke |
| 1712 | | Newcomen steam pump |
| 1733 | | flying shuttle |
| 1765 | | Spinning jenny |
| 1769 | | Water frame, 1st water-powered textile machine |
| 1775 | | Watt's steam engine |
| 1783 | | Sun & Planet gear |
| 1793 | | Cotton gin |
| 1793 | | Jenner's inoculation vs. smallpox |
| 1801 | | Trevithick's steam locomotive |
| 1807 | | Fulton's steamboat |
| 1830 | | Liverpool & Manchester RR |
| 1831 | | Faraday discovers electro-magnet current |
| 1837 | | Morse telegraph; 1st commercial use in 1844 |
| 1837 | | 1st ocean going steamship |
| 1826 | | 1st photograph |
| 1854 | | Bessemer process -> Steel |

| 1869 | | Mendelev's periodic table of elements |
| 1869 | | Suez Canal & Transcont. RR in US |
| 1869 | | Lister applies germ theory to surgery |
| 1870s | | Typewriter |
| 1873 | | telephone |
| 1876 | | phonograph |
| 1877 | | light bulb |
| 1878 | | |
| 1884 | | |
| 1885 | | 1st skyscraper (10 stories) |
| 1885 | | Rabies vaccine |
| 1885 | | Movies |
| 1885 | | Automobile |
| 1885 | | X-rays |
| 1895 | | 1st trans-Atl. radio transmission |
| 1901 | | Powered flight |
| 1903 | | Ford assembly line to mass produce cars |
| 1908 | | Panama Canal |
| 1914 | | |

14.8 INDUSTRIALIZATION SPREADS BEYOND BRITAIN (1850-1900)

1709 Abraham Darby smelts iron with coke

1712 Newcomen steam pump

1733 flying shuttle

1765 Spinning jenny

1769 Water frame, 1st water-powered textile machine

1775 Watt's steam engine

1783 Sun & Planet gear

Cotton gin

1793 Jenner's inoculation vs. smallpox

1801 Trevithick's steam locomotive

Fulton's steamboat

1807 Liverpool & Manchester RR

1830 Faraday discovers electro-magnet current

Morse telegraph; 1st commercial use in 1844

1837 1st ocean going steamship

1826 1st photograph

Bessemer process -> Steel

1854 Pasteur postulates germ theory

1864 Trans-Atlantic telegraph cable

1869 Mendeleev's periodic table of elements

Suez Canal & Transcont. RR in US

1869 Lister applies germ theory to surgery

1870s Typewriter

1873 telephone

1876 phonograph

1878 light bulb

1884 1st skyscraper (10 stories)

1885 Rabies vaccine

1885 Movies

1885 Automobile

1885 X-rays

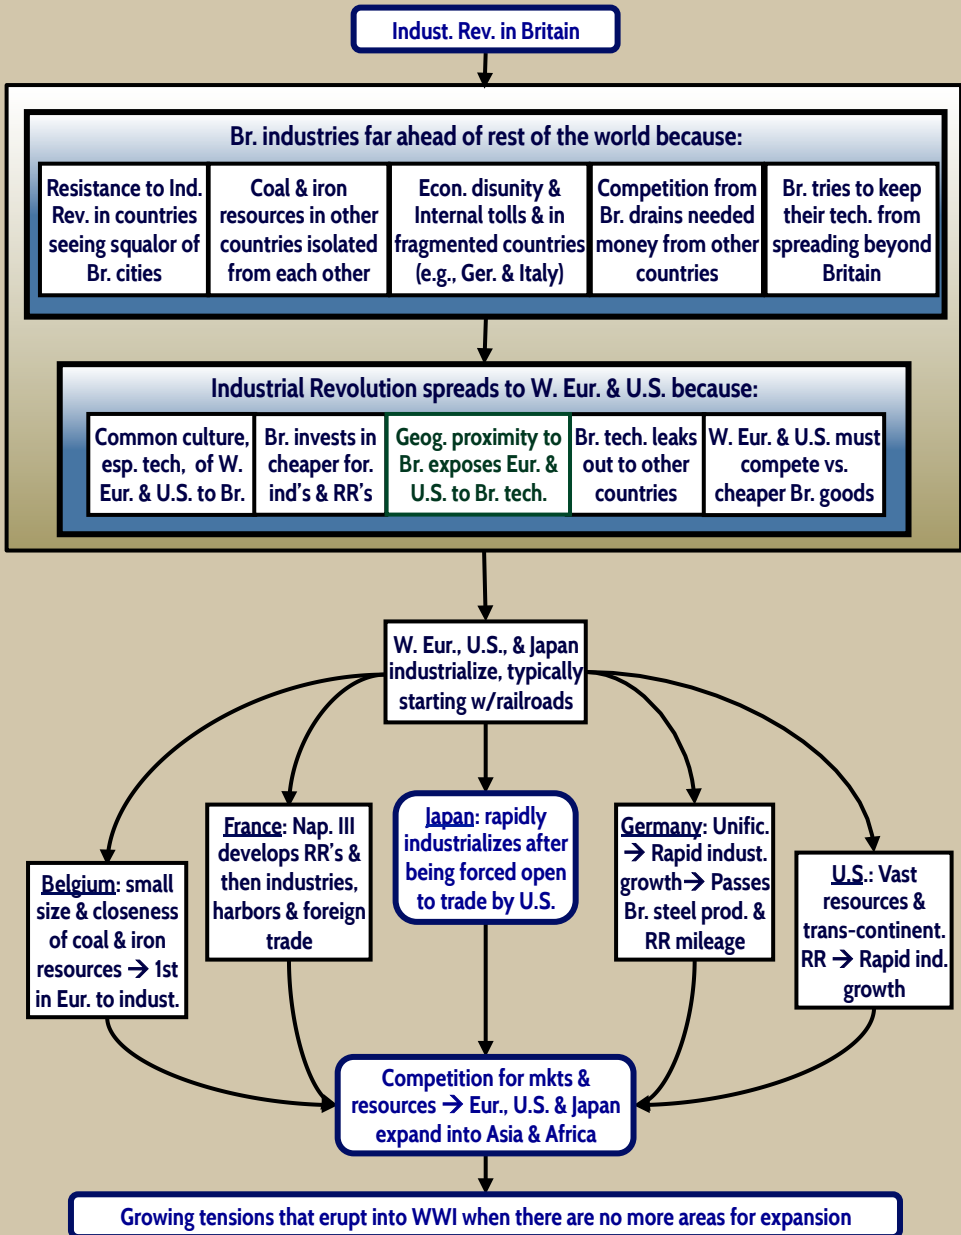

1895 1st trans-Atl. radio transmission

1901 Powered flight

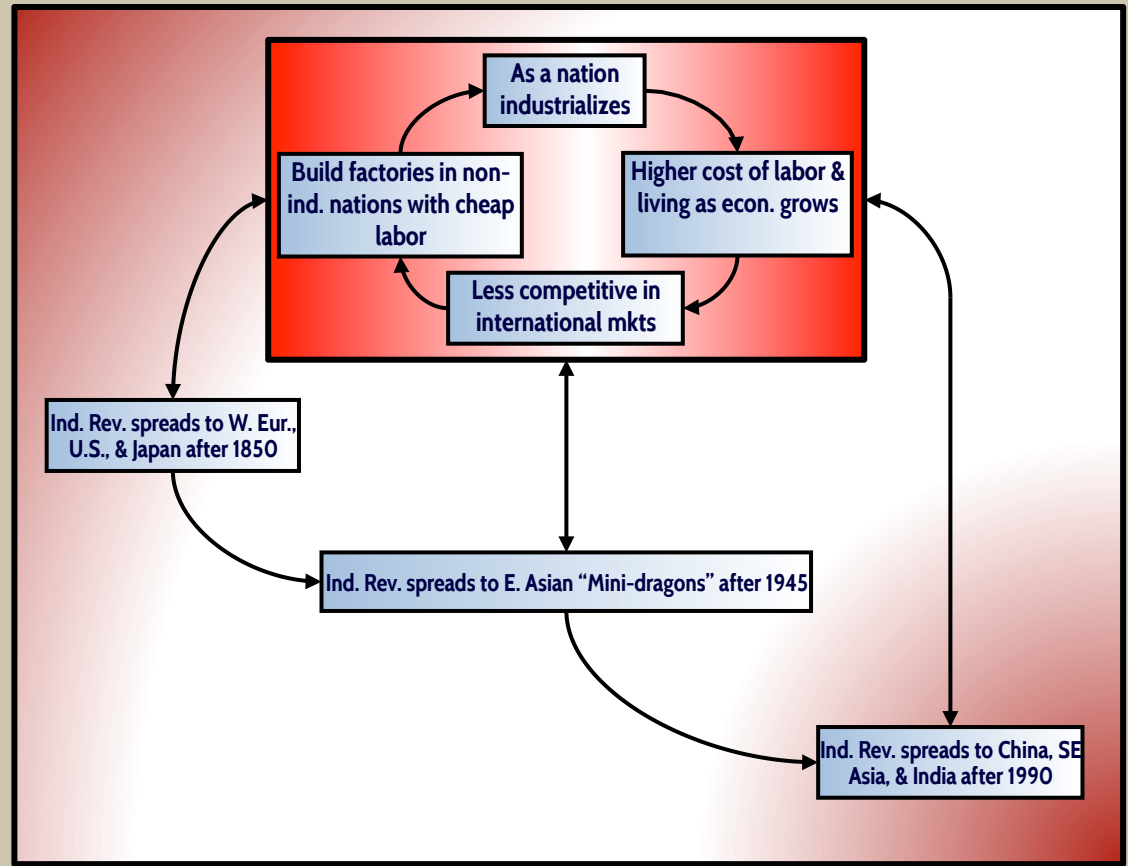

1903 Ford assembly line to mass produce cars

1908 Panama Canal

1914

14.8A THE ONGOING CYCLE OF FOREIGN INVESTMENT AND SPREAD OF INDUSTRIALIZATION

Older indust. nations use capital accrued from previous sales to shift from production-oriented capitalism to financial capitalism, relying on "invisible" exports (e.g., banking and insurance) to maintain econ. Power.

15. Nationalism & imperialism in the late 1800s

Polar History
and the Empire
of the Elves: a Parody

15.1 THE DECLINE OF THE HAPSBURG EMPIRE IN THE 1800s

1848 Revs across Eur.

1839-58 1st Opium War → Taiping Rebellion → 2nd Opium War

1853-6 Crimean War

1854 Japan forced to open to the world

1857 Great Indian Mutiny → Br. takes over India

1861 Kgd of Italy formed

1861 Serfdom abolished in Russia

1865 Salon des Refuses

1867 Meiji Restoration → Japan's modernization

1868 Austro-Pruss. War

1870-1 Unif. of Germany

1873 Impressionists' first exhibition

1873-82 Br buys Eg's shares in Suez Canal → Occup. Eg

1879 Renoir's "Boating Party"

1881 Anglo-Zulu War

1884 Fr. conq. Indochina

1859-85 Berlin Conf. to regulate compet. for Afr. colonies

1885 Leopold II's "Congo Free State"

1888 Van Gogh's "Starry Night over Rhone"

1888 Sino-Jap. War

1894-5 Sp.-Am. War

1898 Boxer Rebellion in China

1898 Brit. takes Sudan

1899 Russo-Japan. War

1899-1902 Boer War → Brit. Control of S. Afr.

1903-5 Entente Cordiale b/w Fr. & Br.

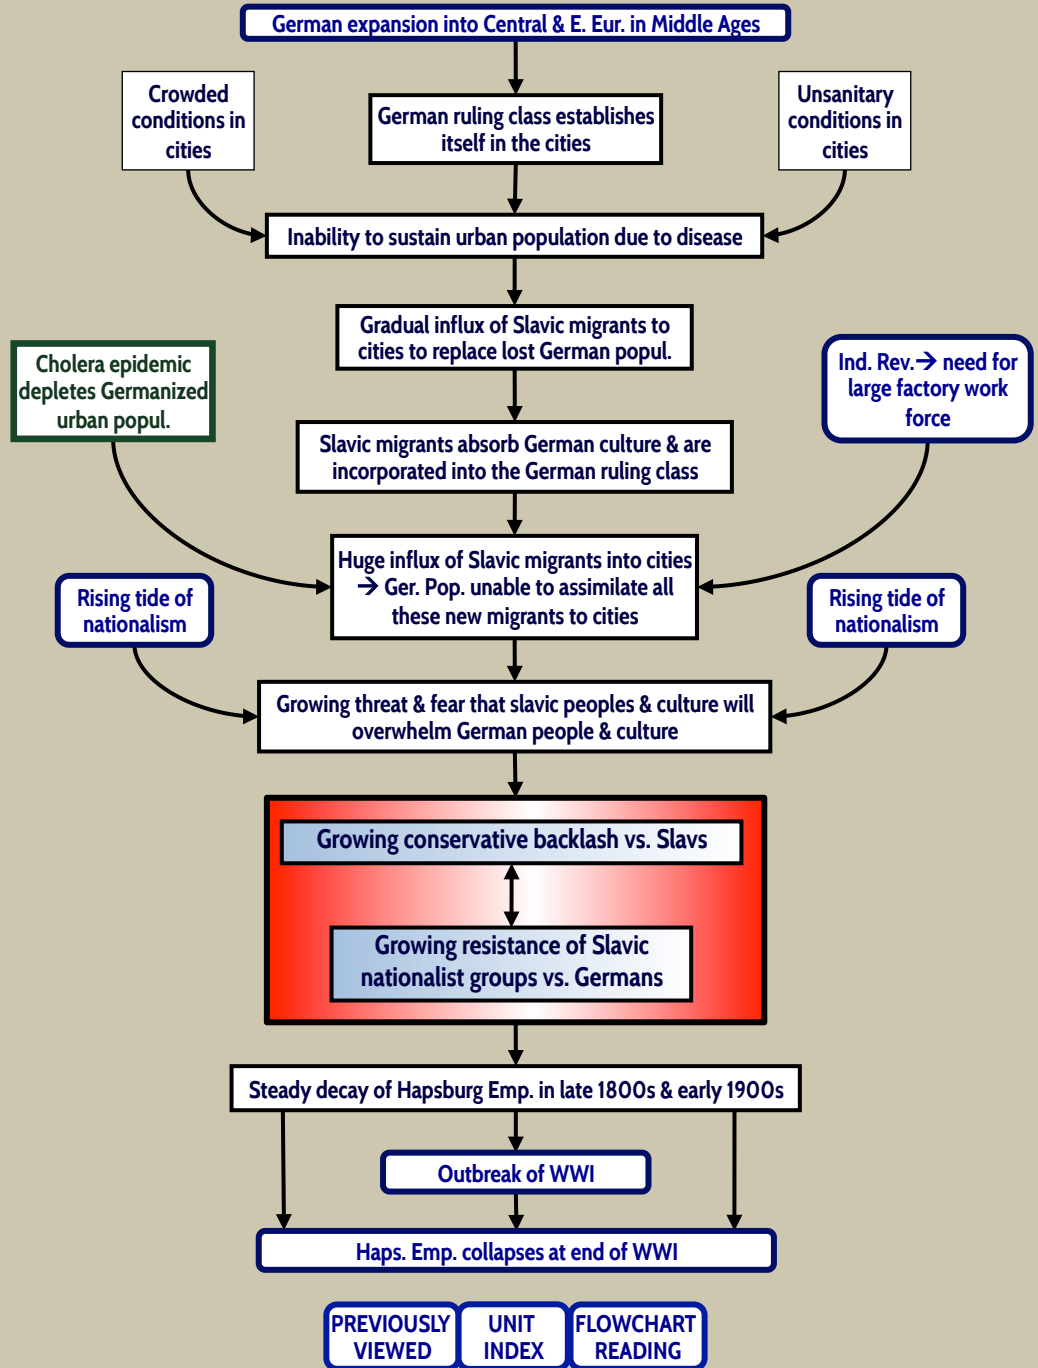

1904 Rev. of 1905 in Russia

1905 Abstract art

c.1900 Chinese Republic founded

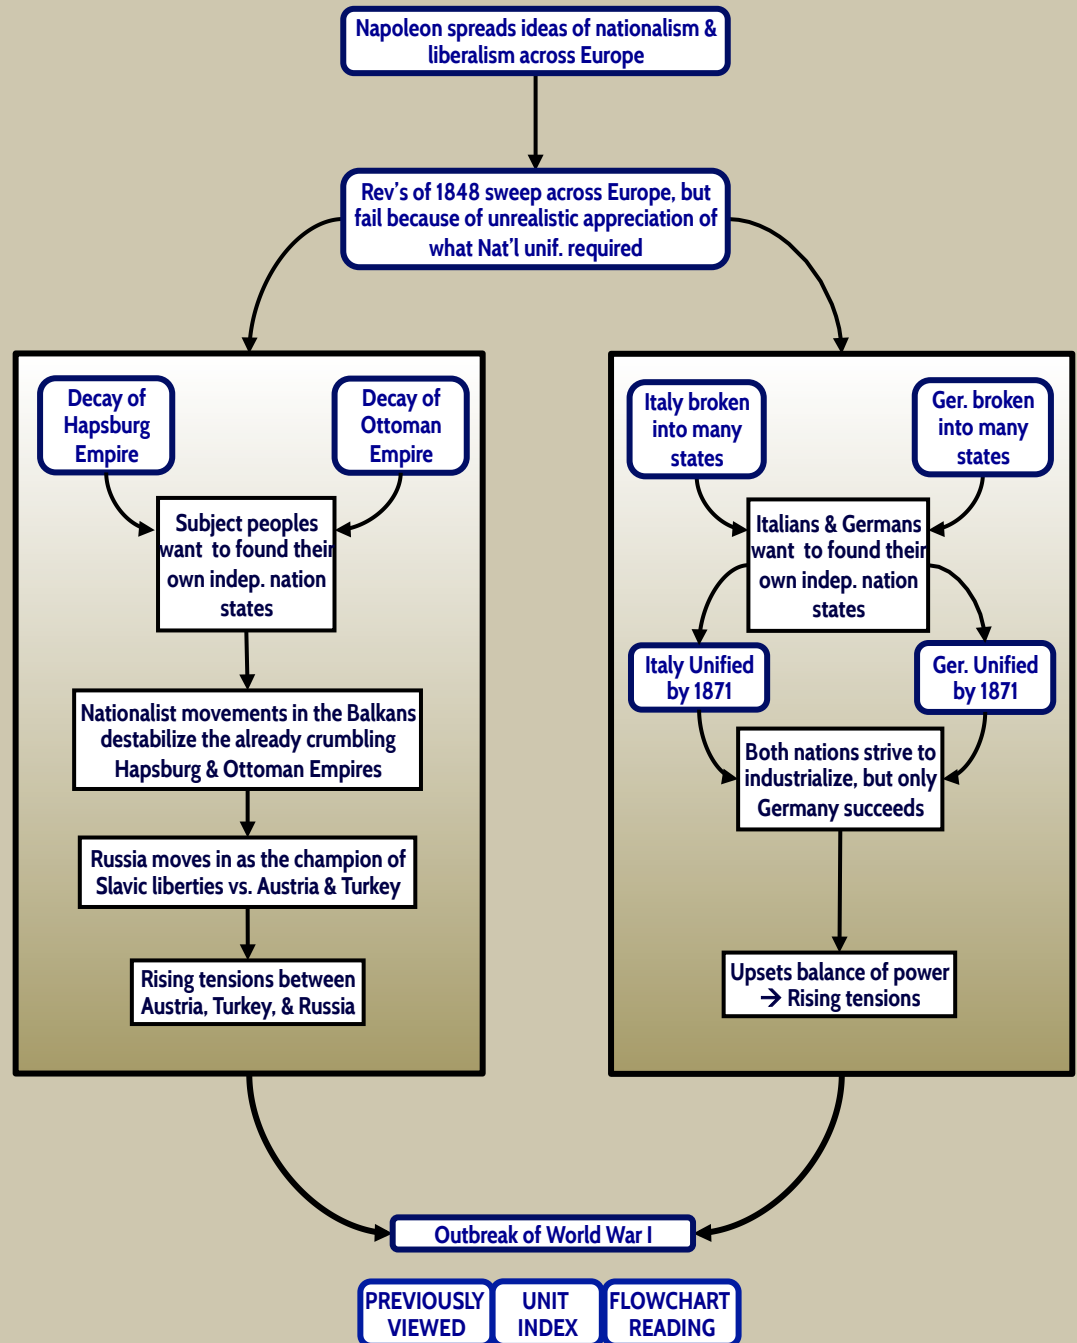

1912 Start of WWI

1914

15.2 EUROPEAN NATIONALISM (1848-1914)

| | | | |
|-----------|---|--|--|
| 1848 | Revs across Eur. | 1st Opium War | Taiping Rebellion |
| 1839-58 | | | → 2nd Opium War |

UNIT INDEX

FLOWCHART READING

15.3 THE UNIFICATION OF ITALY & ITS EFFECTS (1848-1914)

Rev's of 1848 fail when Pope & Duke of Tuscany desert the cause of Italian unification & indep.

Kgd. of Sardinia (aka: Piedmont) seen as the natural leader for Italian unification

Sardinia, needing allies vs. Austria, helps France & Britain vs. Russia in Crimean War → Fr. helps Sardinia vs Aust. in War of 1859, but drops out after two costly victories. Sardinia gets most of N. Italy, while France gets Nice & Savoy for its help

Giuseppe Garibaldi, a fiery rev. leader, furious about Fr. deserting the Ital. cause & then getting Nice, his birthplace, plans to take Nice back → Sard. diverts him to S. Italy & Sicily, which he takes from the Bourbons.

Sard. takes Papal States (exc. Rome) from France

Garibaldi turns S. Italy & Sicily over to Sardinia

Kgd. of Italy founded (1861) → Need 2 areas to complete unif.

| | |
|--|--|
| Venice which falls to Italy after Austro Prussian War (1866) | Rome which falls to Italy after Franco-Prussian War (1871) |
|--|--|

Efforts to build Italy w/national army, RR's, & public education largely fail because:

| | | |
|--|---|--|
| Resistance from local groups (e.g., Mafia) | Uneven distr. of wealth b/w N & S Italy | Different subcultures in N. & S. Italy |
|--|---|--|

Italy's poor performance in World War I

Italy destabilized & open to takeover by Mussolini & the Fascists

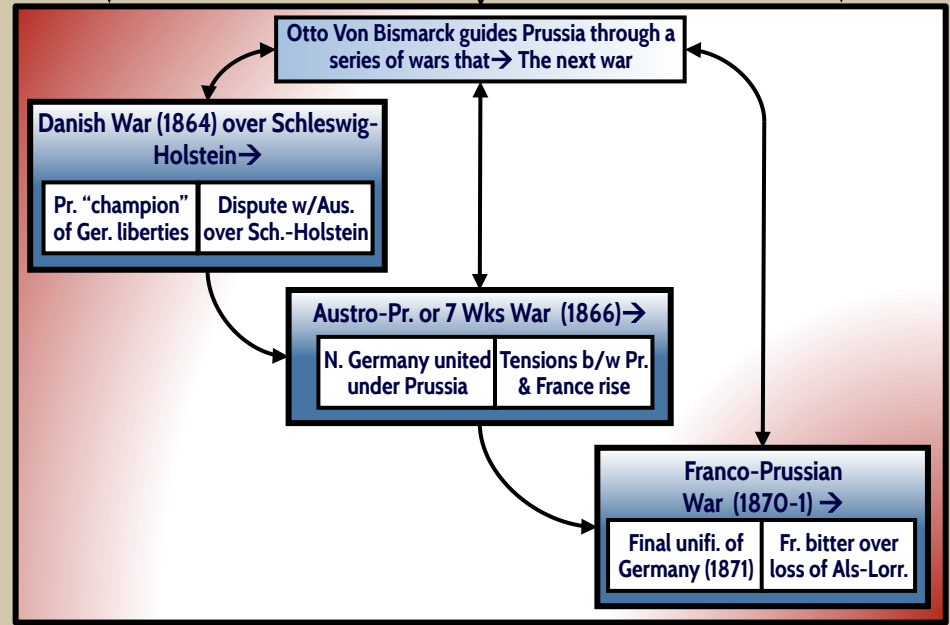

| | | |
|-----------|---|--|
| 1848 | Revs across Eur. | 1st Opium War → Taiping Rebellion |
| 1839-58 | | → 2nd Opium War |

15.4 THE EMERGENCE OF THE GERMAN NATION (1848-1914)

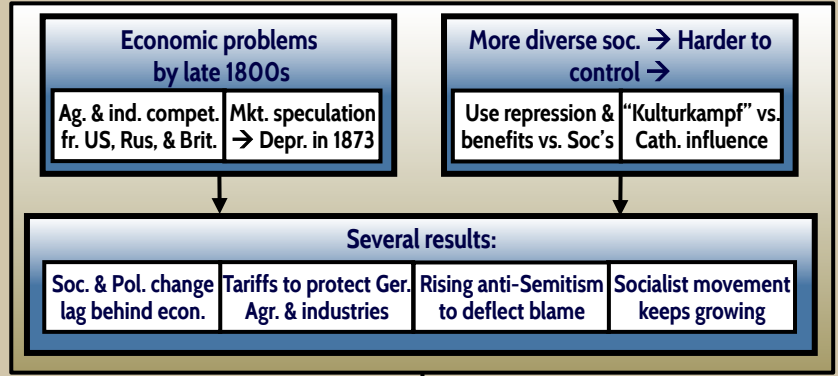

Germany used as battleground since Thirty Years War

Rising tide of Nationalism in 1800s

Cong. of Vienna consolidates Germany into 38 states

Germany rapidly industrializes & even surpasses Brit. steel prod. by 1900

Upsets BOP in Europe

Upsets BOP in Europe

Rising internat'l & domestic tensions -> Outbreak of World War I

PREVIOUSLY VIEWED UNIT INDEX FLOWCHART READING

1848 Revs across Eur.

1839-58 1st Opium War -> Taiping Rebellion -> 2nd Opium War

1853-6 Crimean War

1854 Japan forced to open to the world

1857 Great Indian Mutiny -> Br. takes over India

1861 Kgd of Italy formed

1861 Serfdom abolished in Russia

1865 Salon des Refuses

1867 Meiji Restoration -> Japan's modernization

1868 Austro-Pruss. War

1870-1 Unif. of Germany

1873 Impressionists' first exhibition

1873-82 Br buys Eg's shares in Suez Canal -> Occup. Eg

1879 Renoir's "Boating Party"

1881 Anglo-Zulu War

1884 Fr. conq. Indochina

1859-85 Berlin Conf. to regulate compet. for Afr. colonies

1885 Leopold II's "Congo Free State"

1888 Van Gogh's "Starry Night over Rhone"

1888 Sino-Jap. War

1894-5 Sp.-Am. War

1898 Boxer Rebellion in China

1898 Brit. takes Sudan

1899 Russo-Japan. War

1899-1902 Boer War -> Brit. Control of S. Afr.

15.6 THE BRITISH IN INDIA (c.1600-1947)

Decline of Portuguese Emp. in SE Asia by 1600

Decline of Mughal Empire → Growing turmoil

Br. E. Indies Comp.(BEIC) sets up & must defend trading posts in India

BEIC trains native troops like Eur. armies
 Defeat Fr. expansion in S. India during 7 Yrs War | Defeat Bengalis at Plassey vs. 30:1 odds (1757)

India wide open for exploitation & conquest by BEIC & its employees →
 Many make huge fortunes | Tropical diseases & heat kill many | Many adopt local customs

BEIC in debt → Br. govt. assumes more control

Growing tension between:
 British advocating respect for Ind. civ. | British having no respect for Ind. civ.

Br. send missionaries, some to help Indians & some to show Eur. superiority

Br. rapidly modernize Ind., some to help Indians & some to show Eur. superiority

Many Indians upset either way

Many Indians upset either way

Great India Mutiny (1857) → Br. Gov. takes control of India (1858)
 Dev. Tea, cotton, coal & iron ind's | Continue bldg. RR's & telegr. | Efficient but segregated bur.

Indep.. movement by Hindus → Indian Muslims want sep. state | Br. needs Indian help → More promises of concessions

Gandhi's non-violent movement

Muslim/Hindu clashes worsen

Br. grants indep. (1947), but to separate Hindu India & Muslim Pakistan

1945 Nuremberg Trials

16.4 THE CAUSES OF THE RUSSIAN REVOLUTION)

Russia's huge size, geog. isolation, & history of foreign invasions → Slow moving & backward autocracy

Ind Rev spreads to Russia

Ind. Rev → Social problems

Rising infl. of Marxism

Jap. defeats Rus. (1903-5)

World War I

World War I

Rev. of 1905 → Forces reforms from Tsar Nicholas II:
 Duma (parliament) → Gets gradually stripped of power | Economic reforms → Many peasants get own lands

Growing gap b/w econ. & polit. progress, aggravated by Rus's defeat in WWI

Russian Revolution

17.13A MAO ZEDONG AND CHINA (1937-76)

Civil war b/w Nationalists & Communists is interrupted by World War II although Mao continues to attack & undermine Chinese Nationalists' efforts vs Japan

Lessons of Stalin's disastrous ind. & agr policies

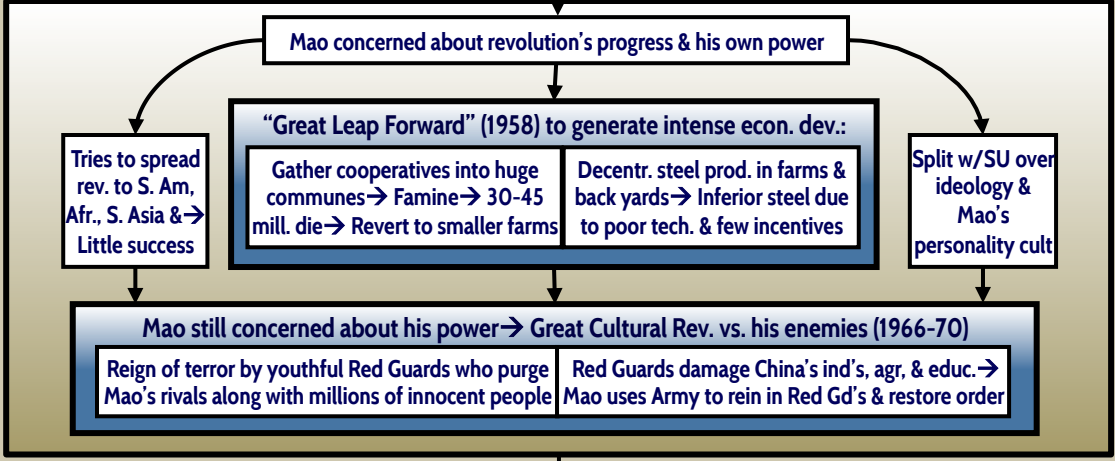

After WWII, civil war resumes → Mao wins due to Stalin's support & moles who betray Nationalist forces

Korean War (1950) → US forces close to China

Aggressive foreign and domestic policies:

- Purges "rich" peasants, relig. groups, bur's, & businessmen
- Trades much needed food to USSR for milit. aid
- Gets nucl. weapons
- Intervenes in Korea (1950) & occupies Tibet (1951)
- Enforces terror through use of propaganda, psych. & physical torture, forced labor camps, & mass rallies to incite mobs vs his enemies

Mao, feeling strong & confident, launches "Let 100 Flowers Bloom" campaign to encourage more intellectual freedom → People criticize Mao → Mao purges them

Chinese people continue to suffer in Mao's later years:

- To increase his own power Mao continues ruinous policies
- Mao's reckless policies nearly → War w/USSR
- Mao normalizes relations w/US in vain hope of getting milit. aid

Mao's death (1976) → More moderate policies

17.19 COLONIAL AND POST COLONIAL AFRICA (c.1870-2000)

BIOLOGICAL, CULTURAL, AND TECHNOLOGICAL EVOLUTION IN HISTORY

Introduction. There are three types of evolution that have driven the development of human societies. The first of these is biological evolution where nature very slowly adapts us physically to our changing environment. Whether one believes in the theory of dynamic biological change and evolution or a more static creationist model of biology, one cannot deny we are biological beings with certain characteristics that largely distinguish us from other animals. There are five major characteristics that make humans unique. One is our binocular and color vision that gives us depth perception and a more detailed view of our surroundings respectively. This sends a lot of information to our brains for processing, making us very much a visually oriented species with 90% of the information we take in coming in through the eyes. Second we have upright posture, which frees our hands. This brings us to the third factor, our hands with opposable thumbs, which allow us to manipulate various objects and our environment. That in itself would be worth very little if it were not for the fourth characteristic, our brain that allows us to use our hands in intelligent and creative ways. The brain also makes possible the fifth characteristic, speech which allows us to share knowledge and ideas quickly so each generation does not have to rediscover that knowledge on its own, giving it time to discover and develop new knowledge and ideas.

This unique combination of biological characteristics is the basis for two other types of evolution: cultural and technological. One can see cultural evolution as how people adapt their behavior to the environment. Since these are conscious rather than totally random, or non-existent, changes, they occur at a much faster pace than biological change. However, the force of tradition typically keeps people from rapidly changing long-standing cultural traditions that generally have served society well in the past. This is because people throughout most of history have barely survived with little or no surplus, giving them little or no margin for error if the new change

does not work, and making them reluctant to change cultural norms very rapidly.

Technological evolution enables people to adapt or change their environment to meet their needs. This is often something that can be done without *immediately* changing cultural norms, therefore meeting little resistance since it typically improves people's standard of living in the short run, while no one foresees its long-term effects. This makes people more likely to develop new inventions, further improving their standard of living, and so on:

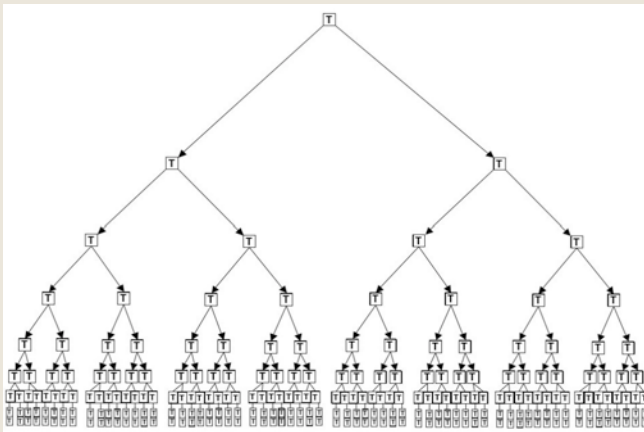

Also, since each new invention often inspires several new inventions, technological change happens at an ever-accelerating and exponential pace that today threatens to spin out of control:

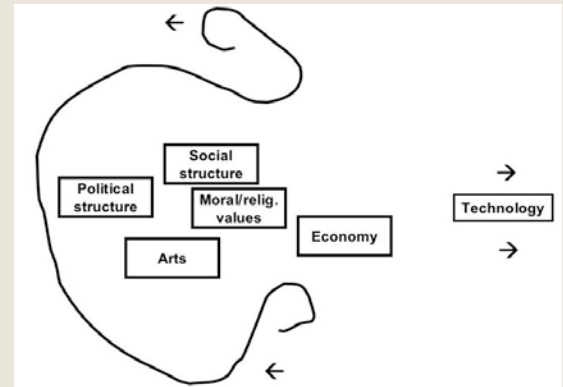

If one part changes faster than the others, they are pulled along, but start to lag:

UNTIL... the rubber band snaps, signifying some sort of revolution or major breakdown

The “Rubber Band Theory”. One of the most important concepts to understand about history is how any particular event or development rarely has just one cause or just one result. Typically, if one part of a culture changes, it leads to changes in the other parts of the culture.

One can visualize all the parts of a culture (social structure, political structure, technology, the arts, religion, economy, military institutions, etc.) as being bound together by a rubber band:

An overview of human history. The combination of cultural and technological change along with the Rubber Band Theory helps explain the overall flow of history. The process driving this comes increasingly from technological change. This leads to surpluses that lead, among other things, to wars and conflict since people have typically fought over material wealth. These surpluses and the wars they cause lead to efforts to find new and better technologies. These create even more surpluses and wars, more new technologies, and so on. Since there are more technologies on which to base new ones, each time this feedback cycles around, technological growth accelerates in speed and intensity. This process has created four successive stages of development in human society, each of which feeds back into the cycle of technological growth, thus leading to the next stage.

First, through the vast majority of our species' existence our ancestors followed a hunting and gathering way of life, with men typically doing the hunting and women gathering fruits and grains while watching the children. Such societies were highly mobile as they pursued wild game. They had little or no surplus and therefore virtually no private property since, being mobile, they could carry very little with them. By the same token, they had to be highly cooperative and share freely, since the men as a group did not always bring home any meat and had to rely on what the women had gathered. All this made for a somewhat egalitarian society with little difference in status between men and women. At this early stage, with little previous technology to draw upon, new technologies developed slowly.

That changed somewhat with the next stage: the invention of agriculture (c.8000 B.C.E.). This forced people to settle down as they generated progressively larger surpluses. For the first time, people could amass private property, which led to different social classes distinguished by wealth. That in turn triggered conflict within the society and wars between societies. With survival based increasingly on brute strength, men emerged as the leaders and women's status started to drop.

Social stratification and conflict accelerated during the next stage, pre-industrial civilization, which started c.3000 B.C.E. Two new inventions especially distinguished this stage. First of all, metallurgy, provided new forms of wealth and

weapons with which to fight over that wealth. Writing helped people keep track of and amass larger amounts of wealth. More wealth led to wars of much greater intensity, frequency, and destructiveness. It also further reduced the status of women who had lost virtually all control over property by now.

The fourth stage, industrial society, started in Britain (c.1750) and has spread rapidly across the globe since then. This period has been especially marked by the rapid acceleration of technological growth. Unfortunately, this has been particularly true of military technology, which has increased the destructive power of warfare by several quantum leaps as seen in the two world wars that dominated the first half of the twentieth century. Ironically, the status of women has risen dramatically in industrial societies for two reasons. First, war as a viable option has been greatly reduced as its destructiveness has risen. Also, machines have reduced the need for or value of brute muscle, thus making women more competitive for jobs and opportunities, even in the military.

The challenges of modern society: the rubber bands stretched. Technology is a double-edged sword that has helped generate by far the highest standard of living and longest life expectancy in human existence. But the spiraling rate of technological growth over the past 200 years has created progressively greater stresses on the "rubber bands" holding human society together. This is because, compared to technological growth, all the other aspects of society (social structure, religion, morals, etc.) are much more dependent for their rates of change on cultural evolution which, as mentioned above, is very traditional and slow. This growing gap between the rates of technological change and that of other parts of society has created ever mounting stresses and strains, and continues to do so as technological growth continues to accelerate. These problems break down into three main categories.

First of all, most aspects of society, being more bounded by traditional rates of cultural change, cannot keep up with and adapt to the rate of technological growth. All too often, new technologies are introduced without studying or trying to anticipate their long-range effects. An example of this is the birth control pill introduced in

1960. The Pill did free women from being burdened with large numbers of children, which was the goal of its inventors. However, few, if any, people gave serious thought to how the Pill would change people's attitudes toward sex and marriage, or how that would affect the status of women and the raising of future generations of children.

A second problem lies in the unbelievable destructive power of modern weapons, in particular hydrogen bombs. Before the industrial revolution, the destructiveness of war was largely proportional to the number of men directly engaged in it, and the number of those men was largely determined by the relatively low productivity of the pre-industrial societies that had to support them over time. This put distinct limits on how long and destructive wars could be, thus giving societies time to recover. Modern warfare, however, is far less limited by such factors. A relatively few men can launch devastating destruction upon the planet totally out of proportion to their numbers. The technology of destruction has grown even faster than the technology of production, making total war as we understand it obsolete.

Finally, modern technology has transformed our economy from being mainly concerned with producing enough for everyone to being concerned with selling all it produces. This has spawned a pervasive culture of materialism and consumerism heavily influenced by advertising. Modern economies rely on more sales and consumption and sales to make the money to expand their production, which requires more consumption, and so on. Given the vastly larger population that is involved in this cycle and the ever growing levels of per capita consumption, there is no way the environment can support this level of growth.

Counter-balancing this fairly grim prospect for the future is the fact that we are an ingenious and adaptable species that could very well see itself through its technological adolescence. For example, during the Cold War the United States and Soviet Union did manage to avoid a catastrophic third world war. While we are not out of the woods yet, there is still hope while there are still some woods left for us.

How Other Animals See: Safety vs. 3D vision
Many animals, ranging from horses to bees, have their eyes positioned more to the sides of their heads. While this limits their depth perception, it does help them see if a predator, such as a lion or can of bug spray, is stalking them.

Comparative ranges of vision for a horse and a bee

Some fun facts about horse and bee vision:

- **Both a horse and bee have blind spots directly behind them, the bee's vision being blocked by its stinger.**
- **A horse can't see directly below its head, so that blind spot seems like a bottomless pit. It sees its shadow in a similar way, which is why horses shy away from their shadows.**
- **A horse must lower its head to see faraway objects.**
- **A horse must raise its head to see close objects.**
- **If an object is closer than 4 feet, the horse can't see it with its binocular vision.**
- **A grazing horse can see almost all the way around its body.**
- **A bee's spectral range of vision extends almost to ultraviolet light.**

The Prime Directive

One of the best expressions of the Rubber Band Theory was in the science fiction series *Star Trek*. Known as the Prime Directive, it stated that we should not interfere with cultures less

technologically developed than our own, because it would throw all other aspects of their cultures out of balance. In one episode, another civilization, somehow exposed to movies about the gangster culture of America in the 1920s, mimicked its superficial aspects in detail, with drastic impact on the rest of its culture.

Similarly, the sudden introduction of Western vaccines into topical and subtropical regions such as Africa may have temporarily relieved the misery caused by various tropical diseases. However, without the accompanying developments that the West experienced, such as gradually changing attitudes toward birth control, the result has been a massive population explosion that could lead to much more drastic results than the gradual effects of tropical diseases.

A POSSIBLE SCENARIO FOR HUMAN EVOLUTION

Introduction: Where to start? While human history is primarily concerned with cultural and technological evolution, we need to understand a possible scenario for the evolution of the biological characteristics that have served as the basis for the human species' other advances. Maybe a good starting point would be some 75,000,000 years ago. This is a mere drop in the bucket of time, but we have a long way to go before reaching anything closely resembling humans. We pick up our story with the lowly tree shrew.

The tree shrew, which appears quite similar to a mouse, hardly looks like anything we would like to call our ancestor. Yet scientists think this little creature was our connecting link with the lower forms of mammals. Converting this animal into a human would tax the skills of the most imaginative artist. It lacked binocular and color vision, upright posture, hands with opposable thumbs, a larger better-developed brain, and speech. In other words, it had none of the five characteristics that distinguish humans as a species. It also had to lose its tail, fur, and long snout.

The first critical step was moving into the trees away from intense competition on the ground. Life in the trees was more three-dimensional, involving accurately judging distances from branch to branch or else taking some nasty falls. This helped the development of binocular vision. Life in the trees also required hanging on to things to keep from falling. As a result, a primitive grasping hand started to evolve. Also, the more three-dimensional world of the trees required more awareness of things in *all* directions. This stimulated brain size and development.

Some 25,000,000 years later some tree shrews have evolved into the *prosimians*. These included the tarsier and ring-tailed lemur, which are often seen at the zoo and mistaken for monkeys. The prosimians resembled humans much more than the tree shrew, having binocular vision, shorter snouts, hands of a sort, and bigger brains. However, they still lacked erect posture and speech, while their brains, hands, and eyes fell far short of human standards. Some 40,000,000 years ago monkeys evolved from the prosimians. Although showing no obvious new developments toward human characteristics, they were more intelligent than prosimians and had better developed hands and eyes.

Next, we come to the apes, our closest cousins. Apes practiced one activity, tree swinging, that helped lead to human evolution in several ways. First of all, since tree swinging put the ape in an upright position, its head had to switch its position in order to see where it was going. A quadrupedal (four-legged) animal's head connects to the spine at the back of the skull. If we were to stand a dog on its hind legs, its head's normal position would have it looking straight up. The same was true for the still quadrupedal ape when it started tree swinging, making it more prone to crash into trees. Therefore, the ape's normal head position moved to connect to the spine at the base of the skull in order to adapt to this new tree swinging posture. This also paved the way for the later adaptation of erect posture that would free the hands for tool use. Speaking of the hands, tree swinging also led to more use and development of the hands giving apes better hand dexterity. The fairly rapid speeds at which apes swung also meant a lot of things came at them quickly and forced them to react quickly, thus leading to further brain development.

If apes had so much going for them, why did they not all evolve into humans? In general, one can say that evolution and natural selection are conservative and do not favor changes unless forced to by circumstances. This was especially the case with chimps, who had an easy niche in nature and felt no need to evolve. It was also true of gorillas whose great size let them stay pretty much the same. Timing was also important. Gibbons and orangutans were swinging in the trees for so long that their arms became over specialized for tree swinging and could not adapt well to life on the ground where our ancestors evolved. On the other hand, baboons came out of the trees too early and had not swung long enough to develop their upright posture. Thus they remained quadrupedal.

Out of the trees. Still, some three to five million years ago some apes did emerge from the trees into the African Savannah (grassland), and the question once again is *why*? The most likely answer is for food, and this is supported by the most plentiful and durable evidence we have from then: their teeth and jawbones. About this time their molars and jawbones got much bigger, suggesting they were eating lots of seeds and grains, which required massive jaws and molars to grind them up. This also meant that the canine teeth, their main defensive weapon in the harsh and dangerous Savannah, got in the way of chewing. Choosing between defense and eating, nature decided eating was more important and the canines were lost.

This of course created the problem of defense against predators. The solution seems to have been some sort of weapon. It was certainly nothing more than a stick, bone, or rock, but it apparently was effective. If it had not been effective we would not be here to talk about it. The importance of all this is that for the first time in the history of life on the planet, an animal was using a form of technology to extend its power dramatically and increase its chances of survival. The dawn of humans, or more properly, hominids had arrived.

The term *hominids* refers to modern humans (i.e., ourselves), our most direct ancestors, and collateral branches of our family tree that came to a dead end cousins, such as the Neanderthals. The earliest of these hominids, known as Australopithecines, lived from one to five million years ago. They were somewhat human in that they had better developed eyes, posture, hands, and brains than the apes. However, scientists do not generally call them humans because their brains were still much smaller than ours (about 450cc compared to around 1400cc for modern man). Their hands also had little or no precision grip, and they probably could not speak. Many see Australopithecines as the missing link between apes and humans.

There were several varieties of Australopithecines. The earliest, *Australopithecus Afarensis*, provided us with one of the most amazing discoveries in archaeology: forty percent of one skeleton. That may not sound like much, but it was unheard of to find that much of such an old skeleton intact. The scientist who found it, Donald Johansen, was so struck by this find that he even gave it the name Lucy after the Beatles song "Lucy in the Sky with Diamonds."

Australopithecus Afarensis was the likely ancestor of two other branches of Australopithecines. One branch, the larger in size, was vegetarian. The other branch ate both meat and plants. The importance of this is that hunting for meat required more inventiveness than did collecting vegetation. As a result, the meat eaters developed tools (possibly including containers for better gathering) and weapons much more than the vegetarians did.

Eventually the meat eating Australopithecines evolved into what many scientists call the first true humans, *Homo Habilis* ("handy man") with a brain capacity of 650cc. They used and made very crude tools, although they still could not speak. For that reason, other scientists reserve the honor of the first

humans for people known as *Homo Erectus* who had a brain capacity of some 750cc., which gave them the ability to speak.

Technological and cultural developments since the Australopithecines. A good deal of controversy surrounds the evolution of humans and their family tree. However, our evolution over the last million years has revolved increasingly around our technological and cultural innovations rather than biological changes. This is largely because on the one hand, biological changes are purely random, thus making evolution quite slow. However, technological and cultural changes are the products of more conscious and focused efforts to solve problems or create something. Therefore, such innovations happen at a much faster pace and accelerate the pace of change since they build upon previous efforts.

There were two main types of technological development our prehistoric ancestors came up with early on: flint tools and fire. Flint is unique among rocks because, when hit in the right way, it shatters, leaving very thin and razor-sharp pieces that can be worked into blades. Over time, as people spread to areas with little available flint or used up once plentiful supplies, they had to make more efficient use of this precious resource. At first, people were somewhat wasteful of it, maybe making only one hand ax out of a block of flint. It is estimated they got only 2-8 inches of blade for every pound of flint they used. Early Ice Age peoples came up with a method of knocking chips off of a piece of flint and using each chip for an ax or spearhead. As a result, they were able to get up to forty inches of blade per pound of flint. Their descendants would further refine this to get forty feet of blade per pound of flint.

Fire. Of all the things that our ancestors invented or mastered to protect themselves from the harshness of the physical environment, none was more important than fire. As the ancient Greek playwright Aeschylus wrote, it was the "brightness of fire that devises all" To the Greeks, it was the source of their crafts and civilization itself. It was what distinguished humans from the rest of the animal kingdom and gave them so much power; too much power as far as Zeus, king of the Greek gods was concerned.

The first people who mastered fire could use it, but probably not make it. As a result, they depended on natural sources such as volcanoes or forest fires caused by lightning for their fire. Considering

animals' natural fear of fire, we must admire the courage of that first individual who dared to pick up a burning ember and take it home. Once our ancestors had harnessed fire and found a way to keep it burning, they discovered some important uses for it.

The first use was probably for hunting and defense against wild animals, since it was obvious that animals feared fire. A common hunting technique would be to start a brush fire and use it to drive game toward other hunters or over a cliff. The value of fire for light and warmth soon became apparent, especially after our ancestors migrated out of Africa into the cooler climates of Europe and Asia. Fire could also harden sharpened sticks into better weapons. Finally, fire was useful for cooking food with several important results.

Cooked meat in particular held several advantages. The heat caused a chemical reaction that created proteins out of the amino acids in meat, thus making it more nutritious and leading to a healthier population. Fire also killed microbes in the meat, making it safer to eat. Finally, fire softened meat, making it possible for the very young and sick to chew it and thus be nourished. Altogether, cooking led to a healthier population that could grow and spread across the globe. We today are so concerned with overpopulation that we lose sight of how important and difficult it was to maintain a stable or growing population until very recently. Back then the average life expectancy was probably no more than twenty years, and half of all children died before the age of five. Thus extinction was a very real possibility. Cooking removed that possibility a bit.

The Ice Ages. Around 200,000 years ago, the planet started turning much colder. The cause of the ice ages is still unknown and subject of several theories including variations in the tilt of the earth's axis and its orbital path, continental drift, and clouds of cosmic dust blocking some of the sun's radiation. Whatever the cause or causes, glacial sheets of ice moved south, covering much of the Northern Hemisphere. Summertime temperatures in England probably reached no more than 50 degrees Fahrenheit. By the same token, winters were horribly cold.

Such harsh conditions forced important changes in our ancestors and the various other life forms then. Keep in mind that physical adaptations were not planned or conscious. Rather, natural selection just accelerated the process whereby genetic mutations

would be favored. What emerged was a whole new array of animals: giant cave bears, saber toothed cats, and woolly mammoths and rhinos to name a few. Our ancestors also went through some changes as well. Homo Erectus, as our prehistoric ancestors from then are called, had moved into cooler climates in search of game and living space. However, when the glaciers came, they were forced to adapt. What had been a fairly stagnant culture and species in stable conditions now changed at a relatively rapid rate. Even more rapid than their physical evolution was the evolution of their technology and culture.

Accelerated technological development. At this point, we see a cycle of technological development emerge to accelerate our evolution. Tool use stimulated brain development, which helped lead to more successful hunting and gathering. The improved diet and resulting brain development stimulated more tool development, better hunting, and so on. This basic feedback set in motion by hunting and tool use continued to repeat itself through the ages and is still at work today. Each new invention we come up with extends our power and also stimulates us to come up with more new inventions. This was a process that had started long before with the Australopithecines and continues now.

Speech. One of the effects of a bigger brain was the evolution of speech. This allowed both closer cooperation and more efficient sharing of information in such ventures as hunting. Therefore, each generation could easily learn the skills its ancestors had developed and perfected over the years instead of spending most of its time re-discovering them. This stimulated more brain development and ability to speak, encouraging more cooperation and sharing of knowledge, and so on. This feedback also fed back into and further accelerated the previous cycle of technological development, stimulating more sophisticated speech, etc.

However, there were severe limits to early humans' speech. For one thing, their pharynx, or voice box, did not drop enough to allow the full range of sounds we are accustomed to making now. As a result, their physical ability to speak was only about one-tenth of ours in terms of the sounds they could make and the speed at which they could make them. Their mental ability to speak was also severely limited. It takes a brain capacity of about 750cc to reach the ability to speak. Babies today reach that threshold between one and two years of age. Many

prehistoric humans may never have reached that capacity. Or if they did reach the threshold of speech, they probably reached it much later in life than children today do. Combining that with their short life spans, prehistoric peoples had little time to develop anything profound to say, greatly impeding cultural and technological progress for a million years or so.

Better hunting and gathering technology. The Ice Ages also reduced the amount of vegetation available for gathering, thus increasing our ancestors' reliance on hunting and develop more powerful weapons. When a better ability to speak combined with the process of each invention stimulating ideas for even more new inventions, a dramatic leap in technology and culture also took place. By 10,000 B.C.E., our ancestors, known as Cro Magnon but essentially Homo Sapiens Sapiens (i.e., ourselves) in a primitive setting, had learned to use other materials, notably wood, bone, and antler, in combination with flint, thus vastly expanding their range of tools and weapons compared to the crude and limited tool kit of the earliest hominids:

- **the use of bone, antler, and ivory** for making tools that flint was unsuited for;
- **sewing needles** that led to warmer, better fitting clothes;
- **the spear** which both extended the range and power of the hunter as a throwing weapon while maintaining a safe distance from dangerous animals when used as a hand held weapon;
- **barbed and grooved spearheads**, which, being more deadly, led to better hunting;
- **the bolo** for tripping up game;
- **the ability to make fire**, giving them a stable source of warmth;
- **grooved air channels** under the fire which led to hotter fires (which would lead to fired ceramics, which led to pottery and the kiln, and eventually to the furnace for smelting metals with all their contributions to civilization);
- **flint sickles**, with bone or wood handles that led to better gathering and a healthier population;
- **the burin**, the first tool for making other tools;
- **woven baskets**, which also led to better gathering and more food;
- **fishing** with spears, nets, and gorges (a type of hook), which led to a more stable food supply; and
- **crude shelters**, built at first as wind breaks in the entrances of caves, and later as free-standing structures

Looking at all these inventions, Cro Magnons seem to tower over their ancestors, much as we see ourselves towering above them. This is deceptive,

however, because we are building on what our ancestors built. Without the accomplishments of Cro Magnon and those who went before them, our own civilization could never have evolved.

All these new advances had profound implications for the future. For one thing, our ancestors' larger brains would help lead to the development of the human family. Secondly, increasingly efficient hunting, gathering, and fishing made possible a more settled lifestyle, giving people time and opportunities to notice certain things around them, in particular the way seeds grow into plants. This revelation was the basis for the next great step in human evolution, the food producing revolution, or agriculture. Finally, better brain development and technology inspired and made possible new activities and behaviors that make the Cro Magnons seem much more modern to us.

Our ancestors' behavior over the last 100,000 years or so also shows a much higher degree of intelligence than ever before. For example, they seem to have first realized the inevitability of death and created a religion to prepare for it. We have found people buried facing east and west, and also with the pollen of flowers in their graves. Our ancestors apparently worshipped the spirits of cave bears with whom they competed for living space. One Neanderthal cave has the skulls of some eighty bears arranged around it.

Prehistoric people also seem to have cared for their sick and infirm as evidenced by the skeleton of one man who lived to about forty years of age (old for back then) with the use of only one arm. They also apparently practiced female infanticide (killing female babies) as a form of population control. This is a comment not so much on our ancestors' brutal nature as on the brutal conditions they had to deal with in order to survive. Not practicing such a measure might have meant extinction for the whole tribe or species.

Cro Magnons seem more modern to us culturally as well, especially in their art. In southern France and Spain they left a number of cave paintings that are amazing for their artistic touch and sensitivity. These paintings depict the various animals people then hunted. Their function may have been some sort of sympathetic magic in which portraying a successful hunt would cause a successful hunt. Whatever their purpose, these paintings are striking in the way they depict these animals in motion. They also can make us feel much more akin to these people we call our ancestors.

All in the Family: Acting Like Baboons
Since hunting and gathering societies have largely vanished from the savannah, anthropologists study the lives of another closely related primate, baboons, to get clues about our own early social development.

The first thing to keep in mind about this environment is that it is a harsh and dangerous place to live. Therefore, since individual baboons, like humans, are not particularly large or fierce compared to predatory lions who hunt them for lunch, they must rely on the safety of numbers to survive, traveling in troupes of 12-15 individuals.

Of course, any other behaviors that reinforce a group mentality and action are also reinforced, such as grooming one another to tighten social bonds and reduce interpersonal tensions (below). More importantly, there is a strong mother-child bond. And, just as the child depends on the mother for protection, the mother depends on the father and other males for protection. The point here is that human mating habits, gender roles, and family structure are heavily influenced on a primal need to act as a social species.

When Did We Start Talking?

While we don't have actual specimens of hominid brains to tell us when they developed speech, there are some clues. One is the size of their skulls, although that tells us nothing about how their brains were organized. There is also the inside of those skulls. As our ancestors' brains developed and expanded, so did their skulls. Therefore, looking at the parts of the skull next to the parietal lobe, which controls speech as well as hand-eye coordination, paleontologists can get some idea of when speech developed. Another clue comes from the sophistication of the flint tools we find, since the center of the brain linked to hand-eye coordination is also located in the parietal lobe. The logic runs like this: the more sophisticated the flint tools, the more developed the

parietal lobe and with it the ability to speak.

These abilities are also linked to hemispheric brain development, as exhibited by most people being right-handed. Evidence of how we can tell when our ancestors became mostly right-handed lies in scrape marks on Neanderthal teeth. It seems they had a habit of stuffing as much meat in their mouths as possible and cutting off the rest with flint blades. Many Neanderthal teeth exhibit scrape marks from this practice, the vast majority being from upper left to lower right, the direction they would scrape their teeth if they were right-handed.

Our "Stupid" Ancestors

In 1908, the French paleontologist, Marcellin Boule, published an article ejecting Neanderthals from our family tree. He also commissioned an illustration of a Neanderthal, portraying it as dumb and brutish, being excessively hairy and having opposable toes. For decades, our impression of prehistoric ancestors was dominated by Boule's stereotype of Neanderthals, when, in fact, they had brains as large as ours (although maybe not as organized) and were highly intelligent.

Recent Neanderthal reconstructions indicate that, if dressed in a modern business suit, he would more or less fit into today's society.

How Long Did Our Ancestors Live?

Choose your poison. Calculating life expectancies for our ancestors is always tricky, although it's pretty safe to say they were significantly lower than now. We know that infant mortality was very high, with maybe one third to one half of all babies not surviving the first year and many young children also succumbing to "childhood" diseases. Similarly, the very act of childbirth may have killed one in ten women. (My own grandmother fell into that category in 1915.) Just think of the ripple effect. Any woman who has delivered a

child by caesarian very likely would not have survived to have more children. Those children would not have even existed to have children of their own, and so on.

Having no concept of germs and hygiene, the slightest infections might prove to be fatal as well. Eating spoiled meat (much more likely without refrigeration) could kill you. So could an untended broken limb that festered into gangrene. With no vaccines or antibiotics, all sorts of diseases we today only know as exotic names could decimate whole populations. (Anyone who has played the computer game *Oregon Trail* has probably died at least once just from scarlet fever.)

Then, of course there was the occasional wild animal that might eat you or the cliff without a guardrail or warning sign you might fall off to your doom while chasing after your dinner. Studies show that high-risk activities, such as hunting large dangerous animals like bears, led to injuries most closely resembling those of rodeo riders today, the largest percentage being injuries to the head and neck. This makes the advanced age of forty years for a one armed man taken care of by his comrades seem less remarkable, since he was probably spared such dangerous tasks as hunting bears or riding in rodeos.

So what were life expectancies? While the figure of thirty years gets thrown around a lot, there are two bits of evidence that make me think it could be significantly lower. Research at an Indian burial mound at Dixon Mounds, Illinois gives an average life expectancy of seventeen years. The same figure has been quoted for the working class in early industrial cities. However, these figures need to be qualified. For one thing, high rates of infant and child mortality bring down the average. Therefore, if you survived childhood, you could probably expect to live into your

thirties or forties. And there have always been those rare individuals lucky and tough enough to live into their eighties or nineties.

Social class would be another variable. For example, while the industrial working class referred to earlier had an average life expectancy of seventeen, the rich had an average of twice that. After all, they had more fresh meat and protein in their diets, and could afford to throw away spoiled food that the poor would still eat. They probably also had cleaner water, and could afford more medical care, for whatever that was worth before germ theory came along in the 1860s. When reading about kings and emperors, I always make a mental note of their ages when they died, and it typically seems to be somewhere in their fifties, thus ten to twenty years longer than their serfs out in the fields. While a statistically valid study might adjust these figures some, I feel confident that the story would remain the same: the rich lived longer than the poor.

Surprisingly, in addition to herbal cures, many of which did relieve at least the symptoms of a malady, there was even a prehistoric form of brain surgery known as trepanning, where the “surgeon” would drill a hole in the skull to clean head wounds. People apparently believed such treatment could also cure epilepsy migraines, and mental disorders. Pieces of the skull taken out would be worn as charms.

[Back to flowchart](#)

A POSSIBLE SCENARIO FOR THE EVOLUTION OF THE HUMAN FAMILY AND GENDER ROLES

The dramatic physical changes our ancestors experienced also triggered equally significant social changes that led to the evolution of the most basic social unit of our species: the family. There were two likely lines of development converging to create the family.

First, as our ancestors moved out of the trees into the savannah in search of grains and grasses, they occasionally came across a carcass that they would pick clean for the meat. This casual scavenging gave them a taste for meat that developed into more intentional hunting. With the females tied down by noisy children, the males were generally the only ones free to hunt. Meanwhile the females and children would gather edible plants. Most likely, hunting was rarely successful, providing only about 10-20% of the food our ancestors ate, although the meat did provide valuable protein. The need to supplement the usually meager returns on their hunting may give us another clue as to why the males kept returning to the rest of the group. This pattern of food sharing created bonds vital to the evolution of the family.

Another development had to do with the evolution of a large brain and head which made the birthing process for humans more difficult. As a result, nature compensated by having human babies come to full term prematurely, making them one of the most helpless animals at birth in all of nature. This greatly increased and prolonged children's dependence on their mothers, who in turn needed protection and help getting food, especially in the harsh environment of the savannah.

The question is: why did males keep returning to the females and children? According to one theory, the answer lies in the evolution of year round mating in females to replace the seasonal estrus cycle that occurs in most mammals. The females who developed this pattern (by a purely random mutation) were better able to attract males to help them with food gathering and protection. As a result, more of their children survived to pass this characteristic on to future generations until it became the prevailing trait in humans.

Over time, these factors (year-round mating and food sharing) created permanent bonds that we have come to know as the family. Strengthening these

bonds were two other factors. One was the added companionship and security of family life. We know, for example, that our prehistoric ancestors would feed and care for crippled members of their group despite their inability to contribute significantly to everyone else's survival. Secondly, there was the emotional satisfaction that children gave their parents in terms of companionship, care in old age, and as an extension of themselves.

Gender differences in the species. For centuries there has been a controversy over the source of differences in male and female behavior and values within our species. Oftentimes described as the "Nature vs. Nurture" debate, it focuses on whether differences between men and women are the result of genetic or environmental factors. Coming largely from the Women's Movement in the 1970s, the pendulum swung heavily to the side of nurture, the assumption being that aggressive tendencies in boys were the result of cultural factors and upbringing. The hope and belief was that if boys could be raised in an environment that didn't stress aggression and violence, they would be no more aggressive than girls. Unfortunately, more recent research shows things are not quite that simple. While the environment is important in determining the way aggression is channeled, there are also inherent genetic factors influencing the equation. Testosterone levels in an individual are one factor. How men's and women's brains are structured is another. This may be the result of the hunting and gathering lifestyle our ancestors followed for the vast majority of our species' existence and the different roles men and women played in it.

For men, who did the hunting, stalking and waiting for game required two main mental abilities: staying focused on one goal for long periods of time and keeping quiet during that prolonged period of waiting. This discouraged verbal socializing that could scare off any game. Nature would favor males whose brains were adapted to these qualities by awarding them successful hunts while killing off the more chatty ones through unsuccessful hunting and starvation.

Women, who performed very different tasks, required very different qualities. While looking for and gathering any edible vegetation, they also had to keep track of several children and look out for predators. Unlike men, who had to stay quiet, those women who cooperated with one another (especially in looking out for one another's children) and communicated verbally would be much more successful than women who operated

quietly and independently of one another. For one thing, the sound of a number of women talking might be enough to scare off potential predators. Such cooperation and communication would also create strong social bonds between the women, providing much of the glue that has kept societies together down through the ages. And just as nature would favor men with brains adapted to focus quietly on one goal, it would favor women whose brains were more adapted to verbal socializing and keeping track of several things at once.

Indeed, recent research has shown that men and women's brains are largely structured in those ways. Women will typically use five times as many words in a situation as men will. Also, while men will listen with just one side of their brains, women will use both sides, indicating more of a talent for multi-tasking. However, there is evidence that men are at times more talkative than women, in the situations described above (women among Along these lines, it is important to note that these are general, not absolute, tendencies in men and women. Within each gender there is a wide range of differences between individuals, thus creating a large gray area that one certainly could not describe as absolutely male or female. Thus one should not use these general tendencies as supporting a "biology is destiny" argument for locking men and women into certain rigid roles. By the same token, these are tendencies we cannot afford to ignore in discussing issues of gender differences.

Nature vs. Nurture and Man vs. Pigeon

A good reference point from which to start a discussion on gender roles is the Taoist symbol for Yin and Yang (below). Yin (the dark field) represents stereotypical "female" qualities: shaded, cool, and passive. Yang (the white field) stands for stereotypical "male" qualities: sunlit, warm, and active.

However, the line separating the two is not a distinct straight line, but a curving one that makes the two seem to blend together. Also, there's a white dot in the dark field and a dark

one in the white field, indicating there's always a bit of yin in the yang and a bit of yang in the yin.

By the same token, when talking about men and women, we have to keep in mind that we are dealing at most with general trends instead of absolutes. On the hormonal level, all men have some of the female hormone, estrogen, and all women have some of the male hormone, testosterone. Thus a woman can be an aggressive athlete and still be "feminine" and a man can be nurturing toward children without losing his "masculinity".

Much of the debate throughout the centuries has been whether we are products of natural abilities we were born with or just products of our environment. Through most of history, the assumption was that men simply had abilities that were both different and superior to those of women.

However, starting in the late 1600s philosophers such as John Locke and Helvetius claimed we were "blank slates" at birth and therefore mainly products of our environment.

Playing off this idea, an Englishman, Jeremy Bentham, came up with a philosophy known as Utilitarianism, claiming that if we provide a perfect environment for people, it will create perfect humans. Thus Bentham advocated a wide range of reforms

affecting everything from postal services to prisons.

Bentham even claimed he could use calculus to quantify how much pleasure someone got from a particular experience.

However, in the 1800s experiments on peas by an Austrian monk, Gregor Mendel, led to the field of genetics, which swung the pendulum back toward the idea that everyone's own innate personalities and abilities are determined by our genes.

In the 20th century, the pendulum swung back again toward the "nurture" side of the argument. This was based largely on the work of B. F. Skinner who did experiments on rats and pigeons, using positive reinforcement to encourage them to learn various tasks such as finding their way through a maze at the end of which was a reward in the form of food.

(Note: the author once lost a game of tic-tac-toe to a pigeon trained in this manner. Not surprisingly, there is no love lost between the author and these creatures.)

Skinner's work especially resonated in the 1970s with advocates of the Women's Liberation Movement, since it seemed to minimize any innate differences between men and women. Therefore, much in the spirit of Jeremy Bentham's Utilitarianism, the idea emerged that if boys and girls were raised in a gender-neutral environment, boys would be less aggressive and violent and girls would be more assertive in traditional "male" environments, such as the classroom and workplace.

However, the pendulum has been swinging back toward the nature argument. Recent scientific research shows significant differences in men and women's brain structures. These differences affect such things as motor and spatial skills, how we communicate with each other, and the incidence of learning disabilities. Many of the differences stem from the introduction of large amounts of testosterone into a male fetus, which helps explain some statistical differences in brain function between the two gender-groups.

Therefore, I'm reminded of the story of a former student's cousin whose mother only let him play with non-aggressive and non-military toys. Then one day she came in to find he had torn off the heads of dolls to use as hand-grenades and was using the bodies as guns.

Wherever one stands on the nature vs. nurture issue, since World War II the sexes have moved closer to one another in a variety of ways such as unisex bathrooms and in clothing that is generally seen as appropriate for both men and women. However, the attitude toward gender-neutral childcare still has a political edge to it, with some people claiming it could undermine the moral fabric of our society.

For the time being, the jury is still out concerning where the balance between nature and nurture lies.

In the meantime, even if we men are pigs, at least we're not pigeons.

Housewife Syndrome

In the 1950s, as more and more Americans moved into their own houses in the suburbs, a new phenomenon emerged known as housewife syndrome: a feeling of despair among young housewives and mothers who found themselves isolated and trapped in their single family homes with the children while their husbands took the family cars to work. What so many women may have been missing for the first time was the social bonding and communal sharing of childcare that had made women's lives tolerable throughout history. In the 1970s, the Women's Liberation movement would help many women attempt to fill this void in other ways, especially with professional careers. Meanwhile, some stay-at-home mothers formed support groups where they could bring their children (who would be kept occupied by playing with each other) while socializing with each other, largely recreating the environment that had helped keep their ancestors sane.

Killer Pigeons as pigeon missiles

B.F. Skinner's work with pigeons took an unusual turn in the 1940s. During World War II missiles, such as the German V-2, could be programmed to hit stationary targets. However, finding and hitting moving targets, in particular battleships, was another matter. Building on his research with pigeons, B. F. Skinner pitched an idea called Project Orcon using trained pigeons to guide the missiles. The pigeons would be pre-trained to peck at pictures of the chosen target, getting a treat only when they hit the photograph directly. Eventually, they became so good at their job that they

could even follow a moving target, engaged in a feeding frenzy of pecking the whole time they could see it.

Being sufficiently trained, three pigeons would be stuffed into the nose of a rocket at 120° from one another to give a 360° view of their surroundings. A series of reflectors inside the nosecone gave the pigeons a view outside of the missile. The reflectors were hinged so that the pecking would alter their orientation and cause the missile to shift in the direction of the target. Skinner received \$25,000 for the experiment, which was initially successful. However, improved electronic guidance put an end to the project.

In the 1970s, the U.S. Coast Guard conducted a similar experiment, this time for search-and-rescue missions. Conditioned by stimulus-response training, whenever they saw the desired target pigeons would go into a feeding frenzy and peck at the screen, which had sensors that turned the helicopter in that direction. The pigeons' success rate was 93% compared to only 38% for humans, partly because they didn't get bored from hours of staring at the featureless vastness of the ocean. The project was abandoned in 1983, however, because it had the unfortunate side effect of causing helicopters to crash into one another.

4. THE BIRTH OF AGRICULTURE (c.8000 B.C.E.)

"Cursed is the ground for your sake; in sorrow shall you eat of it all the days of your life. Thorns also and thistles shall it bring forth to you; and you shall eat the herb of the field. In the sweat of your face shall you eat bread till you return to the ground; for out of it were you taken; for dust you are, and unto dust you shall return." (Genesis)

Introduction. Some 10,000 years ago, only 5-10,000,000 people inhabited the planet, certainly no more. Our ancestors' technology had taken them a long way, but they still lived as part of nature, not in any way as its master. They did not realize it, but the last one per cent of our existence so far would see unbelievable changes sweep across the planet and change its face forever. Humanity stood on the verge of over-running the earth with vast numbers of its species. Supporting those vast numbers was possibly the greatest revolution in our history: agriculture, the ability for people to produce their own food supply. The agricultural revolution had two parts: the domestication of plants and the domestication of livestock.

Why Eurasia and Mesopotamia? Starting with the birth of agriculture most of history's major developments have taken place in the vast land mass known as Eurasia and extending across the Mediterranean and North Africa. Europeans who dominated the globe in the late 1800s and early 1900s claimed religious, cultural, and even biological superiority as the basis for their predominance. While such ideas hold little favor today, there still remains the question of why Asia and Europe have held central place in the history of civilization. Much of the answer probably rests in geographic and biological factors.

The underlying factor is that Eurasia lies along an East-West axis in mostly temperate zones. In contrast, Africa and the Americas are oriented from north to south and thus straddle a variety of climates. As a result, crops found in Eurasia are more adapted to the same diseases, climate, and seasonal variations in sunlight (which determine when plants germinate, flower, and bear fruit). Therefore, domesticated crops and intensive agriculture can spread more rapidly across Eurasia than they can across the vastly different climactic zones in Africa and the Americas. For example,

because of intervening tropical zones, the cultivation of corn in the Temperate Zone of Mexico in the northern hemisphere never spread to Peru in the southern hemisphere until after 1500 when Europeans conquered both regions. Similarly, crops adapted for temperate zones in northern parts of Africa did not reach the southern tip of Africa until Dutch settlers introduced them in the 1600s.

Of course, there are also topographical and even climactic barriers within Eurasia, such as the Tibetan Plateau, Himalayan Mountains, and Asian steppes isolating East Asia from the rest of Eurasia. Therefore, agriculture probably developed independently in China and spread from there to Southeast Asia, Korea, and Japan. However, despite topographical barriers, the similar climates of East Asia and the western half of Eurasia ultimately allowed crop sharing in both directions, thus helping both civilizations advance more quickly.

Why Mesopotamia? More specifically, it was Mesopotamia (modern Iraq) where agriculture first evolved in Eurasia and then spread westward across North Africa and Europe and eastward to the Indus River Valley. Environmental factors favored this specific region as the birthplace of agriculture. First of all, Mesopotamia, and the Middle East in general, have cool rainy winters and hot dry summers, encouraging plants, especially cereals, to develop large seeds for rapid growth in the limited growing season. This produces relatively small plants without woody stems, which, in turn leads to cereals with lots of large seeds (i.e., more food) that are easy to harvest (without woody stems).

Another factor is that Mesopotamia has many self-pollinating crops (six of them exclusive to that area) that can reproduce without pollination with other plants. The importance here is that recessive traits that are vital to farming but harmful to the plant in nature do not get bred out of the plant through cross-pollination. For example, along with the dominant trait for grains and pea pods to shatter in order to spread their seeds is a recessive trait for a few plants not to shatter. This made it easier for people to harvest them, plant more of them next season, and spread the varieties with the normally harmful tendency not to shatter.

Along with the spread of agriculture from Mesopotamia, other ideas and technologies could spread as well, leading to the relatively rapid

development and spread of civilization across Eurasia compared to other regions of the globe whose environments prevented or greatly slowed down such exchanges. And, of course, after the impetus started by Mesopotamia, the exchange of new ideas became two-way, further accelerating the rise and spread of civilization in Eurasia.

The invention of agriculture. In addition to factors unique to Mesopotamia, two other converging factors led to the domestication of plants. First, better hunting and gathering technology provided a more stable food supply. Second, warmer and wetter conditions in the Near East at the end of the last Ice Age about 10,000 years ago led to the spread of cereal grains. Together these provided more stable food supplies that allowed people to settle down in more permanent villages. These villages produced two very different effects that together helped lead to the discovery and triumph of agriculture.

One was a growing population that needed more food than the hunting and gathering lifestyle could supply. This may have been partly due to earlier weaning of the young. Since women in hunting and gathering societies were always on the move, they could deal with only one highly dependent child at a time. Therefore, so they have only one small child to carry at a time, they would nurse their young up to age four to interrupt their fertility until their youngest child was less dependent on the mother. More settled village life made such strict birth control less mandatory, allowing earlier weaning and a higher birth rate as a result.

Settled village life also gave people the opportunity to watch seeds in one place for a long time and notice how seeds grow into plants. Exactly how and when this happened is not known, but women probably made this discovery since they gathered the seeds and had more opportunity to notice how they sprouted and grew. Possible scenarios of this discovery include seeds spilled near camp or a wet grain supply sprouting and growing. However it happened, the realization of the potential of this discovery was probably gradual.

So was the transition to a completely settled agricultural lifestyle. While later civilizations would see agriculture as a gift of the gods, hunting and gathering peoples, such as the early Hebrews quoted above, saw it as a curse since it involved much more work and went against the traditional

ways of life they had followed for countless generations. Whereas tradition today is generally shoved aside and scorned, we should keep in mind that until very recently, it was a major force in people's lives. They did not take change so lightly as we do since it disrupted the fragile stability of their lives. So the question arises as to why did people turn to farming.

The most likely explanation was they had to. For a long time after the discovery of agriculture, people continued to follow a hunting and gathering lifestyle mixed in with some casual agriculture, such as scattering seeds along a riverbank or in a field and coming back in a few months to harvest it. This did improve the food supply, and dramatically increased the number of people that could be supported. Even the primitive agriculture practiced then could support up to fifty times more people than hunting and gathering could. However, those extra people put a growing strain on the natural environment's ability to feed them. One solution was to expand the agriculture. Of course, that led to more food and more population, causing even more strain on the natural food supply and leading to further expansion of the agriculture. In time, both men and women had to devote more and more time to tending the crops and less time to their traditional hunting and gathering ways. Eventually, they settled down and became full-time farmers.

Settled agricultural life had dramatic effects on human society and the environment. First of all, farming required less cooperation and sharing than hunting and gathering did. Before, all members of a tribe had to hunt together and share the results. Since there was no private property or anything to fight over, hunting and gathering societies were (and still are) relatively peaceful and harmonious. In contrast, agriculture allowed individual families to farm their own lands. As a result, private property evolved which led to social classes and more conflict in society between rich and poor.

New agricultural techniques, which replaced the more primitive slash and burn agriculture, also had their effects. The two-field system, which left one field fallow each year to replenish the soil, and crop rotation, which used different crops to take different nutrients out of the soil, reduced soil exhaustion. Both of these, combined with one other technique, irrigation, also created a surplus of grain and the need for a high degree of organization and cooperation. That surplus and level of organization

in turn would lead to the rise of the first cities and civilizations with specialized crafts and technologies such as writing and metallurgy.

In the process of farming, our ancestors also inadvertently disrupted natural selection. There were two varieties of wheat they collected on the hillsides of the Near East. The dominant type shattered upon the slightest touch, scattering the seeds so the species could spread and survive. The other, recessive type, did not scatter its seeds so easily, and thus was harder to find. However, it was easier to harvest since the seeds did not scatter. As a result, a higher proportion of this variety was collected and planted than occurred in nature. With each succeeding year a higher proportion of the non-scattering wheat was harvested and planted. Natural selection had been reversed.

Fun Food Facts

An overwhelming advantage. Of the eight most important agricultural crops in the eastern hemisphere, einkorn wheat, emmer wheat, barley, lentils, peas, chickpeas, rice, and flax, only rice, flax and barley, occurred naturally outside the Fertile Crescent and Anatolia (modern Turkey).

Wild grains provided fifty times more calories than were needed to harvest them.

Rice power. Using traditional methods, a typical rice crop would yield one hundred times as much as was planted, compared to as little as a 2:1 seed to grain ratio of wheat and barley in early medieval Europe. Along with maize and potatoes from the Americas, rice also provides many more calories than wheat and barley. No wonder the populations of South and East Asia have outnumbered those of other civilizations throughout history.

A Chain Reaction of Technology From Pottery & Kilns to the Wheel & Metallurgy
Nowhere is the ripple effect of expanding technology better shown than in how agriculture and settled life led to the wheel and metallurgy,

two of the primary foundation stones of modern technology.

This story actually begins with the mastery of fire in the Paleolithic era, long before the discovery of agriculture. As we have seen, campfires provided heat, light, and defense. They also inadvertently fired any bits of clay in the fire pit. This gave people the idea of purposely firing handmade clay figurines and pottery to make them more durable. This, in turn, led to the realization that hotter fires did a better job of firing clay. Therefore people started building permanent structures (made possible by settled agriculture) to enclose fires and contain their heat. Further experiments showed that small openings in these primitive ovens maximized airflow, creating even hotter fires and the basis for the pottery kiln.

Settled agriculture also made it possible to produce and amass large amounts of pottery for trade, since people no longer had to carry everything they owned as in a mobile hunting and gathering lifestyle. To make pottery more interesting and appealing to customers (especially if there were other potters competing for business), they started decorating their ceramics with pigments made from different minerals. One such mineral was copper oxide, which produced a red color when fired. Firing also inadvertently melted the copper, leaving copper beads in the ashes. This would lead to metallurgy and all the technologies upon which civilization has become increasingly dependent.

The desire and/or need to make more pottery also led to a faster way to turn the pots: the pottery wheel. Not only did that speed up the process of making pottery. It also made it more perfectly circular and regular, thus making

it possible to seal pots with lids that helped keep out bugs and preserve grain supplies, which in turn made for a larger and cleaner food supply and healthier population.

Very likely, the pottery wheel gave someone the idea of turning two such devices on their sides and connecting their centers with an axle. Thus was born the wheel, which would have, and still has, untold profound effects upon civilization.

THE DOMESTICATION OF LIVESTOCK AND ITS EFFECTS

About the same time as the invention of agriculture (c.8000 BC) another revolution occurred: the taming of wild animals for domestic use. As with agriculture, the more settled lifestyle that better hunting and gathering allowed at the end of the last Ice Age was important, because it gave people the time and opportunity to keep and domesticate animals.

However, while animals of many different species have been tamed and kept as pets by humans, only a very few have been big enough (100 pounds or more) to be useful as sources of food and labor while meeting three basic criteria for true domestication. First, they must be herbivorous (plant eaters) and fast growing so they use up a minimum of our food resources and quickly become useful to us as a food source. Herbivores directly convert the plants they eat into meat, while carnivores require at least one extra level (i.e., other animals) in the food chain to survive. Therefore, pound for pound, it will take up to ten times as much plant nutrition to raise and support a carnivore as it does to for an herbivore.

Secondly, animals suitable for domestication should live in herds or packs with a strict social hierarchy of which humans can assume leadership. The third criterion for domestication is that animals must be easy to tame and willing to breed in captivity. This also rules out most carnivores, who are typically aggressive hunters and less easily domesticated than herbivores. An obvious exception is dogs who, being relatively small, must hunt cooperatively in packs, making them more social and easy to domesticate.

As with agricultural plants, what few animal species that are suitable for domestication are found predominantly in Eurasia and especially in what we call the Middle East of the Fertile Crescent. There were five such animals: sheep, goats, cows, pigs, and horses. The first two of these to be domesticated were sheep and goats, largely because they were the most docile and easy to tame. Sheep provided meat, milk, and fur. They also were *ruminants*, which meant they could digest the cellulose from grass, thus making previously useless land (e.g., rocky hillsides) useful.

As with plants, our ancestors also tampered with natural selection, using selective breeding to produce animals that were fat, meaty, slow, and

with long wool rather than fur that is shed seasonally, qualities that are useful for us but normally harmful to a species in the wild. Eventually, this process would produce sheep and goats that differed considerably from their cousins in nature.

The next animal domesticated was the pig (c.7000 BC). Unlike sheep and goats, the pig was not a ruminant and providing no milk or fur. However, pigs did provide meat and, being scavengers, had several advantages. Whether scavenging in the local woods or city streets, they were cheap to keep. They also needed little or no supervision, making them easy to keep compared to flocks of sheep and goats that needed constant shepherding. Finally, until very recently, towns and cities rarely had proper sanitation facilities, making them extremely unclean and unhealthy. Pigs scavenging in the streets helped keep them a little cleaner. In fact, many towns had laws protecting them, despite their mean dispositions and occasional habit of attacking children.

Cattle were next (c.6500 BC), which gave milk, meat, hides, and could eat grass. However, they were bigger, wilder, and tougher to tame than sheep, goats, and pigs, causing some civilizations, such as the Minoans on Crete, to see the bull as a symbol of power. Probably the most innovative use for the cow was to hitch it up to a plow, tapping a non-human energy source that increased the power at our disposal and the amount of land under cultivation many times over. However, the earliest farmers hitched the plow up to the cow's horns, not the most efficient use of its power.

Somewhat later (c.3000 BC), horses were domesticated with three far-reaching effects. First of all, they could be used as a source of labor like cattle although their full potential wouldn't be tapped until the invention of the horse-collar in China by 200 B.C.E., which pulled from the chest rather than the neck. Secondly, mounted warfare made armies much more mobile, dangerous, and destructive. This was especially true of nomadic horsemen who would occasionally be the scourge of richer and more sedentary civilizations. Finally, mounted messengers dramatically quickened communications, making it possible to keep in touch with and rule much larger empires.

Agriculture and domestication of animals created two basic types of lifestyle: settled farmers tending their crops and livestock in the richer farmlands, and nomads wandering with their herds of sheep,

goats, and horses across the dry grasslands on the fringes of civilization. As we shall see, these two ways of life, nomads and farmers, have clashed repeatedly throughout history. We shall also see how the infectious diseases domesticated herds of animals carried would play a critical role in Eurasia's dominance of the planet.

Learning to Ride the Horse

The best evidence for the domestication of the horse points to Kazakhstan in Central Asia between 4000-3000 B.C.E. There is some disagreement about whether it was first ridden or used to pull a chariot, cart, or plow. The survival of horse bits at first indicates they were ridden, although a bit could be used to lead a horse pulling a plow or cart. Supposedly one problem with riding the horse was breeding it up to size where it could easily support the weight of a man. Another problem was learning where to ride it. Riding the smaller donkey had previously dictated riding on its rump, since its back could not support the weight of a man. Therefore, early depictions of horsemen, such as the bronze relief of Assyrian cavalry below, show them precariously perched on the horses' rumps rather than in the safer small of their backs without saddles or stirrups to stabilize them. As a result, they had to be led by attendants on foot, thus neutralizing the advantage of mobility horses normally provide. However, at this early time, the relative size of the horse and man together probably provided an initial psychological edge against enemies not used to such a sight. Such was the case with the Aztecs when they first encountered Spanish cavalry.

Camels in America?

Originally, the Americas had horses and camels, but they were hunted to extinction about 13,000 years ago. Camels made a brief re-entry into North America in the mid 1800s after the U.S.-Mexican War. The U.S. government brought over a bunch of camels and Arab camel drivers to run caravans across the newly acquired

desert Southwest. Unfortunately the camel drivers felt homesick and soon went home. Stuck with a bunch of camels, the government turned them loose in Arizona where they roamed freely for half a century before dying out. There is still a law on the books in Arizona forbidding railroad passengers from shooting at camels.

THE RISE OF CITIES AND HYDRAULIC CIVILIZATIONS (c.8000-3000 B.C.E.)

Introduction: the first cities. Imagine yourself a desert nomad wandering from oasis to oasis with your herd of sheep in the Near East. All you have known is people like yourself living much as you do in tents or under the stars. One day, in your travels you spot what appears to be a mountain off in the distance. In the flat desert plains that seems amazing enough. However, as you approach the mountain, you are even more astounded by its regular pyramidal shape and bright colors. Also, it is surrounded by other rectangular structures, massive towers interspersed with gates teeming with more people than you ever imagined possible. You wander inside the city and your head is spinning from all the hustle and bustle of the market place, the warriors shining brilliantly with bronze armor and weapons, row upon row of mud brick houses, and, towering over everything, that pyramid.

To a nomad, first encountering an ancient city must have been much like walking into a science fiction movie, only more incredible. After all, we have cities on which to base our concepts of science fiction movies. The nomad really had little or nothing to give him the idea for our ancient city. One should see what a remarkable leap forward it was when the human animal started changing the face of the earth with cities. If agriculture, with its surplus that frees other people for other pursuits, is the backbone of civilization, cities are its heart and soul. Cities are where those extra people congregate to practice the arts and skills of civilization: pottery, metallurgy, weaving, art, architecture, literature, commerce, and so on. Even the word *civilization* shows the importance of cities to it, since it comes from the Latin word, *civitas*, meaning city.

The earliest cities arose around 8000 B.C.E., soon after the birth of agriculture, although they do not always seem to have been dependent on farming to survive. The oldest known city was Jericho, dating back to c.8000 B.C.E., making it twice as old as the Egyptian pyramids. Jericho was a desert city, located around a fresh water spring and largely owing its existence to that spring, since traveling caravans would trade their goods to the people of Jericho for its water. Jericho probably had several thousand inhabitants, who were well enough

organized to build a fairly impressive city wall, citadel, and reservoir and dig a moat out of solid rock. Another early city, Catal Huyuk, in modern Turkey, dates from about 6500 B.C.E. It was a religious center, living off of a combination of hunting, farming, and trade.

The rise of hydraulic civilizations. Isolated cities such as Jericho and Catal Huyuk did not create civilizations. That accomplishment depends on a number of cities spread out over an area and sharing a common culture: language, technology, religion, art, and architecture. The first civilizations arose along hot dry river valleys in Egypt, Mesopotamia, northwest India, and China. The importance of rivers to these civilizations has given rise to the term: *hydraulic civilization*, coming from *hydra*, the Greek word for water. Such rivers provided easy transportation and trade for people in their valleys. Such people traded goods and also ideas. In time, a common culture would emerge, as each village would tend to adopt the better ideas and techniques of its neighbors along the river. The rivers and the hot dry climate spawned another activity critical to early civilizations: irrigation.

Let us focus on Mesopotamia, where the Tigris and Euphrates rivers were the only reliable sources of water for farming. The fact that these rivers flooded annually gave the farmers the idea of bringing river water to their fields. At first, it involved nothing more than catching floodwaters and letting them gradually run back to the fields. In time, as the population and need for more farmland increased, the irrigation got more involved and complex. Such a project required a high degree of organization and cooperation, and that required leadership. Keep in mind, ancient peoples viewed rivers as gods. This meant that cutting into them and tapping their water supplies had religious implications. As a result, the local village priest supervised the irrigation.

In return, the priest would get offerings of grain and farm animals. Since these offerings were much more than he could consume himself, the surplus food served as the earliest form of "capital", that is wealth that can be invested in operations beyond what is needed for survival. Naturally, the priest put the "capital" back into his "business", building a bigger temple and storehouse to hold the extra grain and animals. This involved hiring extra accountants, builders, and guards who would settle with their families around the temple. Over time, the irrigation would lead to more crops, which led

to more people, which led to the need to develop more farmland and irrigation. This, in turn led to more offerings and further expansions of the temple and the settlement around it. Once the town was large enough, craftsmen would move in who would provide needed goods such as pottery and tools to the temple's workers. Thus, a third level of population below those of the priest and their workers would emerge. Over the centuries, as the population, irrigation, and temple kept expanding, what was once a small farming village evolved into a thriving city gathered around the temple. Such a city would need or want wood, limestone, metal, and other goods that the area could not supply. As a result, some men would become merchants, traveling far and wide to trade the city's surplus for other goods. In this way, the city would grow even more populous and wealthy.

The long, continuous river valley of Mesopotamia meant that not just one village priest, but dozens were faced with the problems and rewards of irrigation. Thus, the process of cities growing up around temples was repeated over and over throughout Mesopotamia. Since the rivers tended to create a common culture, these cities resembled each other quite a bit in how they grew up and even in how they looked. For example, temple expansion generally took the form of building additions on top of the older temple. This gave the temples, or ziggurats as they were called, the appearance of pyramids. At this point, with dozens of cities united by a common culture springing up throughout Mesopotamia, we can say civilization has emerged. Its first people, the Sumerians, step onto the stage of history around 3000 B.C.E.

Civilization brought problems as well as blessings. For one thing, the continued expansion of population and farmland to feed it eventually led to cities clashing over new lands. With civilization came the first wars. Since priests were ill suited for fighting, they would choose a *lugal*, ("great man") to lead them in the fight. After the war, the *lugal* would be expected to resign his office. However, either because of ambition or the fact that another war was always around the corner, the *lugal* would keep his office. In time, he became a permanent official, the king, who led the city-state in war and administered justice in peacetime.

This often led to tension with priests who felt their own positions threatened. The temple (or, more technically, the gods) controlled most of the land.

This often made the temple unpopular with the people, who looked to the king for protection. Eventually, the king would emerge as the most powerful figure in the city, although the temple would remain quite influential, still controlling much land, patronizing the arts, and acting as a grain bank and redistribution center during times of famine.

Another problem brought on by civilization was that the larger population of cities (sometimes 20-30,000) meant that people did not always know one another. This led to distrust and oftentimes crime. The influx of wealth also meant more clearly defined social classes since the wealth was not distributed evenly. This, plus all the different types of jobs being done, led to distrust and disagreement. Law codes had to be formed and courts of justice maintained, which also led to the need for a king's strong central government.

Town air makes one sick. Since one reason for living in towns was the security of their walls, it was imperative to keep the perimeter of those walls as narrow as possible in order to keep from spreading the city's defenses to thinly. Therefore, towns were typically very crowded and dirty with where garbage and excrement (human and animal) piling up. Therefore, until modern sanitation and medicine came along in the 1800s, life expectancy in towns was generally lower than that in the countryside. As a result, cities were often unable to sustain their populations through natural increase and had to lure peasants and nomads to settle in town with the promise of greater opportunities and excitement.

If the town and rural populations were from different ethnic groups, strife could result. As long as the influx of rural settlers was gradual, they could be assimilated into the town culture. However, if something, such as an epidemic, triggered a sudden population loss in the city, there could be a sudden influx of new settlers who refused to assimilate into the town's dominant culture. This in turn could provoke ethnic strife and the overthrow of the town's ruling class with a new group. This is the likely scenario of how the Akkadians overthrew the Sumerians (c.2350 B.C.E.) and how the ruling urban German class in the Hapsburg Empire went into decline in the 1800s.

Cities and civilization also gave rise to new arts, crafts, and technology. Weaving was certainly one of the most remarkable crafts if we consider how

much imagination it took to see a fabric in the fiber of the flax plant. Its importance should be obvious to anyone who wears clothes. Pottery was another craft of great significance. Sealed pottery jars could keep bugs and vermin out of peoples' food supply, preserving it in terms of quantity and hygiene. The rise of civilization also saw the evolution of two other types of technology vital to our way of life: writing and metallurgy.

Women and Pre-industrial Civilization

The first hydraulic civilizations in Egypt, Mesopotamia, and the Indus River valley brought greater concentrations of wealth. And with that wealth came more conflict, both within cities and between neighboring city-states. In a sense, this is where warfare as we know it began. Of course, there had been tribal wars before, but never on the scale of what happened now.

And, even more than before, a premium was put on men's brute strength at the expense of women.

Another factor working against women was the fact that their work often wasn't as crucial to running a craft in town as it had been in the fields, especially during planting and harvest. Women in town were increasingly confined to the home and treated at times more as property than human beings.

Of course, when looking at various cultures across the globe & historical time, we must realize that there is a vast gray-scale of situations for women. For one thing the transition to lower status was a gradual process that took place at various rates and to various degrees in different places. For example, in medieval England, widows of guild members could carry on their husbands' business, whereas in many or most parts of Europe this was not the case.

Another example was ancient Egypt. Women there had more property rights than their counterparts in more turbulent

areas such as Mesopotamia. For example, in very early in ancient Sumeria, women could train for the highly specialized and prestigious profession of scribe. However, by Babylonian times, the only business they could run was that of a tavern.

We can often see women's higher status at the dawn of civilization in ancient religions, which tended to change more slowly than other aspects of society. For example, the main deity in ancient Japan was the sun goddess Amaterasu. There are also ancient Japanese legends of warrior women. One legend was that of a sorceress Pimiko, who lived shut up with 1000 women and one man, her brother, who was used to communicate orders to her subjects. It wasn't until 1400's and the turbulent era known as the Age of Warring States that women assumed totally submissive roles.

Probably the most famous warrior women were the Amazons of Greek legend. As with most myths and legends, there was likely some kernel of truth at the basis of this legend. In fact, the Greeks had legends of Amazons in several regions, including Asia Minor, the Aegean Sea, and Libya.

Many ancient religions, such as that of the Minoans on Crete, originally worshipped an earth goddess as their primary deity. Minoan art even shows women participating in the sport of bull leaping which also probably had some religious significance. In fact, one could even see the constant bickering between the older Minoan goddess, Hera, and her husband, the more warlike Zeus, as an historical memory of Minoan resistance to the Mycenaean conquest.

While people typically associate Muslim society with veiled women, other civilizations restricted their women's freedom in similar ways. The classical Greeks, when women weren't

confined at home, also had them wear veils as in this Hellenistic statue from the third century BCE.

Similarly, women in medieval and early modern Europe were expected to keep their hair covered in public, only letting it down in the privacy of the home. The almost universal wearing of hats by women until the early 1960s was a lingering holdout of this custom.

In Sung Dynasty China, a surge in agricultural production and population growth prompted a rapid expansion of its cities. As men moved into the cities to practice various crafts instead of farming, they no longer needed the labor of the women that had been so crucial in cultivating rice paddies. From this came the painful and confining practice of foot-binding, which broke the arches of girls' feet, making them unable to walk normally.

Of course one could make the case that women today may subject their feet to a modern version of foot-binding with high heeled shoes.

In the sixteenth century political treatise, *The Prince*, Machiavelli advises rulers to especially avoid taking their subjects' property and women, treating the latter as largely a subset of the former.

Not until the industrial revolution in the 1800s would women's status start to improve appreciably.

Ancient Ikea: Furniture at Jericho

Late one day, when Jericho was being excavated, archaeologists came across a sealed room. Rather than wait till the next morning, they decided to take a peek before quitting for the day. However, the room revealed several pieces of wooden furniture that, being sealed off from the outside world for thousands of years, had not decayed. Unfortunately, opening it up to the moisture of the outside world, the

archaeologists saw the furniture warping before their very eyes. Working late into the night, they coated the wood with melted wax, which would protect it from further warping. One interesting feature of the furniture was it had only three legs, probably because a tripod can sit stably on a rough floor better than something with four legs.

Hazards of Urban Living in the Ancient World

Life in ancient cities had its share of risks. For example, based on Hammurabi's law code, it was apparently not uncommon for the mud brick houses of Mesopotamian cities to collapse on their owners. If the owner died, the builder was supposed to be executed. If the owner's son died, the builder's son would pay the price. If collapsing houses didn't kill you, poisonous snakes lurking in the shadows might. There was also the hazard of scorpions falling from the ceiling onto your face while you slept. In medieval Europe it was rats falling from thatched ceilings. Much better.

Something in the water. Although people had no concept of germ theory or what caused disease, they did have a sense that something in the water could make them sick. Royal palaces were often built around wells to avoid the river water polluted by the commoners. Hittite kings had their water strained, for purposes of ritual purity and protection against black magic, not hygiene, but it still was probably safer. When a Hittite king found a hair in his water, the guilty water carrier was executed.

The Original Gated Communities

Until very recently, a major factor influencing the size of a city has been: defense (i.e., the town wall) in particular the need to keep its perimeter as small as possible. Besides making it easier to defend, this also kept the cost down, good fortifications being quite expensive. The narrow

perimeter of the wall in turn made the city quite crowded with space at a premium.

This also limited urban sprawl, since no one wanted to live outside the town walls' protection against enemies. Any people choosing to live under the walls' protection but outside the city would often be discouraged from doing so by local authorities. At the approach of enemy armies, such suburbs might be cleared out to create a clear field of fire for the city's defenders by denying invaders any cover.

Inside the city walls, the lack of open space and sanitary facilities (unless you count a ditch running down the middle of the street) led to ever mounting piles of garbage and human waste, triggering frequent outbreaks of disease. Until the medical revolution of the 1800s, life expectancies in towns were typically lower than in the countryside. Many cities could not maintain their populations through natural increase, relying on a gradual influx of immigrants seeking their fortunes to sustain their numbers.

The city's crowded conditions also affected architecture. The round huts (probably modeled after older circular tents) proved to be an inefficient use of space, thereby giving way to rectangular architecture as seen in the reconstruction of the ancient city of Catal Huyuk below. Typically, one house's western wall was its neighbor's eastern wall and so on. (In the Babylonian legend upon which *Romeo and Juliet* is based, the star-struck lovers talk through a crack in a wall common to their houses.) Several houses joined together in such a way could also serve as small self-contained fortresses in case invaders broke through the city walls. Even after breaking into Carthage in 146 B.C.E, it took the Romans seven days to subdue the city.

Wild animals, while romanticized in modern cartoons and nature programs, were a major threat to people's lives and wellbeing until everything got paved over and turned into shopping malls. Lions and wolves were constant threats to livestock for both ancient shepherds and American cowboys. David's proficiency with a sling in the Bible was developed to defend sheep against lions rather than protect Israel against giant slow-moving bozos in heavy armor.

In 19th century Singapore, tigers were killing 200 people a year, and as recently as the 1900s there were reports of tiger attacks in villages in India. Therefore, even small villages might have walls, which would be of limited use against large armies, but more practical against bears without opposable thumbs or ladders. By the same token, global warming is driving polar bears into increasing contact with areas of human habitation, and they're not just looking for an ice-cold Coke.

Fighting gridlock. While cities in general were congested, exceptions were made, especially for kings. For example, the Assyrian king, Sennacherib, tore down houses surrounding his new palace in Nineveh to let in light. He also had a ninety-three foot wide processional way leading to his palace. Anyone whose house encroached on this road was hanged on a stake over his house.

FESTIVE DANCING AND ITS IMPORTANCE IN HISTORY

Introduction. One of the hardest aspects of history to document, yet maybe one of the most important, has been festive dancing. It seems especially remote to us, since we have become progressively more isolated as individuals since the industrial revolution, so we tend to lose sight of the importance of community in our lives. However, we are a social species that has relied on numbers to survive down through the ages, which brings up the question: what has kept us together all these years. The biological root of the answer lies largely in a pleasure center in our inner ears that likes a rhythmic beat.

Hunting, gathering, and dancing. Throughout most of our existence as a species, we have relied on hunting and gathering for our survival. Yet this was the time when our species was especially vulnerable and had to depend on the group for survival. One survival technique against large predators was for people to move together to make it seem that the predator was up against one big animal instead of a lot of small scared animals. Very likely, rhythmic community movement had its origins here, and either was based on or led to rhythmic dancing to celebrate or anticipate a successful hunt. When people practice moving together in time for a prolonged period, it induces a trancelike & spiritual experience of all being together as one. Besides being pleasurable, it also made our ancestors more effective in hunting as well as creating cohesiveness for the whole community in day-to-day life.

Whistle while you work. Experiments in rhythmic movement while doing repetitive tasks indicate workers are happier, more efficient, and able to work longer hours. As early as 1835, a German study claimed workers were 25% more productive when performing tasks together rhythmically. In 1901, a peach grower who hired a singer to perform for his workers said it boosted productivity by 30%.

Early civilized dancing. When cities and civilizations evolved into societies containing many times more people than found in hunting and gathering groups, governments needed to provide the basis for identifying with and loyalty to these new states. Therefore they attempted to control collective dancing by formalizing it into state run religions monopolized by the ruling classes.

The cycle of religious dancing. At this point, we can see a cycle that constantly has repeated itself throughout history. Once the state or a ruling clique within a religion has taken it over, they tend to tighten their control by increasingly formalizing the religious rituals. By the same token, the religion becomes increasingly boring and uninspiring to its members. Therefore, some of them start a new sect from within that religion or a new religion comes along, either of which incorporates festive dancing in its rituals, attracting large numbers of new followers. The new faith or sect grows in numbers until some of its members feel a need to impose some order by rigidly formalizing the rituals. Eventually this religion of sect becomes boring and the cycle goes on.

In Western civilization we can see this cycle repeating at least four times. The first time had to do with the wild Dionysian rites spinning off from the Greeks' state religion of Olympian gods. Euripides' play *The Bacchae* gives us a somewhat frightening scenario of what happens when the king tries to suppress these rites, and the Maenads, formerly mild mannered women who are caught up in the frenzy of the Dionysian worship, literally tear him apart. To their credit, the Greeks realized that to maintain our normal rational ways of living, we must occasionally give in to our irrational passions. Therefore, they incorporated and formalized the Dionysian rites into state festivals. One aspect of these festivals was Greek drama, such as Euripides' play discussed above.

The cycle next repeats in the early days of the Christian Church. The Romans, being a bit more conservative than the Greeks, had severely limited the practice of the Dionysian rites. Unfortunately, they saw Christianity in the same light as the Dionysian rites, since both worshipped the son of a woman and god who had died and been resurrected, and both practiced wild, although typically asexual, rites. Therefore, St. Paul, in an effort to dissociate his religion from the Dionysian rites and make it

look legitimate to the Romans, tried to control the festive dancing. As Christianity grew in popularity and a hierarchy of bishops and archbishops evolved, Church leaders continued efforts to calm down its services.

During the eleventh and twelfth centuries, the Church had gone through a major religious revival, largely from the grassroots level of the monasteries, and emerged as the most powerful institution in Western Europe by 1200. In order to gain more control over its more enthusiastic members' practices and beliefs, it banned dancing in church. However this only pushed the dancing out into the streets where the Church had much less control and evolved into Carnival, the festival that precedes the period of Lent leading up to Easter. At first, Carnival may have had some spiritual aspects, but it soon evolved into an excuse to indulge in the various activities banned during Lent, to satisfy any desire for those activities for the next forty days leading up to Easter. Among those activities was eating meat (thus the word carnival as in carnivore) and festive dancing. Carnival also largely became of parody of the Church and ruling classes, who naturally felt somewhat threatened by it. By the mid 1500s, Northern Europe was in the midst of another religious revival, the Protestant Reformation. At this time, Carnival was still being celebrated in the North, when it ran into two obstacles. One was the puritanical idea, especially associated with the Calvinists (AKA Puritans in America), that most any kind of pleasure was evil. At this time Europe was undergoing major shifts away from a land based to a money and credit based economy. Such shifts always leave some people behind, in this case the peasants, and generate social tensions that occasionally turn into armed rebellions. Therefore, the authorities in the North suppressed Carnival, but with some disturbing results. There is evidence by the 1600s that being deprived of communal dancing was creating a sense of isolation in people with a corresponding rise in depression.

Fast forward to the period of the French Revolution in the late 1700s. A new secular idea was sweeping across France and then Europe: nationalism, which united peoples with a common language, history, and culture into that giant collective consciousness called the nation. The revolution's leaders the importance of communal celebrations in bringing people together and actively promoted civic festivals to unite the people behind their leadership.

When Napoleon seized power in 1799, he repeated the mistake of trying to control and structure such celebrations from above with military parades that had a stirring beat, but reduced the people to being a passive audience. The idea was to replace the horizontal social bonds between the people on the same level with a top-down bond between the people and their leader who was supposed to embody the very nation itself. The result, however, was to seriously reduce the impact of such events on creating social bonds among the people.

Drill and march. The application of rhythmic moving together in time to armies (AKA drill and march) has repeatedly proven effective at different times in history. The first successful demonstration of the drill and march took place during the Age of Warring States in early China around 400 B.C.E. when Sun Tzu, on a bet, trained 100 women with halberds who defeated a comparable size group of men not trained in the drill and march. A later shift in emphasis to cavalry led to the drill and march being forgotten in China until its revival under the later Ming and early Qing dynasties.

The pattern would repeat itself again in the 1920s and 1930s in Fascist Italy and Germany with the extra twist that Mussolini and Hitler in particular had modern loudspeaker systems that allowed them to stage-manage huge spectacles with thousands of people attending. These events did use rhythmic chanting of slogans to create some communal feeling, being reinforced by another psychological phenomenon of losing one's individual identity in such huge crowds. However, the predominantly passive role played by the masses could soon make these stage-managed rallies seem boring, giving them limited success in the long run.

After the end of World War II in 1945, accelerated urbanization, suburbanization, and the tendency to move to a new neighborhood or city every few years have created new subdivisions, but not communities, which require generations to sink the deep common roots that truly unite people. Instead, mass media, especially television, has largely replaced community events in which people are

actively involved. Television watching is a fairly solitary activity where it is rare for whole families to watch the same program together. Television may provide us common cultural reference points, but it doesn't give us community. This lack of community seriously inhibits people from participating in common activities such as festive dancing. In fact, the idea of even trying to start such events on just a neighborhood level would seem laughable, so far have we become cut off from our cultural roots and each other.

THE EVOLUTION OF EARLY WARFARE TO c.500 B.C.E.

Introduction: the roots of warfare. Probably one of the most unfortunate aspects of humans is their ability and willingness to kill others of their own species in wars, although some would argue that the crisis mode of warfare stimulates and accelerates new developments, especially in technology. However, with the exception of ants, we are the only species that devotes significant resources to large-scale organized efforts to kill each other. Ironically, warfare may be the most “civilized” of human activities, given the root of the word civilized is the Latin word for cities, and warfare, if not invented by cities and civilization, certainly is expressed in its most extreme form by civilizations. This is largely because of the conflict arising from the growing wealth resulting disparities between rich and poor that civilization created.

Stages of pre-civilized warfare. Even among hunting and gathering peoples, conflict would arise over hunting grounds. At first, when population densities were low, it was possible for the losers to move to another hunting ground. However, as population densities increased, the winners, having little or no surplus food or use for slaves, typically killed the losers, although they might spare the women. However, this changed with the higher population densities, greater surpluses and larger tribes and states that came with agriculture, because the conquerors could either enslave or tax the losers.

Warfare in the early Bronze Age (c.3000-1700 B.C.E.) As cities and civilizations evolved with even greater wealth to defend or take from other civilizations, warfare intensified even more. However, armies consisted mainly of peasant levies that had to get back to their crops, and cities still had limited resources for paying large-scale professional armies. Therefore, all defenders had to do was build fortifications of sunbaked mud bricks behind which they would retreat until the invaders had to leave. At worst, a city might have to acknowledge the invaders as overlords and pay them some tribute to leave. Later, when the opportunity arose, they could revolt.

Burning crops. Even the strategy of wearing down enemies by burning their crops was somewhat rare in early warfare. This was because crops didn't

dry out and become susceptible to burning until soon before harvest, and invading armies' ranks were filled mainly with peasant militia who had to return home to harvest their own crops.

Then sometime after 2400 B.C.E., a new siege weapon, a crude battering ram, was developed, which literally pulverized city walls made of sun dried bricks. Now invaders could either directly occupy and tax subject cities or sack and destroy them. This made possible history's first empires: the Akkadians (c. 2350-2250 B.C.E.) and the Third Dynasty of Ur (c.2100-2000 B.C.E.). As a counter-move to the battering ram, cities built their fortifications using much harder oven baked bricks. This proved effective until the Assyrians devised better battering rams and other siege techniques around 800 B.C.E..

One factor that has affected the frequency of wars has been climate change, such as the drought, which hit Mesopotamia around 2000 B.C.E. As food and resources shrank, conflict over what was left intensified, both in terms of frequency and brutality. Warfare was also more widespread and destructive, leading to fewer resources as irrigation systems fell into disrepair, causing more wars and so on.

Around 1800 B.C.E. Indo-European nomads came down from the north with a deadly combination of two weapons: the composite bow and the horse-drawn chariot. Together these weapons gave them vastly increased mobility and firepower, as well as the initial terror inspired by horses, rarely if ever seen in the civilized world up to now. One kingdom after another collapsed like a house of cards before the onslaught of these nomads with their terrifying beasts. People known as the Hyksos conquered Lower Egypt, while the Kassites overthrew Babylon, and the Aryans moved into the ruins of the Indus River Civilization.

The High Bronze Age (c.1700-1000 B.C.E.) As usual, civilization revived with new and revived empires and kingdoms: The Kassites in Mesopotamia, the Hittites in Asia Minor, New Kingdom Egypt, and the Mycenaean Greeks. Since bronze, horses, and chariots were so expensive, each civilization had a strong autocratic king supported by a small elite nobility who could afford to arm themselves and keep the mass of peasants under control. In fact, although called the Bronze Age, most people at this time were still in the Stone

Age because of the expense of metals. Thus the way these kingdoms fought their wars largely determined their political and social structure.

Sometime around 1200 B.C.E., everything came unraveled for these civilizations, once again because of how they, and their enemies, fought their wars. Much of the advantage chariots gave their owners in war was psychological. Thus battles were typically fought between two elite groups of charioteers while the mass of infantry stood by and watched. However, typically behind each chariot was a lightly armed runner who would rescue their downed charioteers and finish off those of the enemy. Such runners, oftentimes foreign mercenaries, came to realize the vulnerability of chariots to lightly armed infantry throwing javelins to bring down both charioteers and their horses. Armed with these tactics, these peoples either weakened or overthrew the big empires and kingdoms of the day. Although Egypt barely survived, the Hittite Empire, the Mycenaeans and Kassites collapsed, allowing the victors to sack and plunder the riches of these civilizations. The Trojan War, immortalized by Homer, also took place at this time. A period of chaos prevailed for the next 200 years, when a new metal ushered in a new age in warfare and empire building: iron.

The Early Iron Age (c.1000-500 B.C.E.) Because of its abundance, iron, often called the democratic metal, probably ushered in the real age of metals for most people in the civilized world once they had mastered the techniques for smelting and shaping it into tools. Iron created and allowed the exploitation of new forms of wealth, which often led to more wars.

Iron also revolutionized warfare, since states could afford to field much larger armies. Two other factors helped in empire building. One was the phonetic alphabet, which allowed governments to keep much better records on such things as taxes, thus giving them much tighter control over their subjects. The other factor, first developed by northern nomads and copied by the Assyrians, was mounted cavalry. Cavalry's greater mobility allowed armies to move armies more quickly, outflank and surround enemies, and operate on rougher ground than chariots which were prone to broken wheels and axles. Mounted messengers also kept rulers much better informed on news about revolts and invasions, enabling them to defend and expand their empires by a factor of several times.

Therefore, the Neo-Assyrian Empire (934-609 B.C.E.) was three times the size of any previous empire. And the Achaemenid Persian Empire (550-330 B.C.E.) was several times larger still. Besides helping build big empires, iron equipped armies would have a radically different political effect: namely, the rise of democracy among the Greeks.

[Back to flowchart](#)

THE IMPACT OF DISEASE ON EARLY CIVILIZATIONS

Agriculture and cities brought many changes, but not all of them were good. Two things in particular led to problems: irrigation and domestication of animals. The problem with irrigation was that it was transforming a naturally hot and dry environment into a hot and wet one. This brought with it a number of water-borne parasites native to the area, such as the blood fluke that causes Schistosomiasis by burrowing into the skin, entering a new larval stage (schistosomula), then migrating to the liver or lungs, where it matures into the adult form. The overall effect for a society heavily infected with such diseases was a lethargic peasantry unable to produce as much or fight as well against invading enemies.

The second, and more dramatic effect came with the domestication of animals and the subsequent frequent contact with them, because microbes for infectious diseases the animals carried often mutated into forms that were lethal to humans. There are at least 26 diseases we share with poultry, 35 with cattle, 42 with pigs, 46 with sheep and goats, 35 with cattle, 50 with horses, 65 with dogs, and even 32 with rats and mice who typically live in close proximity with humans. The first outbreaks of any of these diseases were often catastrophic, since people had no prior exposure to them and thus had no chance to develop immunities.

The rise of cities was both good news and bad news in this respect. The good news was that the more concentrated populations made possible by cities meant that despite the huge mortality, at least a small percentage of the population could survive and develop resistance to the new disease. The bad news was that the civilization would be more vulnerable to attack by enemies.

In the long run, two things helped populations to develop at least partial immunity to diseases. One was that natural selection favors people with natural resistance to the disease, so they can pass that resistance on to future generations. By the same token, natural selection favors organisms less lethal to their hosts so that they don't have to keep looking for new hosts in order to survive. Therefore the more lethal strains of a disease will typically reach a dead end, literally, when it has killed off all its potential. After six generations or so, a population

was able to adapt enough to keep damage from new outbreaks of a disease from doing too much harm. Oftentimes, the disease becomes a chronic, but less lethal "childhood" sickness that, once people have had it, usually as children, they are immune to any recurrence. Even in their less lethal chronic state, such diseases can have dramatic effects in three ways.

First of all, once adapted to a disease, a civilization could turn it into a lethal weapon, although usually unknowingly, since people didn't understand what caused diseases until the 1800s. Still, people from a civilization could carry a disease to other previously uninfected populations, in particular nomads. This would have one of two results. Either it would virtually wipe out the nomads whose small populations could not sustain the disease long enough to adapt to it. Probably the most dramatic instance of this happening was when Europeans brought infectious diseases, such as smallpox, to the Americas. Within a century, as much as 90% of the Native American population had perished, mostly from European diseases.

On the other hand, the nomads might manage to adapt to the disease and eventually conquer the civilization. The ability to sustain the necessary numbers might come from civilized women captured in raids who could pass on their immunity to their children.

A second effect was that even in their less lethal form, diseases would still kill some people in the cities. Compounding this was the cramped and filthy living conditions typically found in pre-industrial cities. Together these would often prevent cities from sustaining their populations through natural increase. Therefore, people from the countryside and beyond that state's borders would migrate there looking for job opportunities, and often finding them as a result of disease killing previous residents. If something happened that drastically reduced the city's population, there could be a sudden influx of foreign migrants who might replace the older civilization's culture with their own. A likely example of this was the takeover of Sumerian civilization by the foreign Akkadians, not by conquest by infiltration led by Sargon of Kish who held the position of cupbearer to the king.

Finally, there was the effect of civilized diseases on relatively isolated outlying villages that didn't have

the numbers to withstand the initial outbreak of a disease. Such outbreaks would be less frequent, but when they hit, could be much more severe in their effects. An example of this was the American Civil War where big strong soldiers from the countryside died at a much greater rate from diseases than their comrades from the cities who had already been exposed to them and developed some resistance.

A Plague on Bunnies: Rabbits in Australia

Another example of the catastrophic effects of the introduction of a new infectious disease is what was done to rabbits in Australia. Rabbits were unknown to Australia before the British introduced them in 1859. Not only were there no rabbits native to the area, there were no natural predators to control the rabbit population either. As a result, the rabbits were able to multiply like, pardon the expression, rabbits, allowing them to spread like wildfire across the continent and making them a major pest as they consumed the grass desperately needed by shepherders. Supposedly, sixteen rabbits can eat as much grass as one sheep. With close to a billion rabbits infesting the continent, that adds up to the loss of 60 million sheep. And they're cute too.

Any efforts to control them were unsuccessful until 1950 when myxomatosis (a disease related to human smallpox) was introduced. In the first year of exposure, the death rate in exposed rabbits was 99.8%, although the huge rabbit population allowed a large number to survive. In the 2nd year, the death rate dropped to 90%, but still leaving a significant population to carry on. Seven years later, as a result of selecting out rabbits susceptible to the disease and strains of the disease least harmful to their hosts, myxomatosis was killing only 25% of the rabbits. In addition, rabbits found with the disease had much less virulent strains.

Using this as a model of how populations react to new infectious diseases, William McNeill, in his pioneering work, *Plagues and Peoples*, estimated it takes a population around six generations to adapt. For human, that represents 120-150 years.

[Back to flowchart](#)

THE BIRTH OF WRITING

It's hard for us to imagine what a wonder writing was to people who had never seen it. Therefore, consider the story of John Cremony, an army officer in the American southwest writing a letter to his mother back home. A Navajo Indian saw Cremony writing the letter and asked what he was doing. Cremony replied that he wrote words on the paper and sent it home. His mother would look at the paper and get his message. The Navajo just laughed at such a ridiculous story. Therefore, in order to prove his story, Cremony wrote a note and told the Indian to take it to another officer who would read it and give him a piece of candy. The Navajo took the note to the officer who read it and, to the Navajo's astonishment, gave him a piece of candy. To the Navajo's credit, he was smart enough to catch on and pretend he didn't believe this cheap Jedi mind trick and wanted Cremony to repeat it, thus getting another piece of candy.

Before we condemn the Indians or anyone else for not having writing, we should keep in mind that no one thought of the idea until about 5000 years ago. At that time, the first civilizations were emerging, and with them, a much more complex way of life. The temple of the Sumerian city of Lagash provides a good example. It employed some 1200 people, including 300 slaves. The temple employed 205 cloth workers in addition to sailors, millers, bakers, cooks, guards, fishermen, herders, and scribes. Such a complex operation was beyond one man's ability to keep everything straight in his head. A more efficient record keeping system had to be developed.

Prelude to Writing. People used to think that writing developed overnight in response to the needs of civilization. Actually, it gradually evolved with the

increasingly complex society that started to develop with agriculture. At that time, people started making little clay tokens in various shapes to represent the types and numbers of goods they possessed. For example, a man might have ten small clay discs or one large disc to represent the ten bags of grain he owned. It was such a simple system of record keeping that sometimes the tokens had holes in them and were strung together in a necklace.

Around 3500 B.C.E., cities and much more complex economies were evolving. As a result, we find the number of types of tokens expanding dramatically as new types of goods were being produced and traded. Long distance trade was also starting with merchants and temples sending caravans with large amounts of goods from city to city. The caravan drivers would be entrusted with tokens representing all the goods they were travelling with. They would present the tokens along with the goods to a merchant in the next city after making a transaction.

Unfortunately, it was apparently easy for the caravan driver to steal a few goods and the tokens for himself without the first merchant knowing he had done that instead of selling them honestly. As a result, the first merchant started putting the tokens in a sealed clay ball or envelope. If the second merchant found the seal broken, he knew the goods had been tampered with. However, the sealed envelope made it difficult for the caravan driver to remember how many items of each type of merchandise he was travelling with. Therefore, the merchant started making impressions of the shapes of the tokens on the outside of the clay envelope while it was still wet. Before long, someone realized that the envelope and tokens were not needed as long as there was an impression of them in the clay. The tokens were dispensed with, the envelope was flattened into a tablet, and writing was born.

Even after clay tokens were dispensed with, clay envelopes were still used to protect cuneiform tablets from tampering

Different stages of writing. Writing was first developed for keeping records of goods. In time its uses expanded, and that meant new ways to express and interpret the symbols had to be developed. There were four basic stages in the history of writing.

1) Pictographs (c.3500 - 3000 B.C.E.). In this stage, one pictograph or symbol means what it looks like. For example, a picture of the sun means the "sun". This stage was well suited for straight record keeping, but little else.

2) Ideographs (c.3000 - 2100 B.C.E.). Here the symbols can also mean something a bit more abstract than their literal meaning. A sun can mean "day" as well as "sun". A picture of legs can mean "legs" or "walk". Thus the uses of writing were greatly expanded, although there were severe limits on what one can write this way.

3) Rebus writing (c.2100 - 1000 B.C.E.). This was a critical turning point. Up till now, one related to what the symbols looked like to tell the meaning. With rebus writing, one used the phonetic sounds of words created by symbols to create new words. For example, a word like "Neilson" would be very difficult to write with pictographs unless everyone knew what Neilson looked like as distinguished from other people. However, with rebus writing, one could use the sounds suggested by a picture of a man *kneeling* plus a *sun* to build the word "Neilson". Rebus writing, by making the reader relate to the ears, not the eyes, made it possible to write just about anything. It was a complex system, however, since it required hundreds of symbols, one for each syllable used in a

language. Both Mesopotamian cuneiform and Egyptian hieroglyphics used about 700 symbols.

4) Phonetic alphabet (c. 1000 B.C.E. to the present). This system is based on the fact that we can only make about twenty-five or so different sounds, while we can combine those individual sounds into hundreds of symbols, each requiring a different rebus. The alphabet simplifies the process vastly by using just one symbol for each individual sound we make (e.g.--B, D, K, etc.). Although we generally give credit for the alphabet to the Phoenicians (thus the term "phonetics"), it seems the Egyptians also had an alphabet of sorts that the Phoenicians drew upon. The Greeks completed the process by adding vowels, which the Egyptian and Phoenician systems lacked.

Along with writing, mathematics also evolved to help keep records. The Mesopotamians in particular had some sophisticated math, using base 60 instead of base 10 which we use. Mesopotamian influence is reflected even today in our 360-degree circle with 60 minutes in each degree. They seem to have developed the Pythagorean theorem for figuring out the lengths of the sides of a right triangle. They also figured a number of square and cube roots. The ancient Greeks, who gave us much of our math, drew heavily upon the Mesopotamians for their math.

Scribes and education. Before the invention of a much simpler alphabet, only a small group of men had the time to learn how to read and write a system using some 700 symbols. These men were known as scribes.

Scribes usually came from middle class families with the money to pay for their sons' education. In Egypt, the temple oversaw education, but in Mesopotamia private teachers ran their own schools. Education started around age six and lasted about twelve years. Students went to school from sunrise to sunset about four days out

of five, twelve months of the year. Younger students' lessons involved memorizing long lists of symbols that represented various sounds and syllables. Older students memorized the rules for combining those symbols into words. They also learned math for keeping records and surveying fields. At the end of their schooling, they took an exam. If they passed, they became scribes. If they failed, they could only find employment in such lowly jobs as writing letters for people in local villages.

Classroom discipline was harshly enforced by a man in the back of the classroom who carried a stick for beating students who hadn't learned their lessons well enough. If things got too rough for a student, his parents might have their son's teacher over for dinner, have a few beers, and give him a new coat.

Fully qualified scribes could look forward to a promising career working for the king, temple, or rich merchants. They had high status in society, since their skills were so specialized. In some 2500 years of Mesopotamian history, only one king, Ashurbanipal of Assyria, is known to have been able to read. Society was completely dependent on this narrow class of scribes to keep the machinery of government and business running smoothly. In fact, their dependence was so complete that there was always the danger of scribes taking bribes to misread letters or tamper with government records. Oftentimes, letters were introduced with a plea or threat to the scribes reading the letters to read them accurately. We can easily imagine the palace intrigue that resulted from this situation.

Results of writing. The invention and spread of the much simpler alphabet meant that more people could learn to read. As a result society was less dependent on scribes, whose status declined accordingly. The alphabet also meant the uses of writing could expand to such things as literature,

poetry, and history. Before the alphabet the small number of scribes had to devote most of their energies to running government and business. With the alphabet, more people were literate and free to pursue more cultural applications of writing. We should keep in mind that the vast majority of people, especially the lower classes, remained illiterate until about a century ago.

The importance of writing to history is hard to overestimate. Without it, kings, priests, and businessmen would not be able to keep track of anything beyond their immediate surroundings. With it, trade routes could expand and kings could keep the tax and census records necessary for expanding their city-states into empires. Two subsequent inventions have built upon writing and expanded our capabilities as a species by quantum leaps beyond what they had been before: the printing press and the computer. Today, with the computer, we are witnessing a revolution every bit as dramatic as writing was 5000 years ago. But it is important that we keep in mind that the computer traces its lineage back to those first clay tokens used to keep rudimentary records.

The Logistics of Cuneiform Writing

Cuneiform comes from the Latin word, *cuneus*, meaning wedge. Early pictographs drawn in clay presented the problem of clay bunching up and constantly having to be cleaned off of the tablet. To solve this, scribes started using wedge-shaped styluses with which they would punch differently shaped markings into the clay in various combinations. While this saved immense amounts of time from not having to constantly clean off bunched clay, it also made writing less pictographic and harder to interpret,

thus making the scribes' profession much more specialized and vital to society.

The evolution from clay tokens to pictographs through various stages of Mesopotamian ideographs of four scripts for (top to bottom) cattle, dog, metal, and oil. As inventories and the size of tablets needed to record them grew, scribes sitting in the fields found it easier to write if the tablets were turned 90°, those at the temple reading them kept them facing the same direction. As writing became less pictographic and more abstract, the new direction didn't really matter as far as understanding was concerned.

Signing your John Hancock. Since writing before the invention of the alphabet was so specialized and so few people could write, scribes would prepare documents for merchants who would then sign them with signature seals inscribed with their own unique images that no one could supposedly forge. Surviving signature seals comprise some of the tiniest, but also most exquisite, art objects from ancient Mesopotamia.

Since early writing first evolved to keep inventories, a form of early math also had to be developed as in this early Sumerian tablet. From top to bottom we see recorded 8 "gur-sag-gal" of barley, 16 "pounds" of wool and 16 "quarts" of oil. Surprisingly, a

sophisticated math evolved in Mesopotamia which could solve quadratic equations, calculate square roots and fractions, and developed algorithms for multiplication problems.

Above: The evolution of Mesopotamian numbers. Note how the larger scale of later Babylonian civilization required symbols for larger numbers.

Save your receipts.... for 5000 years. Much of what we know about the ancient Middle East comes from unbaked clay tablets recording inventories and contracts that originally were meant to be destroyed for lack of storage space. However, many of these tablets survived because of what destroyed so much else of these civilizations: fire. As palaces and temples burned, either by accident or from wars, many of these clay tablets were fired and hardened in the flames, thus ensuring their survival until discovery by archaeologists.

A Sampling of Mesopotamian Letters

While writing before the alphabet was confined to a narrow class of scribes, we do have some letters that give us a glimpse into ancient people's lives. Topics included such things as a request for a new chariot to replace the one broken on a rough mountain road and a farmer's unique dilemma of having a lion trapped in his loft, complicated by the fact that the

farmer fears he will get in trouble if the lion starves to death, since only kings could legally kill lions. (Apparently kings didn't make house calls as exterminators then.) As a stopgap until a solution is found, the farmer has thrown a couple of dead dogs and a pig into the loft to keep the lion alive.

Following are some letters giving a taste of life in the ancient Near East. We start with a letter from an ancient collection agency.

"Thirty years ago you left the city of Assur. You have never made a deposit since, and we have not recovered one shekel of silver from you, but we have never made you feel bad about this. Our tablets have been going to you with caravan after caravan, but no report from you has ever come here. We have addressed claims to your father but we have not been claiming one shekel of your private silver. Please, do come back right away; should you be too busy with your business, deposit the silver for us. (Remember) we have never made you feel bad about this matter but we are now forced to appear, in your eyes, acting as gentlemen should not. Please, do come back right away or deposit the silver for us. If not, we will send you a notice from the local ruler and the police and thus put you to shame in the assembly of merchants. You will also cease to be one of us."

"Immediately after you left for the trip, Imgur-sin arrived here and claimed 'He owes me one-third of a mina of silver.' He took your wife and your daughter as pledges. Come back before your wife and your daughter die from the work of constantly grinding barley while in detention. Please, get your wife and your daughter out of this."

Many letters concerned supernatural omens.

"As to Your Majesty's request addressed to me concerning (the incident with) the ravens, here are the relevant omens: 'If a raven brings something into a person's house, this man will obtain something that does not belong to him. If a falcon or a raven drops something he is carrying upon a person's house or in front of a man, this house will have much profit. If a bird carries meat, another bird, or anything else, and drops it upon a person's house, this man will obtain a large inheritance.'"

"The sun did not have an eclipse, it let (the computed event) pass by. The planet Venus will reach the constellation Virgo; the heliacal rising of the planet Mercury is near; there will be a hard rain and the storm god Adad will thunder. Your Majesty should know (all this)."

"...This is what he saw in his dream: (the god said) 'Do not rebuild this temple in ruins; if this temple is rebuilt I will make it fall into the river (Euphrates).' On the day after he had this dream, he did not tell it to anybody. The next day he had again the same dream; this is what the god said: 'do not (you, people of Terqa) rebuild this temple; if you rebuild it I will make it fall into the river!' Here I am sending to my lord a piece from the hem of his garment and a lock of his hair (as surety of his truthfulness). Since that very day, the man (who had the dream) has been sick."

Finally, we have this gem showing that spoiled brats are nothing new:

"I have never before written to you for something precious I wanted. But if you want to be like a father to me, get me a fine string full of beads, to be worn around the head. Seal it with your seal and give it to the carrier of this tablet so that he can bring it to me. If you have none at hand, dig it out of the ground"

wherever (such objects) are (found) and send it to me. I want it very much; do not withhold it from me. In this I will see whether you love me as a real father does. Of course, establish its price for me, write it down and send me the tablet. The young man who is coming to you must not see the string of beads. Seal it (in a package) and give it to him. He must not see the string, the one to be worn around the head, which you are sending. It should be full (of beads) and should be beautiful. If I see it and dislike it, I shall send it back!

“Also, send the cloak of which I spoke to you.”

From *Letters from Mesopotamia*, translated and edited by A. Leo Oppenheim, University of Chicago Press, 1967.

The World's Oldest Known Song

Among the elements of ancient Middle Eastern civilization that connect with us today was music. This tablet, unearthed at the site of the ancient coastal city of Ugarit in Syria, is divided by a horizontal line, with the lyrics on the top half and musical directions below. Its subject is the lament of an infertile woman:

*She [the goddess] let the married
couples have children,
She let them be born to the fathers
But the begotten will cry out, 'She
has not borne any child'
Why have not I as a true wife
borne children for you?*

While there are different interpretations of its melody and

rhythm, the tonal sounds would be familiar to us, the notes being similar to a Western-style major "Do-Re-Mi" scale, which previous theories held that the Greeks had invented. Another theory claims that it denotes a type of harmony with two or more notes being played at the same time, which would be another innovation previously thought non-existent in the ancient world.

Music was as important a part of scribes' education as literature composition, mathematics, and the construction of musical instruments.

METALLURGY AND ITS IMPACT

Introduction. The time is around 9000 B.C.E. A Stone Age hunter picks his way through a riverbed looking for flint suitable for tools and weapons. His eye is caught by the sight of a rock that glimmers "far, as from the moon" as the Greek poet Homer would put it over 8000 years later. It certainly is not flint, but it is interesting, so he takes it home to see what he can do with it. The rock bends, but does not break or chip under the blows of his hammer stone. Our hunter can shape it into some little trinket such as a pin that will probably make quite a stir with his friends and family and be a valuable item in trade. In such a modest way was metallurgy born.

Today it would be hard to imagine our civilization without metals. After all, just about every manufactured object we have either has metal in it or was made by metal machines and transported on ships, trains, or trucks made of metal. Without metals, we would literally be living back in the Stone Age. The development of metallurgy was a long, and sometimes devious process that involved five basic steps.

1) Identifying and discovering its usefulness.

There is little in nature to suggest the existence of metals or their usefulness. Our Stone Age hunter managed to find a small copper ingot. Unfortunately, metals rarely occur in such a pure state. Instead, we find them mixed with other minerals in rocks called ore. Ores usually do not present the appearance of anything resembling metal, so the question arises as to how people discovered them. As with so many discoveries, it was probably by accident. One likely scenario is that potters would put some minerals containing copper on the pottery to give it a glaze when fired. The kiln's heat would separate the copper from the rest of the glaze, leaving little beads of copper lying around. Further experiments would lead to the realization that other rocks were also ores containing copper.

2) Locating metals in quantity. Our potters, wanting larger amounts of the copper ore, find there is little to be found lying on the surface. As a result, they start digging near the surface deposits and find more copper ore in the ground or the sides of hills. Eventually, they will find that copper mixes with different minerals to produce a variety of ores rarely resembling each other.

3) Mining the ores. Now that they know where the ores are, they have to mine them. This is one of the more unpleasant aspects of ancient metallurgy. In fact, work in the mines will become the most brutal and demoralizing job in the ancient world, being reserved for slaves and condemned criminals. It is unfortunate that the glories of ancient civilizations and the modern civilizations later built upon them would have to depend so much on the intense suffering of slaves whose life expectancy in many of the mines was no more than six months to a year.

4) Smelting the metal. Smelting means heating an ore to a high enough temperature that the metal will separate from the rest of the ore, known as slag. As stated above, the first incidence of smelting was probably by accident in a pottery kiln. Over the years, metal smiths would come up with various innovations that created hotter fires and the ability to smelt stronger metals such as bronze and iron. Bellows were invented for blowing air into the fire. The kiln was enclosed to trap heat. And charcoal, partially burnt wood that burns at a higher temperature than regular wood, was developed as a fuel.

5) Shaping the metal into something useful. There were two basic methods for doing this. One method was to pour the molten metal into molds. The other was to pound the metal into the desired shape, such as a sword.

The ages of metals. There were three basic ages of metals in the ancient world, named after the dominant metal used for tools and weapons in that day and age: the Copper Age (c.4000 - 3000 B.C.E.), the Bronze Age (c.3000 - 1000 B. C.), and the Iron Age (c. 1000 B.C.E. to the present). They followed this sequence from the easiest metal to smelt and shape (copper) to the hardest to smelt and shape (iron).

The Copper Age saw fairly limited use of copper in the Near East, because copper is a soft metal and not useful for many tools and was also quite expensive for the average person. Therefore, most people continued using stone tools.

The Bronze Age, during which such civilizations as Mesopotamia, Egypt, and Minoan Crete reach their zenith, saw metals come into their own in the Near East. Bronze is an alloy (mixture) of copper and another metal, usually tin, that is much stronger

than either of its components. The first bronze used was a natural alloy of copper and arsenic. Unfortunately, arsenic fumes are deadly, and blacksmiths found it quite unpleasant to work with this variety of bronze. But it did give them the idea of mixing copper with other metals to develop a bronze of copper mixed with a small amount of tin, usually only 1-4% of the total mixture. However, even that much tin was scarce and had to be sought out in Europe and central Asia. This was important because trade routes spread ideas as well as goods. Therefore, we see civilization spreading to Europe and central Asia by way of the tin routes. One drawback of Bronze was its expense, which made it available to a limited number of people. As a result, Bronze Age civilizations were highly aristocratic societies of narrow classes of nobles and priests ruling over masses of peasants still using stone tools.

Around 1200 B.C.E., a massive upheaval of nomadic peoples swept through the civilized Near East, toppling or severely weakening the older cultures in that area. The Hittites in Asia Minor (modern Turkey) and Mycenaean Greeks of Trojan War fame disappeared from history at this time. In fact, the Trojan War was probably part of this upheaval. As far as our story is concerned, this wave of invasions seems to have disrupted the trade routes that supplied the Near East with its bronze. This put a rather abrupt end to the Bronze Age.

By this time, people were quite hooked on the idea of metals, and started looking for a substitute for bronze. That substitute was iron. However, iron presented a severe drawback. It has a smelting temperature much higher than ancient furnaces could obtain. All these furnaces could produce was a spongy mass called bloomery iron. This had a tensile strength little better than copper. Fortunately, smiths kept working with bloomery iron and learned how to use it. Hammering out the impurities led to an improved bloomery iron that was much better than copper, but a poor substitute for bronze. Heating it next to charcoal made the carbon in the charcoal combine with the iron. This created a crude form of carburized steel with a tensile strength twice that of bronze. Even without being able to smelt iron, ancient metal smiths had found a way to make it useful.

Iron has been called the democratic metal because it is so plentiful and so many more people could afford it compared to those who could afford

bronze. It could well be that iron is the metal that pulled most people out of the Stone Age. It was not until the masses could arm themselves with iron that democracy could evolve in such places as the Greek city-states. Although we today use many other materials such as plastics, steel made from iron is still the metal that we make our machines from. Even today, we live very much in the Iron Age.

Metals have been very important to civilization throughout history by creating tools that could do old jobs better than ever and new jobs never done before. For example, iron tipped plows in medieval Europe would lead to more land under cultivation, more population, and the rise of towns and civilization in Europe. Metals allowed for more extensive clearing and exploitation of forests since an iron axe can fell trees much faster than a stone axe can. The better housing and food supplies made possible by metals led to a higher standard of living for people who could be better fed and housed because of metal tools.

Metals also created new sources of wealth in their own right. The value that people placed on gold, silver, and even bronze led to a common medium of exchange that everyone agreed was valuable. This made trade much easier. For example, a leather tanner wanting grain might not be able to find any farmers that wanted to trade their grain for leather. But if the tanner could sell his leather to a third party for silver, any farmer would be willing to trade grain for the tanner's silver because everyone recognized silver as something worth having. As a result, all three parties got what they wanted without having to take the trouble of finding someone with exactly what they needed and willing to trade exactly what they wanted. Precious metals made trade easier, expanded trade, and usually benefited all parties involved. As a result, just about everyone's standard of living went up.

One final stage was the invention of coinage around 700 B.C.E. The advantage of coinage was that a government guaranteed the weight and purity of its metals. As a result, people did not have to worry about being cheated with fixed scales or ingots of gold or silver debased with other less valuable metals. The higher level of trust coinage generated further expanded trade.

Metals also led to problems. The new wealth they created triggered more wars and conflicts over that wealth. The need for charcoal as fuel led to

deforestation, erosion, and possibly climactic changes in such areas as Asia Minor and the Indus River valley. One theory suggests that the Indus River civilization declined because deforestation caused a hotter, drier climate and crop failures. For the first time, human use and misuse of power was backfiring against us. Metals have indeed proven to be a mixed blessing, but one we would not want to live without.

With the end of this unit around the year 1000 B.C.E., we see the human race has attained most of the skills that will help it survive for several thousand years. Not until the Industrial Revolution in the late 1700's will we see many new technological innovations changing people's lives. Until that time, most innovations will be refinements of the skills first developed in the centuries when civilization first emerged.

Identifying Metals in their Natural State

Except for gold (most metals come mixed with other minerals in what are called ores. As the pictures below should indicate, just identifying metals in their natural states was an exceedingly difficult task, especially if one didn't even know what he was looking for to begin with.

Four different varieties of copper ores: (l. to r.): green malachite, two types of azurite, and malachite mixed with azurite

Three different types of iron ore (l. to r.): limonite, goethite, and magnetite

Silver ore, the one on the right being mixed with gold and quartz

The “Gates of Hell”: Ancient Mining
No benefits or health insurance either.
Mining was such an awful job that in Latin the expression “*in metellum*”, literally go to the metals (i.e., mines), was like telling someone to go to hell, because work in the mines was a virtual hell on earth. The lead mines of Sardinia were especially notorious in this respect. In addition to being tightly shackled, newcomers had one eye blinded and the tendons behind one knee cut to hamper escape attempts. Shifts were four hours on, four hours off, around the clock, every day of the year, until the miner died from overworking, malnutrition, physical abuse, and/or suicide. A common form of suicide was suffocation by stuffing clay into the nostrils. Keep in mind that slaves wouldn't be given guns or knives to kill themselves, since they might find other uses for them. Amazingly, the typical life expectancy of these miners was estimated at fourteen months.

[Back to flowchart](#)

FARMERS, NOMADS, AND THE SPREAD OF CIVILIZATION

History until c.1500 C.E. largely involved the relationship between two ways of life that most people followed since the birth of agriculture: nomadic herding and settled farming. Environment largely determined how these peoples lived, with wetter climates or river valleys favoring settled farming and drier climates leading to the nomadic way of life. These peoples often co-existed peacefully, exchanging goods and ideas in peaceful trade. But at other times, clashes would frequently occur either because of population pressures forcing the nomads to try to take more land, nomadic jealousy of the richer civilization's goods, or just mutual hostility between the two ways of life.

Each side had its own advantages in such conflicts. On one hand, civilized peoples usually outnumbered nomads, since agriculture could support more people than nomadic herding could. Also, their armies generally had better organization, discipline, equipment and technology. On the other hand, the nomads, being more involved with animals, had more meat and protein in their diets, making them bigger and stronger than the farmers.

Probably even more decisive was the nomads' mobility, which let them choose the time and place in which to attack the more settled farmers and cities. Mobility also made it harder for slower civilized armies to catch them. Finally, since nomads often lived on land unsuited to farming, it was not usually worth the civilized peoples' time and trouble to try and conquer them, even if they could catch them. This, plus their size, often gave nomads a psychological edge against the farmers, which in any given battle, could be the most decisive element in determining which army would break and run.

Still, as long as a civilization was well governed, its economy healthy, and its armies well trained and disciplined, it was very difficult for a few nomads to prevail. Not until civilization experienced internal troubles such as civil wars, famine, or a breakdown in the government and military organization, could the nomads strike

effectively. Typically, they would do this in small-scale isolated attacks, not in one overwhelming wave. Repeatedly raiding the farms, stealing the livestock, and burning the crops, the underlying basis for civilization, over a period of years would trigger a further breakdown in the government, economy, and defense. This, of course, would lead to further raids, more serious breakdowns, and so on. At the same time, the nomads often infiltrated civilization as merchants, settlers, slaves, and mercenaries (professional soldiers). Eventually, the civilization would be so weakened that the nomads could take over. However, this was just the start of a cycle of civilized decline, revival, and expansion that would repeat itself throughout most of recorded history.

After a nomadic takeover, civilization would continue to decline either because the nomads did not care to keep it going, or they cared but just did not know how. What largely determined their attitude toward civilization was the length of contact they had had with it. Generally the longer the contact with civilization, the more it influenced the nomads and made them want to try to continue it. For example, the Saxons who conquered Roman Britain had little prior contact with the Romans and were quite willing to obliterate any signs of Roman civilization they found. On the other hand, such tribes as the Franks and Visigoths who had been exposed to Roman culture for two centuries tried to adopt Roman titles, copy Roman government, live in Roman style villas, wear Roman togas, and even speak Latin.

However, even if the new nomadic masters tried to carry on the old civilized ways, they usually failed because they did not fully understand how the government, record keeping, and technology worked. As a result, the civilization would continue to break down despite their efforts. The damaged economy might not be able to support schools to train civil servants, or the new masters might not even understand the schools' importance. Therefore as civil servants died off, there would be no new civil servants to take their place. Such vital public works as roads and irrigation canals would not be kept up, and the economy would further decline, making it even harder to maintain an efficient

government. For whatever reasons, either neglect or the inability to understand how civilization worked, the decline would continue for decades, generations, or even centuries, as was the case with Europe after the fall of Rome.

Despite all this, there were forces working in favor of civilization's recovery. First of all, extended contact with civilization gradually made the nomads more willing to try to preserve it. This at least slowed the rate of decline. Also, the greater material comforts of civilization, such as sleeping on a soft bed or in a warm dry house, might change the nomads' attitudes toward civilized life. Finally, and possibly most important, many nomadic men would take civilized wives. Their sons, although part of the nomadic ruling class, would also be influenced by their civilized mothers to be more accepting of civilized ways. They might also marry civilized women and further dilute the nomadic influence in their children. Gradually, the distinction between the nomads and the civilized people they ruled would fade, and with it any nomadic hostility toward civilization.

Gradually, the semi-nomadic masters, with their still somewhat restless nomadic spirit, would rebuild civilization to its previous level and expand it to new frontiers, both culturally and geographically. Of course, the revived civilization would meet new nomadic tribes, and the process would start all over again: new clashes with nomads, their eventual victory in a time of civilized weakness, the further decline of civilization, its revival largely through intermarriage, and its further expansion to new frontiers.

This goes a long way toward exploring much of human history. Of course, each situation had its own particular twists and turns. But the pattern has repeated itself again and again, spreading civilization from such isolated centers as Egypt, Mesopotamia, India, China, Mexico, and Peru. For example, from Mesopotamia and Egypt, civilization would spread to Syria and Palestine, up to Asia Minor, and from there to Greece. The Greeks would bring civilization to Rome and the Western Mediterranean. From there it would spread to northern Europe, and eventually the Americas. If

we add other important elements such as colonization and trade, we can view history, for better or worse, as the gradual but steady march of civilization across the planet.

Farmers and Herders: A Natural Symbiosis

Sheep passing through Madrid in 2010 as part of the Madrid Transhumance Celebration

Relations between farmers and nomads weren't always bad. Normally, nomads could migrate with their sheep across farmland after the harvest, the sheep grazing on the stubble and in return leaving droppings to fertilize their land. Nomads had to be careful not to compete with each other for grazing routes, since the second tribe would find the land grazed out. That is why Abraham and Lot agree to split Palestine in the book of Genesis.

Farmers vs. Herders

***Cain Flying before Jehovah's Curse* by Fernand Cormon, 1880**

It's all a matter of point of view. Since almost all the records we have about nomads come from the pens of civilized writers, we get a very negative view of them as "barbarians". However, the early books of the Old Testament give us a rare look at things from the nomads' point of view. Most notably, in the story of the first murder, it is Cain, the

farmer, who kills Abel, the righteous nomadic shepherd.

A Sumerian myth reflecting the cycle of conflict and reconciliation between farmers and nomads is that about a contest between a shepherd, Dumuzi, and farmer, Enkidu, for the hand of Inanna, the goddess of love. She chooses Enkidu for the fine clothes he has to offer but gives the rejected Dumuzi grazing rights, thus making peace between them.

Royal "Goose Chases": Trying to Catch Nomads

Nomadic horsemen using hit and run tactics

Trying to catch the nomads on their home turf, especially after they had adopted the horse and gained tremendous mobility, was generally a futile effort. For example, around 500 B.C.E. the Persian king, Darius I, launched a massive campaign against the nomadic Scythians in the North. The Scythians, being expert horsemen, constantly eluded the Persians, drawing them deeper and deeper into the steppe, ambushing foraging parties and stragglers, and just making life difficult for the invaders until Darius finally gave up and took his worn out army home. The Chinese, having even greater and more chronic problems with the nomadic horsemen to the North, launched similar campaigns, generally with the same costly result. In the end, they just built a big wall across their northern border to keep intruders out.

Even whole tribes with unmounted women, children, and old people could prove extremely difficult to track down. For example, Chief Joseph and 800 people of the Nez Perce nation outmaneuvered and battled 2,000 U.S. cavalry in an 1170-mile trek that spanned the states of Oregon, Washington, Idaho, Wyoming, and Montana as they tried to escape into Canada. They were finally tracked down and forced to surrender, but only after a five-day battle in freezing conditions that killed most of their leaders and left the women and children freezing.

Mother Knows Best

The influence of mothers on their sons in nomadic society is implied by the Greek historian, Herodotus, who tells us that Persian fathers had virtually nothing to do with their sons until age five. That way, if the son died, as so many children did back then, the father would be spared grief at the loss.

Since nomads typically took civilized women after conquering a civilization, those women most likely raised sons of such unions during their early impressionable years, teaching them their own (i.e., civilized) language and culture, which gradually worked its way into the culture both those take personally by nomadic masters and those staying with and still having children by men of their own population, heavily outnumbered nomadic women. Therefore, even if the civilization's infrastructure fell apart, civilized cultural influences (language, religion, etc.) would persist on two levels: the population in general and among the ruling classes.

Rapid transition. To show how quickly nomads could be assimilated into civilized culture, only one generation after the Vikings founded the duchy of Normandy in 911 C.E., the Duke of Normandy could not find anyone who remembered the old Norse language to teach to his son.

WAR AND PEACE IN MESOPOTAMIA (c.3000-539 B.C.E.)

"Great powers die of indigestion"-- Napoleon

Introduction: the environment. In modern day Iraq, along the banks of the Tigris and Euphrates Rivers, lie the deserted ruins of a civilization that lay forgotten for centuries until its rediscovery in the 1800's. Looking at these ruins, one finds it hard to imagine a thriving civilization full of people haggling in the market place, fighting wars, dancing in festivals, celebrating births and marriages, mourning their dead, and going about their daily routines much as we do today. Yet, that is exactly what went on here when these were not ruins, but the center of the first human civilization.

Every culture is largely a product of its environment and must be understood within the context of that environment. We use the term *geopolitics* to describe an area's geography (physical and climatic) and the effects of that geography on the area's history and politics. Mesopotamia, from the Greek words meaning "land between the rivers," presented a harsh environment to inhabit, but also an ideal one in which to build the first civilization. Its geopolitics consisted of three basic elements:

1) *It was a hot dry river valley.* This forced the inhabitants to organize irrigation projects that led to civilization.

Ancient climate change. Massive expansion of irrigation systems by the Third Dynasty of Ur, rather than being a sign of the dynasty's prosperity, probably reflects a drier climate. Expanded irrigation, which brought salts in the groundwater up into the soil, strained the environment's ability to support the population and probably weakened the Dynasty's ability to contain nomadic raids.

2) *It had virtually no natural resources except for mud and water.* This forced its inhabitants to be very resourceful. Basically, just about everything about early Mesopotamian civilization was made from mud: its houses, temples, palaces,

fortifications, writing tablets, and the crops which were traded for the resources needed to build up this civilization to new heights. Underlying all the glories of this civilization was mud.

Ancient beer. Since brewing helped preserve the barley from spoiling, some historians believe that beer made from barley provided the Sumerians a significant part of their calories as well as a catalyst for barroom brawls.

3) *It was flat and open terrain with virtually no natural barriers.* This led to jealous nomadic neighbors constantly invading Mesopotamia, either breaking up already existing empires or forcing the Mesopotamians to build strong empires at each other's expense in self-defense. Mesopotamian history was nothing if not violent.

Sumer: myth and history (c.2800-2350 B.C.E.). The Sumerians were the people who built the first civilization, living in the southeastern end of Mesopotamia known as Sumer. Our knowledge of the very early Sumerians is much like our knowledge of the early Hebrews in the Biblical book of Genesis. In each case, the dividing line between dim misty legends and a clear historical account was a great flood. In the Bible before the flood, we find patriarchs who loom larger than life, living for well over 900 years each and coming across more like stiff and lifeless statues than real human beings. The same is true of Sumerian heroes or patriarchs before their flood (c.2800 B.C.E.), except they live for tens of thousands of years and seem even more fantastic than the Biblical patriarchs. After the great flood of 2800 B.C.E., we see more written records and, consequently, real personalities emerge. The Bible is the same way after its great flood and Noah. The larger than life patriarchs give way to more human ones, such as Abraham.

The myths that often fill the gaps in the historical record can help us understand real history. If we carefully interpret them, they can tell us about historical events and the values that civilization held. For example, the story of Cain and Abel in the Bible is seen by some as symbolic of the ongoing struggle between farmers and nomads. Only this time it is told from the nomadic Hebrews' point of view rather than from the farmer's point of view. Thus the nomadic shepherd Abel is good and his farmer brother,

Cain, is the murderer. In Mesopotamian myths, the roles are reversed. The many similarities between Biblical stories and Mesopotamian myths suggest early contacts between the two cultures. Both have stories of a great flood and of a paradise, or Garden of Eden, from which humans are driven because of their folly. If a new god replaces an older one, this often signifies that one culture has conquered another. Such was the case when the Babylonian Marduk replaced the Sumerian Enlil as the chief Mesopotamian god, signifying Babylon's conquest of Sumer.

When the Sumerians finally emerge into history, we find them divided into thirteen major city-states who spent a good deal of their time fighting each other. Although they shared a common religion centered around their holy city of Nippur, that religion seems to have done more to spark wars than prevent them. Each city-state had its own patron god or goddess that made it feel superior to the other city-states. Each city-state also wanted to control the holy city of Nippur, which led to constant fighting that caused Nippur to change hands nineteen times in twenty-four years! For centuries, Sumerian chariots and infantry battalions ranged across Mesopotamia, raising its dust in battle. Whenever one city-state, such as Kish, would gain the upper hand and seemed on the verge of conquering Sumer, the other cities would gang up on it and restore the balance of power. And so it went on for centuries.

The Akkadian Empire (c.2350 - 2250 B.C.E.).

It should come as no surprise that all this fighting wore down the Sumerians and left them open to attack from one of the many nomadic desert tribes surrounding them. In this case, it was a people known as the Akkadians. The story goes that its founder, Sargon of Kish, much like Moses, was set afloat in a reed basket as a baby to save his life. He was found by the royal gardener and raised in the palace where he rose quickly to power and influence as the king's cupbearer. At last, he murdered the king and seized the throne, calling himself Sargon, which meant "legitimate king." What this legend most likely tells us is that the Akkadian takeover of Sumer was a long process of gradual infiltration by the Akkadians into Sumerian society rather than the result of one big invasion. The fairly smooth transition to power also suggests that the Akkadians had absorbed much of Sumerian culture and become

civilized. Thus the Akkadian Empire signified the spread of civilization more than its overthrow.

Sargon managed to take over all of Sumer and probably gave it a greater degree of peace than it had known for most of its history. He used Akkadian governors and garrisons (occupation armies) to keep the city-states in line. He would also take hostages and tear down the walls of any rebellious cities to ensure their good behavior.

Once his hold on the Sumer was secure, Sargon fought against the ever-troublesome Elamite tribes in the mountains to the east. He then marched northwestward, subduing all of Mesopotamia and even reaching the Mediterranean Sea, which seemed like the ends of the earth to people then. To commemorate this, Sargon took the title "King of the Four Quarters" (of the known world). His realm was history's first empire.

Sargon's grandson, Naramsin, further extended Akkadian power. However, he supposedly committed the fatal mistake of sacking the holy city of Nippur, which resulted in a series of revolts. These revolts weakened the Akkadian Empire enough to allow some other nomads, the Gutians, to attack and take over. Agade, the Akkadian capital, was so thoroughly destroyed in this turmoil that its location is still not certain.

Sumer's last flowering: the Third Dynasty of Ur (c.2100-2000 B.C.E.). Partly, through a process of absorbing the nomadic Gutians and partly through popular revolts, Sumerian civilization revived in one final flowering known as the Third Dynasty of Ur. Much of Sargon's old empire was reunited, while new cities and expanded trade routes spread civilization northward. The most impressive monument of the age was the ziggurat of Ur. It was 120 feet high with a base of 260 feet by 175 feet. Even today, its mere ruins strike us with awe.

Once again, nomadic tribes, this time the Amorites, weakened and eventually overthrew the Sumerians. As with the earlier Sumerians, civil wars and revolts set them up for this. Gradually, the nomads settled down and new city-states rose up in the north. One of these city-states would build a new civilization grafted upon the old. That city was Babylon.

Hammurabi and the Babylonian Empire

(c.1750-1600 B.C.E.) Certainly one of the most famous figures in Mesopotamian history was the Babylonian king, Hammurabi. When he came to the throne around the year 1750 B.C.E., his city, Babylon, was just one of several city-states vying for power in Mesopotamia. Surrounded by aggressive and warlike rivals, and with a territory only fifty miles in diameter, Babylon needed a shrewd and tough king. Hammurabi fit the bill marvelously.

Over the next twenty-five years, this Babylonian king masterfully maneuvered his city-state among all its hostile neighbors. At one point, he would ally with one state to eliminate another. Later on, he would make a new ally to help him destroy the first. In such a way, he steadily expanded Babylon's borders and swelled its army's ranks with troops supplied by subject cities. One final showdown with the city-state, Larsa, left him master of Mesopotamia and "King of the Four Quarters."

It is one thing to conquer an empire. It is an entirely different thing to hold it together. Hammurabi proved himself an excellent ruler as well as a conqueror. Following the example of the Akkadians, he put governors and garrisons in the subject cities to prevent revolts. But he clearly saw that those measures alone would not be enough to build a lasting empire. Therefore, he worked to establish a code of laws and one language for government and business to tie his empire together. He also constructed public works projects, such as temples and irrigation canals, throughout his empire. By providing jobs and a greater degree of prosperity, he hoped to build loyalty to Babylon or at least reduce resentment to his rule if they saw him working for their welfare.

Little is known about the Babylonian Empire after Hammurabi's death. It seems that his empire entered a period of decline after his death. Usually, the reasons for an empire's decline are numerous, and they interact with each other in a way that makes them feed back upon one another. This creates more problems, making them interact even more intensively, and so on. For example, Hammurabi's building and irrigation projects were very expensive and ate up a good deal of royal revenues. This left the crown with little money to pay its local officials. That led to a greater degree

of freedom for those officials. As a result, their abuses grew, and royal revenues declined further. This process would then repeat itself with greater intensity again and again.

This feedback also led to even more problems. Extra officials were created to gather more taxes, which added further to the burdens of society. In order to pay those extra taxes, farmers started abandoning the two-field system, irrigating and planting both fields each year instead of leaving one fallow. The extra irrigation raised the water table and poisoned the soil with minerals such as salt, while the extra planting without giving the land any rest exhausted the soil's fertility. Crop yields, the underlying basis for civilization, went down and intensified all the other problems feeding into and off of the agriculture. Bit by bit, Babylon's empire crumbled to pieces. And waiting in the wings, as always, were the nomads. Only this time they had a new and frightening weapon with which to terrorize the Near East.

The horse and chariot (c.1650 B.C.E.). As far back as the Sumerians, Mesopotamians had driven in war chariots pulled by wild donkeys, called onagers. However, the old Sumerian chariot had been quite cumbersome, with four solid wheels that added weight and reduced speed and mobility. As a result, such a chariot probably did not play too decisive a role in Mesopotamian warfare. Then, around 1650 B.C.E., nomads from the north appeared with a new type of chariot. It had two wheels mounted on the back, which made it more maneuverable. Also, its wheels were spoked, not solid, making it lighter and faster. Finally, it was pulled by a strange new beast, the horse, which was faster and more powerful than the onager.

Armed with the horse and chariot and the much more powerful composite bow, the northern nomads burst upon the civilized world with a ferocity that sent its kingdoms reeling back in confusion for a century or more. Peasant infantry were totally unprepared for the spectacle of maybe hundreds of chariots drawn by these strange beasts bearing down on them, stirring up clouds of dust, and making strange and terrifying noises. At times, they broke and ran at this sight alone, leaving their cities as open prey to the victorious nomads. All across the Near East, one civilization after another fell prey to the nomads armed with this terrifying new weapon. A people

known as the Hyksos conquered northern Egypt. The Hittites overwhelmed the cities of Asia Minor and even raided as far as Babylon, sacking it in 1595 B.C.E. Another people, the Kassites, conquered Babylon and ruled it more permanently. Further east, the Indus River civilization fell to the Aryans, also armed with the horse and chariot. For a century or more civilization was thrown into turmoil.

Eventually, these nomads would follow the example of other nomadic conquerors by adopting civilized ways and merging their identities with the cultures they had conquered. Civilized people had also learned a lesson: the value of the horse and chariot. For several centuries, the elite corps of Near Eastern armies ruling the battlefields of the Near East would be their battalions of horse drawn chariots.

The First Assyrian Empire (c.1365-1100 B.C.E.). Assyria lies at the northern end of Mesopotamia where many of the trade routes of the Fertile Crescent and the Near East converged. This made Assyria a prosperous land for trade. It also was a dangerous place, since trade routes are also convenient invasion routes. As a result, Assyria had an especially warlike history, and its people were known for two occupations: trade and warfare.

Since they lived in such a rough environment, the Assyrians became quite capable empire builders. Their first empire seems to have encompassed most, if not all, of Mesopotamia, and bordered the newly emerging civilization and empire of the nomadic Hittites. They also conquered the kingdom of Mitanni, originally founded by another chariot driving group of nomads, the Hurrians.

Once again, a new wave of nomads swept in with a devastating ferocity that toppled civilized empires and kingdoms far and wide. To the northwest, a mysterious people known as the Sea Peoples overwhelmed the Hittite Empire. Some of these Sea Peoples, the Peleset (the Biblical Philistines), seriously weakened the Egyptian Empire and conquered Palestine, thus giving Palestine its name. To the west of the Hittites, the Mycenaean Greeks fell to Dorian invaders from the north. The Trojan War was probably part of these upheavals. The Assyrians themselves were not immune, being conquered by the Aramaeans

coming out of the desert. Among the results of these invasions, the trade routes bringing tin to the Near East were cut. This brought the Bronze Age to an abrupt halt and ushered in the Iron Age.

The Second Assyrian Empire (911-612 B.C.E.). The Assyrians were a tough resilient people. Once the dust had settled from the latest round of upheavals and the nomads had started to assume a degree of civilization, the Assyrians reasserted themselves and built what amounted to the greatest Near Eastern Empire up to that point in history. At the height of their power, they ruled over Mesopotamia, Syria, Palestine, and Egypt. There were several reasons for their success as empire builders.

1) *They had a plentiful supply of iron with which to equip their armies.* Other less well-endowed peoples, such as those of Egypt, would be at a decisive disadvantage when fighting the Assyrians.

2) *Refinements in siege warfare.* Up to this point in history, about the only effective method for besieging a city was to starve it into submission. This made sieges long, tedious, and often unsuccessful endeavors. The Assyrians changed all that. They designed rolling siege towers from which they could assault city walls, and battering rams that could pound mud brick walls to dust. Armed with such weapons, the Assyrians were able to reduce city after city and establish a much firmer control over their empire.

3) *A deliberate policy of terror to keep people obedient.* The Assyrians are largely remembered in history as being extremely cruel. To a large extent, this reputation is justified. Cities daring to defy them in a siege or subject peoples desperate enough to revolt often suffered large-scale massacres. The Assyrians themselves who wanted to scare other people from defying them may have exaggerated the extent of this bloodshed. Also, the greater degree of success in besieging cities gave them more opportunities to sack cities than other peoples had. Keep in mind that most ancient peoples indulged in wholesale plunder and slaughter of cities that had tried to resist them and failed. Another Assyrian terrorist tactic was to uproot rebellious peoples en masse and settle them away from their home in order to disorient them in strange surroundings and prevent further revolts. The Ten Lost Tribes of Israel were lost by this process of being resettled

in a new land and gradually losing their culture and identity in the new cultures surrounding them. Contrary to their expectations, the Assyrians' terrorist policies seem to have inspired more revolts than fear.

Mass deportation of peoples was seen as especially effective since gods were typically associated with a place. Thus removing a people from their homeland removed them from the protection of their gods. When more universal religions, such as Judaism and Christianity developed, the idea of god being confined to one place faded away.

4) ***Cavalry.*** At first the horse was seen as useful only for pulling chariots. Eventually, some nomads caught on to the fact that horses could be ridden. This involved solving several problems. First of all, the horse had to be bred up to a size where it was capable of carrying a man. Secondly, it had to get used to someone riding it, since no animal takes kindly to another animal jumping on its back. Finally, people had to figure out where to sit. For some reason, maybe height, men first rode the higher, but precarious, rump. Finally, someone figured out that the lower, but safer, back was a better place to ride.

Nomads to the north especially took to the horse. The speed with which the Plains Indians adapted to the horse when the Spanish introduced it to this continent shows what an impact it probably had on other nomads as well. Nomadic horse archers, controlling their horses with knee pressure, gained a mobility that civilized peoples could never match. Supposedly, a Comanche Indian could fire twenty arrows a minute while hanging under the protection of his horse's neck and moving at a full gallop.

When large civilized armies, such as that of the Persian King, Darius I, tried to conquer such nomads, they usually failed miserably in just trying to catch them. One measure to contain the nomads was the maintenance of long expensive fortified frontiers, such as the Great Wall of China, to stop their raids. Occasionally, the problem of nomadic raids would become a serious threat when various nomadic tribes would be united into one empire, such as that of Attila the Hun or Genghis Khan. Luckily for civilization, such empires were usually dependent on the

personality and leadership of their founders and fell apart soon after their deaths.

The Assyrians were the first civilized people of the Near East to mount the horse for military purposes. Cavalry were more maneuverable and versatile than chariots. For one thing, they could operate on rougher ground than chariot wheels could. Possibly more important, riding the horse led to much faster communications. This allowed kings to build and hold much larger empires than before, since they could learn of revolts and react to them much more quickly. The fact that the Assyrian Empire was three times bigger than any empire, which preceded it, was probably due in large part to the horse.

Assyria administered its empire somewhat harshly but efficiently. States close to the Assyrian homeland answered directly to Assyrian governors and garrisons. States farther away, such as Egypt and Israel, could continue to exist under their own rulers as long as they paid tribute and loyally supplied troops for Assyrian wars. If they rebelled, massacres or mass deportations would result, followed by direct Assyrian rule.

Assyrian history was quite turbulent. It was under constant pressure from nomads to the north, and always quelling revolts within its empire. People objected as much to the Assyrian merchants who flooded their market places as they did to their army and ruling methods. As the Biblical prophet, Nahum put it: "Thou hast multiplied thy merchants above the stars of Heaven" (Nahum III, 16). Assyria's subjects apparently had a wide variety of complaints against their masters.

As long as the empire had able and energetic kings, it survived all these wars and revolts, although they must have been a terrible strain on Assyria's economy and resources. The death of the last strong king, Ashurbanipal, in 625 B.C.E., touched off one last round of popular revolts and invasions that the Assyrians were not destined to survive. An alliance of Babylon with the nomadic Medes to the north finally brought the Assyrian Empire crashing down in ruins. In 612 B.C.E., despite heroic resistance to the last, the Assyrian capital, Nineveh was taken and destroyed. The biblical prophet, Nahum, certainly expressed the feelings of many when he wrote: "Woe to the bloody city!...All who hear of your destruction shall clap their hands over you; for upon whom

has your wickedness not passed continuously." Such celebrating would prove premature, for the Israelites and others like them would soon be trading one master for another. One state that recognized the danger was Egypt. Strangely enough, it allied with the hated Assyrians to stop the advance of a resurgent Babylon. The issue was decided at Carchemish in 605 B.C.E., the last great chariot battle in history. The result was a decisive victory for the Babylonians, who largely took the place of Assyria in the Near East.

The Neo-Babylonian or Chaldaean Empire (612-539 B.C.E.). In dividing the spoils of victory, the Medes got the vast lands to the north, while Babylon got the more compact, but richer and civilized lands of the Fertile Crescent. The Neo-Babylonian or Chaldaean Empire, as it is variously called, encompassed most of the old Assyrian Empire with the exception of Egypt. This period saw Babylon at the height of its power and glory.

Babylon's most famous king during this period was Nebuchadnezzar. His main concern was controlling the Western end of the Fertile Crescent: Syria, Phoenicia, Palestine, and Egypt. He never did conquer Egypt, although it no longer presented a threat to him. The remaining two tribes of Israelites in Judah made the mistake of rebelling. As a result, Jerusalem was sacked and destroyed in 587, and the Jews were hauled to Babylon for a captivity that lasted some seventy years. Fortunately, they kept their identity and were allowed to return home by the Persians who overthrew the Babylonians.

One other people Nebuchadnezzar had trouble with were the Phoenicians who had helped the Jews in this revolt. Although most Phoenician cities surrendered, Tyre did not. This city sat on an island about one-half mile from shore. Supposedly, Nebuchadnezzar laid siege to Tyre for thirteen years without taking it. The main reason was he had no navy with which to blockade Tyre and cut off its supplies. Finally, the Tyrians paid Nebuchadnezzar some tribute if he would leave them alone.

The showpiece of the empire was Babylon, which contained some of the most wondrous sights of the ancient world. The Greek historian, Herodotus, has given us a second hand description of the city at its height. Even taking into account

that Herodotus exaggerated a bit, we get a picture of a marvelous city. The Euphrates River split the city into two halves that were connected by a 400-foot long masonry bridge. A massive double set of walls protected the city from invaders and floods. Herodotus claimed a four-horse chariot could drive on top of the battlements and have enough room to turn around! The main ceremonial gateway was the beautiful Ishtar Gate. It was made of blue glazed bricks and decorated with relief sculptures of various animals. The palace complex covered thirteen acres and supposedly the famous Hanging Gardens of Babylon were placed here. Their purpose was to comfort the queen who was homesick for the lush hills of her homeland. Finally, there was the fabled Tower of Babel, the largest and most elaborate ziggurat of its day. It was eight stories high and, according to Herodotus, the sanctuary on top was filled with tons of gold.

Babylon's final glory was short lived. Various factors combined to weaken it and set it up for a final fall. For one thing, religious disputes over trying to replace Marduk with the moon god split the empire. Even more important were economic factors. Babylon seems to have lost much of its trade because the Medes cut the overland routes to the north. The southern sea routes also suffered when the ports were silted up, preventing ships from coming in or going out. All of these triggered a feedback cycle much like that which wrecked Babylon after Hammurabi's death some 1200 years before. Heavy expenses from building projects and declining revenues from trade caused the government to raise taxes. This extra burden on the peasants caused them to abandon the two-field system and farm and irrigate both fields each year. The soil again became salinated as a result of too much irrigation, which raised the water table and brought salt with it, poisoning the crops in the process. This damaged the economy and lowered tax revenues even further, bringing on more tax increases and so on.

The final blow came in 539 B.C.E. when the Persians took Babylon in a night attack. The center of power shifted away from Babylon to the Persian Empire in the north. Mesopotamia's glory days were over, although its culture heavily influenced the Persians, who in turn heavily influenced Muslim civilization, the dominant culture in the Near East today. As a result,

Mesopotamia is very much with us. Its culture has just changed and evolved with the times.

The "House of Terror" and other Religious Beliefs and Practices

The house of terror. The most impressive monument of the age was the ziggurat of Ur. Its Sumerian name, *E-temen-nigur(u)* means "house whose foundation creates terror", and even today, its mere ruins strike us with awe. Its base measured 210 by 150 feet although we are not sure how tall it was. Its builder, King Shulgi, also declared himself a god in an effort to win the allegiance of his subjects. Saddam Hussein had the façade and ceremonial stairway restored in the 1980s. Unfortunately, it was shaken by bomb blasts and suffered 400 bullet holes during the First Gulf War in 1991, thus living up to its reputation as a house of terror 3,000 years later.

The "real" reason for the flood. The Babylonian version of the Great Flood says the gods could not sleep at night because of all the noise and racket people were making, so they sent the flood to drown out the noise, literally. They shouldn't have been surprised at our behavior and rebelliousness, though, since they fashioned humans from the blood of the demon, Kulgi.

Maybe we really are pigs. In early Sumer, women's legal status was nearly equal to men's, which may explain the prominence of female deities and stories about male faithlessness. For example, the earth goddess, Ninhursag, expels her mate, Enki, from Tilmun, (a paradise like the Garden of Eden), for his faithlessness and for eating eight forbidden fruits. Similarly, when Ishtar, goddess of fertility, finds her husband, Tammuz, partying in her absence, she has him take her place in the underworld, which explains the seasons,

much like similar myths from Egypt (Osiris and Isis), Canaan (Baal and Anat), and Greece (Demeter and Persephone). Throw in the Greek myth of Circe turning Odysseus' men into pigs and a theme seems to emerge.

As was typical in pre-industrial civilizations, women's status started fairly high but quickly declined. In early Sumer women could even become scribes, a fairly prestigious occupation because of it was so specialized. However, as time went on, they lost much of their status, so that by Babylonian times the only business they could legally run was a tavern, which might also be a front for prostitution.

Human sacrifice. Royal funerals in early civilizations such as Sumer and Shang Dynasty China involved the sacrifice of the king's servants and wives to accompany him into the next world. Eventually, animal sacrifices would typically replace human sacrifices, as reflected in the biblical story of Abraham's near sacrifice of his son Isaac and the last minute replacement of a ram as the offering.

Speaking of death. The Sumerian Underworld was ruled by the goddess Ereshkigal and was seen as a dark and murky place that offered no hope of escape to its inhabitants. This is much like the early Hebrew concept of the underworld, *Sheol*, which we find referred to in Job 11:21.

Graveyard shift. In some areas of Mesopotamia, burials were done in shallow graves beneath houses' floors, raising the risk of disease. Eventually, graveyards were moved outside the city, with only kings and maybe some high

officials reserving the right for burial within the city walls.

The Epic of Gilgamesh

The Epic of Gilgamesh was the first great epic poem in history. Although in the poem Gilgamesh is a hero, being two-thirds god, he was also an historic king of Uruk (c.3000 B.C.E.) who was defeated by the king of Kish. Surprisingly, the epic opens with a complaint about his unbridled arrogance and acts toward the people, probably reflecting real complaints of the time. Therefore, they appreciate his deeds abroad all the more since they left the citizens at home in peace.

His first adventure is an encounter with Enkidu, a wild man who has never seen another man or civilization. He is lured to the city by a woman (which he apparently also has never seen), fights Gilgamesh for seven days and nights, and loses, only to become his best friend and sidekick. This reflects the constant struggle and eventual victory of civilized over nomadic ways throughout history.

In his next adventure, when Gilgamesh spurns the love of Ishtar, because such love is always fatal to mortals, she sends a seven-year famine personified as the Bull of Heaven. Gilgamesh and Enkidu kill the bull, which angers the god, Enlil, who causes Enkidu's death through disease. Such an unworthy way to die for such a great hero as Enkidu causes Gilgamesh to realize his own mortality and go in search of immortality.

This quest takes Gilgamesh on a long dangerous journey to find Utnapishtim (in Babylonia, Ziusudra), the Mesopotamian Noah, the only man ever to have attained immortality. He advises Gilgamesh is to give up the quest for

immortality and enjoy life for what it offers. He also relates the story of the flood, a version of which we later encounter in the Bible.

Gilgamesh is unswayed by Utnapishtim's advice, and so the kindly old man tells our hero of a perpetual youth plant at the bottom of the sea. Braving the dangers of the deep and the prickly leaves of the plant, Gilgamesh surfaces with his goal in hand. However, while Gilgamesh is drying off, a snake robs him of his prize and, while making off with the plant, sheds its skin, which explains why the snake constantly sheds and regenerates its skin. The epic ends with Gilgamesh's death and the thought that if Gilgamesh, "peerless, without an equal among men", could not beat fate, what can we do?

Armies and God-Kings

Sumerian armies, such as that pictured above, consisted of four basic parts. The chariots, or more properly battle carts, led the way carrying kings and nobles. They had four solid (not spoked) wheels, which were attached to the axles, so they could not rotate independently. This, along with a rigidly attached yoke harness that could not pivot, made these clunkers hard to turn and maneuver.

Since the larger and more powerful domesticated horse had not reached this far south yet, they were supposedly drawn by wild donkeys known as onagers, but more likely used domesticated donkeys that were easier to control. As a result, Sumerian battle carts probably had

little real function beyond serving as rallying points for the infantry and to boost morale. Not until the horse, pivoting yoke harness, and spoked wheels that turned freely and independently on the axle, would chariot warfare come into its own.

The core of the army would be peasant and town militia armed with long bronze-tipped spears and arranged in a phalanx. For protection, they had leather belts (some with bronze studs) strapped across their chests and draped over their shoulders. A few might have heavy rectangular wooden shields. Leather or bronze helmets protected their heads. Being farmers and townsmen with day jobs, they had little time for training, let alone extended campaigns.

The king would probably have a professional guards regiment, shown in the center carrying big clubs with axe-heads attached to them. Behind them are archers. The fourth element would consist of shepherds and nomads drafted into service as missile troops using bows, slings, javelins, or even rocks. They are shown in the center behind the guards.

However, pitched battles were probably rare since smaller armies could retreat inside their walls and wait for the enemy, which lacked the resources for a sustained siege, to go away. All that changed with Sargon of Kish.

History's first professional army. Sargon of Kish's success in building his empire largely depended on his standing army of 5000 men, probably supported by taxes given by subject cities. By contrast, early Sumerian armies consisted mainly of peasant militia who could only give limited service since they had to tend to their crops at home. The Semitic Akkadians also used hit-and-run tactics, to which the fairly immobile Sumerian phalanxes had a hard time adapting.

Sieges. Recent research suggests another key to Sargon's success in conquering his empire was some sort of crude siege techniques such as a battering ram or undermining, which could bring down the unbaked mud-brick walls of Sumerian cities. Having taken a city, he typically would tear down its walls and install a governor and garrison (occupation army) to keep it under control. After this, city walls were improved with such things as oven baked bricks, thus making them virtually invulnerable to sieges until the Assyrians developed better rams and siege towers c. 900 B.C.

If enemy forces were to break into a city, they often had to deal with vicious house-to-house fighting in the city's narrow streets. Such a battle largely neutralized any advantages an attacking army had in numbers or chariots. Such fighting was typically to the death, since the defenders had little hope of mercy from the attackers, who themselves were furious at the hardships of the siege and street fighting and often impossible to restrain from the orgy of slaughter, rape and destruction that followed the final fall of the city.

The first god-king. Relief sculptures of Naramsin show him wearing a horned helmet, indicating he was the first Mesopotamian ruler to proclaim himself a god. However, unlike their counterparts in Egypt, such boldness was the exception rather than the rule among Mesopotamian rulers.

Hammurabi's Law Code

Maybe not an eye for an eye. Modern research suggests that Hammurabi's famous "eye for an eye" principle was so harsh that it wasn't even used in most cases, judges deferring to the more humane punishments of earlier Sumerian law codes. Below are some of Hammurabi's laws, so judge for yourself if you think they're too harsh.

- If a man has borne false witness in a trial, or has not established the statement that he has made, if that case be a capital trial, that man shall be put to death.
- If a man has stolen goods from a temple, or a house, he shall be put to death; and he that has received the stolen property from him shall be put to death.
- If a man has stolen a child, he shall be put to death.
- If a man has broken into a house he shall be killed and buried before the breach.
- If a man has committed highway robbery...he shall be put to death...
- If the highwayman has not been caught, the man that has been robbed shall state on oath what he has lost and the city or district governor in whose territory or district the robbery took place shall restore to him what he has lost...
- If a life has been lost, the city or district governor shall pay one mina (c. one pound) of silver to the deceased's relatives.
- If a son has struck his father, his hands shall be cut off...
- If a man has knocked out a noble's eye, his eye shall be knocked out.
- If he has knocked out the eye of a plebian (lower class citizen) or has broken the limb of a plebian, he shall pay one mina of silver.

- If any one strike the body of a man higher in rank than he, he shall receive sixty blows with an ox-whip in public.

- If a surgeon has operated with the bronze lancet on a noble for a serious injury and has caused his death, or has removed a cataract for a noble, with the bronze lancet, and has made him lose his eye, his hands shall be cut off.

- If a builder has built a house for a man, and has not made his work sound, and the house he built has fallen and caused the death of his owner, that builder shall be put to death.

- If the owner's son is killed, the builder's son shall be put to death.

- If a slave has said to his master, "You are not my master," he shall be brought to count as his slave, and his master shall cut off his ear.

Daily life in Ancient Mesopotamia
Agriculture was the solid foundation of Mesopotamian civilization, requiring around 90% of the population to support those in the towns. We can gain an inkling of the intense level of constant work required of these peasants to make a living and pay their taxes (typically about 25% of their crops through most of history) by looking how dependent American farmers of fruits and vegetables are on immigrant labor from Mexico because they cannot find American workers willing to work so hard for so little.

The main farming implement was the wooden scratch plow, which was adequate for the thin powdery soils typical of this region. Keep in mind that the area's hot

summers and mild wet winters mandated that crops were planted in the fall and harvested the next spring. The plow was pulled by oxen wearing a yoke harness that pulled on their necks. This was fine for oxen, but not for horses. Not until the Middle Ages when a harness that pulled from the animal's chest could the faster and more durable horse be used for plowing.

Farmers in such a dry climate depended for water on the vast and complex system of irrigation canals that their city-state ran. Maintenance of these canals was never ending as peasants had to dredge them of silt and anything else that settled in them and repair the sluice gates that controlled the flow of water. The large body of Mesopotamian laws concerned with such matters and water rights between farmers underscore irrigation's importance to this culture.

The ancient Mesopotamian home still forms the basis for many homes in the Middle East today. Built of mud bricks around a courtyard, it had a flat roof where people could sleep on hot nights and keep cisterns to catch rain to ensure their water supply in the dry climate. The rectangular shape also made it possible to build such houses in cities that could share walls, thus making more effective use of building materials and space. Typically, such houses would decompose in the rainy season and have to undergo annual repairs.

Like the ancient Greeks, the Sumerians shared a common religion, but each city-state was politically independent and worshipped one particular patron deity from the Sumerian pantheon of gods. Just as the first cities in Mesopotamia grew up around the temple as the economic and political center, the ziggurat remained the social center of the city and focus of each city's pride.

One must also appreciate what incredible engineering feats such monuments represented to less sophisticated neighbors and visitors, especially considering how they towered over the flat landscape of Mesopotamia. However, some people, such as the nomadic Hebrews saw such buildings as the height of folly, as reflected in the biblical story of the Tower of Babel (Ziggurat of Babylon).

Statues of faithful worshippers were left by the thousands in Sumerian temples to keep the gods company when real people weren't around

Long-range trade was the lifeline the Sumerians relied on for goods unavailable in Mesopotamia. Caravan drivers, such as Abraham in the Bible, were the “truck drivers” of the ancient world. Caravans might have 600 pack mules, each capable of carrying 90 pounds. With so much wealth on the road, merchants also had to hire guards to protect their caravans against brigands.

At Sumerian parties, guests would sip barley beer through straws. Some historians believe such beer provided the Sumerians a significant part of their calories, since brewing helped preserve barley from spoiling.

Mesopotamian medicine. Healers in ancient Mesopotamia were priests, pharmacists and physicians, all in one. Medical texts record first the symptoms, the prescription and directions for compounding, then an invocation to the gods. Such methods find counterparts in today's modern pharmaceutical, medical, and spiritual care of the sick.

Assyrian Warfare

The Assyrians were the first civilized people to use cavalry in warfare, adapting it from the northern nomads. Cavalry's greater mobility allowed them to outflank and surround their enemies, move armies more quickly, and operate on rougher ground than chariots which were prone to broken wheels and axles. Interestingly, the Assyrians still used chariots, but they were heavier and probably used as shock units rather than mobile firing platforms like they had been in the Bronze Age. Mounted messengers also helped Assyrian rulers react to revolts more quickly and conquer by far the largest empire up to that time in history.

Learning to ride the horse involved solving several problems. First of all, the horse had to be bred up to a size where it was capable of carrying a man. Secondly, it had to get used to someone riding it, since, animals rarely take kindly to other animals jumping on their backs. Finally, people had to figure out where to sit. For some reason, maybe height, men first rode the higher, but precarious, rump. Finally, someone figured out that the lower, but safer, back was a better place to ride. Seat belts came later, the first one I know of belonging to James I of England in 1600s.

Chariots of fire. Around 900 B.C.E, heavy Assyrian siege towers and battering rams revolutionized warfare again. Such devices were rolled up dirt ramps that were constructed against the walls so they could operate higher where the walls were thinner. While soldiers below battered the wall, those on top of the siege tower provided covering fire to protect the ram and

their comrades from objects, including burning chariots, being thrown down on them. Such devices allowed the Assyrians to storm and sack enemy cities and conquer the largest empire in history up to that time.

This also had the effect making cities less secure from attack and leading to an intensification of warfare. When people started replacing sun-dried with much harder oven-baked bricks or masonry for their fortifications, the balance swung back in favor of defense.

Talk About Respect

Just how well respected were kings back then? Consider this letter from the ruler of Tyre to his overlord:

“To the king, my lord, my god, my sun: A message of your servant Abi-milki of Tyre): Seven times and again seven times I prostrate myself at the feet of Your Majesty—I, the dust under the sandals of Your Majesty. My lord is the sun (god) who rises over all the countries, day after day, according to the ordinance of the sun god his gracious father, whose sweet breath gives life and (which one) craves when he is hiding, who makes the entire country rest under (the protection) of his mighty arm; who thunders in the sky like the storm god so that the entire country trembles at the sound of him.

“This is the message of a slave to his master after he had heard what the kind messenger of the king (said) to his servant upon arriving here, and (felt) the sweet fragrance that came out of the mouth of Your Majesty toward his servant. And he was craving the king’s fragrance before the arrival of the messenger of Your Majesty. How should one not crave for a fragrance, which one’s nose remembers (so well)? And

indeed, I was extremely glad when the fragrance of the king wafted towards me and there was a festival every day because I was so glad...

“You are the sun that rises above me and the wall of bronze that towers (around me). And for this very reason and on account of the mighty arm of Your Majesty, I rest secure....”

From *Letters from Mesopotamia*, translated and edited by A. Leo Oppenheim, University of Chicago Press, 1967.

Babylon: The Queen of Cities

The Greek historian, Herodotus, has given us a second hand description of Babylon at its height. Even taking into account that Herodotus exaggerated a bit, we get a picture of a marvelous city. The Euphrates River split the city into two halves that were connected by a 400-foot long masonry bridge. A massive double set of walls protected the city from invaders and floods. Herodotus claimed a four-horse chariot could drive on top of the battlements and have enough room to turn around!

The main ceremonial gateway was the beautiful Ishtar Gate. It was made of blue glazed bricks and decorated with relief sculptures of various animals. The palace complex covered thirteen acres and supposedly had the famous Hanging Gardens of Babylon. Their purpose was to comfort a queen who was homesick for the lush hills of her homeland. Finally, there was the fabled Tower of Babel, the largest and most elaborate ziggurat of its day. It was eight stories high and, according to Herodotus, the sanctuary on top was filled with tons of gold.

Women's Legal Status in Assyria

The low status of women in ancient Mesopotamia is reflected from the following excerpts from the Code of the Assyrians.

I.2. If a woman, whether the wife of a man or the daughter of a man, utter vulgarity or indulge in low talk, that woman bears her own sin; against her husband, her sons, or her daughter they shall have no claim.

I.7. If a woman bring her hand against a man, they shall prosecute her; 30 *minas* of lead shall she pay, 20 blows shall they inflict on her.

I.8. If a woman in a quarrel injure the testicle of a man, one of her fingers they shall cut off. And if a physician bind it up and the other testicle which is beside it be infected thereby, or take harm; or in a quarrel she injure the other testicle, they shall destroy both of her eyes.

I.9. If a man bring his hand against the wife of a man, treating her like a little child, and they prove it against him, and convict him, one of his fingers they shall cut off. If he kisses her, his lower lip with the blade of an axe they shall draw down and they shall cut off.

I.12. If the wife of a man be walking on the highway, and a man seize her, say to her "I will surely have intercourse with you," if she be not willing and defend herself, and he seize her by force and rape her, whether they catch him upon the wife of a man, or whether at the word of the woman whom he has raped, the elders shall prosecute him, they shall put him to death. There is no punishment for the woman.

I.13. If the wife of a man go out from her house and visit a man where he lives, and he have intercourse with her, knowing

that she is a man's wife, the man and also the woman they shall put to death.

I.14. If a man has relations with the wife of a man either in an inn or on the highway, knowing that she is a man's wife, according as the man, whose wife she is, orders to be done, they shall do to the adulterer. If not knowing that she is a man's wife he rapes her, the adulterer goes free. The husband shall prosecute his wife, doing to her as he likes.

I.15. If a man catch a man with his wife, both of them shall they put to death. If the husband of the woman put his wife to death, he shall also put the man to death. If he cut off the nose of his wife, he shall turn the man into a eunuch, and they shall disfigure the whole of his face.

I.16. If a man has relations with the wife of a man at her wish, there is no penalty for that man. The man shall inflict upon the woman, his wife, the penalty he wishes.

I.18. If a man says to his companion, "They have had intercourse with the wife; I will prove it," and he be not able to prove it, and does not prove it, on that man they shall inflict forty blows, a month of days he shall perform the king's work, they shall mutilate him, and one talent (66 pounds) of lead he shall pay.

I.20. If a man has intercourse with his brother-in-arms, they shall turn him into a eunuch.

I.21. If a man strike the daughter of a man and cause her to drop what is in her, they shall prosecute him, they shall convict him, two talents and thirty *minas* of lead shall he pay, fifty blows they shall inflict on him, one month shall he toil.

I.26. If a woman be dwelling in the house of her father, and her husband has died, any gift which her husband settled upon her---if there be any sons of her husband's, they shall receive it. If there be no sons of her husband's she receives it.

I.32. If a woman be dwelling in the house of father, but has been given to her husband, whether she has been taken to the house of her husband or not, all debts, misdemeanors, and crimes of her husband shall she bear as if she too committed them. Likewise if she be dwelling with her husband, all crimes of his shall she bear as well.

I.35. If a woman, who is a widow, enters into the house of a man, whatsoever she brings with her---all is her husband's. But if a man enters in to a woman's home, whatsoever he brings---all is the woman's.

I.37. If a man divorces his wife, if he wish, he may give her something; if he does not wish, he need not give her anything. Empty shall she go out.

I.40. If the wives of a man, or the daughters of a man go out into the street, their heads are to be veiled. The prostitute is not to be veiled. Maidservants are not to veil themselves. Veiled harlots and maidservants shall have their garments seized and 50 blows inflicted on them and bitumen poured on their heads.

I.46. If a woman whose husband is dead on the death of her husband does not go out from her house, if her husband did not leave her anything, she shall dwell in the house of one of her sons. The sons of her husband shall support her; her food and her drink, as for a fiancé whom they are courting, they shall agree to provide for her. If she be a second wife, and have

no sons of her own, with one of her husband's sons she shall dwell and the group shall support her. If she has sons of her own, her own sons shall support her, and she shall do their work. But if there be one among the sons of her husband who marries her, the other sons need not support her.

I.47. If a man or a woman practices sorcery, and they be caught with it in their hands, they shall prosecute them, they shall convict them. The practicer of magic they shall put to death.

I.50. If a man strike the wife of a man, in her first stage of pregnancy, and cause her to drop that which is in her, it is a crime; two talents of lead he shall pay.

I.51. If a man strike a harlot and cause her to drop that which is in her, blows for blows they shall lay upon him; he shall make restitution for a life.

I.52. If a woman of her own accord drop that which is in her, they shall prosecute her, they shall convict her, they shall crucify her, they shall not bury her. If she dies from dropping that which is in her, they shall crucify her, they shall not bury her.

I.55. If a virgin of her own accord give herself to a man, the man shall take oath, against his wife they shall not draw nigh. Threefold the price of a virgin the ravisher shall pay. The father shall do with his daughter what he pleases.

I.58. Unless it is forbidden in the tablets, a man may strike his wife, pull her hair, her ear he may bruise or pierce. He commits no misdeed thereby.

CYCLES OF THE NILE AND THEIR IMPACT ON ANCIENT EGYPT

"Hail to thee, O Nile, that issues from the earth and comes to keep Egypt alive! When he rises, then the land is in jubilation, then every belly is in joy."

Egypt was the scene of the other great hydraulic or river civilization of the ancient Near East. Like its Mesopotamian counterpart, it evolved in a hot dry river valley that required irrigation which in turn required organization and a strong government that led to civilization. In fact, Egyptians depended so much on the irrigation and the high level of organization and authority needed to maintain it that they considered their rulers, the pharaohs, gods. The power and effectiveness of these god-kings corresponded directly to Egypt's prosperity, which itself depended on the floods' regularity and the effectiveness of the irrigation system.

All rivers flow down. Egyptian soldiers, having never seen any river but the Nile, described the Euphrates as "in flowing north it flowed south". Similarly, coming from a desert climate where the Nile was the only source of water, they described rain as "the Nile falling from the sky."

However, Egypt, unlike Mesopotamia, which had no natural barriers and was open to attack, was isolated by desert to the east and west and the Mediterranean Sea to the north. As a result, its history was relatively peaceful compared to Mesopotamia's, allowing the Egyptians to build a strong centralized state without external disruptions. Egypt's more peaceful environment tended to make the Egyptians optimistic about life, but also suspicious of strangers and new ideas.

More than anything else, the Egyptians realized quite well that their prosperity and welfare depended on the Nile which provided its people with most of what they needed to survive: fish and wildlife, mud for building materials, a "highway" for easy transportation, and papyrus for paper. Most importantly, the Nile floods annually from June to October, watering the ground and replenishing the soil with a rich fertile layer of silt.

The Egyptians called their land *kmt* ("the Black land") after this layer of silt. The real essence of Egypt consisted of a long thin strip of land along the Nile that was never more than a few miles wide. Outside of this strip was the "Red land", the desert. Today one can still stand literally with one foot in the "Black land" and one foot in the "Red land". To the ancient Egyptians, this symbolized the sharp contrast between life and death.

The Egyptian peasant's yearly schedule revolved around the Nile's cycle. During the flood season, he might work on the pharaoh's projects, such as pyramids. When the floods subsided, he would repair any damage to his home and the irrigation canals and then plant his crops. Harvest time would come in time to gather the crops right before the Nile flooded, and the cycle would start all over again.

Egyptian history overall followed a basic cycle corresponding to and ruled by the Nile's flood cycles. Regular floods led to prosperous agriculture, which would increase the pharaoh's tax revenues and his status in the eyes of his subjects who saw him as responsible for the floods as well as irrigation. As a result, his power and the ability to control the local governors and priests in the various city-states (*nomes*) stretched out along the length of the Nile River valley would grow. Pharaoh's increased authority would bring the irrigation system under even tighter and more efficient control, which would further improve Egypt's agriculture and prosperity. This cycle would keep repeating itself as long as regular floods continued.

However, when irregular floods started, the cycle would reverse itself. The agriculture would decline, lowering the pharaoh's tax revenues and discrediting him in the eyes of his subjects. His power and status would decline, as would his control over the provincial governors and priests. As they got increasingly out of control, the efficiency of the irrigation system would decline, further damaging the agriculture and so on. This cycle would also keep repeating until regular floods would return, and the first part of the cycle would start over.

As a result, Egypt's history is divided into six periods whose prosperous times corresponded roughly to regular floods of the Nile and whose troubled times corresponded to periods when the Nile's annual floods were either too high or too low:

The Old Kingdom (c.2850-2150 B.C.E.)
Regular floods (c.3000-2250 B.C.E.)
The First Intermediate Period (c.2190-2052 B.C.E.)
Low floods (c.2250-1950 B.C.E.)
The Middle Kingdom (c.2052-1778 B.C.E.)
Regular floods (c.1950-1840 B.C.E.)
The 2nd Intermediate Period (c.1778-1570 B.C.E.)
High floods (c.1840-1770 B.C.E.)
The New Kingdom (c.1570-1085 B.C.E.)
Regular floods (c.1770-1170 B.C.E.)
The Final Decline (c.1085-525 B.C.E.)
Low floods (c.1170-1100 B.C.E.)

The Papyrus Trail

Papyrus was an all purpose resource that was even used as medicine. However, its popularity as a writing medium (as opposed to cumbersome clay tablets) nearly drove it to extinction in Egypt. In recent decades it has been revived, but limited amounts of paper are made from it, and those just for its historical significance.

Paper was made by laying down a layer of papyrus reeds crosswise on a second layer and then pounding it with a mallet to make the fibers adhere to one another. If you hold a piece of papyrus up to the light, you can see the two layers.

When the Arabs brought back the Chinese invention of paper in the eighth century C.E., it replaced papyrus as a writing medium, being much cheaper to produce and smoother to write on. At that time, the paper was made from soaking rags into a pulp, instead of wood.

It's not Nice to Fool Mother Nature: The Aswan Dam

In the 1960s, the Russians helped build the Aswan Dam to provide Egypt with hydroelectric power. It was a disaster in several ways. For one thing it buried in water a number of valuable archaeological sites. It also blocked the flow of silt downriver, so they had to build an artificial fertilizer plant. By blocking the annual replenishment of the soil by silt from the

Nile, it has contributed to soil erosion and over-irrigation, which brings salt to the surface. Finally, by slowing the flow of the Nile, it allowed the profusion of a snail carrying a hookworm that infected peasants' bloodstream with a chronic disease called Schistosomiasis, which damages internal organs and impairs children's growth and cognitive development.

As the old commercial said, "It's not nice to fool Mother Nature."

EGYPT'S OLD AND MIDDLE KINGDOMS

The Old Kingdom (c.2850-2190 B.C.E.).

Egyptian civilization started much as Mesopotamian civilization did, with the rise of independent city-states, called *nomes*, organized around irrigation projects. These city-states often fought each other for land and power. Bit by bit, different nomes absorbed each other in these wars until there were only two kingdoms left: Upper Egypt in the south, and Lower Egypt in the north. Finally, a king of Upper Egypt, known variously as Menes or Narmer, conquered Lower Egypt and united the land. Soon afterwards, the period of Egyptian history known as the Old Kingdom began. Generally, during periods of prosperity such as the Old Kingdom, Egypt would be united under one pharaoh. However, during times of turmoil, it would split back into Upper and Lower Egypt until a strong ruler reunited the land.

The Old Kingdom was a peaceful and prosperous period. It was also the great age of building pyramids, massive tombs to preserve and protect the dead for the afterlife. Tied in with this was the involved and expensive process of mummification, which preserved the body for the next world. Contrary to popular belief, the pyramids were not built using slave labor, but rather the labor of peasants who were free for such work during the flood season. At this time, the pharaoh was seen as a god who embodied all of Egypt and was the only one entitled to an afterlife. However, Egyptian peasants could feel that they were sharing in some of that afterlife by working on the pyramids. Pyramid building also provided peasants with employment and some income from the pharaoh during the flood season when they could do little else anyway.

Better than human sacrifice. Since the Egyptians saw the afterlife in terms of this one, they made thousands of figurines, called *usaebtis*, to come to life and serve them in the next world.

Below: Shabti in the British Museum

There were about eighty of these monumental structures built. The largest of these, the Great Pyramid at Gizeh, contained some 2.3 million limestone blocks, each weighing several tons. Even in the best of times, building such structures would be a huge burden on the economy. In times of low floods, such as started around 2250 B.C.E., the strain proved to be too much. As a result, the Old Kingdom went into a period of decline.

The First Intermediate Period (2190-2052

B.C.E.). There were several reasons for this decline. The huge cost of the pyramids coupled with low floods and the resulting poor crops have already been mentioned. There were also religious, economic, and political factors. Since the pharaoh mainly worshipped Re, the sun god, at Heliopolis, the priests of Re gained power and prestige. Eventually, they undermined the divinity and status of the pharaoh himself, referring to him merely as the "Son of Re". The pharaohs' status also diminished because they often married women of non-royal blood, which made them seem closer to the people and less god-like.

Besides the economic strain of building pyramids and maintaining priests for the benefit of previous pharaohs, the royal treasury also suffered from giving out lands to various priesthoods and nobles. Consequently, they could establish their positions more independently of the pharaoh. The king's officials ruling the different nomes were often of royal blood themselves. Many of them established hereditary positions in their nomes, passing the governorships on to their sons. In time, they became virtually independent rulers, splitting Egypt up into a number of separate city-states. Symbolic of the pharaoh's decline was the fact that these governors started claiming afterlives for themselves, building their own tombs in their home provinces rather than in the shadow of the pharaoh's pyramid.

As often happens, decline bred further decline. The poor harvests hurt the pharaohs' power and prestige since they were supposedly responsible for good crops. This bred turmoil and civil war, further weakening the agriculture and economy. Nubian tribes from the south and Libyans from the western desert seized the opportunity to raid and add to this anarchy. Contemporary accounts reflect this situation. "The dead are thrown in the river...Laughter has perished. Grief walks the

land." According to one Egyptian historian, "Seventy kings ruled for seventy days." The truth is that for nearly two centuries no king ruled all of Egypt. Five dynasties are listed from this period, but none of them could control more than just part of the land.

The Middle Kingdom (2052-1778 B.C.E.).

Eventually, a strong dynasty arose around the city of Thebes in the south and reunited Upper and Lower Egypt in 2052 B.C.E. The new pharaohs faced three major problems in restoring order to Egypt: powerful local governors, the powerful priesthood of the sun god Re, and agricultural turmoil. The new pharaohs replaced local governors with their own men and rotated them occasionally so they could not establish their power in one area. They also created many of their officials from the middle class of artisans and traders. These men would depend on the pharaoh for their positions since they were from humble origins. As a result, they would be more obedient to the pharaoh.

The priests of Re were dealt with by replacing Re with Amon, the patron god of Thebes, as the main state deity. This broke the power of one priesthood by putting another less threatening one in its place. However, over time the priests of Amon would gather huge amounts of land and power into their own hands, controlling an estimated thirty percent of Egypt's real estate by the time of the New Kingdom.

Agriculture and prosperity revived as the pharaohs repaired the complex irrigation system that the Egyptian peasants relied on. One major engineering project was the restoration of Lake Moeris in the desert west of the Nile Delta. Over the years the channel feeding this lake had silted up, causing the lake to dry up. In the Middle Kingdom, the channel was dredged, the lake was restored, and new farmland was developed around it. The lake also served as a reservoir since its channel could be opened up or blocked off in times of high or low floods respectively.

The Middle Kingdom also saw Egyptian power expand beyond its borders. During the Old Kingdom, no major enemies threatened Egypt's security. As a result, the pharaohs had been content to stay mostly within Egypt's borders along the Nile, just safeguarding their gold supply from Nubia to the south and the copper mines in the Sinai

Desert to the east from nomadic raiders. The pharaohs of the Old Kingdom had not even kept a permanent standing army, relying on civil officials to lead peasant recruits whenever campaigns were necessary.

The anarchy of the First Intermediate Period changed that a bit. The rulers of the Middle Kingdom extended Egypt's power southward into Nubia. This land was important to Egypt as its primary source of gold and had been loosely controlled during the Old Kingdom. Now the pharaohs built a string of massive fortresses along the Nile in Nubia to secure their hold over it. Egypt's influence was also felt to the northeast in Palestine in order to protect its copper mines in the Sinai. Its control here was not nearly as tight as it was over Nubia, which the Egyptians saw as especially vital to their interests.

This period also saw Egyptian trade with the outside world increase in importance. Commercial contacts extended to Cyprus for bronze and copper, Phoenicia for cedar wood, the Minoan civilization on Crete for pottery, and the legendary land of Punt (probably the Somali coast of East Africa) for incense.

Culturally, the Middle Kingdom was a golden age in Egyptian history. Art (especially statuary and jewelry) and literature reached a high point of development. In architecture, pyramids were still built, but not on the grand scale of the Old Kingdom. A burial complex known as the "Labyrinth" was built. It had some 3500 burial chambers and was meant to stop grave robbers with its bewildering complexity rather than with a pyramid's mass. Unfortunately, neither method succeeded in foiling the thieves, and only one tomb from 2500 years of Egyptian history, that of Tutankhamen, escaped being looted. When the Greek historian Herodotus saw the Labyrinth, it was more than just ruins, and he claimed it was more impressive than the pyramids.

Fun Facts About Pyramids

The evolution of the pyramid. The Egyptians believed that in order to have an afterlife, their bodies must be preserved so their *ba* and *ka* (spiritual and physical doubles) could recognize them. Part of this process involved mummifying their bodies. The other part was building a tomb to

protect and preserve their mummified bodies. The first tombs were simple Mastaba tombs in the ground, which were adequate for preserving the bodies in Egypt's hot dry climate. But, since the tombs also held riches to accompany the person into the afterlife, they were also vulnerable to plundering.

The response to plundering was to build pyramids, massive structures with secret passages to the tomb that would foil grave robbers. The earliest pyramids were step pyramids such as this one at Saqqara.

- *The causeways* leading from the Nile to the three Great Pyramids are aligned according to the sunrise of the equinoxes and the summer and winter solstices. The causeway going to the largest pyramid (Khufu) is off of due west by about 14 degrees to north, corresponding to the summer solstice. Similarly, the causeway to the second pyramid (Khafra) is off of due west by about 14 degrees to south, corresponding to the winter solstice, while the causeway to the smallest pyramid (Menkaure) goes due west, corresponding to the spring and fall equinoxes.

- **Finding true north.** The Egyptians believed they had to align their pyramids to true north. To find this, they would erect a circular wall. They would stand in the center of the circle and draw a line to the point of the wall over which a star rose in the east and another line where to where set in the west. By simply bisecting the angle formed by those two lines they had true north.

- Until the Arabs started tearing them off, the Great Pyramid was covered with white 15-ton blocks known as casing stones that were polished flat to an accuracy of 1/100th of an inch to make the pyramid seem to be one giant gleaming stone. This produced an even more impressive and beautiful sight that, according to one theory, reflected light so brightly it could be seen from the moon. They were placed with an accuracy of 5/1000ths of an inch, leaving an intentional gap of about 2/100ths of an inch for adding mortar.

- The Great Pyramid is the only pyramid whose sides are slightly concave and to have airshafts and chambers above ground level.

- *Chariots of the Gods?* The scale of the pyramids has inspired various theories by people such as Erich von Däniken about them being built by aliens from space, since the primitive tools the Egyptians had hardly seem adequate for completing such projects. Some years back, the PBS science show put these assumptions to the test by challenging a group of Egyptian peasants to cut out and transport a 2-ton stone in the time necessary for multiple work crews to cut and transport 2.3 million similar stones. Long story short: they did it.

- Getting stones to the top of such a huge pyramid as it progressively narrowed was another problem to solve. Smaller pyramids and the early stages of building the Great Pyramid could use a wide dirt ramp directly approaching the structure. However, as the Great Pyramid grew too high, one such approach ramp would either be too long or too steep to make the grade. A likely solution was to build a spiral ramp using the outer edge of the completed section to wind up and around the pyramid.

Egyptian Fairy Tales and Proverbs

Talk about imagination. Egyptian folk tales put our ideas about dragons and witches to shame, when talking about wild imagination. Consider the Tale of the Two Brothers, Anubis and Batu. Keep in mind, as with any folk tales in any culture, this might have been passed by word of mouth for centuries before being written down. During that time, hundreds of version might evolve. This is one version.

One day, Anubis' wife tries to seduce his brother, Batu, but (like Joseph) he turns her down. So she tells Anubis that Batu tried to rape her, and he waits in the barn to kill Batu when he returns with the cows. Luckily, the lead cow can talk and says "Look, your elder brother is waiting with his spear to kill you." Batu flees.

Eventually, Anubis learns the truth, kills his wife and throws her to the dogs. Meanwhile, Batu goes to Lebanon and puts his heart in the top of a pine tree and arranges with Anubis to put it in a bowl of cool water if evil ever befalls him.

In Lebanon, the gods make Batu a beautiful wife. However, the sea carries a lock of her hair to Egypt and, as often happens, its scent gets mixed in with pharaoh's laundry, and he falls in love with her. He sends an expedition to find her, which convinces her to desert him for pharaoh and has the pine tree cut down, killing Batu.

Prompted by strange events at home (as if Lebanon is normal), Anubis seeks out his brother's heart and restores him to life. Batu changes himself into a bull to kill his unfaithful wife. She kills the bull, but his blood causes two trees to grow. When the wife hears of the trees, she cuts them down but swallows a flying splinter, making her pregnant, and Batu is reborn as the crown prince, who ascends the throne, judges his mother/wife and makes Anubis his successor. So that's where babies come from.

Egyptian proverbs. While people have always been fascinated and overawed by the Egyptian's accomplishments, such as the pyramids and mummies, their proverbs reveal an equally impressive side to their culture in terms of wisdom. Here is a selection written on temple walls:

*The kingdom of heaven is within you; and whosoever shall know himself shall find it.

*The best and shortest road towards knowledge of truth [is] Nature.

*For every joy there is a price to be paid.

*If his heart rules him, his conscience will soon take the place of the rod.

*What you are doing does not matter so much as what you are learning from doing it.

*If you search for the laws of harmony, you will find knowledge.

*Exuberance is a good stimulus towards action, but the inner light grows in silence and concentration.

*Not the greatest Master can go even one step for his disciple; in himself he must experience each stage of developing consciousness.

Therefore he will know nothing for which he is not ripe.

*The body is the house of God. That is why it is said, "Man know thyself."

*True teaching is not an accumulation of knowledge; it is an awakening of consciousness which goes through successive stages.

*The man who knows how to lead one of his brothers towards what he has known may one day be saved by that very brother.

*People bring about their own undoing through their tongues.

*If one tries to navigate unknown waters one runs the risk of shipwreck. Leave him in error who loves his error.

*Every man is rich in excuses to safeguard his prejudices, his instincts, and his opinions.

*To know means to record in one's memory; but to understand means to blend with the thing and to assimilate it oneself.

*There are two kinds of error: blind credulity and piecemeal criticism.

*Sound skepticism is the necessary condition for good discernment; but piecemeal criticism is an error.

*Love is one thing, knowledge is another.

*True sages are those who give what they have, without meanness and without secret!

*An answer brings no illumination unless the question has matured to a point where it gives rise to this answer which thus becomes its fruit.

*Therefore learn how to put a question.

*What reveals itself to me ceases to be mysterious for me alone: if I unveil it to anyone else, he hears mere words, which betray the living sense:

*Understanding develops by degrees.

*If the Master teaches what is error, the disciple's submission is slavery; if he teaches truth, this submission is ennoblement.

*There grows no wheat where there is no grain.

*An answer is profitable in proportion to the intensity of the quest.

*Listen to your conviction, even if they seem absurd to your reason.

*Know the world in yourself. Never look for yourself in the world, for this would be to project your illusion.

*To teach one must know the nature of those whom one is teaching. In every vital activity it is the path that matters.

*The way of knowledge is narrow.

*Each truth you learn will be, for you, as new as if it had never been written.

*The only active force that arises out of possession is fear of losing the object of possession.

*If you defy an enemy by doubting his courage you double it.

*The first thing necessary in teaching is a master; the second is a pupil capable of carrying on the tradition.

*Peace is the fruit of activity, not of sleep.

*Envious greed must govern to possess and ambition must possess to govern.

*When the governing class isn't chosen for quality it is chosen for material wealth: this always means decadence, the lowest stage a society can reach.

*Two tendencies govern human choice and effort, the search after quantity and the search after quality. They classify mankind.

Some follow Maat, others seek the way of animal instinct.

*Qualities of a moral order are measured by deeds.

*One foot isn't enough to walk with.

*Our senses serve to affirm, not to know.

*We mustn't confuse mastery with mimicry, knowledge with superstitious ignorance.

*Physical consciousness is indispensable for the achievement of knowledge.

*A man can't be judge of his neighbor's intelligence. His own vital experience is never his neighbor's.

*No discussion can throw light if it wanders from the real point.

*Your body is the temple of knowledge.

*Experience will show you, a Master can only point the way.

*A house has the character of the man who lives in it.

*All organs work together in the functioning of the whole.

*A pupil may show you by his own efforts how much he deserves to learn from you.

*Routine and prejudice distort vision. Each man thinks his own horizon is the limit of the world.

*You will free yourself when you learn to be neutral and follow the instructions of your heart without letting things perturb you. This is the way of Maat.

*Judge by cause, not by effect.

*Growth in consciousness doesn't depend on the will of the intellect or its possibilities but on the intensity of the inner urge.

*Every man must act in the rhythm of his time ... such is wisdom.

*Have the wisdom to abandon the values of a time that has passed and pick out the constituents of the future. An environment must be suited to the age and men to their environment.

*Everyone finds himself in the world where he belongs. The essential thing is to have a fixed point from which to check its reality now and then. Always watch and follow nature.

*All seed answer light, but the color is different. The plant reveals what is in the seed.

*Popular beliefs on essential matters must be examined in order to discover the original thought.

*It is the passive resistance from the helm that steers the boat. The key to all problems is the problem of consciousness.

*Man must learn to increase his sense of responsibility and of the fact that everything he does will have its consequences.

*If you would build something solid, don't work with wind: always look for a fixed point, something you know that is stable ... yourself.

*If you would know yourself, take yourself as starting point and go back to its source; your beginning will disclose your end.

*Organization is impossible unless those who know the laws of harmony lay the foundation.

*Knowledge is consciousness of reality. Reality is the sum of the laws that govern nature and of the causes from which they flow.

*Social good is what brings peace to family and society.

*Knowledge is not necessarily wisdom.

*By knowing one reaches belief. By doing one gains conviction. When you know, dare.

*Altruism is the mark of a superior being.

*All is within yourself. Know your most inward self and look for what corresponds with it in nature.

*The seed cannot sprout upwards without simultaneously sending roots into the ground.

*Grain must return to the earth, die, and decompose for new growth to begin.

*Man, know thyself ... and thou shalt know the gods.

EGYPT'S NEW KINGDOM AND DECLINE (1778-525 B.C.E.)

The Second Intermediate Period (1778-1570 B.C.E.). Around 1800 B.C.E., Egypt entered another period of decline. Once again, irregular floods, this time being too high, probably played a role in undermining the pharaoh's power and authority. A series of pharaohs, ending with the rare rule of a woman, Nitocris, marked the end of the Middle Kingdom and the beginning of another period of anarchy, the Second Intermediate Period.

Agricultural decline and political anarchy followed much the same pattern as during the First Intermediate Period, with Egypt splitting back into its upper and lower halves. One new factor added to the confusion: foreign invasion. A group of peoples known to the Egyptians as Hyksos, or "foreign kings", came thundering into Egypt with the horse drawn chariot and the more powerful composite bow. These new weapons allowed them to conquer Lower Egypt, although Thebes in the south remained independent under the priests of Amon. The Biblical Hebrews were probably not among the Hyksos invaders, but they probably entered Egypt during the time of Hyksos rule as reflected in the Biblical story of Joseph, a foreigner who rises to very high status in Egypt.

The Hyksos, like other nomadic invaders, adopted the ways of their civilized subjects. Their rulers used Egyptian titles and customs, wrote their names in hieroglyphics, and worshiped the Egyptian god Seth. They also used Egyptian officials and tried to maintain the administrative machinery. Still, Hyksos rule was a shock to the Egyptians. When rulers from Thebes finally drove them out, their attitude toward the outside world had been radically changed for the worse. The new era which dawned, the New Kingdom, would see the pharaohs actively pursue a policy of foreign conquest and empire building. Egypt's age of glory had arrived.

Noisy hippos. Supposedly, in order to humiliate the Egyptian ruler in Thebes 200 miles to the south, one Hyksos ruler, told him to give up his hippo pool because the animals' splashing kept him awake at night.

The New Kingdom (1570-1085 B.C.E.). Egyptian history is traditionally divided into thirty-one dynasties or ruling families. The most famous of

these are the eighteenth and nineteenth dynasties who established Egypt as a great imperial power in the Near East. The eighteenth dynasty in particular saw a succession of able rulers.

Amenhotep I (1545-1525 B.C.E.) spent much of his reign securing his realm against the desert tribes who had caused so much trouble during the recent period of turmoil. He realized that it was futile to try to hold the entire desert. Instead he seized various oases scattered throughout the Sahara along Egypt's flanks. This deprived the nomads of places from which to launch raids and refresh themselves. It also gave the Egyptians advanced bases so that they could intercept any nomads trying to slip through for raids.

Thutmose I (1525-1490 B.C.E.) was the pharaoh who really established Egypt's empire. He extended Egyptian power into Nubia once again. This meant Egypt controlled a thin strip of river valley some 1200 miles long. Thutmose also advanced into Palestine and Syria to protect Egypt against any "Hyksos" there. The various independent city-states there, such as Byblos and Ugarit, fell before the onslaught of the pharaoh's army, which fought its way all the way to the upper Euphrates River. There many of the Egyptian soldiers experienced rain for the first time, which they could only describe as "the Nile falling from the sky."

Egyptian rule in Palestine and Syria was more lenient than that of such peoples as the Assyrians and Babylonians. For one thing, any cities that fell to the pharaoh were considered the property of the gods (including pharaoh). As a result, they usually refrained from sacking cities since that would be a sacrilege. Some strategic or especially rebellious cities were left with Egyptian governors and garrisons. However, for the most part, the pharaohs left native rulers in power as long as they remained loyal to Egypt. Taking the sons of these rulers as hostages back to Egypt insured such loyalty. There they were educated in Egyptian ways so that by the time they assumed the reins of power, they saw things from a very Egyptian point of view.

After Thutmose I and the brief reign of his son Thutmose II, we encounter the first woman to make a major mark in history, Hatshepsut (1570-1560 B.C.E.). Technically, she was only a regent, or temporary ruler, for the young king, Thutmose III. However, she liked the feeling of power and decided to keep the throne for herself. Since the

Egyptian people probably would not take kindly to a woman's rule, she styled herself as a "king". Her statues sported a beard and obscured her more feminine features. Hatshepsut did not push her luck trying to lead the army, and her reign was generally peaceful as a result. The most famous event of her reign was a trading expedition to the exotic land of Punt, which brought back myrrh, incense, ivory, monkeys, and a panther.

All in the family. Egyptian royalty continued the ancient practice of brother-sister marriages, which probably originated in the early days of agriculture when men married their sisters to keep the farmland in the family. Therefore, Hatshepsut, whose marriage to her brother (Thutmose III's father) was childless, was Thutmose III's aunt, stepmother, and mother-in-law since he married her daughter.

Hatshepsut's peaceful reign was followed by that of the great warrior pharaoh, Thutmose III (1469-1436 B.C.E.). It is a tribute to Hatshepsut's ability that she had been able to keep this able young soldier under her thumb even after he came of age. The new king's frustration at having been kept from his rightful throne for so long was quickly shown by his having Hatshepsut's name erased from all public inscriptions and replaced either with his own name or those of his ancestors. Thutmose III spent much of his reign restoring Egyptian power in Syria and Palestine where it had slipped during Hatshepsut's less aggressive reign. He waged six campaigns there and another eleven against the Hurrians who had settled down to found the powerful kingdom of Mitanni. Much of this required long drawn out sieges, such as that of Megiddo, which lasted eleven months and involved building a wooden palisade and moat to completely cut the city off from outside help. Sometimes trickery was used. At the siege of Joppa, Egyptian troops supposedly got into the city by hiding in grain bags going in through the gates. At other times, the Egyptians found themselves involved in some pretty hard fighting.

Frisky horses. During Thutmose III's campaign in Palestine, his Canaanite opponents released a mare in an attempt to disrupt the stallions in his chariot corps.

Such extended campaigning so far from home forced the Egyptians to build a large professional army. Most recruits were Egyptians, but foreign mercenaries, and even captives of war made up

larger proportions of the army over time. The Egyptian army was divided into divisions of about 5000 men each. The infantry were armed either with bows and arrows or large shields and axes. The most illustrious branch of the army was the chariot corps, organized into groups of twenty-five chariots each. These were light two man chariots that would sweep in front of the enemy while firing arrows into their ranks to disrupt them. After several such passes, the infantry could move in to finish off the enemy. Egypt also developed a navy whose main purpose was to transport the army by sea between Egypt and Palestine, a much easier trip than marching through the Sinai Desert.

Thutmose III's three successors, Amenhotep II, Thutmose IV, and Amenhotep III, ruled Egypt for some seventy years. They were all able warriors and generals, and maintained Egypt's power in the Near East. However, they added little or nothing to the empire, probably feeling it was already about as big as they could effectively rule.

Egypt at the height of its power and glory must have been a fascinating place to visit. Wealth poured into its treasury, allowing the pharaohs to build the massive temples of Karnak and Thebes, the magnificent tombs cut out of cliffs in the Valley of the Kings along the Nile, and gigantic statues of themselves, some of them up to sixty-five feet in height. Another popular kind of monument was the obelisk, or needle. This was a tall thin piece of granite, carved into a pyramid shape at the top. This peak was then covered with gold to reflect the brilliance of the sun god to whom it was dedicated. The Washington Monument is in the form of an obelisk, although it is not made out of a single piece of stone.

Egypt's cities also reflected the influx of wealth and new peoples that its empire brought in. Thebes, the capital, was especially renowned for its wealth and splendor. Even the Greek hero, Achilles, in the great epic of the Trojan War, *The Iliad*, mentions "Egyptian Thebes, the world's great treasure house...Thebes with its one-hundred gates where two-hundred men issue from each gate with horses and chariots." The influx of foreign peoples also meant an influx of foreign ideas, which may have influenced the pharaoh, Amenhotep IV, known to us as Akhenaton.

The reign of Akhenaton (1370-1353 B.C.E.) was a turning point in Egyptian history. Originally, this

new ruler was named Amonhotep in honor of Amon, the primary state god. However, he changed his name to Akhenaton in honor of Aton, the sun god, whom he wanted his people to worship instead. Why he wanted to change the religion is a matter of dispute. Some people think he was influenced by the simpler religious beliefs of his wife, a princess from Mitanni, or even the Hebrews, then captive in Egypt. Others see a more practical motive: trying to break the power of the priests of Amon, who had gradually gathered huge amounts of land and power into their hands over the last 700 years. Some historians estimate that they owned about thirty percent of all the land in Egypt by Akhenaton's reign. This was tax-free land, which deprived the pharaohs of money and created a growing threat to their own power. This in itself would have been enough motive to change the religion, although purer religious motives may have been mixed in as well. It also shows the importance of religion to a society that feels so helpless before the forces of nature.

A lucky accident. After only fifteen years of occupancy, Akhenaton's new capital, Amarna, was abandoned and taken down "pillar and post". Since it was occupied for only a short time, a hill (known as a tel) didn't form over it as with other sites that were continuously occupied and rebuilt over the centuries. It was discovered purely by chance when an angry Egyptian woman pelted a British tourist with "rocks" that, upon closer inspection, turned out to be clay tablets holding official records from the reign of Akhenaton.

Contrary to popular imagination, Akhenaton did not create a monotheistic religion worshipping only one god. Instead, he made Aton the primary focus of worship in Egypt, with the royal family worshipping him for all of Egypt's benefit. This eliminated the need for any extensive priesthood, which certainly angered the priests of Amon. They in turn played upon people's fears of what would happen if the old gods who had protected Egypt for so long were neglected. In a traditional society such as Egypt, these fears were a powerful force to overcome. Akhenaton tried to escape these problems by moving the capital from Thebes, the center of Amon's worship, to a new city, Tell-el-Amarna, dedicated to Aton. In the end, Akhenaton's experiment failed and barely outlived

him. The nine-year-old Tutankhaton, better known to us as Tutankhamon after he changed his name to please the old state deity, Amon, and his powerful priests, succeeded him. Ironically, Tutankhamon is the best known of the pharaohs, although he was probably just a puppet of the resurgent priests of Amon and died before he was even old enough to rule on his own. However, it was his tomb alone that was destined to survive the ravages of grave robbers and give us a clue to the wealth and splendor of Egypt at its height.

The internal turmoil caused by Akhenaton's reforms and the reaction against them weakened Egypt's hold on its empire and brought its golden age and the eighteenth dynasty to an end. The empire did experience a revival under the nineteenth dynasty founded by Ramses I (1304-1303 B.C.E.). By now, Egypt's main rival for power in the Near East, the kingdom of Mitanni, had been replaced by an even more dangerous power, the Hittite empire. Once again, the pharaoh's chariot corps rolled northward to defend Egypt's interests. Seti I (1303-1290 B.C.E.) met the Hittites and defeated them, but they still remained a power in Palestine.

Seti's successor, Ramses II (1290-1223 B.C.E.), took up the struggle and met the Hittites at Kadesh, one of history's great chariot battles. After being routed by a Hittite surprise attack, Ramses rallied his troops and struck back at the Hittites who had stopped to loot the Egyptian camp. The battle ended basically as a draw that led to a peace treaty and marriage alliance between the two powers. It is remarkable that, after such bitter fighting, the Egyptian and Hittite empires settled down to a peaceful co-existence that lasted until the fall of the Hittite Empire around 1200 B.C.E. At one point, Egypt even sent grain to the Hittites during a famine.

Ramses II was the last Pharaoh to see Egyptian power at its height. After his death, Egypt entered a period of slow but steady decline. The first major shock to its power was the invasion by a mysterious people known to us only as the Sea Peoples. Who they were is not exactly clear, but some of them seem to have come from the area of the Aegean Sea around Greece.

Their path of conquest followed the Eastern coast of the Mediterranean. The Hittite Empire crashed down in ruins before their onslaught and disappeared from history. Syria and Palestine were

hit next as the Sea Peoples passed on to Egypt where the first recorded naval battle in history was fought. The Egyptians won, but it took a tremendous effort that sapped their strength. The *Peleset*, as the Egyptians called the Sea Peoples, made their way to Palestine (which gets its name from them), settled down, and became the Biblical Philistines. This period may also be the time of the Exodus when the Israelites made good their escape from Egypt to the Promised Land.

Final decline (c.1085-525 B.C.E.). By 1085 B.C.E., Egypt was clearly in decline. It had lost its possessions in Palestine to the Philistines and Israelites, while revolts and raids in Nubia were destroying its grip on that vital part of its empire. It also suffered from various internal problems. For one thing, low floods had damaged its economy and weakened its ability to recover from other troubles. For another thing, the powerful priesthood of Amon was a greater threat than ever to the pharaoh's power, especially after Akhenaton's attempt to destroy them had soured relations between king and priests. Finally, the increased reliance on foreign mercenaries created problems since the pharaohs often did not have the money to pay them. This made the troops restless and put the pharaohs into a very dangerous position.

Egypt's internal troubles added to the problems outside its borders. In 940 B.C.E., a Libyan general by the name of Sheshonk forced his way into the royal family through marriage, overthrew his in-laws, and founded the twenty-second dynasty. Around 750 B.C.E., Nubians coming up from the south founded another foreign dynasty, the twenty-fifth. The fact that these foreign rulers had absorbed Egyptian culture can be seen in the pyramids that the Nubians built in their kingdom of Kush to the south.

Egypt was destined to fall under the rule of other peoples even less friendly to its civilization. In 652 B.C.E., the Assyrian king, Ashurbanipal, conquered Upper and Lower Egypt. Although the Egyptians drove the hated Assyrians from their land a few years later, their freedom was short-lived. In 525 B.C.E., the Persian king, Cambyses, overwhelmed any resistance to his armies and took over the Egyptian kingdom. It is at this point that we can say that the age of the pharaohs came to an end, as a long succession of Persian, Macedonian, Roman, Arab, Turkish, and British powers would rule it for the next 2400 years. Not until the modern era

would a native Egyptian again rule over the Gift of the Nile.

Obelisks, Tombs, and Grave Robbing
Down through the centuries, visitors and conquerors, fascinated by Egyptian civilization, have taken home various souvenirs, among them most of its major obelisks. As a result, obelisks grace such cities as Rome, Paris, and even New York City's Central Park. The one in New York is called Cleopatra's needle, although it was actually erected by Hatshepsut some 1400 years before Cleopatra's reign. The Temple of Hatshepsut Obelisk at Karnak, which is 97 feet high and weighs 323 tons

Valley of the Kings. In an effort to foil grave robbers, pharaohs during the New Kingdom were buried in tombs at the end of long tunnels dug out of cliffs along the Nile in what is known as the Valley of the Kings (above). One tomb was placed 320 feet underground at end of a 700-foot tunnel. Unfortunately, of the sixty royal tombs buried this way in these cliffs, only that of a minor pharaoh, known as Tut, escaped being totally ransacked, largely because rubble from a later grave covered its entrance. Even so, Tut's tomb had been broken into twice, although grave robbers were apparently scared off by authorities before they could loot it.

Grave robbing Egyptian style. Typically, grave robbers would tunnel into a tomb from behind to keep from alerting guards with broken seals on the door so they could come back later if they wanted. They then broke open stone sarcophagi,

hacked the gilding from coffins, tore mummies apart for jewelry, and sometimes set the tomb on fire, so they could scrape the melted gold off the floor. Grave robbing released into circulation large amounts of gold that had been hoarded by the pharaohs. Unfortunately, the sudden release of so much precious metal into circulation wreaked havoc with Egypt's economy by triggering inflation.

Holding an Empire

Conquering and maintaining an empire involved extended campaigning far from home, which in turn required a large professional army. Most recruits were Egyptians, but foreign mercenaries, and even captives of war made up larger proportions of the army over time. The Egyptian army was divided into divisions of about 5000 men each. The infantry were armed either with bows and arrows or large shields and axes.

The most illustrious branch of the army was the chariot corps, organized into groups of twenty-five chariots each. These were light two man chariots that would sweep in front of the enemy while firing arrows into their ranks to disrupt them. After several such passes, the infantry could move in to finish off the enemy.

Each Egyptian chariot had a runner behind it to protect and tend wounded comrades and help the chariot crew get out of any tough spots, such as ruts.

This type of warfare with a narrow aristocratic elite fighting from expensive horse-drawn chariots dominated fighting in the Middle East and paralleled the social structure of ancient Middle Eastern societies. Since only kings and nobles could fight this way,

they virtually monopolized the use of force, thus giving them tighter control of society. Not until the much cheaper and plentiful iron technology came along, most notably in Greece, would lower classes be able to dominate warfare and then politics.

Chariots, with their thin wheels, were easily broken by rough ground and might have to be carried when an army was on the march. The wheels often had to be removed when not in use, or else they would gradually warp from the weight. Mycenaean Greek inventories record a huge stockpile of chariot wheels, sort of the Tire Barn of the ancient world.

Egypt also developed a navy whose main purpose was to transport the army and supplies by sea between Egypt and Palestine, a much easier trip than marching through the Sinai Desert.

From the Egyptian perspective, Nubia in the south with its plentiful gold deposits, was actually more important than Palestine. Whereas the Egyptians were generally content to rule the coastal cities of the north with vassal kings, they directly ruled Nubia, holding it with huge forts, such as that of Buhen (below).

The Hittite Empire

Egypt's main rival for dominance of Syria and Palestine was the mysterious Hittite Empire. Until the 19th century, the only clues people had to the existence of the Hittites were a few vague references, such as one in the Bible to an officer of King David's. Then European travelers started discovering markers referring to the Hittites scattered across Asia Minor (aka Turkey). Bit by bit they pieced together the existence of an empire that dominated most of present-day Turkey rivaled Egypt in power.

The Hittites were one of a number of peoples, like the Hyksos and Kassites, coming down from the North with the deadly combination of the composite bow with the horse-drawn chariot. The composite bow consisted of a mixture of wood and horn, giving it much more power and range than the wooden bow used to this point. It had a maximum range of about 250 meters and was powerful enough to tear through bronze armor. On each side of a chariot was a quiver with 30-40 arrows, suggesting its primary use was as a mobile firing platform for soldiers armed with the composite bow.

The arrival of the Hittites and other nomads around 1700 B.C.E created a great upheaval throughout the Middle East. The Hittites sacked Babylon in 1595 B.C.E, although leaving it to another group of nomads, the Kassites, to dominate Mesopotamia for several centuries. Meanwhile, the Hyksos conquered Lower Egypt, thus spreading the use of the composite bow and horse and chariot to the Egyptians, who would later use this technology against the Hittites in battle, using them.

A model of how Hattusas probably appeared at its height

Hittite rule was relatively moderate, their legal system emphasizing compensation to victims more than punishment of criminals. Women also had a relatively high status compared to their counterparts in Mesopotamia.

Hittite chariots were bigger and stronger than those of Egypt and other peoples, holding three men instead of just two. They may have been used as shock weapons to ram their flimsier opponents.

The Hittites would vanish as suddenly and mysteriously as they arrived when, around 1200 B.C.E., a new upheaval of peoples in the Eastern Mediterranean would bring their empire crashing down, to remain all but forgotten for 3,000 years.

The Sea Peoples

Among the various problems Egypt faced around 1200 B.C.E. were invasions by the so-called Sea Peoples who suddenly burst upon the scene in the north, sacking cities and empires throughout the Eastern Mediterranean. most notably the Hittites. Who they were is still a matter of

conjecture, but they seem to have been a mixture of different peoples who joined together for these invasions.

As the Pharaoh Ramses III who met and defeated them recorded:

"The foreign countries made a plot in their islands. Dislodged and scattered by battle were the lands all at one time, and no land could stand before their arms, beginning with Khatti [1], Kode [2], Carchemish [3], Arzawa [4], and Alasiya [5]... A camp was set up in one place in Amor [6], and they desolated its people and its land as though they had never come into being. They came, the flame prepared before them, onwards to Egypt. Their confederacy consisted of Peleset, Tjekker, Sheklesh, Danu, and Weshesh, united lands, and they laid their hands upon the lands to the entire circuit of the earth, their hearts bent and trustful 'Our plan is accomplished!' But the heart of this god, the lord of the gods, was prepared and ready to ensnare them like birds... I established my boundary in Djahi [7], prepared in front of them, the local princes, garrison-commanders, and Maryannu. I caused to be prepared the river mouth like a strong wall with warships, galleys, and skiffs. They were completely equipped both fore and aft with brave fighters carrying their weapons and infantry of all the pick of Egypt, being like roaring lions upon the mountains; chariotry with able warriors and all goodly officers whose hands were competent. Their horses quivered in all their limbs, prepared to crush the foreign countries under their hoofs. "

1] Khatti: The Hittite empire in Anatolia, Hatti

[2] Kode: Cilicia

[3] Carchemish: City on the Euphrates in northern Syria

[4] Arzawa: Country in western Anatolia, allied to Hatti

[5] Alasiya: Cyprus

[6] Amor: Amurru in northern Syria

[7] Djahi: region in Canaan, possibly in the Judean hills

According to Ramses, the Sea Peoples sailed up the Nile where Egyptian ships armed with both rams and archers ambushed and annihilated them with overwhelming firepower. Soldiers stationed on the shore finished off any survivors. The invaders also attacked by land, their army paralleling their ships' movement along the coast. However, their land forces met with no better luck in Egypt than their navy did.

Some of these people, known to the Egyptians as the Peleset and to the Hebrews as Philistines, gave their name to the land where they ultimately settled: Palestine. Others may have become the Israelite tribe of Dan, also known as the Denyen and Danaoi who attacked Troy. A cryptic passage in the Bible (Judges 18:1) says the Danites "had no inheritance in Israel", while another (Judges V: 17) asks: "And Dan, why did he live close to the ships?"

Although Ramses defeated this invasion, it was a turning point for Egypt, as it seriously weakened Egypt's hold on Palestine and Syria and inaugurated the long period of final decline in its glorious history.

Maybe just as important was the new technology some of the Sea Peoples may have picked up in the Hittite Empire and spread along with their power: iron. As suggested by a biblical passage that the Israelites had to rely on the Philistines for repairing their tools, this would largely explain the huge problems they and other older cultures based on bronze technology had fighting the Sea Peoples.

12. THE INDUS RIVER CIVILIZATION AND THE PATTERN OF INDIAN HISTORY

The Indus River Civilization (c.2500-1700 B.C.E.), evolving in modern Pakistan, was the third of history's great civilizations and would be the basis for India's culture. Like Egypt and Mesopotamia, this was a hydraulic civilization based upon highly organized irrigation and flood control projects requiring a strong central authority to govern their construction and maintenance. Although the Harappan civilization (named after one of its main sites, Harappa) had writing, too little has survived to be deciphered. Therefore, we are not even clear whether there was one central government for the entire region or a number of independent city-states.

However, archaeological evidence clearly shows this was a highly organized civilization. The main cities, Harappa and Mohenjo Daro, had sophisticated urban planning and were built on immense mounds of earth and rubble as protection against floods. Harappa's citadel mound was forty feet high, reinforced against erosion by a forty-five foot thick brick-facing wall, and topped by strong fortifications. Another, slightly smaller mound probably contained graineries, threshing floors, and furnaces for bronze smelting. Altogether the entire complex of mounds covered an area three miles in circumference. Other towns and cities were almost identical to Harappa in layout, each having a west-facing citadel surrounded by blocks of houses and a north-south grid of main streets. The houses were also of a standard design, having a central courtyard surrounded by smaller rooms and corridors. Even the bricks were of two standard types: oven fired for foundations and public buildings and sun dried for private homes. Possibly the most impressive feature was the sophisticated sewage and drainage systems, with brick drain pipes issuing from each home to city-sewers which led to main sewers.

Harappan trade extended as far as Mesopotamia, exporting jewelry made from clay, gold, silver, and semi-precious stones, cotton fabrics (a product unique to this area then), and ceramic toy wagons and animals. A system of standard weights and measures promoted trade between the cities of the Indus. The weights were based on units of 16,

much like India's present currency, the rupee, which consists of sixteen *annans*.

Cubes that may have been part of the Indus civilization's system of weights & measures.

Crudely made statuettes suggest a religion devoted to a mother goddess. Stamp seal inscriptions show the Harappans probably revered such animals as the elephant, tiger, rhino, and buffalo. Large brick lined baths indicate that another feature of their religion was ritual bathing. Both this and a reverence for animals are features of present day Hinduism, suggesting its roots extend back to the Harappan civilization.

There are several theories about the end of the Harappans. Two focus on the climate turning more arid, either from deforestation or a shift of the monsoons away from the river valley. Another suggests that too much irrigation raised the water table and salinated the soil, much as happened in Mesopotamia several times. A fourth theory is that the Indus River changed its course, leaving the Harappan cities high and dry. Whatever the reasons, the Harappans abandoned their cities around 1700 B.C.E., being replaced by new settlers producing much cruder artifacts. Then, around 1500 B.C.E. new invaders, the Aryans armed with the horse and chariot, took over. They would gradually expand to the south-east and develop the civilization we call Indian. However, various aspects of Harappan civilization, especially religious, would survive as integral parts of Indian culture.

The pattern of Indian history. India's geography and climate are varied and have largely determined the course of its history. There are five main features of the environment to consider. First, India is hot and humid, breeding many diseases, which both slowed conquest and absorption of India by newcomers and gave people less faith in this life and reason to explore more spiritual paths. Secondly, the Himalaya and Hindu Kush mountains, two of the tallest ranges in the world, cut India cut off from the rest of Asia. Also, India

is a huge subcontinent cut into very distinct regions ranging from the mountains in the north through the tropical river valley of the Ganges to the barren deserts of the Deccan. All these factors have made it a very difficult country to conquer. Finally, two other factors, India's position on the Indian Ocean and Arabian Sea plus its abundance of spices, gems, and cotton, attracted trade, new peoples, and ideas to its shores.

(l. to r): Along with other mountain ranges, the Himalayas, (“the roof of the world”), have inhibited, but not stopped, invasions by various peoples from the North. The Ganges floodplain which covers NE India. The Deccan, India’s hot central plateau

Together, these factors have made Indian culture and history extremely complex and varied. At the same time it has resisted conquest and attracted new peoples, both keeping them distinct from one another yet absorbing them into the greater unifying fabric of its culture. As a result, Indian history defies treatment as a mere succession of empires, since it has rarely been completely unified by one power. However, there is a certain unity to India's history as seen in its main religion, Hinduism, which has as many variations as India has peoples, yet still maintains a common core that lets us speak about India as a culture that has at once resisted and absorbed a long succession of invaders from Aryans and Greeks to Muslims and the British.

Bringing a Civilization to Life from the Dust

A reconstruction of what Mohenjo Daro probably looked like

Even more than Mesopotamia and Egypt, figuring out the essence of the Harappan (Indus River) civilization and bringing it to life in a way we can relate to is a real challenge. For one thing, Scholars still haven’t even reached agreement on what known languages, if any, the Harappan language was related to. The Harappan script is also a matter of controversy. Although it contains an estimated 400 symbols (600 according to another source) its inscriptions rarely contain more than four or five symbols, something some scholars say is not consistent with true literacy. Therefore, we have very little idea of what the Harappans thought of themselves and the rest of the world.

This forces archaeologists and historians to rely on the physical evidence of surviving artifacts and the foundations of buildings. Of course the only artifacts that have survived are those made of durable materials like stone or clay. Even if those are plentiful, they tell us little about what perishable materials were used, the purposes they were used for, and how plentiful they were. Therefore, archaeologists have to rely on indirect evidence.

Carnelian jewelry and signature seals from the Indus Civilization, which indicate likely contact with and influence from Mesopotamia. The yogic position of the figure in the last seal hints at some continuity between the Harappan culture and later Indian religious practices.

For example, some Native Americans would decorate pottery before firing by impressing woven fabrics onto them.

Even though we have no woven fabrics from their culture at that time, we can infer from pottery that has survived that they did indeed weave fabrics.

Another type of inference can come from soil discoloration in a site. Although no wood may have survived from that culture, darker soil can indicate wooden posts were used as the corner posts of a building. Even after the posts rotted away, they left different minerals that darkened that part of the soil. If archaeologists uncover a pattern of such darker spots, they can reconstruct the shape of that building. Blackened soil in the middle of that pattern could indicate a fire pit and the likelihood of that building being a home. Very carefully scraping away the soil in the fire pit often reveals bone fragments and seeds, giving hints to those people's diets. And if some of their foods and other materials they used didn't come from that region, that could indicate trade routes.

One such material was obsidian, a beautiful black volcanic glass with properties like flint that was highly valued for making ceremonial knives. Since each volcano makes its own unique obsidian, finding artifacts made of its obsidian can help reconstruct trade routes and even long-range networks of trade.

Oftentimes, the only hint that a city had inhabited a certain spot would be a dirt hill, known as a *tel* from the Arab word for mound. Over the centuries of its life, a city would build new structures and streets on top of old ones wrecked by floods, earthquakes, etc. This would gradually raise the level of the city until it was abandoned. Dust would blow in, covering the city until the only evidence of its former existence would be a dirt mound, such as Tel Hazor in Galilee

(below). Over the centuries, different peoples would move in and out, and the very existence of the city would be forgotten until archaeologists started unearthing these tells in the 19th century.

Unfortunately, archaeology in the 1800s was more a treasure hunt for gold than a serious scientific and historical exercise, and treasure hunters would virtually bulldoze a site, thus destroying valuable evidence of postholes, fire pits, and tiny fish bones.

For example, Charles Masson described the ruins of Harappa in 1842, but it was the 1920s before archaeologists paid serious attention to it. Meanwhile, in the 1850s, the British, who were building railroads through the area, used Harappa's oven baked bricks as ballast.

The other major type of evidence consists of the remaining foundations of buildings. Sometimes archaeologists are lucky, such as at Pompeii where volcanic ash from Mt. Vesuvius covered the entire city at one time, leaving it frozen in time for later generations to discover.

Unfortunately, all that usually remain are the foundations of buildings. Carefully excavating these can reveal street plans of cities and the presence of such things as urban planning. The location of a complex of large foundations can tell us where the city's center was with its temples and public buildings.

Excavated ruins of Harappa's granary

However, this cannot tell us how tall the buildings were or how they were decorated, so archeologists will sometimes rely on modern analogies and common sense to reconstruct the buildings. For example, a hot dry climate would dictate houses be built to stay as cool as possible with thick walls, low doorways, and narrow windows to keep out the heat. Roofs would be flat to give more space for storage and activities in the crowded urban environment where every square inch was valued. Flat roofs also provided a place to sleep during the cooler nights.

Out of all these, we can reconstruct, with some confidence, how cities such as Mohenjo Daro looked in their heyday, and even some details of how people lived.

MASTERS OF THE SEA: THE PHOENICIANS (c.1200-500 B.C.E.)

It is easy for us today to take sea-borne trade and travel. But what if no one had dared to venture across the sea. After all, humans do not take naturally to water, and it is conceivable that a natural fear would have kept us complete landlubbers. If that had been the case, the Americas, Australia, Britain, Japan, and numerous other islands would have been completely outside the mainstream of history. Even contact between points within the vast land mass of Asia, Europe, and Africa would have been much more restricted when one considers how much of that contact has been by way of rivers and seas. The lack of water travel might have slowed the progress of human civilization to a virtual snail's pace. Of course, we cannot know for sure how severe the impact would have been, but it certainly would have been significant. However, people with their natural curiosity did take to the water. Although the Phoenicians were not the first to do so, they advanced the art and technology of seafaring to the point that they are considered the premier sailors of antiquity.

Geopolitics. As with other civilizations, the Phoenicians' environment, or geopolitics, largely influenced their history. First, ancient Phoenicia, modern day Lebanon, was a hilly coastal area whose rough terrain made it hard to unite. As a result, independent city-states such as Byblos, Ugarit, Tyre, and Sidon emerged along the coast.

Secondly, the Phoenicians did not have the sort of rich soil that one found in Egypt and Mesopotamia. In fact, they had only two major natural resources that were useful for trading: timber and snails. Their timber, the fabled cedars of Lebanon, was highly prized for use on the building projects and navies of the ancient Near East. Unfortunately, all that remain are a few isolated clumps of trees, since the cedar forests on the hillsides were clear-cut to meet the demands of ancient customers. The result has been the serious and most likely irreversible erosion of Lebanon's soils. Most likely, the absence of trees to transpire moisture and moderate temperatures also produced a hotter drier climate. The other, rather unlikely resource was the murex snail. This creature, when left to rot in a pool of water under the hot Near Eastern sun, secreted a hormone that produced a precious colorfast dye of scarlet (ancient

purple) color. It took 30,000 of these rotting snails to produce one pound of this dye, making it very expensive. As a result, purple is still seen as the color of royalty, since kings were about the only ones who could afford to dye anything purple. All those decaying snails must have also made it imperative to place the dye works downwind from the cities.

With virtually only these two things to trade, the Phoenicians had to become shrewd traders and, indeed, they were among the sharpest businessmen in the ancient world. Part of their cleverness was the ability to copy other peoples' art and manufacturing styles in order to produce and sell those goods at a cheaper price. It is difficult to identify a distinctive Phoenician artistic style since they were such brilliant copycats. Another example of their business acumen is how they adapted an Egyptian script into the alphabet we use today, minus the vowels. This allowed each merchant to keep his own records rather than having to rely on an expensive scribe to do it for him.

The third and final geopolitical factor of Phoenicia was its position between the two great civilizations of the time: Egypt and Mesopotamia. This brought a lot of trade their way, but also left Phoenicia caught in wars between its powerful neighbors, a situation that modern Lebanon still faces today. For example, the city of Tyre supposedly withstood a siege of five years by the Assyrians and another siege of thirteen years by the Babylonians. Hemmed in and harassed by these empires, the Phoenicians found themselves with only one way to go: across the sea.

The evolution of the Phoenician sailing ship, like so many other developments, was largely the fusion of other people's ideas, although the result bore the distinctive mark of Phoenician genius. There were two main shipbuilding traditions the Phoenicians would draw upon: those of the Minoans on Crete and the Egyptians.

The Minoans who flourished from around 2000 to 1500 B.C.E. were the first real sailors of the ancient Near East. Their ships evolved from dugout canoes to larger craft, with the canoe itself serving as a backbone or keel to which other planks were fastened to build up the sides. The Egyptians did most of their sailing in the safe waters of the Nile or on short excursions along the coast between Egypt and Palestine. Unfortunately, they only had the

short stubby acacia tree from which to make planks. As a result, their ships were patchworks of boards resembling a jigsaw puzzle and requiring a lot of internal support. So the Egyptians put in ribs and cross braces, called thwarts, to hold their ships together.

The Phoenicians, in deciding between using the Minoan keel or Egyptian ribs and thwarts, chose both. This resulted in a rather bulky, but sturdy sailing vessel. In order to seal it against leaking, a layer of tar or pitch covered the lower part of the hull, which the Greek poet, Homer, was referring to this when he spoke of the "black ships". Ships' hulls also often had lead or copper sheaths to guard against sea worms eating into the wood.

For short journeys, men could row these ships, but that was tiring, labor intensive, and expensive in wages and food (which would also take valuable cargo space from trade items). Eventually people figured out how to use wind power, an especially ingenious way of harnessing free energy from nature. Sailing with the wind was no problem. Sailing with a cross or headwind was an entirely different matter. The Phoenicians learned the technique of tacking, turning the sails at an angle to the wind in order to go in the general direction desired. This involved a good deal of zigzagging at different angles to the wind, but it beat rowing, and became a basic part of the sailor's art from then on.

Unfortunately, sea travel and trade also brought piracy, which led to designing specialized warships and naval tactics to meet this threat. At first, naval fights consisted of firing arrows at each other and then grappling enemy ships with hooks to board them for hand-to-hand combat. This mode of fighting at sea continued to be used all the way up through the 1500's C.E. However, around 1000 B.C.E., someone got the idea that sinking enemy ships was a much easier and safer way of disposing of the enemy than fighting them face to face. To this end ships were made much sleeker and more maneuverable with rams attached below the waterline on the bows (fronts) of the ships. The goal now was to ram a hole in the side of the enemy ship and sink it. If that failed, sweeping the enemy ship to shear off its oars with one's ram was the next best thing, since it crippled the other ship and set it up for getting rammed on the next pass. Eventually, a new type of warship evolved, the trireme, a streamlined, low lying ship powered by three banks of oars. It was the most lethal weapon on the high

seas, especially when powered by highly trained expert crews. Slaves were not generally used in ancient fleets, since they were too unreliable, and the main difference between two fleets was often the quality of their rowing crews.

Phoenician exploration and colonies. Equipped with reliable ships and sailing techniques, the Phoenicians took to the sea in search of new markets, resources, and homes. In the process, they explored new lands where they often founded colonies. Their travels took them across the Mediterranean and through the Pillars of Hercules (Straits of Gibraltar), which most people considered the ends of the earth. From there, they sailed to Britain, which to most people was no more than a legend, but for the Phoenicians was a valuable source of tin. Even more astounding, they probably sailed around Africa two thousand years before Vasco da Gama did it for Portugal. Unfortunately, we have few details of Phoenician voyages since they wanted to keep geographic knowledge secret from any competition, in particular the Greeks, who might want to invade their markets. We do know that their method of exploration involved coast hopping rather than open sea sailing, since there were no reliable ways to navigate in open waters at this time.

The Phoenicians also founded colonies around the Mediterranean, in particular along the coast of North Africa. The most famous of these colonies was Carthage, founded by refugees from Tyre who were led by a woman known variously as Elissa, the Biblical Jezebel, and Dido in the Roman epic, the *Aeneid*. Carthage commanded the passage between the Eastern and Western Mediterranean and soon surpassed its mother city in power and wealth. The Carthaginians claimed the Western Mediterranean was their "lake" and tried to keep other peoples out. This led to centuries of bitter warfare between the Carthaginians and Greeks over the island of Sicily. In the end, both sides wore each other out and left the way open for another power, Rome, to take over. After three long and bitter wars, the Romans finally destroyed Carthage in 146 B.C.E., pronouncing a curse on anyone who dared settle there again. However, a century later the Romans themselves, recognizing the Phoenicians' excellent eye for a city, re-founded a new city on that site, even naming it Carthage. Ironically, some 500 years later, a Germanic tribe, the Vandals, seized Carthage and used it as a base from which to launch a raid and sack Rome in 455 C.E.

International Languages for Copycats & Traders

The custom of making cheap copies of products to undersell the originals is nothing new, and the Phoenicians were masters of the practice. After all, given the time and difficulties of transportation, it was expensive, tedious, and dangerous to go all the way to Egypt, buy a sarcophagus lid, then go all the way to some place like Assyria and sell it for a profit to cover the costs of getting and transporting it. It was much simpler to make good copies of such things at home and take them to Assyria where “Egyptian” goods would be seem exotic and command a good price. After all, who in Assyria could even tell the difference between an authentic Egyptian sarcophagus lid and a cheaper knockoff?

Lingua franca (literally French language) is a term referring to a common language used to communicate for trade and diplomacy between different cultures. It comes from the 1700s when French was the dominant power and cultural influence in Europe, and any educated person would learn French to communicate in other European countries and their colonies. It typically has also been seen as a sign of being educated and urbane.

The first such language was Sumerian, which remained a part of a scribe’s curriculum in Mesopotamia literature and poetry long after the Sumerians’ political power had waned. It was succeeded by Akkadian written in cuneiform and remained so for centuries as wars, trade, and diplomacy spread throughout the Fertile Crescent. Even diplomacy between Egypt and the Hittite Empire was carried on in cuneiform, since both cultures’ scripts were hieroglyphic and thus difficult to use in other languages. By contrast cuneiform was based purely on sounds and more easily adapted to other languages.

In succeeding centuries, other languages would serve as the *linguae francae* of their eras. Alexander the Great’s conquests made Koine (common) Greek the language of the Eastern Mediterranean for 1000 years. Rome’s empire did the same for Latin in the West, where it remained an essential part of the curriculum and the Catholic faith until the twentieth century and is still offered in schools. Similarly, because of the Arabs’ political power extending from Spain to India and the belief that one should learn the Quran in its original language, Arabic has been the *lingua franca* of the Muslim world. In East Asia, China has functioned as the common language between cultures. In the last century, British and American political and cultural influence have made English a global *lingua franca*.

However, trading far outside the range of one’s *lingua franca* where there was no common language understood on either side was more tricky. According to the Greek historian, Herodotus, this is how the Phoenicians (AKA Carthaginians) managed it:

"The Phoenicians no sooner arrive-- they unload their wares. Having arranged them in an orderly fashion along the beach, leave them and returning aboard their ships, raise a great smoke. The natives, when they see the smoke, come down to the shore-- lay out as much gold as they think the goods are worth, and then withdraw to a distance. The Carthaginians then come ashore and look. If it does not seem sufficient, they go aboard ship and wait patiently. Then the natives approach and add to their gold until the Carthaginians are content. Neither party deals unfairly by the other: for the Carthaginians never touch the gold until it comes up to the worth of their goods, nor do the natives ever carry off the goods until the gold is taken away."

The Phoenician Alphabet and Spelling Bees

The idea behind the phonetic alphabet was to have one symbol for each of the 20-30 sounds we use in our particular language instead of one symbol for each of the hundreds of syllables and sound combinations we can make.

Although the Phoenicians are popularly credited with inventing the *phonetic* alphabet (thus its name), it was probably more an Egyptian development of gradually reducing syllabaries (writing scripts like cuneiform with a symbol for each syllable and/or combination of sounds one can make) down to fewer and fewer symbols until they had an alphabet.

Even if the Egyptians invented the alphabet, it was the Phoenicians who adopted the alphabet for keeping their own records and spread its use in their travels. Among those receiving it were the Greeks, who would add one more innovation that Semitic writing scripts didn't need: vowels.

As any student of a foreign language will tell you, different languages make or stress certain sounds while not using others. As a result, phonetic alphabets for different languages will often have variations. For instance, the Latin alphabet, from which we derive our own alphabet, had no letters for j and w.

Languages also change over time so that the sounds associated with certain languages will change as well. A good example is beta, the ancient Greek letter for b, which is now pronounced like a v. Both b and v are what linguists call bilabials, since both sounds are made with both lips. Peter the Great of Russia inaugurated a reform of the Cyrillic alphabet in the early 1700s to reflect the changes in the Russian language over the previous centuries.

Spelling, especially with more standardization since the invention of the printing press (c.1451), has had an even harder time keeping up with changes. Keep in mind that spelling originally reflects how a word is pronounced. Thus the English word *knight* is not spelled that way to make spelling bees more challenging. Rather, it's a history lesson frozen in time telling us how it was pronounced in the middle Ages.

Ancient Warships and Naval Tactics

Unfortunately, sea trade was often a tempting target for pirates, and merchants had to defend themselves at sea. Up to now, naval battles had largely been land battles fought at sea, with the each side trying to board the enemy's ships and take them over. Obviously, this was a dangerous way to conduct trade. If only there were a better way.

Then, one day a shipwright created a specially designed war galley with a ram on the front, the goal now being to ram enemy ships in the side and sink them. They also streamlined their ships to make them faster than their enemies. The key to victory now was speed and maneuverability, as seen below in the *penteconter* (50-oared galley).

But what if their enemies did the same thing?

They could lengthen the ship to add more rowers and speed, but that would also make the ship more fragile and harder to turn. Therefore, they tried an extra bank (level) of oars. This made the ships a bit taller, but the extra power and speed from the added rowers more than made up

for that. Further experiments arrived at an arrangement of three banks of oars as the maximum and optimum size of the galley.

Thus was born the *trireme*, the premier warship of its time. Later variations would be called *quadriremes*, *quinquiremes*, etc., which historians used to think referred to how many banks of oars there were. However, modern experiments suggest that the numbers referred to the numbers of rowers per vertical line of oars. For example, a trireme could have three banks of oars with one man per oar. However, if a second rower were added to the top bank, it would be called a quadrireme. Two rowers per oar on the top two banks would make it a quinquireme, and so on. Experiments have shown that the maximum number of men on one oar was eight. Beyond that, the man at the far end of the oar would have to do too much running to keep up with the movement of his end of the oar.

Naval tactics. There were two basic tactics ancient navies used these ships for. The first was ramming the side of an enemy ship to sink it (below left). One problem would be if a ship embedded its ram so deeply in the enemy ship that it couldn't easily extricate itself by backwatering, making it a sitting target for another enemy ship.

The other tactic was the oar rake (above right). If a ship couldn't get a clean shot at ramming an enemy ship, it might approach at an oblique angle, shearing off the enemy oars with its ram, leaving the immobilized enemy ship a sitting target to be rammed. One danger of this tactic was the attacking ship's crew's failure to pull in its oars to avoid losing them as well when the two ships passed closely by one another. Success in using either of these tactics depended primarily on the quality of the crews involved. Therefore, despite the impression given in Hollywood epics, slave crews were generally not used since they were unreliable

Naval games of Chicken. Another gutsy move, known as the Rhodian tactic, involved steering for a head-on collision with an enemy ship. At the last moment the rowers would drag their oars which, like a car slamming on the brakes, would cause the front of the ship to dip down and undercut the other ship, ramming it below the waterline while only getting rammed above the waterline. The jolt of impact between two ships in a naval battle could easily throw people overboard if they weren't hanging on tight.

However, these tactics required large crews of highly skilled rowers rowing in complete unison. For example, one trireme would need 170 such rowers, while ancient fleets often topped 100 such ships. Thus, each fleet in a battle using the tactics of ramming and oar rakes could have over 20,000 skilled rowers.

And those rowers were quite vulnerable and hard to replace. In addition to deaths in naval battles,

which could be horrific, rowers faced the risks of storms and shipwreck. The storm that wrecked the Roman fleet off the coast of Sicily in 254 B.C.E. may have killed 100,000 men back when populations were much lower and such losses were much harder to replace.

Therefore, given the difficulty of finding and replacing skilled rowers, navies down through history usually reverted to the time-honored strategy of grappling and boarding enemy ships to turn sea battles into land battles. Such tactics required less skill in maneuvering so that navies could rely on cheaper free and slave labor. To compensate for the lack of skilled rowers, warships also tended to get bigger. One monstrous double-hulled warship required 3,000 rowers, and proved impractical to use in battle.

Making rowers' lives more miserable and dangerous were the extremely cramped and filthy conditions in which they lived. The streamlined nature of ancient galleys dictated that multiple layers of rowers were packed in like sardines leaving virtually no elbow or head room. Air circulation was minimal, making conditions extremely hot.

If ships were in a hurry, rowers would be fed while rowing, crewmen even stuffing wine-soaked bread into the rowers' mouths so they wouldn't even miss a stroke while rowing. Just one rower missing a stroke could cause a chain reaction of all the oars on that side running afoul of one another, maybe even forcing the

whole crew to stop rowing so they can regain their rhythm.

There were also no bathrooms, except the narrow benches where the rowers might be stuck 24/7. Pity the poor men on lower levels directly beneath comrades who were equally desperate for a potty break.

Reportedly, people could sometimes pick up the stench of these navies before they could even see them approaching. Ships would often be submerged to wash away the filth after a voyage.

A diagram showing the arrangement of rowers on a trireme

In order to keep time in rowing with all the oars in the same line in the water, all the oars needed to be the same weight and length (about 14 feet). This raised the problem of how to keep the oars of the top level of rowers (thranites) the same length as the others, since they were higher up and farther from the water. The solution was the outrigger, a construction built out from the hull. Therefore, while the thranites were vertically farther from the water, they were horizontally closer to the line where all the oars met the water, thus keeping them all the same length. The only difference was that the thranites had to row at a steeper angle than the other levels of rowers. As a result, they were generally the most skilled and highest paid rowers on a ship.

Building Ships Without Nails

One of the things we especially take for granted today is mass-produced nails, which we can buy by the hundreds for just a few dollars at the local hardware store. However, such a simple technology is only made possible by precisely calibrated machines that did not exist until the industrial revolution in the 1800s. Before the invention of nails, ships were held together by *mortise and tenon* construction. Below is a description of how to build an ancient ship using this technique.

The hull's planks (A) were fitted with upper & lower rows of holes & slots.

Smaller slats (B), also with holes, were placed into the slots of the lower plank, with their holes lining up with the plank's holes.

Pegs (C) were then put through the holes, locking the slats and plank in place.

The next plank was put in place over the lower plank, with the slats fitting into its lower slots and its lower holes lined up with the upper holes of the slats.

Pegs were then put through the holes of the plank and upper holes of the slats, locking the plank into place with the lower plank.

Once complete, the entire hull was covered with a layer of copper or lead to keep out sea worms and barnacles and then coated with tar or pitch to make it watertight.

The 1st Circumnavigation of Africa (c.600 B.C.E.)

Unlike the Portuguese explorer da Gama, the Phoenicians started on the east coast of Africa and sailed back up the west coast.

The Greek historian, Herodotus, a source hostile to the Phoenicians, tells us an Egyptian pharaoh commissioned a Phoenician crew to sail around Africa. Along the way they ate elephant meat and met a hairy tribe of people known as gorillas, whose females apparently were not too friendly, one of them mauling a Phoenician sailor. (They killed her and brought her skin back to Carthage.) According to the captain, as they sailed west around the southern tip of Africa, the sun was to their right (i.e., north). As a result, Herodotus dismissed the story of this voyage as a typical Phoenician lie, because everyone knows the sun is always to the south. That is, everyone in the northern hemisphere, but not in the southern hemisphere, where the sun *is* to the north. Therefore, for the very reason Herodotus thought the Phoenicians were lying, we think they were telling the truth.

In 2008, a group of scientists with the approval of the Royal Geographical Society, set out to recreate the Phoenician circumnavigation of Africa. Two years later, they had accomplished this feat in the *Phoenicia*, a full-size replica of a Phoenician sailing ship even built using ancient methods.

A Short History of Carthage

The most illustrious and powerful Phoenician city wasn't even in Phoenicia. Rather it was Carthage, a Tyrian colony on the coast of North Africa.

According to legend, Carthage was founded by a queen of Tyre, named Elissa (known as Jezebel in the *Bible* and as Dido in the Roman epic, *The Aeneid*). When Elissa asked the local natives for some land, they jokingly told her she could have as much land as she could cover with an oxhide. Completely undaunted, she had an oxhide cut into narrow strips and laid end to end around a perimeter of land that would become Carthage.

A view of how ancient Carthage probably looked. Its circular naval harbor was protected by a very narrow approach.

As with other Phoenician cities, Carthage's main sources of wealth were trade and manufacture. Therefore, it is hard to identify Carthaginian workmanship since they, like other Phoenicians, made cheap copies of other cultures' goods in order to undersell the competition. Also, although of more Middle Eastern origin, Carthage's culture was heavily influenced by its arch-rivals, the Greeks.

Carthage ruled the coast of North Africa, southern Spain, and the western end of Sicily. Control of that strategic island would have secured the markets and riches of the

Western Mediterranean, but the Carthaginians faced a race of sailors and merchants just as determined as they were to control Sicily: the Greeks.

Over the centuries, a pattern of wars emerged where Carthage would mount a huge offensive and nearly conquer Sicily, until a leader, usually from Syracuse), would emerge to save the Greek cause. Then each side would recover for a few years and start all over again. Thus a series of Syracusan leaders Gelon (480), Dionysius (early 300's), and Agathocles (late 300's), and Pyrrhus of Epirus (270's), a king from north-western Greece, each saved the Greek cause in turn. Ironically, a people with little or no experience at sea, the Romans, would be the winner.

The Punic Wars, as the three wars between Rome and Carthage are called, spanned over a century (264-146 BCE) and collectively constituted one of the most epic struggles in history. In the First Punic War (264-241 BCE) Rome built its first navy and crushed several Carthaginian fleets, only to have its own fleets swallowed up by storms. After 23 years, the Romans destroyed one last Carthaginian fleet, thus ending the war and stripping Carthage of Sicily and Sardinia.

But Carthage wasn't finished yet. Its general, Hamilcar Barca more than compensated for the loss of Sicily by conquering much of Spain, thus providing his home city with a new

source of silver and mercenaries. The renewed Carthaginian threat triggered a Second Punic War (218-201 BCE). In order to take the war to Rome's back yard, the Carthaginian general, Hannibal, marched his army, including 37 war elephants over the Alps into Italy. (All but one of the elephants, named Cyrus, died in the crossing.)

Hannibal would prove to be one of history's greatest generals, destroying one Roman army after another and holding the Romans at bay in Italy for 16 years. However, the Romans were every bit as persevering as the Carthaginians. Behind the leadership of their own brilliant general, Scipio Africanus, they drove the Carthaginians from Spain and invaded North Africa. This forced Hannibal to return to defend his home city. At the battle of Zama in 202 BCE, the Romans defeated Hannibal, and Carthage sued for peace.

Despite a harsh peace treaty, Carthage recovered its prosperity, although not its political or military power. However, Rome remained paranoid about a revived Carthage and treacherously attacked it in 149 BCE. The Third Punic War (149-146 BCE) amounted to little more than an epic siege of Carthage that ended with its destruction by the Romans. The victors burned the city and cursed the ground for any future settlers.

However, Carthage's story wasn't over yet as it took an ironic twist that played itself out some 600 years later. Despite the curse they laid on the land, the Romans resettled Carthage a century after its destruction. Once again, Carthage flourished. And

then, in the 5th century CE, when the Roman Empire in the West was falling apart, a Germanic tribe known as the Vandals invaded North Africa, took Carthage, and used it as a base to attack shipping in the Mediterranean. In 455, the Vandal fleet sailed up the Tiber River and sacked Rome, seeming to exact revenge for the destruction of the Phoenician city 600 years earlier.

[Back to flowchart](#)

14. THE ISRAELITES (c.2000-500 B.C.E.)

Introduction. Another people who had an even greater impact on history without building a great empire were the Israelites, also known as the Hebrews or Jews. In the course of their history, they would establish Judaism as the first great monotheistic religion and also heavily influence Christianity and Islam. Together these are the three dominant religions throughout the Near East, Europe, much of Africa, the Western Hemisphere and Australia. In addition, these faiths have also shaped the law codes, art, culture, social customs, economics, and histories of their respective societies. Yet if it had not been for their religion, the Jews probably would not have been any more than a footnote in the history books.

The Patriarchal period (c.2000-1650 B.C.E.).

The Jews first appear as the *Habiru*, a Mesopotamian word referring generically to any nomads whom they came into contact with. It was only much later that the *Habiru*, or Hebrews, were associated specifically with the Jews. Evidence of contact between Mesopotamia and the early Hebrews can be seen in the various stories shared by the two cultures, such as the Great Flood. Around 2000 B.C.E., various groups of *Habiru*, known as Amorites, gradually weakened and overthrew the Sumerian empire of the Third Dynasty of Ur. Among these tribes was a patriarchal clan that would come to be known as the Jews. One leader of this clan was Abraham, whom Jews, Christians, and Muslims all look back upon as their spiritual ancestor. While many of his Amorite kinsmen and allies were settling down and adapting to the civilized ways of their subjects, Abraham continued in his nomadic ways. His travels took him over much of the civilized world from Mesopotamia to various places in Palestine, then known as Canaan. He even made his way to Egypt during a famine before returning to Canaan. Thus Abraham's travels put him in contact with the great civilizations of the ancient Near East. Several Biblical stories, such as that of the Great Flood, seem to reflect this contact.

Abraham is especially remembered for his **covenant**. This was an agreement with his god to follow and worship him exclusively in exchange for his protection. Such a covenant was apparently not unique among Semitic tribes. For example, Abraham refers to the god of his brother Nahor

(Genesis 31: 53), implying Nahor and his people had a similar covenant with their own particular god. This also seems to imply that Abraham and his people believed in other gods at this time, but refused to worship them. Instead, they were the "chosen people" of their god, a distinction that would grow in importance as they came to see their god in more universal and cosmic proportions as the only god.

The Egyptian Period and Exodus (c.1650-1200 B.C.E.).

Around 1650 B.C.E., the Hebrews' history became intertwined with that of Egypt. It was at this time that the Semitic people known as the Hyksos overran and ruled much of Egypt. Although the Hebrews were probably not part of the actual invasion, they do seem to have been related to the Hyksos. For example, Hyksos names with "Jacob", a Hebrew name, occur. The story of the quick rise to power of Joseph, Abraham's descendant, probably could not have occurred under native Egyptian rule. And when Joseph's family migrated to Egypt, they went to Goshen, a Hyksos city.

There is about a 400-year lapse between the end of Genesis, when Joseph is at the height of his power, and the beginning of the next book of the Bible, Exodus. At that point we find Joseph's people, the Israelites, enslaved by the Egyptians. What has happened in between has been a resurgence of Egyptian power that drove the Hyksos out of Egypt. Naturally, the Israelites did not fare too well in this change of masters.

It was probably during the upheaval of peoples the Egyptians called the Sea Peoples that the next great figure in Jewish history, Moses, was born. Although he grew up in the upper ranks of Egyptian society, Moses kept, or regained, touch with his unfortunate kinsmen. Pitying an Israelite slave who was being beaten by his Egyptian master, Moses killed the Egyptian and then fled into the desert. It was there that he found what he saw as a sign from God: a burning bush that was not consumed in its flames. This inspired him to lead his people out of Egypt.

The Exodus, as this mass migration is called, is probably the most important single event in the history of the Jews, since it won them their freedom and gave them their identity as a people. It probably occurred after Ramses II's reign, when the strain of extended warfare and the burden of

supporting the powerful priesthood of Amon were starting to take their toll on Egypt. The Biblical ten plagues that forced the pharaoh to let the Israelites go may reflect Egypt's internal troubles at that time. Also, more than the Israelites escaped at this time, as reflected in the Bible's reference to a "mixed multitude".

The Ten Plagues that afflicted Egypt were:
1) The Nile turning into blood; 2) skin boils; 3) gnats; 4) flies; 5) locusts; 6) dead cows; 7) darkness; 8) hail; 9) frogs; and 10) Passover when an angel of death killed all the firstborn sons of Egyptians.

***Reed or Red.* Some scholars think that "Red Sea" mistranslation of "Sea of Reeds" of which there are three fordable lakes fitting that description.**

There are six possible locations for Mt. Sinai

The Exodus was also important in the development of the Jewish religion. The climactic event of the Exodus was receiving the Ten Commandments at Mt. Sinai. The revolutionary nature of these laws is easily obscured by the fact that they have become an essential part of our culture. This makes them commonplace, and thus taken for granted. However, the idea that people are morally responsible for their own actions rather than just being at the mercy of fickle gods who act unpredictably dates from the time of the Ten Commandments. Also, the idea of worshipping only one god and not making idols that one can touch and feel was a radical departure from most other peoples' practice up to that point in history. Since that time, the Ten Commandments have served as the religious, moral, and ethical foundations for the Jewish, Christian, and Islamic cultures.

Israel (c.1200-586 B.C.E.). The Bible tells us the Israelites wandered for forty years in the wilderness. This might be a reasonable figure for a nomadic people used to wandering. Both Archaeology and the Bible give us a date of around 1200 B.C.E. for the Israelites' entrance into the Promised Land, because this was when Jericho and other Canaanite cities seem to have been destroyed by invaders. Also the Sea Peoples, or Peleset as

the Egyptians called them, probably arrived in Palestine about this time. Although they would later be the Israelites' archenemies, the Philistines, their raids at this time probably helped the Israelites by weakening the Egyptian Empire.

The Bible gives two very different versions of the conquest of Israel. One version has Joshua, Moses' successor, winning one spectacular victory that delivered the whole land into the Israelites' hands. The other version gives the impression of a piecemeal conquest. This is probably closer to the truth. The nomadic Israelites were divided into twelve tribes loosely held together by their common religion. Most likely, each tribe took over its own part of Israel independently of the other tribes. It was a fairly drawn out process that involved fighting here and peaceful absorption there. Many of the inhabitants were Habiru, akin to the Israelites, but who had stayed behind when Joseph and his clan went to Egypt.

Israel's geopolitics did not mark it out as the ideal place to settle. It was hot and dry with scattered areas that had enough fertile soil and water to make them worth settling in. It had few natural resources besides some copper and iron in the south. Worst of all, it was in between the great empires of Egypt to the south and Mesopotamia to the north. This made it a constant battleground or highway for invading armies. That situation has not changed too much to the present day.

***Angelic topography.* According to popular legend, Palestine was so rocky because, when God sent angels with a bag of rocks to distribute over the earth, the bag broke and all its contents fell on Palestine.**

Settling in Israel created two very different problems for the Israelites. Like other nomadic peoples who conquered civilized areas, the Israelites found themselves drawn to adopt the ways of their more settled subjects. However, their transition to civilization was particularly difficult, because the Canaanites' polytheistic religion drew many Israelites to its rituals. Since the Israelites saw themselves as God's chosen people, and felt that their survival and success depended on God's favor, they took very harsh measures against anyone, Israelite or Canaanite, they found practicing pagan religions.

Another problem the Israelites faced was hostile neighbors, especially the Sea Peoples, or Philistines, who had settled in the coastal areas of Palestine. These people, possibly from contact with the Hittites, whom they had conquered, had iron technology and weapons. This gave them a decisive edge in battle that allowed them to deal some fairly serious beatings to the different Israelite tribes. As long as the tribes remained separate and did not cooperate, the Philistines could do just about as they pleased. They even captured the Israelites' holiest object, the Ark of the Covenant, in battle. Because of this outrage, the Israelites started agitating for a king to unite them against the common enemy.

The Tribe of Dan may have once been Sea Peoples, known elsewhere as Danaoi in the *Iliad* and also as Denyen. A vague reference in the Bible talks about the men of the Dan living by the sea: "And Dan, why did he live close to the ships?" (Judges V: 17)

Up to this point, the main officials of the Israelites had been tribal leaders called judges. These men, such as Samson and Gideon, often served as military leaders as well as performing judicial functions. There was at least one woman judge, Deborah, who was renowned for her wisdom. The most influential of the judges at this time was Samuel. He tried to convince the Israelites that a king would be a bad idea, since he would demand military service and forced labor, just as they had endured when in Egypt. Nevertheless, the people insisted and Samuel chose Saul as Israel's first king.

Saul's reign (c.1020-1000 B.C.E.) was not a happy one. Besides facing the formidable Philistines and other enemies in battle, he also had to deal with the different tribes refusing to cooperate with each other. He even had trouble with the judge Samuel, who may have been jealous of the power this new king was taking at the expense of the judges. In the end, Saul's reign ended in a military disaster at the hands of the Philistines. His reign was important, nonetheless, because, once the Israelites had taken that fateful step towards civilized monarchy, they never went back to their old nomadic ways.

***Royal headaches.* Saul seems to have suffered from severe headaches, possibly migraines, which only the soothing music played by David could cure.**

The reigns of the next two kings, David (c.1000-961 B.C.E.) and Solomon (961-922 B.C.E.), saw Israel's power at its height. The Israelites during this time were able to extend their sway directly or indirectly over the Eastern Mediterranean coast from the Sinai Desert in the south to the Euphrates River in the north. Much of their success was a result of timing, since both Egypt and Assyria were experiencing internal problems at the time, creating a power vacuum which the Israelites could fill.

The reigns of David and Solomon saw further signs of the transition from nomadic to civilized life. David founded, or refounded, the city of Jerusalem and built a splendid palace there. Solomon built a magnificent temple in which the Ark of the Covenant could reside rather than in a tent. Both kings built up a standing army and bureaucracy to protect and rule the land. Of course, there was a price for all this: heavy taxation and even forced labor. True to Samuel's prediction, many Israelites did grumble about how this was just like their forced labor in Egypt.

***I told you so.* Just like Samuel had told the Israelites, when they got a king their taxes would go up. In addition to higher taxes, building the Temple also involved the forced labor of 180,000 workers. The royal court wasn't cheap either. Each month one tribe supplied the court with its food and drink. On a daily basis it supposedly consumed: 155 bushels of flour, 300 bushels of meal, 30 oxen, and 100 sheep. Keep in mind Solomon had 700 wives, most of whom probably needed to eat.**

The divided kingdom (922-586 B.C.E.).

Dissatisfaction with Solomon's high taxes and forced labor led to the kingdom splitting after his death in 922 B.C.E. The ten tribes in the north, feeling they had borne more than their fair share of the burden, broke away and founded the kingdom of Israel, while David's line continued to rule the remaining two tribes in the southern kingdom of

Judah. Neither kingdom had the power and resources to maintain itself in the style of David and Solomon. A growing gap between rich and poor led to social turmoil, while corruption and internal quarrels further weakened each kingdom. And all the while, the spreading shadow of the Assyrian Empire was approaching the Israelites.

Both kingdoms gave in to Assyrian rule and were allowed to govern themselves as long as they loyally supplied the Assyrians with money and troops. Unfortunately, the northern kingdom of Israel made the mistake of rebelling. The Assyrian lion descended with typical speed and ferocity, killing much of the population and dragging the rest off into mass exile. There, the ten tribes of Israel became the "ten lost tribes of Israel", being absorbed by the surrounding cultures and losing their identity as a people.

Rats or plague? The Assyrians did besiege Jerusalem in 688 B.C.E., but were apparently repulsed. The Biblical version in II Kings says the city was delivered by God who slew 185,000 Assyrians (a lot more than they could have possibly brought). Whatever the number, this suggests some sort of epidemic, such as cholera, as the agent of their destruction. The Greek Historian, Herodotus, says it was an infestation of rodents that ate the Assyrians' bowstrings. Or course, rodents also carry disease, so the two accounts may not be that far apart.

The southern kingdom of Judah managed to hang on until 586 B.C.E., when it rebelled against the Babylonian successors to the Assyrian Empire. Babylonian vengeance was also swift and deadly. Jerusalem was sacked and burned, and the remaining two tribes were dragged into captivity in Babylonia. However, these two tribes managed to survive and keep their identity, largely because the Persians, who conquered the Babylonians in 539 B.C.E., allowed them to return to their homeland before they were totally absorbed and had lost their identity.

Ironically, this time of troubles saw the Jewish religion achieve new heights. Since the time of David, a succession of prophets had emerged in order to chastise the people for their sins and warn them of God's retribution. When that retribution came at the hands of outside powers, such as Assyria and Babylon, the idea emerged that the

Jewish god was the god of all peoples. For example, the prophet Jonah was sent to warn the Assyrians to mend their ways, showing a concern for **Gentiles** (non Jewish peoples) that had not appeared previously.

Also, in the midst of all these troubles, a messianic idea evolved of a day when divine grace would put an end to human conflict and suffering. Unlike most ancient peoples, such as the Greeks and Romans, who put their golden ages in the past, the Jews saw theirs in the future. The Jews passed this idea on to Christianity and Islam. In later centuries, it would become one of the most dynamic forces in the history of human thought. The Jews were fortunate to have such an optimistic view of the future, for they would need it. Few, if any, people, have endured the suffering and displacement that they were destined to undergo in the 2500 years after the fall of Jerusalem while still maintaining their identity as a people. Although the Persians let them return home from Babylon, fate would not let them stay there.

In 66 C.E., the Jews rebelled against another master, this time Rome. Four years later, Roman legions broke into, sacked, and destroyed Jerusalem. This was the start of the **Diaspora**, or dispersal of the Jews. For the next 1900 years, the Jews would be a people without a home. Scattered across Europe and the Near East, they would experience alternating periods of tolerance and intense persecution at the hands of the people under whom they lived. The low point of all this was the methodical execution of 6,000,000 Jews by the Nazis in World War II. Remarkably, the Jews kept their identity as a people, and in 1948 finally regained a homeland in Israel. Seeing them through all these centuries of trials and tribulations was the vision of a better day to come when *"Nation shall not lift up sword against nation Neither shall they learn war anymore."* (Isaiah 2:4)

Joshua and the Giants

The Osiris pillars in the Temple of Ramses II at Abu Simbel

As the Israelites approached Canaan, Moses sent twelve spies to scout it out. When they returned with reports of a land of giants, only Joshua and one other spy, Caleb, felt confident about moving in. Because of their lack of faith, the Israelites had to wander forty years in the wilderness before finally entering the Promised Land.

So what were the giants they saw? Very likely they were giant statues meant to scare and intimidate people, especially desert nomads having no prior experience with such things. Apparently, they did the job. One can almost imagine an ancient accountant entering the costs of these statues as part of the defense budget. Yes, the Israelites had been in Egypt, but after long years of wandering in the wilderness few if any old timers remained who may have actually seen something like this and knew what they were. That's assuming the Israelites were in a part of Egypt that had such statues.

It's good to keep in mind that monumental statues and architecture, besides being a great ego trip for the rulers who had them built, also served the practical purpose of scaring away invaders and keeping the locals in line. To maintain that fiction, rulers typically did few public appearances, and those would be from elevated positions to distort people's perception of them. Thus the only impression their subjects usually had of them were larger than lifelike statues put in very public places. I'm reminded of an account by a Russian peasant's meeting with Tsar Nicholas II and his disappointment with how short and ordinary he was. Along those lines, when emperor Hirohito announced Japan's surrender in 1945, it was the first time the Japanese public had ever heard him speak. Even then it wasn't a live broadcast, but a taped one.

Closer to home, in most presidential elections it is the taller candidate who wins. We still seem to crave a larger than life hero to solve our problems and protect us.

Gideon and Samson

Two other famous judges in the Bible were Gideon and Samson. What makes them and other characters in the Bible, like David and Saul, interesting is that they are so human and flawed. Compare this to kings like Ramses II of Egypt, who have themselves portrayed as gods, or at least godlike, and capable of no mistakes, much like modern politicians. But, then again, the Bible is not about people so much as about God and how even the greatest of us need God's help. A little humility doesn't hurt either.

Gideon. When God comes to Gideon, (meaning "Destroyer," "Mighty warrior," or "Feller of trees") and tells him to destroy idols to Baal and fight the Midianites and Amelikes, Gideon asks for a sign, that the next morning there will be a dry fleece with wet ground all around. When God performs this sign, Gideon asks God to reverse the sign for the next morning (i.e., a wet fleece surrounded by dry ground. When God, showing a great deal of patience by the way, does this, Gideon finally agrees to go.

When 32,000 men show up to fight the Midianites, God has Gideon send home those who were afraid, which reduces his army by 22,000. But God tells Gideon this is still too many, so he has them go to the river for a drink and send home those who lap the water like dogs instead of cupping it and bringing to their faces. Only 300 men are left after this test. Then Gideon and his 300, equipped with horns and torches, surround the Midianite camp. At the sign they blow their horns (think of a big marching band bursting into your room at 3 AM) surprising and confusing the Midianites so much that they turn on each other with their swords.

Samson, of course, was famous for his long hair that somehow gave him super-strength to do such things as wrestle a lion with his bare hands and kill an entire army with a donkey's jawbone. His girlfriend, Delilah, a Philistine spy, kept trying to find the secret of his strength. So he told her that binding him with seven bowstrings would weaken him. So she tried that while he was asleep, but when the Philistines came, he broke the strings and killed them. So she cries that he doesn't love her, and, for some reason, he isn't suspicious and tells her to bind him with fresh rope, which she does and the same thing happens again. So she cries some more and he tells her to bind his hair, and she does with the same results again.

Even after destroying a lot of good rope and bowstrings, not to mention having to kill hundreds of Philistines, Samson still isn't suspicious of Delilah, who's crying up a storm again, and he finally tells her to cut his hair. This time of course, he does lose his strength and is captured and blinded by the Philistines.

However, the Philistines, don't seem any brighter than Samson and forget to keep his hair short. When it grows back, he regains his strength and, with a prayer to God for strength, brings down a temple, killing a bunch of Philistines, not to mention himself.

Two Mothers One Baby, & a Very Wise King
In the Bible, when asked by God as what gift he would desire, king Solomon replied he wanted the wisdom to govern justly. Indeed, the Israelite king's wisdom was so proverbial that we still have the expression "as wise as Solomon."

Nothing better illustrates this than the story of two young mothers, one of whose baby has died. After she tries to switch babies with the

other woman, a dispute ensues. They take the case to king Solomon, who has no way of telling who the living baby belongs to. So he tells a guard to cut the baby in half and give part to each woman. The woman whose baby died agrees to this, while the real mother says the imposter can have the living baby if only the king will spare it. Thus he knew the real mother for the selfless love only a mother could have.

The long strange evolution of the angel
Although the *Bible* has several references to Angels as messengers of God, there is no detailed description of how they looked. Not that this stopped people from filling in this gap of information with their imaginations. Oddly enough, the story begins with the Assyrians who used gigantic statues of monstrous winged bulls with human heads to flank the gates of their palaces. Their main purpose was to scare visitors and subjects into behaving. Knowing the Assyrians, it seems to have worked.

Fast forward a few centuries to King Solomon of Israel who is about to build the Temple in Jerusalem. Having little experience in such architecture, he hires the Phoenician king of Tyre, Hiram. Of course, the Phoenicians were among history's greatest copycats, so Hiram, looking for something to model his cherubim (angels) on to guard the Holy of Holies, uses the Assyrian man-headed winged bulls.

Over time, the cherubim became more anthropomorphic (human in form) and assumed the forms of adult human-like beings with wings, sometimes fearsomely armed with swords of fire (especially in Northern Europe), sometimes just as messengers.

Then something strange happened. They devolved into cute “cherubic” winged babies flying around in the backgrounds of paintings.

Some painters, such as El Greco, even showed them as disembodied winged babies’ heads which, when one thinks about it, were as creepy and frightening as giant man-headed winged bulls.

The Sling

The sling was the traditional weapon of shepherds, such as David, because it was cheap and deadly. With practice, slingers could fire stones or lead bullets at tremendous velocity and with deadly accuracy. So the idea that David was at such a disadvantage against Goliath may be a bit of an overstatement, especially if he could keep his distance from the lumbering giant wearing cumbersome armor.

Since slingers needed a lot of individual space to swing their weapons without obstruction, armies could only employ a few of them, so they couldn’t provide concentrated firepower against an enemy army. However, they were good for skirmishing, and generals like Hannibal often had a number of slingers with them. Slingers liked to inscribe their lead bullets with insults and nasty messages for their recipients. The two places with reputations for the best slingers were the Balearic Islands at the western end of the Mediterranean and the island of Rhodes at the eastern end.

THE PERSIAN EMPIRE (c.550-330 B.C.E.)

Introduction. Few people today can boast a longer and prouder history than the Iranians, descendants of the ancient Persians. Not only did they build the greatest empire of the ancient Near East, but they also absorbed the ancient civilizations they ruled, in particular that of Mesopotamia. They then added their own distinctive touches and passed them on to Islamic civilization, still one of the main cultural traditions of modern times. Therefore, this remarkable people who have survived and flourished from antiquity to the present have been a major connecting link with our past.

We first encounter the Persians around 2000 B.C.E. emerging from the grassy steppes of Central Asia in the north. At that point, they were closely associated with two other peoples: the Medes and Aryans. The latter of these turned eastward, crossed the Hindu Kush Mountains, and overthrew the Indus River civilization. Eventually these nomads would settle down and build Indian civilization upon the foundations laid by the Indus culture. Meanwhile the Persians and Medes were turning westward where they encountered the Elamites, a people whose extended contact with Mesopotamia had influenced them to absorb the culture of the "Cradle of Civilization".

The Medes and Persians in turn started absorbing Elamite culture. One need only look at the relief sculptures of the Persians, with their curly beards and stiff formal poses, to see the connection with Mesopotamia. However, the process of becoming civilized was a long one for these people, since they were still on the northeastern fringes of the older Near Eastern cultures. When they emerge fully into the light of history in the pages of the Greek historian Herodotus, they are still very nomadic in their customs and values. According to Herodotus, the nomadic Persians had only three simple goals in educating their sons: "to ride a horse, to draw a bow, and to speak the truth." What more did nomads need? The Medes were actually the first of these nomadic peoples to establish an empire when they joined forces with Babylon to overthrow the Assyrian Empire in 612 B.C.E. In the aftermath, Babylon took the richer civilized lands of the Fertile Crescent, while the Medes took the more extensive but wilder lands to the north. Among their subjects were their compatriots, the Persians. It is here that we encounter the founder of the Persian Empire.

Cyrus the Great and the Rise of Persia (c.550-522 B.C.E.). Herodotus gives us a detailed and somewhat fanciful account of Cyrus the Great's rise to power. As in the stories of so many great men and legendary figures in history, from Sargon of Kish and Moses to Oedipus and Romulus and Remus, Cyrus barely survived infancy due to a royal death sentence from a king nervous about the child's destiny. In each story, someone saves the baby, who grows up and comes back to overthrow the king who tried to do him in. What does seem clear is that Cyrus led the Persians in revolt against the Medes and overthrew them around 550 B.C.E.

Although the Medes' old neighbors were certainly glad to see the powerful Median state overthrown, they soon found their new neighbor, Persia, was an even more dangerous foe. Cyrus first turned westward against Croesus, king of Lydia in Asia Minor, a land renowned for its wealth, as seen in the old saying "rich as Croesus" to denote how wealthy someone is. In order to deal with the tough Lydian cavalry, Cyrus placed camels in front of his lines. The Lydian horses, unused to the camels' strange smell, panicked and bolted, giving Cyrus the victory and Lydia.

Cyrus next turned south against Babylon, whose empire was seething with revolt. Herodotus claims that Cyrus had his troops divert the course of the Euphrates so they could march into the city's unguarded river gates. However true that may be, Babylon's empire collapsed like a house of cards, leaving Cyrus the master of a huge empire. Still, he pressed onward, this time into the vast and wild expanses of Central Asia. His intentions here were probably defensive, to protect the frontiers of civilization from the swarms of nomadic horsemen to the northeast. It was here in 530 B.C.E. that Cyrus died in battle against a tribe known as the Massagetae. In his twenty-nine year reign, he had built the largest empire in history up to that time.

Cyrus' son and successor, Cambyses (530-522 B.C.E.), is mainly remembered for his conquest of Egypt in 525 B.C.E. His attempts to conquer the Nile further south and the desert oases of the Sahara met with less success. Supposedly, one of Cambyses' armies was swallowed up by a desert sandstorm. Cambyses was especially unpopular with the Egyptians, who claimed he committed various atrocities, including the slaying of the sacred bull of Apis. Since our main source for his life is Herodotus, who relied heavily on Egyptian

sources for his book, we have a picture of Cambyses as a drunken lunatic. Cambyses died in 522 B.C.E on his way to Babylon to crush a revolt led by his cousin, Darius, who then succeeded him as the next Great King of Persia.

The power of quick thinking. According to Herodotus, Persian boys were taught three things: to ride a horse, shoot a bow, and tell the truth. This created a dilemma for a Persian noble when the king, Cambyses, who was known as a drunkard and lunatic, asked who was better: himself or his father. Not wanting either to lie or offend the king, he responded: "You are not equal to your father for you do not have a son equal to the one he had."

Darius I "the Great" and the consolidation of the Persian Empire. Although Cyrus had founded the Persian Empire, Darius I (522-486 B.C.E.) gave it the internal organization and structure that allowed it to last for 200 years. His accomplishment is all the more impressive when we consider the empire's enormous size, the scale of which no one had ever dealt with before. Darius dealt especially with three areas: organization of the empire's provinces, keeping the provincial governors under control, and maintaining communications with his far flung empire.

Organizing the provincial government presented two options. Darius could either create small provinces with governors too weak to rebel, but also too weak to defend their provinces against invasion. Or he could create large provinces able to defend themselves, but also more capable of defying his authority. He created about twenty large provinces, called *satrapies*. These ensured that he would not have to race from one end of his empire to the other defending it against every little tribe that decided to attack. Each such campaign might involve years of preparation, marching and fighting. Meanwhile, other frontiers would be vulnerable to attack, involving more years of campaigning and leaving the king with little time for other duties.

Since larger provinces gave the governors, known as *satraps*, a lot of power, Darius took several precautions to keep his satraps from rebelling. For one thing, he had the provincial treasury officials, secretaries, and garrisons answer directly to him,

not to the satraps, except in emergencies. This generally deprived the satraps of the money and troops they needed to revolt while ensuring the defense of the satrapies. There were also officials known as the "King's Ears". These personal agents of the king would travel to the various satraps' courts to check up on their behavior and official records. The King's Ears commanded a great deal of fear and respect, sometimes showing up with no armed escort, but still being able to put down rebellious satraps before the revolts went beyond the planning stages.

Communications in such a far-flung realm was another major problem. Here the Persians adopted the Assyrian practice of setting up a system of relay riders, much like the old Pony Express in American history. Each horse and rider would carry a message for a day and then pass it on to the next horse and rider. In order to speed things along, the Persians established a road system to tie the empire together. The most famous of these was the King's Highway, which stretched 1677 miles from the Persian capital of Susa to Sardis in Asia Minor. It had patrols against bandits, relay stations with fresh horses for the royal messengers, and 111 inns for travelers, placed about one day's journey apart from each other. Another road going through the desert to Egypt had underground cisterns with water for travelers. Although these roads helped trade and travel, their main priority was for the relay riders who could carry a message from Sardis to the king in Susa within seven days, an amazing speed for back then. As Herodotus described these riders: *"Nothing stops these couriers from covering their allotted stops in the quickest possible time--neither snow, rain, heat, nor darkness."*

In general, Darius took existing practices and institutions and adopted them on a larger scale. However, in one respect, he differed quite markedly from previous Mesopotamian rulers. That was in his treatment of Persia's subjects. Darius realized that there was no way his far-flung empire could survive constant revolts such as had plagued the Assyrians. Therefore, he followed a policy of tolerance toward his subjects' customs and religions. For example, the Jews were allowed to return to Israel from their Babylonian captivity, causing them to sing the Persians' praises in the Bible.

Darius and other Persian kings also adopted local titles, such as pharaoh in Egypt, to win popular support. Sometimes they also kept local rulers in

power as Persian vassals, such as in the Greek cities in Asia Minor. This hopefully would ensure them more loyalty, although it could backfire if those rulers were unpopular to begin with. While Persian rule may not have been wildly popular, most people tolerated it as an improvement over the harsher rule of the Assyrians and Babylonians. Keeping their subjects happy went a long way toward keeping the Persian Empire intact. It also ensured the cooperation of the Syrians and Babylonians, whose scribes and administrative skills were badly needed to keep the government running smoothly.

The Persians also worked hard to promote economic prosperity. Their roads, strong government, and stable coinage encouraged trade. They also promoted agriculture with irrigation projects and the introduction of new crops to different areas, such as sesame to Egypt and rice to Mesopotamia. Of course, increased prosperity also generated more taxes. The Persians also kept their subjects happy by charging moderate tax rates, about twenty per cent of a person's income. Despite this modest tax rate, the Persian kings were fabulously wealthy. By the time Alexander the Great took over the Persian Empire in 330 B.C.E., the Persian kings had reportedly amassed a treasury of 5500 tons of silver.

Darius and other Persian kings further enhanced their authority by assuming divine or semi-divine status to overawe their subjects. In certain provinces, such as Egypt, they took the titles of local rulers who were often seen as gods. They also built a fabulous capital, Persepolis, in the middle of the desert, and adorned it with magnificent government buildings. The Persians also adopted the elaborate court ritual of their subjects. One had to go through a virtual army of officials before getting an audience with the king. When one approached the king, he performed a rite known as *proskynesis*, which involved throwing oneself at the king's feet. It was a great honor just to be allowed to kiss the hem of his garment and a serious offence for anyone outside the king's closest friends and advisors to look him in the eye. Such elaborate ritual could enhance the king's authority, but it could also cut him off from the day-to-day realities of empire.

Religion. The Persians, like most ancient peoples, started out with a polytheistic religion to account for

the forces of nature. However, around 600 B.C.E., a new religion emerged, called *Zoroastrianism* after its founder, Zoroaster. This was a dualistic religion, which meant it saw life as a constant struggle between the forces of good and evil. In the end people would all be held accountable for their deeds in a judgment day when they would go to heaven as a reward for good deeds or suffer eternal punishment for their sins. Zoroastrianism seems to have had some influence on Judaism. In the book of Daniel, which takes place at the Persian court, the ideas of Heaven and Hell and of Satan as a force always opposed to God first appear in the Bible. Both of these ideas have become central to Christianity and Islam as well as Judaism.

Decline and fall (c.464-330 B.C.E.). Any state needs a strong ruler to keep things running smoothly. After the death of Xerxes (486-464 B.C.E.), the Persian Empire lacked that strong hand. As a result, various problems developed that fed back upon one another and led to Persia's decline and fall. For one thing, weak rulers led to numerous provincial revolts, especially in Egypt, which always had detested Persian rule. Secondly, the provincial satraps also became more independent, ruling their satrapies more as kings than as the king's loyal subjects. They even carried on their own foreign policies and waged war on each other, which only added to Persia's problems.

Revolts and unruly satraps caused serious economic problems for the empire. Persian taxes became heavier and more oppressive, which led to economic depression and revolts, which in turn led to more repression, heavier taxes and so on. The Persian kings also started hoarding gold and silver rather than re-circulating it. This created economic turmoil without enough gold and silver for doing business. As a result of this economic turmoil, the Persian kings got weaker still, which fed back into the problem of revolts and powerful satraps and so on.

Around 400 B.C.E., Cyrus the Younger, a royal prince, rebelled against his brother and king, Artaxerxes. Although Cyrus was killed in battle, his force of 10,000 Greek mercenaries survived only to find themselves stranded in the heart of Persia. In order to get home, they marched and fought their way through a good part of the Persian Empire. This exploit, known as the March of the Ten Thousand, exposed the weakness of the empire. And encouraged Alexander the Great to invade

Persia, which he conquered in a remarkably short time and with a remarkably small army.

Nevertheless, the Persians survived and reestablished their empire under the Sassanid dynasty around 200 C.E. Around 650 C.E., they fell once again, this time to the Arabs inspired by their new religion, Islam. Still, Persia survived, passing its culture on to the Arabs. Thus the Islamic culture which emerged was very much Persian, and ultimately Mesopotamian, in origin. The Persian Empire revived once again around 1500 under the Safavid dynasty, and its culture and traditions live on today in modern Iran.

The Golden Touch

Lydia's neighbor, Phrygia, was also renowned for its wealth thanks to gold dust in its rivers. We remember this through a Phrygian king named Midas.

Gold stater of Croesus of Lydia

Croesus of Lydia's legendary wealth was the source of one of history's great innovations, coinage. Very simply, this gave people a piece of gold (which for some silly reason everyone thought was valuable) in a standard increment of guaranteed weight and purity. This eliminated the need to weigh and test every lump of gold in every trade transaction, saving people a lot of time and giving them the peace of mind, thus promoting more trade and wealth. Also, since only the state had the right to issue coins, it gained more control over the flow of wealth. This also expedited the collection of taxes.

Croesus of Lydia Destroys a Great Empire: His Own

In addition to coinage, Croesus of Lydia provided us with one of the great stories of folly in history. As Cyrus' Persian realm advanced westward, Croesus became more and more determined to go to war with the

rising new power. The Greek sage and Croesus' friend, Solon, warned the king against this:

"...they [the Persians] eat as much as they have, never as much as they want. They drink no wine but only water. They have no good things at all, not even figs for dessert. Now if you conquer this people, what will you get from them, seeing they have nothing for you to take? And if they conquer you, think how many good things you will lose, for once they taste the luxuries of Lydia they will hold on to them so tightly that nothing will make them let go. I am thankful myself that the gods have never put it into the Persians' heads to attack the Lydians."

Although still dead set on going to war, Croesus decided to ask the gods, who supposedly spoke through certain chosen priests and priestesses known as oracles. But first, he had to figure out which oracle was the most reliable. So Croesus sent messengers to all the famous oracles with the question of what he would be doing in 100 days. Only the oracle of Apollo at Delphi got the right answer: boiling a rabbit and tortoise together in the same pot.

Cyrus of Persia's camels panic the Lydian cavalry before the walls of Sardis

Having figured out which oracle was best, he sent messengers to Delphi to ask Apollo if he should go to war with Persia. However, the oracle was prone to giving ambiguous answers that could be interpreted either way, thus making it difficult to ever prove it wrong. This also had the effect of making people interpret

the oracle's answers however they wanted. Therefore, when the oracle told Croesus that if he went to war he would destroy a great empire, he assumed the empire would be Persia.

Wrong.

After an indecisive battle, both armies disbanded for winter, the usual practice then since weather was bad, roads were muddy, and forage for horses was hard to get. Except that after disbanding, Cyrus regrouped his army and rapidly marched on the Lydian capital, Sardis, appearing so suddenly that, as the Greek historian Herodotus would put it, he was the messenger of his own arrival.

Croesus gathered his own army, in particular the excellent Lydian cavalry, and marched out to meet Cyrus. But the Persian king had another trick up his sleeve: camels. Seeing that there were no camels in this part of the world, Cyrus knew the Lydian horses weren't used to their smell. So he put a line of camels in front of his army, the scent of which immediately panicked the Lydian horses, disrupting their army and giving Cyrus the victory.

As the oracle had foretold, Croesus had indeed destroyed a great empire: his own.

A Greek vase shows Cyrus rescuing Croesus from burning himself to death on his own pyre. According to Herodotus, Cyrus was unable to quench the flames. Therefore, Croesus called out to Apollo,

who immediately blew up a big storm that saved the Lydian king. Seeing the esteem in which the gods held Croesus, Cyrus kept him as a trusted advisor. At least that's the story according to Herodotus. Newer research indicates Croesus died when Sardis fell.

The Writing on the Wall

The expression *writing on the wall*, indicating a portent of doom, goes back to the Persian conquest of Babylon in 539 B.C.E. as recounted in the biblical book of "Daniel". According to the story, the Babylonian king Belshazzar has a banquet, gets drunk, and orders the gold goblets sacked from the temple of Jerusalem in 586 B.C.E. brought out to praise 'the gods of gold and silver, brass, iron, wood, and stone'. Soon afterward, a disembodied hand appears and writes a cryptic message on the wall: "mene, mene, Tekel u-Pharsin." Unable to interpret this, the king summons the Jew, Daniel, since he is reputedly be gifted in such matters. Daniel's interpretation was:

"And this is the writing that was inscribed: mina, mina, shekel, half-mina. This is the interpretation of the matter: mina, God has numbered the days of your kingdom and brought it to an end; shekel, you have been weighed on the scales and found wanting; half-mina, your kingdom is divided and given to the Medes and Persians."- Daniel 5:25-28

A mina was a measure of currency, from the root of the word to count. Shekel, another measure of currency came from the word to weigh. The word *peres* for half shekel could also mean divide.

That very night, Cyrus' Persians entered Babylon and overthrew the dissolute Belshazzar.

Persian Hydraulic Engineering

The power of strong backs. The Persians were hydraulic engineers par excellence. In order to conquer Babylon, Cyrus diverted the Euphrates River, which ran through the middle of the city, and walked in while the Babylonians were distracted by a religious festival. Similarly, a century later when the Athenians had sailed up the Nile to help an Egyptian revolt, the Persians diverted a channel of the Delta, leaving the entire Athenian fleet stuck in the mud.

On a more constructive note, the Persians dug a canal connecting the Nile to the Red Sea, establishing direct water trade between India and the Mediterranean. The canal eventually silted up and a more permanent canal wasn't built until the completion of the Suez Canal in 1869.

The Power of the Great King

The Persian religion, Zoroastrianism, held kingship as sacred, but did not see the king as a god. Still, one had to be extremely careful around the Great King. Symbolic of this was the practice of *proskynesis*, kneeling with one's face to the floor as a sign of complete submission. It was a great honor to be allowed to kiss the hem of the Great King's robe.

Safety tip of the day: Never look the king directly in the eye.

The power of a word. The fear and respect accorded the king's agents, known as the King's Ears, was apparent when one of them showed up in the court of a satrap planning a revolt. He read three decrees from the king. The first decree was routine, just to see if the satrap's troops were listening. The second decree ordered the satrap's troops to throw down their arms. The hall immediately resounded with the sound of weapons clanging on the palace floor. The third decree was for

the satrap's troops to arrest and kill the satrap. The revolt was over before it could begin.

Some costly furniture. The Great King's justice could be harsh. For example, when one of his satraps, Sisamenes, was caught in corruption, Darius had him skinned and made into a chair. Then he made Sisamenes' son the new governor and sat him in that chair as a constant reminder of the price of corruption.

However, the king, not being seen as a god, was subject to his own laws. Illustrating this is the biblical story of Daniel, a trusted advisor to king Xerxes, and an object of jealousy from others at court. Knowing Daniel was Jewish and not allowed to worship other gods, his enemies tricked Xerxes into making a law condemning anyone not willing to worship the Persian god Ahuramazda. The evil counselors then pointed out to Xerxes that Daniel was disobeying the law. As a result, despite his friendship with Daniel, Xerxes had to abide by his own law and have Daniel thrown to the lions. Luckily, the lions weren't hungry then and, taking this as a sign from God, Xerxes had his friend released.

16. PRE-COLUMBIAN AMERICA TO C.1500 C.E.

Introduction. What if a bunch of Cro Magnons (i.e., our species 30,000 years ago) were dropped onto another planet with the same basic conditions and ecology as earth? Being isolated from any other cultures, would they develop civilizations comparable to those that developed in the eastern hemisphere? To answer that question, we need look no further than the Americas, because civilizations did develop there most likely without any outside cultural contacts.

However, the civilizations that developed there lagged significantly behind those in Eurasia and North Africa, largely because of four environmental factors. First of all, the Americas, like Africa, are aligned along a north-south axis, unlike the civilizations in Eurasia and North Africa, which are aligned along an east-west axis. The significance of this is that being in roughly the same latitudinal zone with similar cycles and amounts of daylight, civilizations in Eurasia could more easily share crops with one another. By contrast, in the Americas it was harder to spread cultivation of crops such as corn from Mexico because it took a long time to adapt them to regions with different amounts of sunlight. Secondly, corn, the main domestic crop, was originally a grass that was much harder than other crops, such as wheat and rice, to develop into a plant yielding enough food to sustain large populations, one of the primary requirements for developing a civilization. Third, the two main centers where civilizations developed in the Americas, Mexico and Peru, were cut off from contact with one another by jungles and mountains, which minimized their ability to share new ideas and technology. In fact, they seem to have been unaware of each other's existence when Europeans arrived. Contrast this with Eurasia, where all sorts of ideas and technology did spread between civilizations. Early China borrowed quite a bit from the Middle East, and later became the source of much technology used in the West, such as the compass, which allowed the Europeans to reach the Americas and effectively destroy the civilizations that were developing there.

The fourth factor was largely man-made, namely excellent hunting technology and techniques that wiped out horses and camels, which did exist in the Americas when humans first arrived. This had two major effects. First, it left Native Americans with

no large draught animals for pulling plows. This severely reduced the amount of land one person could farm and the amount of food available to sustain extra populations in cities and civilization. Secondly, since large herds of domestic animals have been the primary source of communicable diseases from which humans suffer, the lack of such animals made the Americas relatively free of such diseases. In the short run this helped Native Americans. However, having had no prior exposure to such diseases as smallpox and measles, they had virtually no resistance when first exposed to them by Europeans. Some estimates of Native American population loss between 1500 and 1600 run as high as 94%. As stated previously, civilization in the Americas developed independently in two primary locations: Central America, especially Mexico, in the north and Peru in the south.

[Back to flowchart](#)

PRE-COLUMBIAN MEXICO

Mesoamerica (Mexico and Central America). The first civilization in this part of the Americas was that of the Mayans (c.250-900 C.E.), although they built upon the older culture of the Olmecs, in what is now south-central Mexico. Some historians hesitate to call Olmec culture a civilization, since it seems they established ritual centers where people gathered at particular times of the year rather than being inhabited by large numbers of people year round. The Olmecs are especially remembered for their giant carvings of heads. They also practiced blood sacrifices and played a ballgame, both of which would become distinctive features of the Mayans and of all the Mesoamerican civilizations that followed them. It seems to have been like racquetball in that players tried to keep a rubber ball (sometimes weighing as much as nine pounds) in play on a narrow court between two walls. However, they could not use their hands, and later versions had a circular goal higher than the heads of the players. This game often had ritual purposes than might even involve a human sacrifice of the losing team.

Most people count the Mayans as the first true Mesoamerican civilization and refer to the period of their cultural flourishing as the Classical period of Mesomerica. However, instead of being major population centers, their “cities” were more ritual centers/royal courts centered on royal dynasties that also had priestly duties, giving them much of their power and status. Politically, they functioned as city-states, some of which, such as Tikal and Palenque, ruled over a number of such smaller states.

The Mayans were the real basis for later Mesoamerican civilizations, having sophisticated astronomy and math, including the use of zero, which helped them develop remarkably precise calendars. The Mayans were the only Pre-Columbian civilization known to have writing. Appearing similar to Egyptian writing, it is typically referred to as hieroglyphic, consisting of around 1000 symbols representing a mixture of logograms (e.g., & representing and) and syllables. As in the ancient Middle East, such a system made writing a highly specialized craft, giving scribes a high position in society. Later Mesoamerican societies, such as the Aztecs, did have books written on three barks. However, these only held pictures mostly concerned with religious and ritual topics.

Mayan cities and architecture served as the model for cities of ensuing civilizations: being centered on a plaza that was usually oriented toward a cardinal direction. Plazas typically were ringed with government buildings, stepped temple pyramids (for blood sacrifices, including humans), sometimes a ball-court. The stepped pyramid became the most notable feature of Mesoamerican architecture, spreading as far north as Cahokia, Illinois.

The reasons for the fall of the Mayans around 900 C.E. remain a mystery. There are various theories, such as disease or revolt by the lower classes. Because writing was limited to so few people, it was lost after the fall of the Mayans, whose successors never revived the concept beyond books with pictures describing such things as religious rituals. As a result, historians are limited to art and archaeology as their main sources of information about the peoples who came afterward. There were a variety of peoples who built upon the Mayan achievement, much as successive peoples built upon Sumerian civilization in Mesopotamia. However, without written records, we know relatively little about them beyond their names: Zapotecs, Mixtecs, Toltecs, and so on. In fact many historians now think that the Toltecs were invented by the Aztecs as their mythical predecessors.

One early city that seems to have traded influences with the Mayans was Teotihuacan, which flourished c.100-450 C.E. in central Mexico. After the Great Pyramid of Cholula in Peru, it had the two largest pyramids in the Americas, the temples of the Sun and the Moon, and a population estimated between 100,000 and 250,000 people, making it one of the largest cities in the world at that time. As with the Toltecs, there is controversy over who built and ruled the city and the extent of its political power. Equally mysterious is the reasons for its decline, although it seems to correspond with a period of droughts in the mid sixth century. Skeletal evidence of infants from the time shows signs of malnutrition. Also evidence of fires limited to major public buildings could indicate the city fell to foreign invaders or internal revolt. Teotihuacan, with its two great pyramids remained a sacred site place of pilgrimage to later cultures, being seen by the Aztecs as the birthplace of the sun.

Mesoamerican civilizations constantly faced migrations and invasions by northern nomads who were generically referred to by the more civilized peoples in Mexico as *Chichimec* 's, a term roughly

translated as barbarians. Over time, these peoples would assimilate, revive, and expand the cultures of the older Mexican civilizations in much the same way that nomadic tribes did time and again in Eurasia.

The influence of Mexican civilization extended northward into the American Southwest and up the Mississippi River to Cahokia, Illinois, not far from St. Louis. Urban planning around plazas, art motifs, and architecture were all based on those found in Mexico. Cahokia had a pyramid mound that was the largest such earthen structure in the Americas. Its population at its height in the eleventh century is estimated at between 8,000 and 40,000. It also had Woodhenge, a circle of posts used for marking the solstices and equinoxes. Cahokia was abandoned around 1400 C.E., although, once again, the reasons remain a mystery.

The final Mesoamerican civilization before the arrival of Europeans was that of the Aztecs, who established their capital, Tenochtitlan, on artificial islands (*chinampas*) in the middle of Lake Texcoco in the Valley of Mexico. By the 1500s, it had a population of some 200,000 people, dwarfing virtually every city in Europe at that time, except maybe Paris. Making this possible was its location in the middle of the lake, which allowed critical food supplies to be transported by water from a much larger area of farmland than most other Meso-American cities. The Aztecs would expand their city and the farmland feeding it by making more chinampas, which could yield up to seven crops a year and support the city's huge population.

Tenochtitlan was laid out in a rectangular grid crisscrossed by canals, much like Venice. It was accessible both by water and by way of three causeways leading north, south and west to the shores of Lake Texcoco. There were several bridges in the causeways to allow canoes to sail through. These bridges could also be removed if the city were under attack. Since much of Lake Texcoco's water is brackish, the Aztecs built a dike to protect the city's fresh water springs. There was a twin city, Tlatelolco, which was taken over by Tenochtitlan in 1473.

One of the most famous (or infamous) aspects of Aztec culture was its religion, which demanded massive human sacrifices to feed the sun god. Aztec warfare was primarily for the purpose of capturing sacrificial victims rather than killing the enemy.

This made many of the Aztecs' subjects, who were ripe for revolt by the time of Cortez's arrival, join him to overthrow them.

Meso-American Religious Beliefs

As one might expect from a civilization evolving in total isolation, Meso-American religions had both striking differences from those in the Eastern Hemisphere, but also basic similarities, since they evolved in similar conditions. One similarity was they were polytheistic, seeing gods and spirits in the different forces of nature they could not control. They could merge their gods' characteristics in seemingly endless ways and combinations. Much like the Egyptians, some of their gods would have human faces and animal bodies or vice versa.

On the other hand, since they saw time as cyclical, they didn't see particular gods or attributes as permanently good or evil. What might be appropriate at one time or season could be inappropriate at another. One of the more unique Mayan deities was Ixtab, goddess of suicide, an act the Mayans believed sent one to Heaven.

Left: Tlaloc, the Aztec version of the Meso-American rain god and & thunder as well as fertility & agriculture.

Sometimes he was shown as an old man w/amphibian or reptilian fangs & tears, symbolizing rain. He carried an ax to symbolize thunder. Sometimes referred to as "he who lights the sky" and "he who urinates."

Right: An Olmec chaneque

The Mayan Calendars and Apocalypse

Mayan astronomical observations were so precise they could plot the course of Venus within 14 seconds per year. Mayan priests could predict solar and lunar eclipses, an ability that may have overawed the rest of the populace and kept them submissive.

The Mayans had several calendars, largely drawn from older Olmec calendars and influencing most later Mesoamerican calendars. These calendars include a lunar one and a 584 day cycle for the planet Venus. One was a regular solar calendar (Haab') of 365 days with eighteen months of twenty days each and five "nameless" days (Wayab') at the end of the year. These last five days were considered particularly dangerous, because it was believed that the boundaries between this world and the underworld dissolved, thus letting in evil spirits that could unleash catastrophes. Of course there were special rituals and customs designed to prevent such disasters, such as not leaving home or washing and combing one's hair. Since the Haab' had exactly 365 days, it was a full day off every four years, and therefore was not used for agricultural purposes.

There was also a religious calendar of 260 days known as a Tzolk'in. There are different theories on the origin of this calendar (e.g., the length of human pregnancy since the first missed menstrual cycle or the length of time it takes crops to mature). A larger unit of time, known as a Calendar Round, consisted of a 52-year cycle when the solar and religious calendars would end on the same day. There was fear that end of this cycle would bring the end of the world, so there were great ceremonies and ritual purifications performed, including evidence of the people even destroying their possessions and houses in preparation for this event.

When the apocalypse didn't take place there would be great celebrations, often involving the erection of commemorative stela and even new temples.

Much was made of the Mayan prediction of the end of the world on December 21, 2012 when Saturn, Venus, Mercury, Uranus, and the moon lined up in relation to the main pyramid at Chichen Itza at sunrise (11:11 GMT). All I can say is that on December 22, some people were terribly disappointed.

One aspect of Olmec and Meso-American religions was the belief in Chanèques, old dwarf-like creatures with baby faces who pestered people in general with bad practical jokes and especially enjoyed molesting women. The best way to deal with them was to throw water over them, leading to the theory that they were associated with Tlaloc, the rain god.

Mayan Writing and Math

The Mayans had the only writing system in pre-Columbian America that fully represented a spoken language. Like Egyptian hieroglyphics, it was a mixture of

logograms representing specific words (lower left) and phonetic symbols for syllables. At some times, it had up to 500 symbols. While many inscriptions survive, only four complete books escaped methodical destruction by the Spanish who saw Mayan writings as satanic.

Along with astronomy, Mayan math was highly developed, including the use of zero for sophisticated calculations.

Mayan positional number system

Aztec History and the Mexican Flag
The Mexican flag is based on the story of how the god, Huitzilopochtli (“Left-handed Hummingbird”) told the wandering Aztecs to settle where they found an eagle perched on a cactus and eating a rattlesnake. When they found such a sight they founded their capital, Tenochtitlan, the site of present day Mexico City. Earlier the host king of a city-state had exiled them when they had honored his daughter by skinning her and wearing her skin in a ceremonial dance. Apparently, the king was not very religious.

In the Aztec language Tenochtitlan meant “place of the prickly pear cactus”.

Aztec Warfare

Aztec warfare was more a ritualized affair, the goal being for individuals to capture enemies for sacrifice to their gods. Another ritualistic aspect of Aztec warfare was announcing the time and place for a battle to their enemies.

The distinctive Aztec weapon was an ax consisting of a wooden club with sharp pieces of obsidian protruding from it. By contrast, the Spanish, although heavily outnumbered, had superior weapons and worked together to kill any individual Aztec warriors trying to capture them. Even during the last ditch defense of Tenochtitlan, the Aztecs were focused on capturing Spaniards to be sacrificed to their gods.

Although nobles led the army, commoners could rise up through the ranks through valor in combat. Capturing an enemy earned a warrior the right to wear a cloak with flowers into battle. Capturing four enemies (sort of like an Aztec ace) earned him a jaguar skin. Much like the ancient Spartans, Aztec women who died in childbirth were honored like warriors.

The Aztecs would spare a conquered city, but destroy its temples, forcing their new subjects to worship the Aztec gods. This idea of the gods going to war had parallels in the Eastern Hemisphere. A good example would be how the gods and goddesses take part in the fighting in the legends of the Trojan War.

Aztec Religion

According to Aztec beliefs, the gods created humans from their own blood, so humans were constantly indebted to them. There was also the belief in the instability of the world, in particular the recurring deaths of the sun and its renewal through the sacrifice of one of the gods.

Keeping the sun going on a day-to-day basis required human sacrifices on a colossal scale compared to any other civilization. Estimates for the numbers of victims range from 20,000 to 80,000 in a single year. Not surprisingly, the Aztecs were not popular among their subject peoples who had to supply these victims.

The Aztec sunstone and calendar, which was modeled after the Mayan Calendar

The Aztec New 52-year (Calendar Round). The Aztecs, like the Mayans, believed they were currently living in the age of the fifth sun, which could perish at the end of a current 52-year cycle. Therefore, the end of such a cycle was a period of intense anxiety for the Aztecs, who fasted, stayed at home, and most importantly, extinguished all fires for the days preceding it. It was the job of the priests to light a new fire at the precise moment the Pleiades appeared on August 13, the Mayan and Aztec New Year. This was done by cutting open a victim's chest, and working furiously to kindle a new fire in the open wound. Once the fire was lit, the priests quickly removed the victim's heart and cast it onto a brazier. Hundreds of couriers were lined up to ignite their

torches and scatter throughout the city to rekindle the temples' altar fires and then the hearths in people's homes. After that there would be twelve days of wild celebrations to mark the beginning of the new 52-year cycle.

In case you're curious, the last Calendar Round before Cortez' arrival in 1519 occurred in 1507.

The Aztec Capital and Society

Tenochtitlan was the Aztec home city, located in the middle of Lake Texcoco which itself was surrounded by other city-states tributary to the Aztecs. Tenochtitlan had an aqueduct for clean water and three causeways connecting it to the surrounding shores. When under attack, sections of these causeways could be removed. In typical Meso-American fashion, it had a central plaza aligned along a north-south axis and containing its main temples.

Mayans and Aztecs, much like the Sumerians, would use old temples as the foundation for new ones. Archaeologists sometimes would find 7 or 8 layers of temples, the old ones nested inside newer levels. This cutaway (right) of the Great Temple of Tenochtitlan shows six such layers.

Thanks to its position in the middle of a lake, it was possible to supply and support a huge population estimated at 200,000 to 300,000. This was especially crucial because the wheel had not been developed in the Americas, except for children's toys. Whenever they needed to expand their

city, the Aztecs built more *chinampas*, man-made floating gardens the Aztecs would make by sinking fences into the lake bed, filling them with dirt and rooting them with trees.

About 95% of Aztec society consisted of commoners (macehualtin) who did the work for the other 5% who were nobles (pitipin), including the emperor (tlatoni). Among the nobles' privileges was exclusive the right to wear cotton clothing, violation of which by a commoner brought the death sentence. They also had the right to wear gold jewelry and live in two-story houses. Nobles lived under a harsh code of conduct as well, being expected to act with dignity and humility and even to sacrifice their own blood in the religion rituals. Dishonest officials, such as judges also faced the death penalty.

The emperor was an absolute ruler who was considered superhuman. He commanded the army in battle and served as high priest for the Aztec religion. He also lived in incredible luxury, surrounded by a court consisting of hundreds of nobles, singers, dancers and other entertainers.

PRE-COLUMBIAN PERU TO C.1500 C.E.

Peru. The other center of civilization, culminating with the Inca, was what is now Peru. This region had three different ecological zones, which provided different resources: the Amazon rain forest to the east where root crops were grown, the desert coast to the west which had excellent fishing, and the Andes Altiplano in between where potatoes were grown. Except for Tibet, the Altiplano is the largest plateau on earth, averaging 3,300 meters in altitude. Its climate is cool and dry, making Lake Titicaca its primary source of fresh water. The Altiplano also had the one significant beast of burden in the Americas, the llama. However, it could only carry half the load that its counterparts in Eurasia could, giving it limited usefulness.

Much like in Mesopotamia, civilization in Peru started largely with irrigation of rivers coming from the Andes down to the desert coast. Such projects required organization, leading to a hierarchy of authority that collected surplus crops as taxes/offerings and settled in ritual centers. However, since the Peruvian cultures had no writings or even books with pictures, we know even less about them than we do about Mesoamerica.

Peruvian civilization began with the Chavin Culture (c.900-200 BCE) in the Altiplano and on the coast of central Peru. Its early center, the "Old Temple" at Chavín de Huántar, built c. 900 BCE, was more a place for ritual gathering rather than a city, having residences for only a few hundred people. Not until c.400 CE was there a jump in population and the development of proto-cities (large central communities with smaller satellite communities nearby), the evolution of specialized crafts such as ceramics and gold work, and the social stratification that comes with uneven distribution of wealth. The llama was also domesticated at this time. A religious elite who led the rituals believed to be essential for divine favor ruled the Chavin culture. Archaeological evidence suggests that the Chavin culture did not engage in warfare, although surrounding peoples did.

Following the Chavin came the Moche Culture (c.100-800 CE) in the northern coastal plain of Peru. They are mainly noted for their irrigation projects, gold work, and in particular ceramics. Moche culture had the ability to mass-produce ceramics through the use of molds. More remarkable was the striking realism of their ceramic

portraits. Scholars still debate whether this was a single empire or a group of states sharing the same culture. Ice core samples from the Andes indicate serious climactic disruptions in the sixth century consisting of thirty years of heavy rains and then thirty years of drought. This did not immediately cause the downfall of the Moche, but may have opened the way for other factors that would.

The Chimu Culture (c.900-1470 CE) succeeded the Moche, also flourishing in Peru's northern coastal plain. They founded a kingdom in the early 1300s, which expanded over a wide area. Their power was concentrated in four walled cities, the most important of which, Chan Chan, had an estimated 12,000 artisans making up the bulk of its population. Interestingly, the Chimu primarily worshipped the moon, since it is visible during both night and day. They saw the sun, which the Inca mainly worshipped, as a destructive force, probably because of its intensity in the desert. The Chimu were conquered in 1470 by the best-known Peruvian civilization, the Inca.

The Inca first developed as a city-state around Cuzco in the 1100s. Their real expansion began in 1438 under the leadership of Sapa Inca who conquered most of southern Peru. By 1520, the eve of the Spanish conquest, the empire stretched in a thin line along the Andes from southern Columbia in the north to northern Argentina and Chile in the south. Tying this elongated empire together was a remarkable system of some 15-25,000 miles of roads that often had to span mountain gorges. It counts as one of the great engineering feats of the pre-industrial world. The Inca had a corps of relay runners to carry messages with remarkable speed and efficiency. Politically, the empire was organized with four main provincial centers carrying out the will of the great Inca (ruler) in Cuzco.

Inca society had a strict hierarchy of classes enforced by strict laws. In spirit it was largely socialist, with the state collecting crops and redistributing them according to individual needs to ensure the welfare of everyone. Laws were also strict. Like the Aztecs, they primarily worshipped the sun. However, they had nothing like the Aztecs' human sacrifices to alienate their subjects. Although they lacked a writing system, Incas were capable of sophisticated record keeping with the use of the quipu, a system of knots on color-coded strings and knots that could keep track of various goods.

They could even use it to write accounts of events. However, that system was so complicated that it still hasn't been deciphered.

The coming of the Europeans. Both the Aztecs and Incas were at the height of their power when the Europeans arrived in the early 1500s. Amazingly, Spanish conquistadors were able to topple these empires quickly with tiny forces: Cortez commanding only several hundred men in Mexico and Pizarro doing the same with a mere 167 men in Peru. Three factors especially helped both men: civil unrest, the rigid authoritarian structure that ruled both empires, and disease. In Mexico, many of the Aztecs' subjects joined the Spanish in overthrowing their masters, while a civil war was raging when Pizarro invaded Peru. In both cases, the Spanish captured the local rulers, largely paralyzing their subjects into inaction long enough for the Spanish to gain a commanding position to take over. Finally, and in the long run most devastating, was smallpox, which broke out during the siege of Tenochtitlan, seriously weakening the city's defenses and spirit. In the case of Peru, smallpox preceded Pizarro and weakened the Incan Empire before the Spanish arrived. In both cases, empires seemingly at the height of their power vanished almost overnight.

Macchu Pichu and Incan Walls

Macchu Pichu is probably the best-known Incan site. Perched on a mountain ledge 7,970 feet above sea level, it was probably built as an estate for the Inca emperor, Pachacuti (1438-1472), but was abandoned in 1572 after the Spanish conquest. However, the Spanish never found it. As a result, it remained unknown, except to locals, until its discovery in 1911 by the American historian Hiram Bingham.

Inca walls were built of polished stones that fit together so tightly that one cannot fit a piece of paper between them. They were

also built without mortar, making them more flexible without breaking in an earthquake. By contrast, brick and mortar buildings were the first to go in the San Francisco Earthquake in 1906.

The Qipu

Although they lacked a writing system, Incas were capable of sophisticated record keeping with the use the quipu, a system of knots on color-coded strings that could keep track of various goods. They could even use it to write accounts of events. However, that system was so complicated that it still hasn't been deciphered.

The Last Inca

After his capture by Pizarro, the captive emperor, Atahualpa, promised to give Pizarro a room filled with gold and two other rooms with silver in return for his release. Having received the ransom, Pizarro had Atahualpa strangled and then made his younger brother, Túpac Hualpa, puppet emperor of the Incas. When he died of smallpox, Pizarro appointed Manco Inca Yupanqui as emperor and tried to rule through him. However, mistreatment by Pizarro's brothers prompted Manco Inca to escape and trigger a rebellion, supposedly raising an army of 200,000 men. After being defeated by the Spanish, Manco retreated into the mountains where he held out until his death in 1544. His son, Túpac Amaru, succeeded him as the last ruler of the Inca until his murder by the Spanish in 1572.

BRONZE AGE GREECE: THE MINOANS & MYCENAEANS (c.2000-1100B.C.E.)

Introduction. While the peoples of the ancient Near East gave us civilization, the Greeks gave it forms and meanings that make us look to them as the founders of our own culture, Western Civilization. Greek genius and energy extended in numerous directions. Much of our math and science plus the idea of scientific research and the acquisition of knowledge apart from any religious or political authority goes back to the Greeks. The philosophy of such Greeks as Socrates, Plato, and Aristotle laid the foundations for the way we look at the world today. Our art, architecture, drama, literature, and poetry are all firmly based on Greek models. And possibly most important, our ideas of democracy, the value of the individual in society, and toleration of dissent and open criticism as a means of improving society were all products of the Greek genius. Even those critical of our own society and Western Civilization overall have the Greeks, creators of Western Civilization, to thank for that right.

Greece's geography strongly affected its history. Greece was a hilly and mountainous land, breaking it up into literally hundreds of independent city-states. These city-states spent much of their time fighting one another rather than uniting in a common cause. Greece was also by the sea with many natural harbors. This and the fact that it had poor soil and few natural resources forced the Greeks to be traders and sailors, following in the footsteps of the Phoenicians and eventually surpassing them.

The Minoans (c.2000-1500 B.C.E.). The first Greek civilization was that of the Minoans on the island of Crete just south of Greece. Quite clearly, the Minoans were heavily influenced by two older Near Eastern civilizations, Mesopotamia and Egypt, by way of the Cycladic Islands, which formed natural stepping-stones for the spread of people from Greece and of civilized ideas from the Middle East. Egyptian influence on the Minoans is especially apparent. Minoan architecture used columns much as Egyptian architecture did. Minoan art also seems to copy Egyptian art by only showing people in profile, never frontally. Still, the Minoans added their own touches, making their figures much more natural looking than the still figures we find in Egyptian art.

Since we have not been able to translate the few examples of their hieroglyphic script, known as Linear A, there are some very large gaps in the picture we have of these people. We do not even know what the people on Crete called themselves. The term *Minoans* comes from Greek myths concerning a legendary king of Crete, Minos, who supposedly ruled a vast sea empire. As with most myths, there is a grain of truth in this myth, for the Minoans were a seafaring people who depended on their navy and trade for power and prosperity.

Two things, both relating to Crete's maritime position, largely determined the nature of the Minoan's civilization. First, they had a large fleet, which was useful for both trade and defense. Second, Crete's isolated position meant there was no major threat to its security at this time and therefore little need for fortifications. These two factors helped create a peaceful and prosperous civilization reflected in three aspects of Minoan culture: its cities and architecture, the status of its women, and its art, especially its pottery.

The Minoans had several main cities centered around palace complexes which collected the island's surplus wealth as taxes and redistributed it to support the various activities that distinguish a civilization: arts, crafts, trade, and government. The largest of these centers was at Knossos, whose palace complex was so big and confusing to visitors, that it has come down to us in Greek myth as the Labyrinth, or maze, home of the legendary beast, the Minotaur. The sophistication of the Minoans is also shown by the fact that they had water pipes, sewers, and even toilets with pipes leading to outside drains. Since their island position eliminated the need for fortifications, Minoan cities were less crowded and more spread out than cities in other civilizations.

More than a maze. Labyrinth comes from the Greek word *labrys*, meaning double-headed axe, a common Minoan symbol. Later it referred to the huge Minoan palace (i.e., house of the *labrys*). Interestingly, while the axe is a symbol of male power in other cultures, Minoan art shows only goddesses and priestesses wielding it.

Minoan women seem to have had much higher status than their counterparts in many other ancient civilizations. One likely reason was that, in the absence of a powerful warrior class and a constant

need for defense, they had more opportunity for attaining some social stature. This is reflected in their religion where the primary deity was an earth goddess. Minoan art also depicts women as being much freer, even participating with men in a dangerous gymnastic ritual of vaulting themselves over a charging bull.

Minoan art especially its pottery, also shows a peaceful prosperous society, depicting floral designs and such marine wildlife as dolphins and octopuses rather than scenes of war. Its diffusion around the Aegean and Eastern Mediterranean shows that Minoan influence was quite widespread, extending throughout the Cycladic Islands and Southern Greece. The myth of Theseus and the Minotaur where Athens had to send a yearly sacrifice of its children to Crete, reflects Minoan rule and indicates that it might not always have been so peaceful. Recent archaeological evidence indicates the Minoans did at times practice human sacrifices.

Minoan civilization continued to prosper until it came to a sudden and mysterious end. A combination of archaeology and mythology provide clues to how this may have happened. This eruption triggered a series of devastating tsunamis that leveled Crete's cities, which were all on the north face of the island in the tidal wave's path. In addition, it also destroyed the Minoans' navy, leaving them defenseless against invaders. Recent discoveries of jumbled mixtures of building materials, potter fragments, and tiny sea organisms far inland and above sea level indicate the devastating power of the tsunamis. Together these weakened the Minoans enough to let another people, the Mycenaean Greeks eventually take over around 1450 B.C.E.

This seems to correspond to the myth of the lost continent of Atlantis, passed on to the Greeks from the Egyptians who had been frequent trading partners with the Minoans. When the Minoans, whose fleet was likely destroyed by the tidal wave, suddenly stopped coming to visit Egypt, stories drifted southward about an island blown into the sea (i.e., Thera) which the Egyptians assumed was Crete. Over the centuries the stories kept growing until Crete became the vast mythical continent and empire of Atlantis set in the *Atlantic* Ocean. The Greeks picked up the story, which is found in its most complete form in Plato's dialogues, *Timaeus* and *Critias*.

The Mycenaeans (c.1500-1100 B.C.E.) were Greeks from the mainland who took advantage of the Minoans' weakened state to conquer Crete and assume Minoan dominance of the Aegean and Eastern Mediterranean. They were a vigorous and active people who engaged in trade and some piracy over a wide area extending from southern Italy in the west to Troy and the Black Sea in the northeast. We are almost as much in the dark about Mycenaean history and society as we are about the Minoans. We do have some written records in a script called Linear B which concern themselves mainly with official tax records and inventories.

Three types of evidence tell us at least a little about Mycenaean society. First of all, we know that they were divided into different city-states such as Mycenae, Pylos, Tiryns, and Athens. Most of these consisted of highly fortified central palace complexes, which ruled over surrounding villages. The Mycenaeans tried to run these as highly centralized states such as existed in Egypt and Mesopotamia. We do not know if these city-states were completely independent or looked to one city, probably Mycenae, for leadership. However, sources, such as the *Iliad* tell us that the Mycenaeans could apparently unite in a common endeavor such as the Trojan War.

Second, the art, armor, and remains of fortifications, such as those at Mycenae, tell us the Mycenaeans were much more warlike than the Minoans. Later Greeks had no idea of the existence of Mycenaean civilization and thought these massive walls and gates had been built by a mythical race of giants known as the Cyclopes.

Finally, archaeological remains also tell us that the Mycenaeans, at least the upper classes, were fabulously wealthy from trade and probably occasional piracy. Gold funeral masks, jewelry, bronze weapons, tripods, and a storeroom with 2853 stemmed goblets all attest to the Mycenaeans' wealth. Keep in mind this is only what we have found. There is no telling how much of their wealth was plundered by grave robbers.

Wheel maintenance. Because spoked wheels on Bronze Age chariots were so fragile, people would remove them when the chariots were not in use so the weight of the chariot didn't warp the wheels. Inventory records at Knossos from the Mycenaean

period record they had 340 chariots and 1000 pairs of chariot wheels.

Around 1200 B.C.E., a period of migrations and turmoil began that would weaken and eventually help destroy Mycenaean civilization. Once again, the main troublemakers were the Sea Peoples whom we have seen destroy the Hittite Empire, conquer the coast of Palestine, and shake the Egyptian Empire to its very foundations. The Sea Peoples also hit the Mycenaeans, destroying some settlements and driving other inhabitants inland or across the sea away from their raids. The historical Trojan War and sack of Troy took place at this time at the hands of the Mycenaeans, who may have been running from and, in some cases, joining up with the Sea Peoples. Hittite records associate their own decline with people known as the *Ahiwaya*, translated as "Achaeans" (Greeks).

Troy and the Sea Peoples. In the *Odyssey*, Odysseus makes up a story of being part of an expedition that first sacked Troy and then attacked Egypt, only to be defeated, much like what happened with the Sea Peoples. An alternate version of the Trojan War says the Helen at Troy was only a phantom Helen and that Menelaus had to go to Egypt to get his real wife back.

Whatever role the Mycenaeans may have played in all these raids, the result was widespread turmoil as cities were sacked, populations displaced, and trade disrupted. Even though the Mycenaeans survived the actual onslaught of the Sea Peoples, they did not survive the aftermath of all this destruction. Reduced revenue from trade may have caused more warfare between the city-states over the meager resources left in Greece. This warfare would only serve to weaken the Mycenaeans further, wreck trade even more, aggravate grain shortages at home, and so on. This recurring feedback of problems opened the way for a new wave of Greek tribes, the Dorians, to move down and take over much of Greece. A period of anarchy and poverty now settled over the Greek world, virtually blotting out any memories of the Minoans and Mycenaeans. However, on top of the foundations laid by these early Greek cultures an even more creative and vibrant civilization would be built, that of the classical Greeks.

Reconstructing Previously Unknown Civilizations

An artist's idea of how the Minoan center at Knossos looked

It was the Englishman, Sir Arthur Evans who discovered the Minoans in 1894. Being extremely near sighted, he was especially interested in signature seals, since his poor vision encouraged viewing them very close-up and in detail. When told there were plenty such seals on Crete, he went there where he discovered a whole new civilization by accident.

Evans is often criticized for his use of modern construction materials, especially concrete, and the assumptions he made in reconstructing the Minoan capital, Knossos. But to be fair, archaeology was in its infancy in the 1800s and there were no established rules on how to excavate a site. To many, it was little more than a treasure hunt to dig up gold and other precious objects while virtually bulldozing away other less exciting, but more critical, bits of evidence about that civilization. That's what The German classical enthusiast, Heinrich Schliemann, basically did when he discovered and excavated the site of Troy in 1870. Symbolizing this is a picture of his wife Sophie wearing the gold and jewelry taken from Troy as if it were her personal wardrobe.

Complicating efforts for Evans was Linear A, some sort of hieroglyphic script that still remains undeciphered since there are so few

surviving examples of it to work from. Our main example of Linear A is the Phaistos Disk, discovered in 1908. It is written on both sides in a spiral pattern with 242 symbols divided into 61 groups. Interestingly, the symbols were stamped, not written, raising speculation that the Minoans were capable of “printing” out large numbers of a document. Of course this raises the question of where are there other copies. Also, whom would they be for, since reading was so complicated and limited to very few people.

Thera: A Catastrophe of Nuclear Proportions

A tsunami one-half second before hitting Sumatra in 2007. This photo was found preserved in a digital camera a year and a half later. Its owner presumably lost his life within seconds of taking it.

Steam explosions. The eruption on Thera was a steam explosion where water rushes into a crack in the volcano, exposing it to super hot magma that quickly heats the water to steam, expanding it to one hundred times its previous volume and triggering a violent explosion.

In a similar eruption on Krakatoa in 1883, the shock wave circled the globe four times in one direction and three times the other. Traveling at the speed of sound, the eruption was heard three and a half hours later in Madagascar. It stampeded sheep in Australia and panicked natives in the South Pacific. The tsunami it

generated picked up a Dutch freighter and set it back down a half mile inland. It blew a cubic mile of dust into the air, darkening the sky 150 kilometers away, slightly lowering global temperatures for several years and also producing some spectacular sunsets.

Thera’s crater was four times the size of Krakatoa’s, suggesting it may have been the most catastrophic volcanic explosion on Earth in the last 10,000 years. Some scientists calculate it was 90 times greater than the Mt. St. Helens eruption. The satellite photo below suggests the roughly circular outline the island had before half of it was blown to bits.

Bad timing. Ash fall evidence from Thera indicates it erupted in late winter or early spring when Minoan ships would be in one of their five harbors, all of which were on the northern coast of Crete and in the tsunami’s path. The tsunami may have been 300 feet high, swamping the coast of North Africa and driving salty seawater 200 miles up the Nile, with consequent effects on Egypt’s agriculture. Some even associate Thera’s eruption with the Ten Plagues that hit Egypt where contemporary sources talked about the Western sky darkening.

Thera’s settlement at Akrotiri was buried in 900 feet of ash, more than what buried Pompeii. Ash fall had a more long-term impact by blocking sunlight and cooling the climate on a global scale for several years before settling back to earth. By comparison, ash fall from the Tambora volcanic eruption in Indonesia in 1815, the largest in recorded history, a year later produced what was called the “year without summer” and the greatest famine of the

1800s in the United States and Europe. Famines in turn breed political unrest, possibly explaining the Hittite invasion of Syria to get grain and the seven year of famine predicted for Egypt in Joseph's dream and subsequent migrations of people there, including the Hyksos.

Mycenae

The “Cyclopean walls” of Mycenae’s fortifications were 5 meters thick & 10-12 meters high

The palace complex at Mycenae was entered through the Lion’s Gate, over which was a lintel stone weighing ten tons. On top of that were two large statues of lions. Mycenae’s wall was ten meters high and 900 meters long, being made of stones weighing up to 12 tons each. For water, there was an underground cistern right outside the citadel that could only be approached by a tunnel from within Mycenae’s walls.

The nearby Treasury of Atreus, a tholos (beehive) tomb built into the side of a hill, has an entrance more than five meters high over which is placed a stone lintel weighing 120 tons. Inside, the dome is sixteen meters in diameter & fourteen meters high.

Entrance to the giant tholos (“beehive”) tomb at Mycenae known as the Treasury of Atreus for all the treasure Mycenaean rulers had buried with them.

Tholos tombs were dug out of the sides of hills. The entrance to the one at Mycenae is 17 feet high with a single stone slab across the top weighing 120 tons. The facade was fitted with brightly colored stones and flanked by two ornamented columns of red and green stone.

Inside the Treasury of Atreus, the dome is nearly 30 feet in diameter and 43 feet high, built of large stone blocks cut in a curve and fitted so precisely that it is still perfectly sound 3200 years later. Originally the dome was decorated with bronze rosettes nailed to the stones. We still have some of the bronze nails.

Mycenaean Warfare

One view on how Mycenaean nobles may have fought from chariots in the Trojan War (c.1200 B.C.E.) Homer, living some 500 years later when chariots were no longer used in battle, thought warriors in the Trojan War just rode them to battle where they dismounted to fight.

Most of Homer’s descriptions of battles at Troy as duels between heroic nobles are probably to make his story more exciting, much like in Hollywood movies. A few passages in the *Iliad* describe the armies as fighting in “close ordered ranks,” which is probably more typical of how battles were fought.

There was no standardization of Mycenaean arms and armor. The richest nobles could afford a full suit of armor known as the Dendra panoply and worn by the charioteer at the top. Most warriors were probably armed just with helmets, shields and fabric greaves (shin guards). Helmets were either of bronze or boar's teeth glued onto a leather cap (below). Most warriors probably couldn't afford a helmet of any sort.

Mycenaean shields were constructed of several layers of hide glued together. They also had a strap that went around the neck so that a warrior getting the worst of it could hang the shield over his back as he ran away. Homer describes some body-length tower shields in a concave figure-8 shape. However, these had gone out of use some 200 years before the Trojan War took place.

Homer also seems to have confused Mycenaean long pikes with the throwing javelins of his own day. Both would have been used, but the longer pikes kept enemies at bay better, especially when warriors fought in a close phalanx-type formation.

The end of chariot warfare. In the turmoil of the late Bronze Age, foreign mercenaries who served as chariot runners had become familiar with chariots and horses and seem to have caught on to two weaknesses of horse-drawn chariots. For one thing, they saw that the chariot drivers and warriors could be hauled down from behind. Secondly, they saw that horses did not like impaling themselves on a wall of spears and would not charge formations of infantry that stood their ground instead of panicking. Once that psychological edge was lost, the days of chariot warfare dominated by a few rich nobles were numbered, and so were the Bronze Age civilizations that depended on them.

Slavery in Ancient Greece

A Greek woman being taken captive. The primary source for new slaves was warfare, usually with a neighboring Greek state. This meant that most Greek slaves shared a common language and culture with their masters, many having been free Greeks earlier in life.

Slavery in the ancient world was so common that few people even questioned its morality, largely because even the simplest tasks were so labor

intensive that some sort of help was needed. Most Greek slave owners had only one or two slaves that they probably worked alongside with in their fields or shops. Thus, in many cases they were to some degree part of the family.

But have things really changed that much when we think of who harvests our fruit and vegetables and makes our clothes?

[Back to flowchart](#)

In town, life was generally easier for household slaves, whose tasks were much less grueling than those on the farm. Educated slaves taken in war would have it the easiest, serving as tutors for their masters' children or as accountants. After the disastrous siege of Syracuse (413 B.C.E.), Athenian prisoners able to recite Greek playwrights were rescued from long agonizing deaths in local quarries. Such slaves would often have more authority and more comfortable lives than most freemen. Greek authors complained, with some exaggeration, about how uppity many slaves were, wearing fancy clothes and being disrespectful to their masters and other free Greeks. Stock characters in later Greek and Roman comedy portrayed slaves as constantly conniving to get something at the expense of their dimwitted masters (below), a theme that has continued down through history to modern sitcoms, with hired help replacing slaves in the plotlines.

By the same token, many slaves were treated horribly, especially those working in mines or on rich nobles' estates (which grew in number after 400 B.C.E.) The silver mines of Laurium owned by Athens were especially notorious for their brutality. This lends an ironic twist to our perception of the Athenians as being the foremost example of democracy when we consider that the basis for supporting that democracy came from the brutal slave labor in the silver mines of Laurium.

THE DARK AGE OF GREECE AND RISE OF THE POLIS (c.1100-750 B.C.E.)

Introduction: the Dark Age of Greece. The centuries following the fall of the Mycenaeans are mostly obscured from our view by an extreme scarcity of records. As a result, this is known as the Dark Age of Greek history. Still, there are a few things that we know about this period that saw the transition from Mycenaean to classical Greek civilization. It was a period of chaos and the movements of peoples. New tribes of Greeks, the Dorians, moved in and displaced or conquered older inhabitants. Those peoples in turn would migrate, oftentimes overseas, in search of new homes. It was also a period of illiteracy and poverty leaving us no written records or sophisticated monuments to tell us about the culture of this period.

All this led to the Greek world at this time being divided up between various Greek-speaking peoples who were distinguishable from each other by slight differences in dialect and religious practices. However, their similarities were important enough so that we can talk about the Greeks as a people. Two of these Greek peoples in particular should be mentioned: the Dorians and Ionians. The Dorians were Greek invaders who came down from the north to conquer many of the Mycenaean strongholds around 1100 B.C.E. Sometimes they completely blended in with their pre-Dorian subjects, and there was little class conflict in their city-states. In other places the Dorians did not intermarry and remained a distinct ruling class over the non-Dorian population. The most extreme cases of this were Sparta and Thessaly, where the non-Dorians were virtually enslaved and forced to work the soil for the ruling Dorians. Such situations posed a constant threat of violence within city-states.

The Ionians were pre-Dorian inhabitants who avoided conquest by the Dorians, either by fighting them off or by migrating. The region of Attica, centered around Athens, was one main pocket of resistance to Dorian conquest, as seen in the myth of the Athenian king, Codrus, who sacrificed himself in battle to ensure Athens' safety against a Dorian invasion. Many Ionians either chose to migrate overseas or were forced to do so by invaders. Most of them settled in the Cycladic Islands or on the western coast of Asia Minor, which became known as Ionia from the large number of Ionian Greeks there.

The birth of the Polis. The chaos and Greece's mountainous terrain forced people to huddle under the protection of a defensible hill known as an *acropolis*. By 800 B.C.E., these fortified centers had produced more security and settled conditions that triggered two important developments vital to the emergence of Greek culture. First, the more settled conditions plus the fact that Greece was by the sea and had few resources led to a revival of trade and contact with the older cultures to the East. For example, the Greeks adopted the Phoenician alphabet and added vowels to it, so literacy returned to Greece. Also, Egyptian influence can be seen in Greek architecture and sculpture. Here too we see the Greeks would add their own innovations, giving their pillars more slender and graceful lines, and creating more lifelike statues than the stiff formal Egyptian models they had to copy. These influences would lead to and be the partial basis of classical Greek civilization.

The typical *acropolis* was originally a bit inland on a hill to give people ample time to seek shelter when enemies were spotted coming in from the sea. As times became more settled, the term polis shifted from its original meaning of fortified settlement to the city that had sprung up around it. Since the city had outgrown the polis' original function of defense, it became the site of the city's temples.

Also, the settled conditions along with Greece's poor soils and hilly and dry conditions led to a new type of agriculture and farmer at this time. Instead of the overly centralized agriculture of the Mycenaean period and the under-worked aristocratic estates of the earlier Dark Age, farmers started developing less desirable lands, which the nobles probably did not even want. Rather than raising just grain crops or grazing livestock, they developed a mixed agriculture of grains, orchards, and vineyards that was better adapted to the varied conditions of their lands and climate. The intensive labor such farms required bred very independent farmers who would be largely responsible for the emergence of democracy in the Greek polis.

The revival of trade and development of small independent farms also combined to allow the settlements to grow into towns and cities (*poleis*) that spread out beyond the confines of their original acropolises. Later, in some cities, notably Athens, the acropolis would become a place to build temples

to the gods while also serving as a reminder of earlier more turbulent times. In order to understand the Greeks, one must understand what this most distinctive of all Greek institutions, the *polis* (city-state), meant to them.

The word *polis* means city, but it was much more than that to the Greek citizen. It was the central focus of his political, cultural, religious, and social life. Much of this was because the Greek climate was ideal for people to spend most of their time outdoors. Therefore, they interacted with one another much more than we do and became more tightly knit as a community. Since poleis were so isolated from each other by mountains, they became largely self sufficient and self-conscious communities. Greeks generally saw their poleis as complete in themselves, not needing to unite with other Greek poleis for more security or fulfillment. We can see three main qualities that were typical of major and minor poleis alike.

1) *The polis was an independent political unit* with its own foreign policy, coinage, patron deity, and even calendar. For example, the tiny island of Ceos off the coast of Attica, had four independent city-states, each claiming the right to carry on its own business and wage war as it saw fit-- all this on an island no more than ten miles in length!

Greek political terminology

- **Politics: Activities concerning the polis**
- **Monarchy: rule by one person (from *archon*, meaning ruler)**
- **Democracy: rule by the people**
- **Oligarchy: rule by a few**
- **Aristocracy: Rule by the best (i.e., the nobles)**
- **Anarchy: Rule by no one**
- **Plutocracy: rule by the rich**
- **Meritocracy: rule by those deserving to rule (i.e., those w/merit)**

2) *The polis was on a small scale.* This is obvious from the example of Ceos. But consider a major city-state such as Corinth, which controlled an area of only some 320 square miles, considerably smaller than an average county in one of our states. Athens, by far the most influential of the city-states on our own culture, controlled an area only about the size of Rhode Island. Yet it is to Athens that we look for the birth of such things as our drama, philosophy, architecture, history, and democracy.

“Small scale” especially describes the Greek polis, Mycenae, whose entire army of 80 men

showed up for the battle of Plataea against the Persians in 479 B.C.E.

3) *The polis was personal in nature.* This follows logically from its small size. Greek philosophers such as Aristotle and Plato thought that a polis should be small enough for every citizen to know every other citizen. If it got any bigger, it would get too impersonal and not work for the individual citizen's benefit. Even in Athens, the most populous Greek city-state, some citizens could pay their taxes in very personal ways, such as by equipping and maintaining a warship for a year or by producing a dramatic play for the yearly festival dedicated to Dionysus. This tended to breed a healthy competition where citizens would strive to make their plays or warships the best ones possible, thus benefiting the polis as a whole.

The polis' small and personal nature bred an intense loyalty in its citizens that had both its good and bad points. On the plus side, it did inspire members of the community to work hard for the civic welfare. The incredible accomplishments of Athens in the fifth century B.C.E. are the most outstanding example of what this civic pride could accomplish.

The Athenian leader, Pericles, largely summed up the Greek civic spirit: “We do not say someone not involved in the polis’ affairs is minding his own business. We say he has no business here at all.”

On the negative side, the polis' narrow loyalties led to intense rivalries and chronic warfare between neighboring city-states. These wars could be long, bitter, and costly. Sparta and Argos were almost always in a state of war with each other or armed truce waiting for war. The Peloponnesian War between Sparta and Athens lasted 27 years, destroying Athens' empire and golden age. Sometimes city-states would be entirely destroyed in these wars, such as happened to Plataea and Sybaris. In addition, there was often civil strife within the city-state as well: between rich and poor, Dorians and non-Dorians, and citizens and non-citizens. This internal turmoil could be every bit as vicious and bloody as fighting between city-states. Ultimately, the Greeks sealed their own doom by wasting energy and resources in their own petty squabbles while other larger powers were waiting in the wings for the right moment to strike.

However, there were several factors that gave the Greeks a common identity and some degree of unity. First of all, the Greeks spoke a common language that largely gave them a common way of looking at things. The Greeks generally divided the world into those who spoke Greek and those who did not. Those who did not speak Greek were called *barbarians*, since, to the Greeks, they senselessly babbled ("bar-bar-bar").

Religion also gave the Greeks a common identity. Athletic contests in honor of the gods especially emphasized the Greeks' unity as a people. The most famous of these were the Olympic Games held every four years in honor of Zeus. During these games a truce was called between all Greek city-states, allowing Greeks to travel in peace to the games, even through the territory of hostile states. The modern Olympics, although no more successful than the ancient games in putting an end to war, still serve as a symbol of peace in a less than peaceful world.

Even the high and mighty pay. Philip II of Macedon, who would conquer Greece, was fined for violating the sacred truce and molesting Athenians going to the Olympics. He paid his dues.

Finally, several city-states might combine into leagues. These leagues might be purely for the purpose of celebrating religious rites or kinship common to their cities. A good example was the Delphic Amphictyony, a league of twelve cities formed to promote and protect the Oracle of Delphi. Some leagues were for political and defensive purposes. The Peloponnesian League under Sparta and the Delian League under Athens were for such a purpose and together claimed the loyalties of most of the city-states in Greece and Ionia. This was good for preventing war between individual city-states. But it backfired when Sparta and Athens went to war in 431 B.C.E. and dragged most of the Greek world into the most tragic and destructive struggle in ancient Greek history.

By 750 B.C.E., the Greek world had largely taken shape as a collection of city-states, often at war with one another, but also feeling certain common ties of language, religion, and customs. At this point, there was nothing remarkable about the Greeks, but forces were at work that would transform Greece into the home of democracy and the birthplace of Western Civilization.
Reckoning time in Olympiads

Reckoning time in Olympiads

Among other things the Olympics did to promote some unity among Greeks was a common way of reckoning time, since each polis had its own calendar. The basic unit of time was the Olympiad, the four-year period between Olympic games. Greeks addressing an audience from different poleis with different calendars would give dates as such and such year of such and such Olympiad.

For example:

776 B.C.E. = 1st year of 1st Olympiad

775 B.C.E. = 2nd year of 1st Olympiad

772 B.C.E. = 1st year of 2nd Olympiad

676 B.C.E. = 1st year of 26th Olympiad

478 B.C.E. = 3rd year of 75th Olympiad

An Introduction to Homer & Trojan War cycle

"Rage--Goddess, sing the rage of Peleus' son

Achilles,

*Murderous, doomed, that cost the Achaeans
countless losses,*

*Hurled in their multitudes to the house of
Hades strong souls*

*Of heroes, but gave their bodies to be the
delicate feasting*

*Of dogs, of all birds, and the will of Zeus was
accomplished*

*Since that time when first there stood in
division of conflict*

*Atreus' son the lord of men and brilliant
Achilles"*

Thus begins Homer's *Iliad*, the great epic of the Trojan War and the first great work of literature in Western Civilization. Homer was the first and greatest of poets to the Greeks, who looked to him for moral guidance, relied on him for inspiration for their plays, and had Greek schoolboys memorize whole chapters of his *Iliad* and *Odyssey* as an essential part of their education. Such was Homer's grip on the Greek imagination that Alexander the Great, believing himself a descendant of the Greek hero, Achilles, slept each night with a copy of the *Iliad* under his pillow and made Troy the first stop on his march across Asia.

The Iliad (from Ilium the Greek word for Troy) is part of a larger cycle of poems about

the Trojan War and itself only describes a few days in the tenth year of that struggle. Therefore, by the end of the poem, Troy's fate, while foretold, is still not resolved. Although full of action, the *Iliad* is also a remarkably mature statement on the human condition, human values, and the tragic impact of war on its innocent victims as well as those who fight it.

Background. The story starts with the wedding of a sea nymph, Thetis, to a mortal, Peleus (whose son will be Achilles). All the gods are invited except one, Eris (Discord), who, to get revenge, makes a golden apple with the inscription "To the most beautiful" and throws it between the goddesses Aphrodite, Athena, and Hera. An argument ensues over the apple between the three goddesses who go to Zeus to judge who gets it. Zeus is wise enough to avoid this controversy and sends them to a Trojan prince, Paris, to award the apple. Each goddess offers Paris a bribe for the apple, Hera promising great power, Athena offering prowess in battle, and Aphrodite promising the most beautiful woman in the world. Aphrodite's bribe seems the most enticing and Paris gives her the apple, in the process making two very bitter and powerful enemies for himself and Troy.

The most beautiful woman in the world is Helen, wife of Menelaus of Sparta. With Aphrodite's help, Paris entices Helen to leave with him for Troy. When the Trojans, also bewitched by Helen's unearthly beauty, refuse to return her to Menelaus and the Greeks, the war is on. The Greeks sit for nine years before Troy but are unable to breach its walls, occupying themselves by plundering surrounding cities. One of the slaves taken in these raids is the daughter of a priest of Apollo. When Agamemnon, leader of the Greeks refuses to return the girl to her father, Apollo unleashes an epidemic upon the Greek camp which has raged for nine days when a council is called to determine the cause of the

epidemic. It is at this point that the *Iliad* begins.

Summary of the *Iliad*. The poem begins with the poet's invocation (cited above) to the Muse of song and poetry to inspire him to sing his tale. The very first word of the poem is "rage", referring to the rage of Achilles and the tragic chain of events that rage unleashes. Achilles' anger is triggered when, Agamemnon, told he must give his slave girl back to her father to appease Apollo, angrily takes the slave girl Achilles, the greatest of the Greek warriors, had won from the same city. At stake for the two warriors and most valued by men in Homeric society is their honor, which is visibly measured by the plunder taken in battle. Furious over this insult, Achilles quits the war and has his mother, Thetis, convince Zeus to give the Trojans victory in battle so the Greeks will sorely miss him and beg him to come back to help them. It is a request that will tragically backfire on Achilles.

As the Trojans, aware of Achilles' absence, venture out to fight the Greeks, Paris calls for a truce and rashly challenges any Greek to a duel to decide the fate of the war. When Helen's estranged husband, Menelaus, eagerly steps forth, Paris skulks back into the Trojan ranks. However, Hector, Paris' brother and the greatest hero of the Trojans, forces Paris back out for the decisive duel. Menelaus, lusting for revenge on the cowardly wife-stealer, is beating Paris and about to finish him off, when Aphrodite saves him and whisks him off to Helen's bedroom. As Menelaus rages back and forth looking for his foe, Athena and Hera, fearing the war will end before Troy is destroyed, trick a Trojan archer, Pandarus, into thinking if he shoots the unprotected Menelaus, Troy will win the war and he will be a hero. However, Athena only lets Pandarus' arrow draw enough blood to shock and anger the Greeks over this treachery. With the truce thus broken, the war resumes.

At first, the fighting favors the Greeks thanks to the exploits of Diomedes who, with Athena's help, even wounds Ares, the god of war. Alarmed by all this, Hector goes into Troy to get his brother back into the fight and to urge the women of Troy to offer sacrifices for victory. The tragedy of war, especially for women, is tenderly captured by Homer's description of Hector's final farewell to his wife, Andromache:

*"So speaking he set his child again in the arms of his beloved wife, who took him back again to her fragrant bosom smiling in her tears; and her husband saw, and took pity upon her, and stroked her with his hand, and called her by name and spoke to her:
' Poor Andromache! Why does your heart sorrow so much for me?
No man is going to hurl me to Hades, unless it is fated,
but as for fate, I think that no man yet has escaped it
once it has taken its first form, neither brave man nor coward.
Go therefore back to our house, and take up your own work,
the loom and the distaff, and see to it that your handmaidens
ply their work also; but the men must see to the fighting,
all men who are the people of Ilion [Troy], but I beyond others.'
So Glorious Hector spoke and again took up the helmet
with its crest of horse-hair, while his beloved wife went homeward,
turning to look back on the way, letting the live tears fall.
And as she came in speed into the well settled household
of Hector the slayer of men, she found numbers of handmaidens
within, and her coming stirred all of them into lamentation.*

*So they mourned in his house over Hector while he was living
still, for they thought he would never again come back from the fighting
alive, escaping the Achaian hands and their violence." (vi, 482-502)*

The emotion of this scene is intensified by the fact that it is the last time Andromache ever sees her husband alive. After this, Hector goes out and challenges any Greek to a duel to decide the outcome of the war. Meeting his challenge is Ajax, a huge warrior who, more than any other Greek, stands his ground even when the gods clearly favor Troy that day. The two men fight a long inconclusive duel that is only cut short by nightfall. As a sign of mutual respect, the two warriors exchange gifts before returning to their respective armies. Any such signs of civility will soon be extinguished by the escalating savagery of war.

The next day, Zeus, ready to honor his promise to Thetis, forbids any of the other gods from getting involved in the fighting, although he does give in to Athena's plea to let them give their favorite heroes advice. In the subsequent fighting, Zeus gives victory to the Trojans as one Greek hero after another is wounded and the Greeks fall back to their camp. Homer's description of the violence of the fighting is both poetic and brutal:

*"Aias, Oileus' son, in an outrush caught Kleoboulos
alive, where he was fouled in the running confusion, and there
unstrung his strength, hewing with the hilted sword at the neck,
so all the sword was smoking with blood and over both eyes
closed the red death and the strong destiny." (xvi, 330-334)*

*"Meriones on his light feet overtaking Akamas
stabbed him in the right shoulder as he climbed up behind his horses*

and the darkness drifted over his eyes as he crashed from the chariot." (xvi, 342-4)

"There first of all he struck with the shining spear Pronoos in the chest where it was left bare by the shield, & unstrung his limbs' strength." (xvi, 399-400)

"Next he struck Erylaos, as he swept in, with a great stone in the middle of the head, and all the head broke into two pieces inside the heavy helmet, and he in the dust face downward dropped while death breaking the spirit drifted about him." (xvi, 411-414)

The Greeks are driven to their ships where the fighting assumes new levels of brutal desperation. Any previous civility between the two sides is replaced by such acts as savagely throwing the heads of slain enemies at their surviving comrades' feet. As the Trojans close in to burn the Greek ships, only Ajax seems can hold the line, desperately cutting down any Trojan threatening his ship with fire.

Although Achilles may be able to turn a cold and unfeeling eye from his former comrades' threatened destruction, his best friend, Patroclus, cannot. Patroclus convinces him to lend him his armor to make the Trojans believe Achilles is back in the fight, thus giving the Greeks enough time to escape with their lives. He promises to return as soon as the Greeks have been given such a reprieve, but gets caught up in the excitement of the Trojans fleeing him (in Achilles' armor), pursuing them to their walls and even trying to storm them. But Hector, helped by Apollo, kills Patroclus and strips him of Achilles' armor.

Achilles, grief stricken by Patroclus' death, makes amends with the Greeks, but spurns Agamemnon's offer to return the slave girl

over whom the tragic argument had started. Even though it is foretold that his own death will soon follow Hector's, all that matters to Achilles now is avenging Patroclus' death. At Thetis' request, Hephaestus, the god of fire, fashions a brilliant suit of armor that only makes Achilles more imposing and invincible in battle. Consumed by his bloodlust for revenge, he goes on a terrifying and murderous rampage, even taking twelve Trojans as prisoners for a human sacrifice at Patroclus' funeral. Not even the renewed participation of the gods can stem the fury of Achilles in battle:

"As inhuman fire sweeps on in fury through the deep angles of a drywood mountain and sets ablaze the depth of the timber and the blustering wind lashes the flame along, so Achilles swept everywhere with his spear like something more than a mortal harrying them as they died, and the black earth ran blood." (xx, 409-494)

The panicked Trojans flee into their city. But Hector, blaming himself for this disaster since he had convinced the Trojans to stand against Achilles, decides to stand against him despite the pleading of his parents and others from the walls above. After coldly rejecting Hector's request that the victor return his opponent's body to his people for decent burial, the battle is joined. Achilles slays Hector, strips him of his (Achilles') old armor, and brutally drags the dead Trojan hero's naked body behind his chariot in the dust. At this point, Andromache, working at her loom to keep her mind off the battle, learns of her husband's fate. Notice how Homer ends this passage with a description of the gifts Aphrodite had given Andromache for her headdress on her wedding day, and how they fall off her head now that her husband has died and her relationship with Hector has come full circle:

*"She heard from the great bastion the noise of mourning and sorrow.
Her limbs spun, and the shuttle dropped from her hand to the ground. Then she called aloud to her lovely-haired handmaidens: 'Come here. Two of you come with me, so I can see what has happened. I heard the voice of Hector's honoured mother, within me my own heart rising beats in my mouth, my limbs under me are frozen. Surely some evil is near for the children of Priam. May what I say come never close to my ear; yet dreadfully I fear that great Achilleus might have cut off bold Hector alone, away from the city, and be driving him into the flat land, might put an end to that bitter pride of courage, that always was on him, since he would never stay back where the men were in numbers but break far out in front, and give way in his fury to no man.' So she spoke, and ran out of the house like a raving woman with pulsing heart, and her two handmaidens went along with her. But when she came to the bastion and where the men were gathered she stopped, staring on the wall; and she saw him being dragged in front of the city, and the running horses dragged him at random toward the hollow ships of the Achaians. The darkness of night misted over the eyes of Andromache. She fell backward, and gasped the life breath from her, and far off threw from her head the shining gear that ordered her headdress, the diadem and the cap, and the holding-band woven together, and the circlet, which Aphrodite the golden once had given her*

on that day when Hector of the shining helmet led her forth from the house of Eetion, and gave numberless gifts to win her." (xxii, 447-73)

Victory does not appease Achilles' rage, even as he daily drags Hector's naked body, still tied to his chariot, around Patroclus' funeral pyre. However, the gods protect Hector's body from decay and escort Priam, his old father and king of Troy, to Achilles' tent to ransom his son's body. Recognizing the will of the gods and moved by the pathetic sight of this old man forced to beg his son's killer to let him recover his body, Achilles agrees to the ransom. The two men grieve together and then share a meal as a sign of some sort of reconciliation (though the war will go on). Achilles has come to terms with his own humanity and at last realizes the futility of his actions and all he has lived for. In the end his real victory, rather than being over any external enemy, is over the beast within himself, but at a terrible cost.

The fall of Troy and the returns of the Greeks. The *Iliad* ends with Troy still standing, although perched on the edge of doom. Its final days play out in tragic form (making it a favorite theme of later Greek tragedies). New allies, first the Amazons and then the Ethiopians, come to help the Trojans, but are defeated by Achilles. Achilles himself is soon killed (which he knew from a prophecy would happen soon after he killed Hector). When the Greeks award his armor to Odysseus as the one who has done the most to help the Greek war effort, his main competitor, Ajax, commits suicide after a fit of madness. Paris also dies in an archery duel, but the Trojans still refuse to surrender Helen and her treasure. Even after the Greeks, as directed by soothsayers, get the bow and arrows of Heracles (which never miss their mark) and steal the Palladium, a statue of Pallas Athena protecting Troy, the city continues to stand.

Then one day the Greeks are suddenly gone, leaving only a mysterious giant wooden horse and an actor, Sinon, who conveniently gets caught by the Trojans. He convinces the Trojans that the Greeks had left the horse as an offering to Poseidon to ensure a safe homecoming and had built it big enough so the Trojans could not bring it into their city, since it would make them invincible against attack. Despite several warnings, the Trojans bring the horse into their city, and, to fit it in, break part of their gate as well as the charm its walls (built by Poseidon and Apollo) had against any attackers. That night, the main Greek army returns while Greeks hidden in the horse climb out, kill the guards, and open the gates to their comrades. Troy is brutally sacked and destroyed, its men killed, its women and children enslaved, and its temples desecrated.

The gods, angry over sacrileges done to their temples, ensure that most of the Greek heroes' returns are neither easy nor happy. Agamemnon's own wife, Clytemnestra, upon his return, murders him, because of a continuing curse of bloodguilt. There were versions where Diomedes and Odysseus, return home to find their wives unfaithful. One version even has Menelaus find the Helen he takes back at Troy is only a phantom Helen and he must go to Egypt to recover his true wife before returning home happily.

The *Odyssey* is the most famous tale of the returns, recounting the trials and adventures of Odysseus as he desperately tries to get home to his wife Penelope and son Telemachus.

*"Tell me Muse, of the man of many ways, who was driven far journeys, after he had sacked Troy's sacred citadel.
Many were they whose cities he saw, whose minds he learned of,
Many the pains he suffered in his spirit on the wide sea,*

struggling for his own life and the homecoming of his companions."

It is significant that Homer's other great epic should focus on Odysseus, since in many ways he is the archetypal Greek hero. More than his strength and bravery in battle, the Greeks admired his quick-witted resourcefulness (including an incredible talent for lying) that gets him through one crisis after another. At one point when the giant cyclops, Polyphemus has trapped him and his men, Odysseus says his name is Nobody. Later, when the injured cyclops is screaming in pain from being blinded in his sleep by Odysseus, and neighbors ask what the problem is, Polyphemus' reply that Nobody hurt him sends the neighbors home satisfied.

The *Odyssey* is more of classic adventure tale traveling across a mythical world of gods, monsters, sorceresses, and shipwrecks, climaxing with a battle against the villainous suitors who have invaded Odysseus' household, and ending with the happy reunion of Odysseus and his family after twenty years' absence. The *Iliad*, by contrast, stays in the same location, is much more ambiguous in its ending and its attitude toward material values, divine justice, and our purpose in life. However, that also makes it a much more thought provoking and powerful statement that has inspired succeeding generations to question assumptions about such issues as divine justice and the human condition.

The Yearly Round of Agriculture in Greece
Greece was not a particularly fertile country, with a dry climate, rough terrain, and only 30% of its land being arable, with much of that controlled by nobles. Reliance on just one crop put farmers at risk of starvation, since there was no backup crop or surplus from previous years. Therefore, the Greeks diversified to raising grain, grapes and olives. In addition to spreading the risk of starvation, this also spread the intense workload across the whole calendar year.

Grapes were harvested in August and September, then poured into a vat and trampled to squeeze the juice into waiting jars where they would ferment into wine. Greek wine was more of a thick syrup that was typically mixed with at least three parts water for every part wine. Even children drank it.

Grain crops, such as wheat and barley were planted in the fall to take advantage of the cooler rainy weather of winter and avoid the scorching Mediterranean summers. Harvest took place in late spring or early summer.

Olives were harvested in October and November. Boys climbed the trees to shake the olives out of the branches into nets below. Oil was then squeezed out using a simple olive press.

A Greek vase depicting the harvesting of olives

Sybaris and the Danger of Dancing Horses
Being so independent, Greek *poleis* could develop fierce rivalries, such as that between Crotona and Sybaris in Southern Italy. From Sybaris we get the word *sybarite*, meaning someone who indulges in decadent luxury, because Sybaris was legendary for its wealth and such stories as the one about the man who couldn't sleep well because a crumpled rose petal had gotten into his bed. Sybaris may have been the first city with a streetlight system.

Sybarites also taught their horses to dance to music, and this would be their ultimate undoing. In 510 B.C.E., when at war with their archrival, Crotona, they found a band in front of Crotona's army. As the battle

began, the band struck up a tune that apparently sent the Sybarite horses boogying on down while the Crotonites passed right through the Sybarite cavalry and into the city. At least that's the story. Crotona did indeed destroy Sybaris in 510 B.C.E., and then diverted the River Crathis over its site to destroy any evidence of its existence. It wasn't rediscovered until the mid 1960s.

The Olympics

The Olympics were more a religious festival than athletic event, although the ancient Greeks saw physical excellence as a form of worship to gods who themselves were seen as just really big people. All people who could show they were Greeks were invited, and during the games, there was a sacred truce across Greece to protect athletes traveling to Olympia. Of course, cheating was seen as a sacrilege, and cheaters, when caught, had to dedicate a statue to Zeus along a particular walkway at Olympia, thus immortalizing themselves in a less than desirable way.

Athletes trained at Olympia for ten months, as did the judges, who were all chosen from the host city, Elis.

The stadium was just a grassy knoll around the field and could hold about 45,000 men. It was hot, dusty, and infested with flies, and one of the most common prayers by spectators was to *Zeus, averter of flies*. There was also a carnival atmosphere, described in five words by the comic playwright, Menander: "*Crowd, market, acrobats, amusement, thieves*"

There are two legends about how the Olympics began. In one Agamemnon's grandfather, Pelops, won a race to gain a woman's hand in marriage. In the other

Apollo beat Hermes in a race and Ares in a boxing match. At first, there was one race of one *stade* (~192 meters). Later a 2 *stade* and 24-stade race were added. Originally, participants wore a loincloth, but later ran in the nude, except in the hoplite race where they wore a helmet, shield, and greaves (bronze shin guards).

Boxing was one of the oldest Greek sports, being mentioned in the *Iliad* as one of the games held in honor of Patroclus. It was added as the second Olympic sport in 688 BCE. According to mythology, Apollo invented boxing, defeating and killing Phorbas, a boxer who urged travelers through Delphi to compete with him. Another tradition had Apollo beating Ares in a boxing match at Olympia. To soften the blows, boxers wrapped their fists with tape around mutton fat. In Roman times, these were reinforced with lead, making the sport much more brutal and dangerous.

One strategy was to position an opponent with the sun in his face. There was no holding one's opponent or punching his genitals. There were also no time limits or separate rounds, though both boxers could agree to a break or kind of sudden death known as a *klimax*, which was taking turns hitting each other in the head. (Maybe this is where the term sudden death came from.)

In *wrestling*, contestants were anointed with olive oil then dusted with powder to make them easier to grasp. Competition took place in "*keroma*", or beeswax, a muddy and sticky arena. Victory depended on one competitor acknowledging defeat by raising his right hand with the index finger pointed.

Rules:

- * Blows were not allowed.
- * Tripping was permitted.

- * No biting or gouging was allowed.
- * There was no weight distinction.

The pankration, ("all strength") a combination of wrestling and boxing, was added in 648 B.C.E. in the 33rd Olympiad. Greeks believed that the Athenian hero, Theseus, invented it order to defeat the Minotaur in the labyrinth.

There were no boxing gloves used in the pankration. Only biting and gouging of the genitals were forbidden, making it the most dangerous and toughest of all events. Kicking was frowned on, but still played an important part in the pankration. A kick to the stomach was called *gastrizein* (the stomach-trick). Three champions won by breaking their opponents' fingers, which was seen as a sign they couldn't bring their opponents down. One of them, Sostratus of Sicyon, was known as "Mr. Fingertips." Another champion, Arrachion of Phigalia, was being strangled and losing consciousness, so he twisted his opponent's leg, causing him to surrender just as he died. He was probably the only dead athlete to win the Olympics.

The quoit or javelin was important in both war and hunting and is mentioned by Homer as one of the sports in the games Achilles held to honor his friend Patroclus.

The javelin was about as long as a man's height. We don't know if it had simply a pointed end, or a metal head like those used in battle; both types are seen in vase paintings.

Distinguishing the ancient from the modern javelin was a leather strap formed in a loop and attached at the javelin's center of gravity. In war and hunting, thongs were also used, but were permanently attached. In the case of athletics, each competitor tied the thong

where it helped him the most. The fingers released the thong upon throwing the quoit. The thong increased the power and distance of the throw by making the grip more secure and putting a spin on the javelin in flight.

There were two forms of this event: throwing for distance or at a target.

Throwing for distance (also included in the pentathlon) required making the javelin fall within an area defined on three sides.

First the athlete tightened the thong, putting his index and middle fingers into the loop. He pushed the javelin back with his left hand to tighten the thong and to grip the fingers of his right hand. The run-up and throw used the same throwing style used by javelin-throwers today.

Throwing the javelin at a target was commonly done on horseback, which required a steady eye, a strong hand, and the flexibility of an experienced horseman. As the horse was galloping, the rider had to throw the javelin at a target when the horse reached a certain point or a certain distance from the target. The horse's movement of the horse affected the steadiness of the rider's hand and control over his movements. Thus he had to keep complete coordination between the rhythm of the horse's gallop and the movement of his hand, while still keeping his eyes focused on the target.

The pentathlon was added in 708 B.C.E. in the 18th Olympiad and consisted of five events: discus, javelin, long jump, running, and wrestling. According to mythology, the pentathlon was invented by the hero Jason, who awarded the prize to his friend Peleus (who had come in second in everything but wrestling, in which he placed first).

The pentathlon was a combination of two types of events that existed in ancient world: the light events (jumping, running and javelin) and heavy events (discus and

wrestling). We don't know exactly how the winner was decided or the order of events except that wrestling was last.

The discus was one event that had no relation to military exercises or farm work. It went back at least to Homer's Iliad when it is an event in Patroclus' funeral games.

In Greek mythology the discus was responsible for several accidental killings such as when Zephyr blew Apollo's throw off course, killing his friend, Hyakinthos.

The discus was originally made of stone, and then later made of iron, lead, or bronze. Like today, it had two convex curves with a large circumference, ranging from 17 to 32 cm in diameter and weighing from 1.3 to 6.6 kilograms.

Small wooden pegs marked a thrower's performance, and it was measured with rods. The natural movements of an athlete have not changed except that the athlete had to keep his feet in place. Unlike mythology, there are no reports of any accidents during the competition, because the spectators sat on the embankments.

Broad jump with weights. The sport of jumping is linked to ancient warfare in Greece with its rough terrain where soldiers' ability to jump during battle would have been crucial. In the ancient Olympic Games jumping existed primarily as a component of the pentathlon, and was seldom held as a singular event.

Unlike modern jumping, ancient Greek athletes held stone or lead weights called *halters (above)* as a means to increase the distance of a jump. He did this by swinging the weights during the

run-up to his jump and holding onto them until the end of his flight, when he jettisoned them backwards. Then, he came down on the soil with his feet together.

The jump was considered one of the most difficult of the original Olympic events because of the timing and coordination required between running and jumping and swinging and releasing the weights. For this reason, the jump was at times accompanied by a flute player, whose sounds underlined the rhythm and musical flow of a properly executed jump.

Chariot racing (both 2 & 4 horse) was added in 680 B.C.E. Races involved heats of ten chariots running 12 laps (8 miles) with 23 turns, leading to many accidents. The prize for winning went to the owner, even if she was a woman, not the driver, who was only awarded a cotton headband.

This event was especially prestigious to win since it was the one place where owners could show off their wealth with fancy trapping. One year the Athenian, Alcibiades entered no fewer than seven splendid chariot teams. Another Athenian, Cimon, father of Miltiades, won three times had had the Horses buried in the family tomb.

The Roman emperor, Nero, delayed the games from 65 to 67 C.E. so he could compete personally entering a 10-horse chariot. Although he was thrown from the chariot, he was given the crown anyway, since if he could've finished he would certainly have won. Later his victory was declared invalid and the bribe he paid was ordered returned.

Women and the Olympics. Women were banned from the Olympics and any woman caught there was to be thrown down from Mt. Typaeum. One woman, Kalliptaira or Pherenike, whose father, husband, and two brothers were all Olympic victors, entered the games disguised as a trainer to see her son compete. When he won, her dress got caught as she jumped the fence to greet him, exposing her as a woman. Fortunately, she was pardoned since so many of her family were Olympic victors, although later trainers had to enter naked to prevent such a security breach from recurring.

Although women could not directly compete in the Olympics, they could enter chariots for the chariot race, the prize for which went to the owner, not the driver. Women did have their own parallel games in honor of Hera, but they only consisted of a foot race, like the first Olympics.

Olympic victors were awarded an olive wreath...along with fame and virtual immortality among their citizens. A breach would be opened in the city wall for the victory parade. Poems would be composed in their honor, the most revered poet next to Homer being Pindar of Thebes, who largely wrote odes to victorious athletes. In some cases, free meals for life were given to victors. In the case of Milo of Crotona, this was no bargain, since he supposedly ate a whole cow every day.

Famous Olympic athletes. Stories, however true, abound concerning Olympic athletes. One such athlete, Milo of Crotona, trained by carrying a calf around on his shoulders. As the calf grew, so did his strength. Supposedly he died when he stuck hands and feet into a tree with wedges inserted into it in an effort to split it. Unfortunately, he got trapped when the wood snapped shut and he was eaten by wild animals.

Another athlete, Theagenes of Thasos, reportedly won 1400 crowns at various games. After his death, an archrival would come each night and beat on a statue dedicated to Theagenes, until one night it fell and killed him. The statue was tried for murder, convicted after putting up a weak defense, and exiled to the bottom of the sea. However, when a famine hit, the statue was restored and Theagenes was worshipped as a god of healing. Go figure.

The Olympics were part of a four-year cycle of games, the others being the Pythian Games held at Delphi, the Isthmian Games, and Nemean Games. In addition, city-states often held their own religious/sports festivals, the most famous being the Panathenaea in honor of Athena at Athens.

THE RISE OF GREEK DEMOCRACY (c.750-500 B.C.E)

The Age of Colonization (c.750-550 B.C.E). Greece was not a rich land capable of supporting a large population. Yet the revival of stable conditions and the rise of a new class of independent farmers practicing a mixed agriculture of grains, vines, and orchards after 800 B.C.E brought population growth. This, in turn, brought problems, since family lands had to be split up among the surviving sons. These sons also had families to support, but on less land than their fathers had. Greece's poor soil and occasional droughts would lead to famines, forcing the victims of those crop failures to seek loans from the rich nobles. Of course, there was interest on the loan, generally equal to one-sixth of the peasants' crops. Failure to pay back the loan and interest in time led to the loss of the family lands or the personal freedom of the farmer and his family. Unfortunately, bad harvests often run in cycles of several years at a time. As a result, the Greek poleis in the eighth century B.C.E had a few rich nobles and a multitude of desperately poor people, creating an unstable situation for the polis and the nobles who controlled it. Therefore, many city-states started looking for new lands on which to settle their surplus populations. The Age of Colonization was born.

Word study: economics. The word economics comes from the Greek word *oikos*, meaning land, which was the basis for the Greek economy. Thus the leader of a new colony was known as an oikist, since he parceled out land to his followers.

The Greeks looked for several qualities in a site for a colony: good soil, plentiful natural resources, defensible land, and a good location for trade. They especially found such sites along the coasts of the North Aegean and Black Seas to the northeast, and Sicily and Southern Italy to the west. However, Greek colonies dotted the map of the Mediterranean

from Egypt and Cyrene in North Africa to Spain and Southern France in the West.

Founding a colony was no easy task. A leader and enough settlers had to be found, which often involved two city-states combining their efforts to found the colony. Finding a site for the colony was also a problem. Generally, colonists would ask the Oracle of Delphi for advice, usually getting a vague double-edged answer that could be interpreted in several ways, thus making the Oracle always right. For example, the colonists who founded Byzantium by the Black Sea were told to found their city across from the blind men. They figured the blind men were the settlers of nearby Chalcedon who had missed the much superior site of nearby Byzantium, since it controlled the trade routes between the Black and Aegean Seas and between Europe and Asia.

Although a colony was an independent city-state in its own right, it generally kept close relations with its mother city (*metropolis*), symbolized by taking part of the metropolis' sacred fire, representing its life, to light the fire of the new colony. Eventually, many Greek colonies, especially ones to the west such as Syracuse, Tarentum, and Neapolis (Naples), would surpass their mother cities in wealth and power. As a result, Southern Italy and Sicily came to be known as Magna Graecia, (Greater Greece).

Colonies triggered a feedback cycle that would help maintain the colonial movement and lead to dramatic economic, social, and political changes in the Greek homeland. First of all, colonies relieved population pressures at home and provided resources to their mother cities. This helped support the emergence of craftsmen who made such things as pottery and armor for export. It also made life easier for the free farmers who had more land now that there was less crowding. These two rising groups, craftsmen and free farmers, constituted a new group, the middle class, which could

afford arms and armor and help defend their poleis.

That, in turn, allowed the Greeks to deploy into a *phalanx*, a much larger mass formation of heavily armored soldiers who together formed a sort of human tank. Thanks to this deadly new formation, the Greeks were better able to found and defend colonies in territories with large hostile populations. This would feed back into the beginning of the process whereby colonies would produce more wealth and resources that would add further to the rising middle class that could afford arms and armor, leading to more heavily armed Greeks who could found and defend more colonies, and so on.

Another development that helped this process was a new invention: coinage. Although for centuries, people had used gold and silver as common mediums of exchange to expedite trade, there were always problems of determining the accurate weight and purity of such metals to avoid being cheated. Then, around 600 B.C.E., the Lydians, neighbors of the Ionian Greeks in Asia Minor, issued the first coins, lumps of gold marked with a government stamp guaranteeing the weight and purity of those lumps. Greek poleis soon picked up on this practice and issued their own coins. Coinage created a more portable form of wealth that everyone agreed was valuable. Trade became much easier to carry on, thus increasing its volume and the fortunes of the merchants involved in it. Overall, this signaled a growing shift from the land-based economy dominated by the nobles to the more dynamic money economy controlled by the middle class.

The Western way of war. The cycle of colonization spread a new type of warfare across the Greek world. Previously, Greek warfare had been the domain of the nobles, since they were the only ones who could afford the arms and armor necessary for fighting in the front lines. While this put the

brunt of the fighting on their shoulders, it also gave them prestige and power, since they had the weapons to enforce their will.

However, by the mid seventh century B.C.E., the wealth brought in by colonies led to a new type of warfare, the hoplite phalanx, a compact formation of heavily armored soldiers (hoplites, from the Greek word for shield) with overlapping shields and armed with spears. The idea was to use the weight of the phalanx to plow through the enemy. It wasn't elegant, but it was effective and brought into play two new revolutionary factors. First, since the phalanx's success relied on numbers, anyone able to afford heavy armor and shield had to be used. This meant including the rising middle class of independent farmers, craftsmen, and merchants, which would have a dramatic impact on the polis' political structure in the future.

Secondly, the hoplite phalanx created a new concept of warfare. Previously, when warfare had been primarily a matter of honor and power for a narrow group of kings and nobles who had nothing better to do, battles had mainly been a matter of hit-and-run tactics with some face-to-face combat. However, with middle class farmers now making up the bulk of the phalanx, warfare became a matter of defending their very livelihood. Therefore, the practice developed of meeting invaders in short, but brutal, head-on clashes to protect the defending farmers' lands and homes from ruin. Also, the fact that most of those fighting the battles had regular occupations to get back to reinforced this urge for a quick resolution of a war in one decisive battle.

This concept of resolving wars in decisive head-on clashes long outlived the Greek poleis that started it. The Romans would subscribe to this principle with systematic efficiency and pass it on to Western Civilization where it is still seen as *the* way to fight wars. Until the mid 1900s this strategy served Western powers well, but in recent decades it has not always

proven effective, as the Vietnam War, Israeli occupation of the West Bank and Gaza, and American occupation in Iraq have shown.

Pheidon, the ruler of Argos, was the first to use the new hoplite phalanx against Sparta, defeating it in the process. Soon Sparta had adapted to these new tactics, and other Greek poleis quickly proceeded to arm their middle classes and form phalanxes of their own in order to survive. Soon the "Hoplite Revolution" had spread throughout Greece and its colonies.

By 550 B.C.E, the cycle of Greek colonization was running out as few good sites for new colonies remained. However, colonization had spread of Greek civilization to other peoples, notably the Macedonians to the north and the Romans to the west. Rome in particular would adapt Greek culture to its own needs and pass it on to Western Civilization.

The rise of Greek democracy. Increased prosperity oftentimes leads to trouble, for it creates expectations of power and status to go with it. People who have virtually nothing expect nothing more. People who have had a taste of something generally expect more and will even fight to get it. Such is the fuel of revolutions, and ancient Greece was no exception. The problem was that, while the middle class artisans and farmers had little or no social status or political power to go with the expectation to fight in the phalanx. Their frustration in more commercial poleis played itself out somewhat differently than in the more agricultural poleis, but ultimately with the same basic result.

In many, usually the more commercial poleis such as Corinth, Megara, and Athens, some disgruntled and ambitious nobles used the frustrated middle class to seize power from the ruling aristocracy. The government they set up was called a tyranny, from the Greek word tyrannos, meaning one-man rule. Such an arrangement was usually illegal, but not

necessarily evil. That association with the word tyrant would come later.

In order to maintain his popularity, the tyrant typically did three things. First, he protected peoples' rights with a written law code, literally carved in stone, so that the laws could not be changed or interpreted upon the whim of the rich and powerful. Second, he confiscated the lands of the nobles he had driven from power and redistributed them among the poor. Finally, he provided jobs through building projects: harbors, fortifications, and stone temples with graceful fluted columns, a new Greek innovation. In addition, tyrants had the means to patronize the arts. Thus the sixth century B.C.E. saw a flourishing of Greek culture in such areas as architecture, sculpture, and poetry.

A crucial shortcut. One particularly useful public works project the tyrant, Periander of Corinth, sponsored was a runway for hauling ships across the Isthmus of Corinth thus saving sailors a 200 mile voyage through treacherous waters from the Aegean Sea to the Gulf of Corinth. Much of Corinth's prosperity came from this runway which operated all the way to 883 C.E. Today a canal performs the same service for ships.

However, the increased prosperity brought on by the tyrants only gave the people a taste for more of the same. By the second or third generation, tyrants could not or would not meet those growing demands, and people grew resentful. In reaction to this resentment, tyrants would often resort to repressive measures, which just caused more resentment, more repression, and so on. Eventually, this feedback of resentment and repression would lead to a revolution to replace the tyrants with a limited democracy especially favoring the hoplite class of small landholding farmers, though excluding the poor, women, and slaves.

Bratty behavior. Tyrants' sons were often brats who mistreated their subjects and seemed to do everything they could to get themselves overthrown, as seen in this dialogue between Dionysius, tyrant of Syracuse, and his son:

Dionysius: *"You should stop treating people that way"*

His son: *"That's easy for you to say. You never had a tyrant for a father."*

Dionysius: *"And if you keep acting like that, you won't have a tyrant for a son."*
Dad turned out to be right.

In the more agricultural poleis, the farmer-hoplites seem to have taken control more peacefully. Their dual status as farmers and hoplites supported each other in maintaining control. As farmers, they were the ones who could afford arms and armor and serve in the phalanx. And as hoplites in the phalanx, they were the ones with the power to run the state. Much like the states that experienced tyrannies, these agrarian poleis also established limited democracies favoring the small land-holding farmers. While these democracies may have excluded a majority of their populations, they did exhibit several characteristics that made them a unique experiment in history and a giant step toward democracy.

1) *A high value was placed on equality, at least among the citizens ruling the polis.* This ethos of equality discouraged the accumulation of large fortunes and encouraged the rich to donate their services and wealth to the polis. This created a fine balance between individual rights and working for the welfare of the society as a whole that helped create fairly stable poleis.

2) *The polis was largely dominated by a middle class of small landholders, merchants, and craftsmen..*

In addition to women and slaves, Greek democracies typically excluded freemen without any property from the full advantages

of citizenship. However, despite its shortcomings, the moderate style of democracy born in Greece by 500 B.C.E was the basis for the later, much more broadly based democracy in Athens and our own idea of individuals controlling their own destinies.

3) *Hoplite warfare limited the scope and damage of warfare among the Greek poleis.* Since it was the farmers who both declared war and fought it for the polis, they made sure that it was short and decisive so it would not disrupt their agricultural work or damage their crops. A typical war might take only three days: one day to march into enemy territory, one day to fight, and one day to get back home to the crops. They also made sure it was cheap. Since hoplite warfare was simple and everyone supplied his own equipment and rations, there was no need for taxes to support generals and buy supplies. This limited, almost ritualistic, style of warfare maintained a stability among the Greek poleis despite the frequency of their wars.

Private Property & Infanticide in Greece

The early Greeks had no clearly defined concept of private property, since they saw their farms as ancestral land belonging to all their ancestors, and thus not theirs to sell. However, they could sign away the rights to part of their crops (typically one-sixth) as collateral on loans, which was a halfway step to the fully developed idea of private property.

The Greeks also did not practice primogeniture (giving all their land to the oldest sons), maybe from a belief that since their farms were ancestral lands, they also belonged to all their descendants. As a result, in families with more than one son, farms would be split up into progressively smaller plots that

eventually couldn't support all the families living on them. To avoid this situation, Greeks commonly tried to limit their families to one son, the extra help needed on the farms coming from slaves who had no rights of inheritance. (This also gives another perspective on why slaves were seen as so crucial to ancient societies that did not practice primogeniture.)

Extra sons would be left on temple steps in the hope that someone would adopt them before they died. Of course, with high childhood mortality rates, this could backfire if the surviving eldest son died after any younger brothers had been disposed of. In Mary Renault's historical novel, *The Last of the Wine*, the main character explains how the plague that swept through Athens in 430 B.C.E. saved his life by killing his older brother.

Similarly, the Greeks tried to limit family size to only one girl. Even though daughters had no inheritance rights, their families were expected to provide them with dowries to attract prospective husbands who would take them off their families' hands. Thus peasants and poor urban families were especially likely to abandon daughters on temple steps or even engage in outright female infanticide.

The Oracle of Delphi

The theater at Delphi, which was also the site of the Pythean games, one of the four-year cycle of athletic competitions in Greece, and the only one with musical and poetic contests

There were numerous oracles throughout the ancient world, but the one at Delphi had the highest reputation when it came to giving advice and predicting the future. In mythology, Delphi was where Apollo slew a monstrous dragon known as the Python and buried its remains so they could rot and emanate inspirational fumes.

An elderly local woman of blameless character was chosen to be the priestess, known as the Pythea, through whom Apollo would speak. Sitting on a tripod, she would breathe in some intoxicating fumes, which some believe came from gasses containing ethylene, a natural intoxicant, emanating from a fissure in the earth. The Pythea would babble some drug-induced nonsense that the priests would "translate." Typically, their answers would be ambiguous enough to be interpreted in more than one way, thus making it impossible to prove the Oracle wrong.

Apollo only "inhabited" Delphi nine months of the year, spending the winter in the North with the Hyperboreans. During that time Dionysus, the god of wine and revelry and Apollo's half-brother, took his place and the Oracle was closed for business. Even in the remaining nine months, the Oracle was

only open the seventh day of each month

Petitioners, carrying laurel branches sacred to Apollo, would bring a sacrificial animal (usually a goat), and a monetary fee for the god. Lots were drawn to determine the order of admission, although representatives of city-states and those with especially large donations to Apollo got to move up in line. (The bribe by Croesus of Lydia's representatives was supposedly so large they secured a permanent spot at the head of the line.)

The sacrificial goat was first showered with water and observed to make sure it shivered from the hooves upward, and then sacrificed to observe its organs, in particular its liver, to ensure the signs were favorable. According to Plutarch, the priests once put the question to the Pythea despite bad omens, causing her to go into a violent hysterical reaction and die.

When the Pythea was not available, petitioners could put simple Yes-or-No questions to the priests, who would then toss some colored beans, one color meaning "yes," another "no."

The huge amount of wealth in offerings stored in various city-states' treasuries at Delphi made it a tempting target. In the fourth century B.C.E. a neighboring polis, Phokis, seized Delphi and used its treasures to buy a big army of mercenaries with which to terrorize neighboring poleis. This led to the Third *Sacred War* (356 BC–346 BC), which exhausted Thebes and other Greek city-states and helped Philip of Macedon conquer Greece.

The treasury of the Athenians' offerings to Apollo at Delphi. Many other city-states had such treasuries, making Delphi a tempting target for its neighbors.

Some famous prophecies by the Pythea.

- When Croesus of Lydia asked if he should go to war with Persia, the oracle said if he did, he would destroy a great empire. He went to war and, as the oracle predicted, destroyed a great empire... his own.
- Colonists from Megara were told to found their city across from the blind men. They figured the blind men were the settlers of Chalcedon who had missed the much superior site of nearby Byzantium, since it controlled the trade routes between the Black and Aegean Seas and between Europe and Asia.
- When the Athenians asked where to found a colony, the oracle replied "You must found your city where you shall drink water by measure and eat barley cake w/o measure." Luckily the Athenians found some very fertile land near a spring known as *Medimnos* to the locals. Since *medimnos* was also the Greek word for dry measure, like a bushel, they could indeed drink water by measure and eat without measure (at least compared to the meager harvests back home). The result was the city of Thurii in southern Italy.

- When the Athenians asked the oracle how to defeat the huge invasion of Persians led by Xerxes, the Pythia initially told them to flee to the ends of the earth. Not satisfied with this response, they finally got a second reply that the wooden walls alone would remain unvanquished. This sparked a vigorous debate on whether it meant an old wooden wall around the Acropolis or the navy. One Athenian, Themistocles was convinced it meant the navy and convinced the Athenians to invest a sudden windfall of money into a crash-building program to construct 200 triremes. As it turned out, Themistocles was right and his fleet saved Athens and the rest of Greece.

Greek Colonies: Like “Frogs Around a Pond”

A map showing areas of Greek (green), Phoenician (pink), and Etruscan (yellow) colonization

“Like frogs around a pond” is how Plato described the Greeks who had settled in hundreds of colonies around the Mediterranean, Aegean, and Black Seas. The Greeks founded so many colonies in Southern Italy and Sicily that the area became known as Magna Graecia (Greater Greece). However, we should remember each colony had its own proud history as an independent state.

Behind each colony was a mother city known as a metropolis. Several *poleis* founded large numbers of colonies. Miletus, the foremost Greek polis in Ionia (western Turkey) led colonization in the North Aegean and Black Sea, supposedly founding some 70 cities (although probably fewer). Chalkis, from the island of Euboea, founded some 30 colonies in the North-western Aegean, giving that region the name Chalcidice.

Below are some of the more prominent Greek colonies, some of them still important cities, and pictures of their distinctive coinage.

Neapolis, modern Naples. was founded by colonists from Corinth around 750 B.C.E. and remains the most important city in Southern Italy.

Tarentum, founded 712 B.C.E. was the only colony Sparta founded. Supposedly during its foundation was the Second Messenian War, during which a number of sons were mysteriously born even though the men were away at war. These sons made claims to their own Spartan land, leading to tensions that were solved by sending the claimants to found a colony in Italy if they gave up claims to land back home. The result was Tarentum, which would grow into one of the richest and most powerful cities in Southern Italy. In fact, it was so rich that it waged war by hiring foreign kings to its fighting for it. One such king would be Pyrrhus of Epirus who was hired to stop the expansion of another rising Italian state: Rome.

Syracuse, also founded by Corinth in 733 B.C.E, was the greatest Greek city in Sicily, leading other Greeks against Carthage’s repeated attempts to conquer the island.

Messana, controlling the straits between Italy and Sicily, was founded by Messenian refugees fleeing from Sparta. Its original name was Zancle, meaning “reaping hook” from the shape of his harbor.

Massalia (modern Marseilles) was a colony of Phokaia in Ionia. The oath settlers took, which as a common form of oath, was to toss iron bars into the sea and swear that they would not return to Phokaia until those iron bars floated to the top.

A Colonization Agreement by Settlers from Thera (c.630 B.C.E.).

The following decree was found in the island of Thera (Santorini) regulating the colonists setting out to found Cyrene in North Africa. It gets across the desperate conditions that drove Greeks to leave their home cities to find new homes.

“It was resolved by the Assembly [at Thera]. Since Apollo spontaneously ordered Battus and the Theraeans to colonize Cyrene, the Theraeans are determined to send to Libya Battus as leader and king; and the Theraeans shall sail as his companions. They shall sail on equal terms from each

household, one son from each. Men in the prime of youth are to be enlisted from all the districts. Of the other Theraeans any free man may sail if he wishes. If the colonists occupy the settlement, men from the same households who later land in Libya shall share in citizenship, shall be eligible for office, and shall be allotted unoccupied land. But if they fail to occupy the settlement and if the people of Thera are unable to help them and if for five years they are beset by privation, then they may without fear leave the land [and return] to Thera, [receive back] their property and be citizens. He who refuses to sail when the city sends him shall be liable to the death penalty and his property shall be confiscated. Any father who gives refuge or asylum (?) to his son or any brother who [does the same] for his brothers shall suffer the same penalty as the person refusing to sail.

“On these terms they swore oaths, both those who stayed behind and those who sailed to found the colony. And they invoked curses on those who violated the terms and did not abide by them, whether living in Libya or staying behind. They fashioned waxen images and all together, men, women, boys and girls, watched (?) [them] burn while pronouncing curses, [saying that] any person who did not abide by this oath but violated it should waste away and melt like the images, he and his son and his property; but that those who abided by this oath, whether they sailed to Libya or stayed behind, should find much happiness, they and their sons.

When Theran colonists tried to return home from Cyrene in N. Africa, the people of Thera drove them back since their island was already overpopulated.

The Invention of Coinage

A comparison of the relative sizes of different Greek coins

The basic coin of Ancient Greece was the silver *drachma* (literally “handful”), which was a bit bigger than a dime. Six silver *obols* (from the Greek word for a spit of iron) equaled one drachma. For larger transactions there were the mina, (1.1 pounds of silver and worth 100 drachmas) and the talent weighing 66 pounds and worth 6,000 drachmae or 60 minae. In the fifth century B.C.E., the typical laborer earned 3 obols a day, or 180 drachmae a year. It would cost about a talent of silver to pay the crew of a warship for one month.

One of the first Greek coins to be minted, a silver stater of Miletus (c.525 B.C.E. Its small size gives an indication of the value and rarity of silver coins at this early date.

How to mint an ancient coin. The flan (lump of metal) was placed between the reverse die on top and the obverse die underneath (both of which were carved backwards so their impression would come out right on the finished coin. Striking the punch with the hammer would leave an impression on both sides of the coin.

Since coins were struck manually, mistakes were more common than today. For example, the punch might slip off the coin, causing an off-strike with only part of the obverse (front) of the coin showing in one

corner. Or coins might inadvertently be struck a second time. Since coins were expensive to strike, such coins would often be put into circulation rather than melting them back down for re-striking.

The Hoplite Phalanx & Western Way of War

Two Greek poleis' phalanxes about to clash in battle.

The Advent Of Hoplite Warfare (c.650 B.C.E.). Previously, only nobles could afford armor, which gave them tight control on power in the polis. Then around 650 B.C.E., Pheidon of Argos came up with a new innovation. As the Spartan nobles, Argos' archenemies arrived for battle, they were surprised as a much larger army than the usual few hundred Argive nobles showed up. Worse than that, they charged at a run in a compact mass that could roll over anyone who got in their way. Needless to say, the Spartans didn't stick around to ask any questions.

But for them to survive, they had to adapt to this new style of hoplite phalanx warfare. So did Tegea, Sparta's next foe. And so did every other polis that wanted to survive the constant wars with their neighbors. Soon the “hoplite revolution” had spread across

Greece and what Victor Davis Hanson calls the Western Way of War, was born.

Hoplite equipment. Since each hoplite (heavily armed infantryman) had to supply his own arms and armor, one would see a large variety of individual equipment in a Greek hoplite phalanx. Each man decorated his shield with his own or his family's design so that he could easily find his shield and his friends could recognize him in battle.

At first a fully armed hoplite's equipment included several pieces. One was a Corinthian helmet that totally encased the head except for narrow slits in front. While giving maximum protection, this also could create a terrifying sense of isolation and confusion as to the situation evolving around them. Thus the close order of battle also served the purpose of reassuring the hoplite he was not alone. The hoplite also wore bronze body armor and greaves (shin guards) and carried a large convex-shaped wooden shield (*hoplon*) covered with a thin layer of bronze. The convex shape allowed him more protection as he buried his shoulder into it to push his side to victory. All this could weight up to sixty-five pounds, being worn in the hot summer sun while exerting oneself to the absolute limit.

The primary weapon was a six to eight foot-long spear with points at both ends. When held upright as he pushed forward, the extra point, called a lizard sticker, allowed a hoplite to quickly punch down on any wounded enemies he may be stepping over. When held overhead, which men in the front ranks did since they were face to face with the enemy, the extra point gave the spear more balance, allowing the hoplite to hold it closer to the center and extend his reach. He also carried a short sword as a secondary weapon, which was especially useful if the spear shattered (which they

often did) and he needed something for the very cramped melee taking place.

Later, the hoplite's equipment was modified by adopting a more open helmet so one could see better, a cape hanging from the shield or boots to replace the greaves, and lighter armor made of multiple levels of linen glued together. While lighter and cheaper, this also made the hoplite more vulnerable in battle, probably leading to higher casualty rates. To compensate, spears got progressively longer until they evolved into the 13-foot long Macedonian pike.

The Face of Battle from inside a phalanx. Hoplite phalanx battles were bloody, but usually brief affairs, being in essence big shoving matches and brawls to break the other side's formation...sort of like American football, except with knives. As such, they required little training, just a lot of nerve.

To keep their courage up, soldiers would typically pass around the wineskin to steady their nerves, a common practice, whether officially or unofficially condoned, through most of history. They would also sing a paean (hymn) to one of the gods. Writers referred to this reaction as *pseudomachia* (false courage). The comic playwright, Aristophanes, may have best expressed the terror battle inspired, saying that if medals were brown, we'd all be heroes.

Both sides would approach in close formations generally around eight men

deep, each man hugging to his comrade on the right to cover his unshielded right side, which often caused phalanxes to drift to their right as they advanced. As they were about to meet, they might charge the last 100-200 meters at a run. This gave added momentum, but also made the phalanx's ranks a bit ragged. However, that didn't matter much, since everyone would quickly pile up behind his front ranks to deliver the big push.

The front ranks were more involved in hacking and stabbing at their counterparts, while trying to keep their balance as they were crushed between the two armies pushing desperately against one another. To an extent, it was a series of separate battles and shoving matches between individual columns of men. Opposing soldiers might have found themselves side by side in their separate columns shoving in opposite directions and not even free to deal with each other as they were pushed onward past each other. Another dynamic may have been a tumbling effect as hoplites were shoved backwards and lost their footing. Similarly, those moving forward might trip over fallen soldiers, thus disrupting their forward momentum and allowing the enemy to regain some momentum.

Many casualties came from being trampled or suffocated. Exhaustion also must have taken its toll as the heavy armor in the hot sun could even cause heat strokes and heart attacks, especially for the older men in the ranks. No surprise then that the first thing hoplites did after battle was take off their armor.

The crucial moment came either when one phalanx broke through a significant part of the enemy, or panic set in and men from one side ran away. Such action typically began at the rear of the army where men were freer to leave. For that reason, some of the steadier veterans would be stationed in

back to prevent younger soldiers from panicking. If an army kept its ranks for an orderly retreat, it might lose 5% of its men. If it broke and ran, that number would rise significantly, depending on how serious the victors' pursuit was to take down men with their backs exposed to attack from behind. Huge disparities in casualties between two armies in a battle generally reflect a great slaughter after the battle had been decided.

In the aftermath, the invaders would retreat home or face a prolonged siege of the defenders' city. Since most of the victors were also full-time farmers who had to get home to tend their crops, they would leave with little being accomplished beyond bragging rights and maybe a few slaves being taken. Rarely did one polis win such a decisive victory as to conquer another polis or wipe it out. Even the defenders' crops would be left largely untouched, since wheat and barley aren't dry enough to burn until right before harvest time, and the victors had to be home by then. Likewise, olive orchards and vineyards were relatively untouched, because it took a lot of time and labor to cut them down, and the victors couldn't afford to be away from home that long.

A view from behind a phalanx illustrating the "push of pike." This also gives a sense of phalanx warfare as more of a brawl and shoving match than being organized and well drilled. The Spartans would change that (and Western warfare forever) with the drill and march)

That begs the question of what this accomplished. Actually, quite a bit. For one thing, as ironic as it may sound, hoplite phalanx warfare probably kept Greece more stable, since it relied on a highly ritualized type of warfare fought by farmers

heavily constrained by the limits of their agricultural year. It has been said that a typical war between two poleis lasted three days: one to march to your enemy's land, one to fight the battle, and one to get back home. While it may be a bit of a stretch to describe Greek wars in such simplistic terms, it does emphasize how their style of warfare limited the damage done to the polis. Not until the more professionalized and prolonged warfare developed by Athens and Sparta in the late fifth century B.C.E. did Greek wars turn into the destructive phenomenon that would wreck the polis and leave the way open for Macedon to take over.

Secondly, hoplite phalanx warfare created a whole new dynamic within Greek society, since it depended on middle class farmers, not just a few elite nobles to defend the polis. And once those farmers were armed and the playing field with the nobles was more level, they were much less likely to blindly follow orders unless they saw them as in their interests as well.

Third, the Greeks had created a style of warfare that made them Greeks dangerous way beyond their numbers, allowing them to successfully found and defend colonies throughout the Mediterranean and also defend drive off two invasions by the Persian Empire. This in turn gave them a psychological edge in fighting non-Greeks. Enemies, like the Persians at Marathon, thought the Greeks were crazy maniacs, charging against larger armies for face-to-face combat. Of course this was what made the heavily armored hoplite phalanx so effective against lighter armed troops with little or no protective armor. In addition, anytime you can make your opponent think you're crazy and capable of doing anything gives you a distinct psychological advantage. And that psychological edge is 90% of any fight.

From warrior to soldier. Finally, the Greek way of war created a new definition of hero that carries down to the present. Hoplite battles were quick but bloody affairs, being little more than glorified shoving matches with sharp edged weapons thrown in to add to the fun. A phalanx's success depended above all on each man holding his place in line. As the Greeks put it, you wear armor for yourself but carry your shield for your comrades. This created a whole new military ethos that survives today. Instead of the lone Homeric warrior fighting to win personal glory, heroism now consisted of the soldier holding his place in line and fighting for the group. History has shown that in battles between organized soldiers and lone warriors, the soldiers usually win. Ask any veteran of fighting in Iraq, Afghanistan, or Vietnam what he was fighting for, his first answer won't be personal glory, the flag, mom, or apple pie. It will be his comrades in arms.

The poet Tyrtaeus' exhortation to a young Spartan hoplite

"Beautiful and honorable [kalon] it is for a brave [agathos] warrior to die, fallen among the foremost fighters, in battle for his native land; but to leave his polis and rich fields and beg--that is most painful of all, as he wanders with his dear mother and aged father, his small children and wedded wife. Detested he will be in the eyes of all those to whom he comes, constrained by need and hateful poverty. He shames his birth and belies his glorious appearance; dishonor and misery are his companions. If no account is taken of a warrior who is a wanderer, if there is no respect for him or his family in the future, then let us fight with all our hearts for this land and die for our children, no longer hesitating to risk our lives. Young men, stand firm beside each other and fight. Do not begin shameful flight or fear. Rather create a mighty, valorous spirit in your breasts, and do not show love for your lives when you are

fighting with warriors. Do not flee, abandoning the older men, whose knees are no longer nimble. For shameful-and-ugly [aischron] it is for an older warrior to fall among the foremost fighters and lie out ahead of the young men-- a man whose hair is already white and his beard gray-- as he breathes out his valorous spirit in the dust, holding his bloody genitals in his own hands, his body laid bare. Shameful-and-ugly [aischra] is this to the eyes, and a cause of resentment to look upon. But to the young men all is seemly, while the glorious flower of lovely youth is theirs. To men the young man is admirable to look upon, and to women lovable while he lives, and beautiful-and-honorable when he lies among the foremost fighters. So let a man take a firm stance and stand fast, with both feet planted upon the ground, biting his lip with his teeth."

THE RISE OF SPARTA TO 500 B.C.E.

*"Come home with your shield or on it."
--Spartan women to their men leaving for war*

The Laconic answer. By 338 BC, Philip II of Macedon had conquered all of Greece except Sparta, which by then had fallen on hard times, having only a lingering reputation for mental and physical toughness, though her army was only about 1000 men as opposed to Philip's 25-30,000.

Besides toughness, the Spartans so renown for short sentences and replies that we still use the word laconic (describing brevity of speech), from Laconia, the region surrounding Sparta. Therefore, with his army poised on Sparta's borders, Philip sent a message: "When I enter your country, if you do not yield at once, I will burn your villages and destroy your cities. If I enter Laconia, I will level it the ground."

The Spartan answer was typically laconic and to the point: "If".

Philip left them alone.

No Greek city-state aroused such great interest and admiration among other Greeks as Sparta. This was largely because the Spartans did about everything contrary to the way other Greeks did. For example, Sparta had no fortifications, claiming its men were its walls. While other Greeks emphasized their individuality with their own personal armor, the Spartans wore red uniforms that masked their individuality and any blood lost from wounds. Therefore, it should come as no surprise that we remember Sparta for being a military state always ready for war, but not against other city-states so much as against its own enserfed subjects.

Originally, Sparta was much like other Greek city-states, being a leader in poetry and dance. However, by 750 B.C.E., population growth led to the need for expansion. Instead of colonizing overseas, like other Greeks did, the Spartans decided to attack their neighbors, the Messenians. In two bitterly fought wars, they subdued the Messenians and turned them into serfs (*Helots*) who had to work the soil for their masters. Unfortunately for the Spartans, the Helots vastly outnumbered them.

As a result, Sparta became a military state constantly on guard against the ever-present threat of a Helot revolt. This especially shaped five aspects of Spartan society: its infants, its boys, its girls, its government, and its foreign policy. Infants were the virtual property of the state from birth when state inspectors would examine them for any signs of weakness or defects. Babies judged unlikely to be able to serve as healthy soldiers or mothers were left to die on nearby Mt. Taygetus.

Boys were taken from home at age seven to live in the barracks. There they were formed into platoons under the command of an older man and the ablest of their number. Life in the barracks involved a lot of hard exercise and bullying by the older boys. At age twelve it got much worse. Adolescence brought the Spartan training at its worst. The boys received one flimsy garment, although they usually trained and exercised in the nude. They slept out in the open year round, only being allowed to make a bed of rushes that were picked by hand, not cut. They were fed very little, forcing them to steal food to supplement their diet and teaching them to forage the countryside as soldiers. Their training, games, and punishments were all extremely harsh. One notorious contest involved tying boys to the altar of Artemis Orthia and flogging them until they cried out. Reportedly, some of them kept silent until they died under the lash.

Double indemnity. Spartan boys caught stealing were beaten twice: once for stealing and once for getting caught.

Sobriety tests. Spartan boys learned sobriety by having to watch a helot get extremely drunk and act like a fool. Similarly, I know a woman who, when her teenage daughter came home drunk, forced her to look at herself in a mirror for an extended time. At first she thought it was funny, but soon saw how ridiculous she looked. She never came home drunk again (or at least let her mother catch her doing so).

At age eighteen, the Spartan entered the *Krypteia*, or secret police, for two years. The *Krypteia*'s task was to spy on and terrorize the Helots in order to keep them from plotting revolt. The Spartans even declared ritual warfare on the Helots each year to remind themselves and the Helots of their situation and Spartan resolve to deal with it. At age twenty, the Spartan entered the army where he would spend

the next thirty years. As an adult, he could grow his hair shoulder length in the Spartan fashion to look more terrifying to his enemies. Not surprisingly, he had little in the way of a family life. However, it was illegal *not* to marry in Sparta, since it was part of the Spartan's duty to produce strong healthy children for the next generation. After getting married, the young husband might have to sneak out of the barracks at night in order to see his wife and children. It was said some Spartan fathers went for years without seeing their families by the light of day. At age fifty, the Spartan could finally move home, although he remained on active reserve for ten more years.

***Not exactly the Food Channel.* Spartans were also notorious for their horrible food, in particular their goat's blood soup. One visitor, having tasted their food, said it was no wonder Spartans weren't afraid to die.**

***Spartan Match.com.* Unmarried Spartan men were said to be attacked in the street by unmarried Spartan women and were forced to march naked down the street singing this was a fitting punishment for not having wives. Eventually, all the unmarried Spartan men and women would be put into a dark room where they would randomly find their spouses. Maybe the Spartan view of love and romance was best seen in their statue of Aphrodite with her legs shackled.**

Girls did not have it much easier. Although they did live at home rather than in the barracks, they also went through arduous training and exercise. All of this was for one purpose: to produce strong healthy children for the next generation. Surprisingly, Spartan women were the most liberated women in ancient Greece. This was because the men were away with the army, leaving the women to supervise the Helots and run the farms. In fact, Spartan women scandalized other Greeks with how outspoken and free they were.

***Burial rights.* Only Spartan men who had died in battle and women who had died in childbirth were granted the right of tombstones.**

***Beating swords into money.* To prevent the pursuit of material wealth and promote strong**

muscles, Spartan money was made of iron bars.

Spartan government, in sharp contrast with the democracies found in other city-states, kept elements of the old monarchy and aristocracy. They had two kings whose duty was to lead the army. Most power rested with five officials known as *ephors* and a council of thirty elders, the *Gerousia*. There was also an assembly of all Spartan men that voted only on issues the *Gerousia* presented them. The Spartans had a very conservative foreign policy, since they did not want to risk a Helot revolt while they were away at war. They did extend their influence through leadership of the Peloponnesian League, which contained most of the city-states in the Peloponnesus, making Sparta the most powerful Greek city-state, although its army was never very large.

***Rewarding the big mouths.* Even Spartan voting was unique. Someone would hide out of sight of the assembly and judge which side voted louder.**

Spartan discipline did produce magnificent soldiers, inured to hardship and blind obedience to authority, but with little talent for original thinking or self-discipline. However, in the Persian wars, the Spartans would do more than their share in the defense of freedom, as ironic as that may have sounded to them.

Sparta and Argos: A Heated Rivalry

Like high school rivalries that go back beyond anyone's living memory of why they started, the Greek polis typically had an intense rivalry with a neighboring polis. Except, of course, the Greeks played out their rivalries with spears instead of basketballs. Sparta was no exception to this, its archenemy being the nearby city-state of Argos.

Stories about concerning this long-standing rivalry and hatred, going back at least to 660 B.C.E. when Pheidon of Argos first used the hoplite phalanx against the Spartans at Hysiae, seizing control of Elis and the Olympics. The Spartans seem to have driven him out by c.570 B.C., giving control of the

Olympics to Elis, which became a strong ally with Sparta after that.

One of the more famous incidents between Sparta and Argos was the Battle of the Champions, when each side chose 300 champions to decide a war. In the end, there were two Argives and one Spartan left, so the Argives went home to announce their victory. Meanwhile the lone Spartan stayed to claim the field and victory, leaving the issue in dispute.

Another well-known story concerned the Battle of Sepia in 494 B.C.E. The Argives decided they could do no better than copy the Spartan army's moves to keep them from gaining a tactical advantage. So for several days the Spartans would come out in formation and the Argives would match that formation, then the Spartans would sound their trumpets to break for breakfast and the Argives would do the same. Naturally the Spartans grew weary of this pattern, until one day after more of this copycat maneuvering, the Spartan trumpets sounded, and so did the trumpets of the Argives who broke for breakfast. However, following previous orders the Spartans quickly reformed and charged, breaking in just as the Argives were sitting down to their Wheaties.

Sparta and the Western Way of Drill-and-March

Part of a Spartan phalanx. Unlike the individually decorated shields most Greeks carried, the Spartans uniformly decorated theirs with the Greek L, for Lacedaemonians, which included full-blooded Spartiates and other free people in Sparta, known as the *perioeci* (dwellers round). The

uniformity of Spartan equipment help reinforce the ethos of fighting together for one another, not individually for personal gain or glory.

In his book *Keeping Together in Time*, William McNeill relates how after hours of drill-and-march in the army he would actually feel somewhat exhilarated. He traces this feeling to the cadence of the march and a pleasure center in our ears that likes a beat. From there he hypothesizes that the success of modern Western armies has been the rediscovery of the drill-and-march used by the Romans. Such a group exercise creates strong feelings of solidarity among soldiers and makes them more likely to stand together and hold their ground in the chaos and terror of battle. This is why armies still use it even though marching in ranks on the modern battlefield would be suicidal.

The combined armies (left) of Sparta and another polis collide with an opposing phalanx. The Spartans (bottom left), who are well-drilled, still keep their ranks neat, while the other *poleis'* phalanxes are already bunched up together like a bunch of 5-year olds playing soccer. Notice how the Spartans here are only six ranks deep as opposed to most other phalanxes, which have eight ranks. This is because of Sparta's low population and the need sometimes to spread out their line to keep from being outflanked. The quality of their soldiers usually more than made up the difference. The Spartans also

hold the right side of the line. This was the most dangerous position and thus the place of honor in the Greek phalanx because a hoplite's right side was unshielded.

We know the Romans used the drill-and-march, but did they invent it, or learn it from someone else? My suspicion is the Spartans invented it, the evidence being, besides their reputation in battle, the fact that they marched to music. Also, although Sparta spurned most cultural pursuits, it did continue to value and practice choral (group) dancing after the Lycurgan reforms.

From the Spartans drill-and-march may have spread to the Thebans. The 50-deep phalanx that Epaminondas pioneered must have required much more training and coordination that the drill and march could provide. Furthermore, we know Philip II of Macedon watched the Thebans train when he was a hostage in Thebes as a boy. Philip would be the next connecting link, since his phalanx required much more precise coordination and maneuvering than the brawling style of the citizen hoplite phalanx.

The Macedonian system spread across a vast area thanks to Alexander's campaigns, and I would guess the Romans, having multiple contacts with the Hellenistic system starting with Pyrrhus of Epirus around 280 B.C.E., at some point adopted it as their own, probably the late first century B.C.E. when Marius' reforms made the Roman army a professional organization with full-time soldiers that had the time to practice the drill-and-march. At the peak of the Roman army's efficiency, legionaries would train with the drill-and-march four hours a day, transforming them from warriors to soldiers in a well-oiled military machine that no one could match head to head for centuries.

The Roman Empire's decline and fall largely correlated with the declining use of the drill-and-march. This was partly because of growing reliance on more mobile cavalry, horses not able to coordinate their movements with the precision that humans can. Another factor was increased reliance on barbarian recruits who, still imbued with the individualistic warrior ethos, were unwilling to succumb to the cooperative group movements that the Roman system demanded of its soldiers.

Therefore, the drill-and-march was largely lost in the West for a thousand years, until the Renaissance when massed infantry formations started again to dominate the battlefields of Europe. The key to this revival was the Renaissance's recovery of ancient Greek and Roman texts, particularly those of Aelian and Vegetius, who described the Roman system in detail.

It's likely that the Swiss, who fought in dense phalanxes of pikemen, were familiar with these texts and used them to coordinate their complex maneuvers, making them the terror of Renaissance battlefields until other people caught on to their techniques and/or learned to read Latin.

We know that in the late 1500s, the Dutch leader, Maurice of Nassau adapted the Roman system to loading and firing the cumbersome matchlock muskets of the day to create a constant rate of gunfire by rotating successive lines of musketeers, much like the Romans would rotate in fresh lines of infantry to relieve the tired ones up front. As firearms progressively dominated the battlefields of Europe, so did the drill-and-march and the Western way of war that went with it.

THE RISE OF ATHENS TO 500 B.C.E.

While Athens is the city we generally think of when the Greeks are mentioned, it did not always seem destined for glory. Rather, its greatness was the product of a long history laying the foundations for the great accomplishments of the fifth century B.C.E.

Athens's foundation myth. According to the story, Poseidon and Athena had a contest to see who the new city in Attica would be named after. Poseidon gave the city spring of water, while Athena gave it the olive tree. Athena won, since Poseidon, as god of the sea, had produced a spring of salt water, while olive oil would prove a most useful commodity for the Athenians to trade. Still, it would be on the sea, Poseidon's realm, that the Athenians would build their power.

Two things in Athens' early history led to internal peace that made its history and development much easier. First of all, there was no Dorian conquest of *Attica*, the region surrounding Athens. The myth of the Athenian king, Codrus, who sacrificed himself in battle against the Dorians tells us there probably was Dorian pressure on Attica, but that it failed. Consequently, with no conflict of Dorians against non-Dorians, internal peace could reign in Athenian society. Second, Athens united all of Attica under its rule at a fairly early date and made all its subjects Athenian citizens. Therefore, they were more likely to work for Athens' interests in contrast to the Spartan Helots who were always looking for an opportunity to revolt.

Despite these advantages, the tensions that accompanied both a rising middle class and overpopulation in other poleis affected Athens as well. For example, there was a failed attempt to establish tyranny at Athens by a man named Cylon who seized the Acropolis with the aid of Megarian troops.

One issue causing discontent was the lack of a written law code. Since nobles controlled the religion, which was seen as the source of law, they could say the law was whatever they pleased and then change it at will. At last, in 621 B.C.E., they gave in and commissioned Draco, whose name

meant "dragon", to write down the laws. His law code was so harsh that even today we use the term "draconian" to describe something extremely severe. Some people claimed Draco's law code was written in blood rather than ink. But Draco did get the laws written down, which was a step forward for the people. And, of course, they wanted more.

By 600 B.C.E., the nobles in Athens were becoming more nervous as the complaints of the very poor and the rising middle class grew increasingly louder. As a result, they gave a man named Solon extraordinary powers to reform the state and ease the tensions between the different classes. Solon passed both economic and political reforms that laid the foundations for Athens' later greatness.

The Draconic answer? When asked why he specified the death sentence for such crimes as idleness and stealing a cabbage or apple, Draco replied, "Yes, it's unfair. Little crimes and big crimes get the same punishment. If only I could think of a punishment worse than death for the serious ones."

Economic reforms. Solon improved Athens' economy in several ways. First, since Attica's soil was particularly poor for farming wheat and barley, he outlawed the export of grain from Attica. This encouraged the cultivation of olive trees that were better suited for Attica's soil. The olive oil produced from these trees was a valuable commodity used for cleansing and as a fuel for light and cooking. Later, grapevines would also be cultivated, and Attica's wine became still another highly valued Athenian product. Second, Solon developed trade and manufacture in Athens, largely through attracting skilled craftsmen to settle there. He especially encouraged pottery since Attica had excellent clay for ceramics. In later years, Athenian pottery would come to be some of the most beautiful and highly valued in the Mediterranean. One other thing Solon did to relieve the poverty in Athens was to abolish debts and debt slavery. While this was not popular with the nobles, it did ease some of the tensions threatening Athenian society at that time.

The profits gained from selling olive oil, pottery, and wine were then used for buying grain from the Black Sea. Since Athens' economy now was much more suited to local conditions than when it was barely getting by on the old subsistence agriculture, it could buy the grain it needed and still have money left over. The Athenians could use this extra money for further developing their economy through more trade, industry, and olive orchards. This would lead to even more profits, and so on.

Solon's reforms set the stage for the Persian Wars and Athens' later cultural accomplishments. Since Athens was heavily dependent on the Black Sea for grain, it was very sensitive to any events in that part of the world, just as the United States today is sensitive to events in Middle East where it gets much of its oil. As a result, Athens expanded to the shores of the Black Sea, thus leading to a collision with Persia over control of that region.

Solon's political reforms made the Athenian state more democratic in three ways. First, he changed the qualifications for holding public office from being determined by birth into a particular class to how much wealth one had. This meant that someone not born a noble still had a chance to rise up through society by means of his ability. Solon also admitted the poorest class of citizens to participate in the popular assembly and juries. Finally, he granted a few powers and privileges to the popular assembly, which opened the way for more sweeping democratic reforms a century later.

These measures delayed, but did not prevent, the overthrow of the aristocrats by a tyrant. Fighting in Athens continued between the Hill (peasants on small farms), Shore (artisans and traders), and Plain (nobles) factions. Eventually, the leader of the hill faction, Peisistratus, gained the upper hand and became tyrant. Peisistratus did two things important for Athens' future. For one thing, like other Greek tyrants, he enriched the lower classes by providing them with land and jobs on building projects. Second, he secured Athens' grain supply from the Black Sea by getting control of the town of Sigeum, which safeguarded Athens' grain ships in that area but also set Athens up for an eventual clash with Persia.

Perseverance furthers. It took Peisistratus three times to secure power as tyrant. One time he faked his own mugging to get voted a bodyguard with which he tried to seize power. Another time he dressed an unusually tall woman in armor and rode with her in a chariot to Athens, spreading word that Athena was coming to put him in power. Incredibly, it worked.

There were also cultural developments during Peisistratus' rule. For one thing, he gathered scholars to take all the different versions of Homer's *Iliad* and decide which was the definitive one. One other cultural accomplishment was the invention of tragic drama. This evolved from rather boisterous goat songs (*tragoidea*) dedicated to Dionysus, the god of song and revelry. However, by this time, these songs had become much more serious, and the addition of an actor to interact with the chorus of fifty led to the birth of drama.

From oral to written tradition. By writing down a definitive version of any oral tradition, there is no telling what alternate versions are lost and forgotten. For example, in one version of the Trojan War cycle, Penelope has been unfaithful to Odysseus and kills him when he returns from Troy.

Tragoidea, the Greek word for goat songs, is the root of our word tragedy. The connection is somewhat inappropriate (by our standards) songs sung to Dionysus by satyrs or goat shepherds. At some point, the songs started getting more serious and were formalized into being sung by a chorus of fifty men. Thespis (from whose name we get the word Thespian) created the first actor, took the next step by having one actor step out and engage in dialogue with the chorus, to create some tension and make things more interesting. Other playwrights continued adding innovations. Aeschylus added a second actor on stage, and Sophocles added a third actor and scenery while reducing the chorus from 50 members to 15.

As we have seen, in most poleis the first generation of tyrants would rule rather peacefully. For example, Cypselus, tyrant of Corinth, was so popular that he went about without so much as a bodyguard. However, the second or third generation of tyrants usually ran into problems, either because their rule was oppressive or people wanted more political rights to go along with their rising wealth. Athens was no exception. Peisistratus ruled and died peacefully, but his son, Hippias, ruled more oppressively, especially after an unsuccessful assassination attempt aroused his suspicions of all around him. Popular anger would grow, triggering more oppression, causing more anger, and so on. Finally, Hippias was driven out of Athens with help from the Spartans who then put a garrison of 700 soldiers in Athens' Acropolis. However, the Spartans were hardly the people to go along with the democratic aspirations of the Athenians, and their garrison had to be driven out of the Acropolis before democracy could be established. The man who did this, Cleisthenes, was also responsible for setting up a stable democracy at Athens.

“First go free the Athenians.” In order to get Sparta’s help against Hippias, Cleisthenes made a huge donation to the oracle of Delphi. After that, whenever the Spartans consulted the oracle, the only answer they could get was, “First go free the Athenians.”

Cleisthenes saw clearly that the friction between the factions of Hill, Shore, and Plain and between the four different tribes had to be stopped. He cleverly did this by breaking up the old tribes and replacing them with ten artificial tribes comprised of elements from different tribes and factions. Artificially mixing people from different loyalties tended to break up those old loyalties, leaving only loyalty to Athens. Cleisthenes also made the popular assembly the main law making body. The democracy that emerged, much like those in other poleis of the time, was a somewhat limited one favoring the middle class of farmers, merchants and craftsmen. However, it was still a democracy, which meant the Athenians had more than ever at stake Athens' security.

Therefore, the combination of this greater sense of commitment to Athens, the struggle with Persia over the security of the Black Sea grain supply, and the fortunate discovery of large deposits of silver at Laurium in Attica, would prompt the Athenians to use their economic power to build a navy with which to fight Persia. It was this navy which would lead the Greeks to victory over Persia and lay the foundations for the Athenian Empire in the fifth century B.C.E. That empire in turn would provide the wealth to support the cultural flowering at Athens that has been the basis for so much of Western Civilization.

Mystery Cults

A dancing Maenad

There was little that was inspirational or hopeful about the traditional Greek religion of Olympian gods. In the *Odyssey*, Achilles’ ghost tells Odysseus he would rather be a slave on earth than rule in Hades (the Underworld). As result, many Greeks turned to mystery cults (from the Greek *mystes*, meaning secret) as a supplement to, rather than replacement for, the old religion. We know little about these cults since, as the name implies, they were highly secretive, the death penalty being the punishment for divulging what went on in them. The playwright, Aeschylus, was even put on trial for his life for hinting at what occurred in the Eleusinian rites.

Athens was especially known for the Eleusinian Mysteries sacred to Demeter, mother of Persephone who, since she ate 6 pomegranate seeds after being kidnapped to Hades, had to return there for half of every year, thus causing winter. To the Greeks, her return every spring symbolized eternal rebirth, which they hoped to attain from the Eleusinian Mysteries.

Another god connected with mystery cults was Bacchus, god of wine and revelry. His primary followers were women known as maenads (“raving ones”) who reportedly engaged in wild drunken rites in the forests and hills and doing such “uncivilized” things as nursing wild animals, playing with snakes, and killing prey with their bare hands and eating their flesh raw. Since the Dionysian rites were both wild and secretive, the Romans would outlaw them and be suspicious of any other secretive cults, including one called Christianity.

Dionysus, god of wine and revelry, surrounded by maenads, women devoted to his wild rites and revelries.

The Archaic Period (c.700-500 BCE) was a very active and creative period in Greek history with figures becoming less stylized and more natural looking. The powerful city of Corinth was the innovator at this time and dominated pottery exportation in the 7th and early 6th centuries B.C.E. The vessel below comes from an Etruscan site in central Italy, a region where Greek commercial contacts and influence were strong. The decorative motifs include exotic animals, "oriental" creatures such as the sphinx, and filler ornaments such as rosettes.

In the 6th century BCE, black figure ware (black figures painted onto red background) became the dominant technique in pottery. Figures also continued their evolution to a more natural style. Although Corinth still led the way, Athenian pottery was also making its mark.

Early Greek Art: the Geometric and Archaic Eras

People typically think of the naturalistic classical style of sculpture and pottery painting when reminded of the Greeks. However, the classical style was the product of a long evolution of different styles that also showed the Greeks’ energy and strong creative impulse. They also show influences from other cultures, in particular Egypt, and highlight the contributions of other Greek *poleis*, notably Corinth.

The Geometric style (shown above) was the earliest type of pottery in the recovery after the Dark Age (c.110-800 BCE), being decorated with highly stylized figures along with geometric designs.

Attic Black Figure Amphora with a lid (c.540 BCE).

In archaic sculpture, the predominant motif was the *Kouros* (youth) or *Kore* (maiden). One can see the strong Egyptian influence in the stylized pose and eyes.

**Statue of a kouros ca. 590–580
B.C.E.; Athens,; Naxian marble;
Ht. w/o plinth 76" (193.04 cm)**

Since we see Greek sculpture and temples today as bare marble, it is easy to forget that they were originally painted, as evidenced by a few flecks of paint remaining on some statues. The Greeks seem to have liked bright colors, as seen by this reconstruction of how a kore (statue of a young maiden) was painted.

THE IONIAN PHILOSOPHERS AND THE BIRTH OF WESTERN SCIENCE

Introduction. When people think of the ancient Greeks, they usually think of such things as Greek architecture, literature, and democracy. However, there is one other contribution they made that is central to Western Civilization: the birth of Western science.

There were three main factors that converged to help create Greek science. First of all, there was the influence of Egypt, especially in medicine, which the Greeks would draw heavily upon. Second, Mesopotamian civilization also had a significant impact, passing on its math and astronomy, including the ability to predict eclipses (although they did not know why they occurred). Third, there was the growing prosperity and freedom of expression in the polis, allowing the Greeks to break free of older mythological explanations and come up with totally new theories. All these factors combined to make the Greeks the first people to give non-mythological explanations of the universe. Such non-mythological explanations are what we call science.

However, there were also three basic limitations handicapping Greek scientists compared to scientists today. For one thing, they had no concept of science as we understand it. They thought of themselves as philosophers (literally "lovers of wisdom") who were seeking answers to all sorts of problems about their world: moral, ethical, and metaphysical as well as physical. The Greeks did not divide knowledge into separate disciplines the way we do. The philosopher, Plato, lectured on geometry as well as what we call philosophy, seeing them as closely intertwined, while Parmenides of Elea and Empedocles of Acragas wrote on physical science in poetic verse. Second, the Greeks had no guidelines on what they were supposed to be studying, since they were the first to ask these kinds of questions without relying on religious explanations. However, they did define certain issues and came up with the right questions to ask, which is a major part of solving a problem. Finally,

they had no instruments to help them gather data, which slowed progress tremendously.

The Milesian philosophers. Greek science was born with the Ionian philosophers, especially in Miletus, around 600 B.C.E. The first of these philosophers, Thales of Miletus, successfully predicted a solar eclipse in 585 B.C.E., calculated the distance of ships at sea, and experimented with the strange magnetic properties of a rock near the city of Magnesia (from which we get the term "magnet"). However, the question that Thales and other Ionian philosophers wrestled with was: What is the primary element that is the root of all matter and change? Thales postulated that there is one primary element in nature, water, since it can exist in all three states of matter: solid, liquid, and gas.

A bit too preoccupied. Supposedly, Thales was so preoccupied with gazing at the heavens while walking along one day that he fell into a well. The same solar eclipse Thales predicted in 585 B.C.E. also interrupted a battle between the Medes and Lydians, frightening them into making peace with one another.

Thales' student, Anaximander, proposed the theory that the stars and planets are concentric rings of fire surrounding the earth and that humans evolved from fish, since babies are too helpless at birth to survive on their own and therefore must arise from simpler more self-sufficient species. He disagreed with Thales over the primary element, saying water was not the primary element since it does not give rise to fire. Therefore, the primary element should be some indeterminate element with built-in opposites (e.g., hot vs. cold; wet vs. dry). For lack of a better name, he called this element the "Boundless." Another Milesian, Anaximenes, said the primary element was air or vapor, since rain is pressed from the air.

Anaximander thought the earth was shaped like a cylinder, three times as wide as it is deep. He also said heavenly bodies are rings of fire obscured by mist except for holes through which we can view small parts.

Making room for fire. Three of the four elements, earth, water, and air, corresponded to the three states of matter. However, fire created a dilemma, since it was neither solid, liquid, nor gas, yet it obviously existed. Therefore, it was given the status of being a fourth element.

The nature of change. All these speculations were based on the assumption there is one eternal and unchanging element that is the basis for all matter. Yet, if there is just one unchanging element, how does one account for all the apparent diversity and change one apparently sees in nature? From this time, Greek science was largely split into two camps: those who said we can trust our senses and those who said we cannot.

Among those who distrusted the senses was Parmenides of Elea, who, through some rather interesting logic, said there is no such thing as motion. He based this on the premise that there is no such thing as nothingness or empty space since it is illogical to assume that something can arise from nothing. Therefore, matter cannot be destroyed, since that would create empty space. Also, we cannot move, since that would involve moving into empty space, which of course, cannot exist. The implication was that any movement we perceive is an illusion, thus showing we cannot trust our senses.

On the other hand, there was Heraclitus of Ephesus, who said the world consists largely of opposites, such as day and night, hot and cold, wet and dry, etc. These opposites act upon one another to create change. Therefore not only does change occur, but is constant. As Heraclitus would say, you cannot put your foot into the same river twice, since it is always different water flowing by. However, since we perceive change, we must trust our senses at least to an extent.

A partial reconciliation of these views was worked out by two different philosophers postulating the general idea of numerous unchanging elements that could combine with each other in various ways. First, there was Empedocles of Acragas who said

that the mind can be deceived as well as the senses, so we should use both. This led to his theory of four elements, earth, water, air, and fire, where any substance is defined by a fixed proportion of one or more of these elements (e.g., bone = 4 parts fire, 2 parts water, and 2 parts earth). Although the specifics were wrong, Empedocles' idea of a Law of Fixed Proportions is an important part of chemistry today.

In the fifth century B.C.E., Democritus of Abdera developed the first atomic theory, saying the universe consists both of void and tiny indestructible atoms. He said these atoms are in perpetual motion and collision causing constant change and new compounds. Differences in substance are supposedly due to the shapes of the atoms and their positions and arrangements relative to one another.

In the fifth century B.C.E., Athens, with its powerful empire and money, became the new center of philosophy, drawing learned men from all over the Greek world. Many of these men were known as the Sophists. They doubted our ability to discover the answers to the riddles of nature, and therefore turned philosophy's focus more to issues concerning Man and his place in society. As one philosopher, Protagoras, put it, "Man is the measure of all things." Being widely traveled, the Sophists doubted the existence of absolute right and wrong since they had seen different cultures react differently to moral issues, such as public nudity, which did not bother the Greeks. As a result, they claimed that morals were socially induced and changeable from society to society. Some Sophists supposedly boasted they could teach their students to prove the right side of an argument to be wrong. This, plus the fact that they taught for money, discredited them in many people's eyes.

Too radical for even the Athenians. Anaxagoras of Clazomenae hypothesized there was life on other planets and that the sun was a rock as big as the Peloponnesus. Apparently, these ideas were too much even for the normally open-minded Athenians who tried him for impiety.

Luckily, Anaxagoras' friend, the powerful politician, Pericles, got him off the hook. Heraclides Ponticus came up with the idea of the earth rotating on its axis and that Mercury and Venus circle the sun, which still circles the earth.

Socrates (470-399 B.C.E.) was one of Athens' most famous philosophers at this time. Like the Sophists, with whom he was wrongly associated, he focused on Man and society rather than the forces of nature. As the Roman philosopher, Cicero, put it, "Socrates called philosophy down from the sky..." Unlike the Sophists, he did not see morals as relative to different societies and situations. He saw right and wrong as absolute and worked to show that we each have within us the innate ability to arrive at that truth. Therefore, his method of teaching, known even today as the Socratic method, was to question his students' ideas rather than lecture on his own. Through a series of leading questions he would help his students realize the truth for themselves.

Unfortunately, such a technique practiced in public tended to embarrass a number of people trapped by Socrates' logic, thus making him several enemies. In 399 B.C.E., he was tried and executed for corrupting the youth and introducing new gods into the state. Although Socrates left us no writings, his pupil Plato preserved his teachings in a number of written dialogues. Socrates influenced two other giants in Greek philosophy, Plato and Aristotle, who both agreed with Socrates on our innate ability to reason. However, they differed greatly on the old question of whether or not we can trust our senses.

Socrates in deep thought. Supposedly during the siege of Potidaea in the Peloponnesian War, Socrates was suddenly struck by a thought and became so absorbed in thinking that he just stopped in his tracks. Having stayed in that position all that day and the following night and attracted a crowd of onlookers in the process, he finally resolved the problem the next day and resumed walking as if nothing unusual had happened.

***Socrates and the Oracle.* Another story about Socrates was that a student of his asked the Oracle of Delphi if anyone was wiser than Socrates. Instead of its usual ambiguous answer, the oracle said no one was wiser than Socrates. Hearing this, Socrates tried to disprove the Oracle, but finally agreed with it, saying that, while other people typically claimed knowledge and expertise in something or other, at least he realized how little he really knew.**

Plato (428-347) was the first of these philosophers. He was also influenced by the early philosopher and mathematician, Pythagoras of Croton in South Italy, who is most famous for the Pythagorean theorem for finding the length of the hypotenuse in a right triangle. Pythagoras thought that all the principles of the universe were bound up with the mystical properties of numbers. He felt the whole universe can be perceived as a harmony of numbers, even defining objects as numbers (e.g., justice = 4). He saw music as mathematical and, in the process, discovered the principles of octaves and fifths. He also thought the universe orbited around a central fire, a theory that would ultimately influence Copernicus in his heliocentric theory 2000 years later.

Some other Pythagorean numerical values assigned to various things were: Male=3; Female=2; Marriage=5; Opportunity=7; 10= perfect number

Plato drew upon Pythagoras' idea of a central fire and proposed there are two worlds: the perfect World of Being and this world, which is the imperfect World of Becoming where things are constantly changing. This makes it impossible for us to truly know anything, since this world is only a dim reflection of the perfect World of Being. As Plato put it, our perception of reality was no better than that of a man in a cave, trying to perceive the outside world through viewing the shadows cast against the wall of the cave by a fire. Since our senses alone cannot be trusted, Plato said we should rely on abstract reason, especially math, much as Pythagoras had. The sign over the entrance to

Plato's school, the Academy, reflected this quite well: "Let no one unskilled in geometry enter."

In Plato's allegory of the cave, one person breaks free and experiences the real world outside. When he comes back to tell the others about true reality, they kill him, a likely reference to the trial and execution of Socrates.

Aristotle (384-322 B.C.E.) was a pupil at Plato's Academy, but held a very different view of the world from his old teacher, believing in the value of the senses as well as the mind. Although he agreed with Plato on our innate power of reasoning, he asserted that nothing exists in our minds that does not first exist in the sensory world. Therefore, we must rely on our senses and experiment to discover the truth.

Aristotle accepted the theory of four elements and the idea that the elements were defined on the basis of two sets of contrasting qualities: hot vs. cold, and wet vs. dry, with earth being cold and dry, water being cold and wet, air being hot and wet, and fire being hot and dry. Thus, according to Aristotle, we should be able to change substances by changing their qualities. The best example was heating cold and wet water to make it into hot and wet air (vapor). This idea would inspire generations of alchemists in the fruitless pursuit of a means of turning lead into gold.

Aristotle said the four elements have a natural tendency to move toward the center of the universe, with the heavier substances (earth and water) displacing the lighter ones (air and fire), so that water rests on land, air on top of water, and fire on top of air. He also said there was a celestial element, ether, which was perfect and unchanging and moved in perfect circles around the center of the universe, which is earth where all terrestrial elements are clustered.

***Greek medical theories.* Some Greek doctors argued there was one cause for all diseases, while others said each individual case of sickness was a unique disease.**

Eventually the dominant theory to emerge would be that of the four humors (bile, black bile, blood, and phlegm) that each corresponded to one of the four elements. Supposedly, sickness was the result of an imbalance of the humors, cured by some form of purgative such as bleeding, induced vomiting, or enemas. The theory of humors would dominate Western medical practice into the 1800s.

Aristotle's theories of the elements and universe were highly logical and interlocking, making it hard to disprove one part without attacking the whole system. Although Aristotle often failed to test his own theories (so that he reported the wrong number of horse's teeth and men's ribs), his theories were easier to understand than Plato's and reinstated the value of the senses, compiling data, and experimenting in order to find the truth. Although Plato's theories would not be the most widely accepted over the next 2000 years, they would survive and be revived during the Italian Renaissance. Since then, the idea of using math to verify scientific theories has also been an essential part of Western Science. While both Plato and Aristotle had flaws in their theories, they each contributed powerful ideas that would have profound effects on Western civilization for 2000 years until the Scientific Revolution of the 1700's.

Greek Lyric Poetry

Pindar

In the seventh century B.C. a new style of poetry, Lyric, succeeded the more stately and heroic epic. Lyric poems were shorter, used different meters, and most importantly, were concerned with the whole range of human experience from the heartaches of love and death to running away in battle, political propaganda, and insulting one's enemies. Unlike Homer, whose

purpose was to glorify his heroes, the Lyric poets often showed their subjects (including themselves) in an unfavorable and insulting light, which gave an even more human touch to their poetry than did Homer's idealized verse. For example, compare Homer's terrifying description of a storm at sea in the *Odyssey* with Archilochus of Paros' simple but moving epitaph for a sailor lost at sea:

But after we had left the island and there was no more land in sight, but only the sky and the sea, then Kronian Zeus drew on a blueblack cloud, and settled it over the hollow ship, and the open sea was darkened beneath it; and she ran on, but not for a very long time, as suddenly a screaming west Wind came upon us, stormily blowing, and the blast of the stormwind snapped both forestays that were holding the mast, and the mast went over backwards, and all the running gear collapsed in the wash; and at the stern of the ship the mast pole crashed down on the steersman's head and pounded to pieces all the bones of his head, so that he like a diver dropped from the high deck, and the proud life left his bones there. Zeus with thunder and lightning together crushed on our vessel, and, struck by the thunderbolt of Zeus, she spun in a circle, and all was full of brimstone. My men were thrown in the water, and bobbing like seacrows they were washed away on the running waves all around the black ship, and the god took away their homecoming."

Hide we away these painful gifts of the lord Poseidon

Archilochus of Paros (c.680-640 BC) is an especially good poet to start with thanks to his willingness to show himself in such an honest (and often unflattering) light. Several of his

poems aimed at insulting the family of a woman who jilted him supposedly were so effective that not only the woman, but her sisters as well, hanged themselves from embarrassment and shame. The first poem shamelessly brags about how he ran away in battle, something Homer would never consider glorifying.

Some Barbarian is waving my shield, since I was obliged to Leave that perfectly good piece of equipment behind Under a bush. But I got away, so what does it matter? Let the shield go; I can buy another one equally good.

I will make nothing better by crying, I will make nothing Worse by giving myself what entertainment I can

Glaukos, a soldier of fortune's your friend as long as he's fighting

One main thing I understand, to come back with deadly evil at the man who does me wrong

[This reflects a cultural value that was common among the Greeks and Romans before supposedly being replaced by the Christian ethos of love and forgiveness. The epitaph of the Roman dictator, Sulla, was basically a paraphrase of this sentiment.]

Hipponax of Ephesos (c.550 BC) shows us an angry side of the Greeks

Keep travelling, you swine, the whole way toward Smyrna. Go through the Lydian land, past the tomb of Alyattes, The grave of Gyges and the pillar of Megastrys, The monument of Atys, son of Alyattes,

*Big chief, and point your paunch against
the sun's setting.*

*Hold my jacket, somebody, while I hit
Boupalos in the eye.
I can hit with both hands, and I never miss
punches.*

*Semonides of Amorgos gives us some interesting
insights into the Greeks' less than enlightened
attitudes toward women by comparing them to
different animals and forces of nature.*

*One from the sea. She has two different
sorts of mood.*

*One day she is all smiles and happiness. A
man*

*Who comes to visit sees her in the house
and says:*

*"There is no better wife than this one
anywhere*

*In all mankind, nor prettier." Then,
another day*

*There'll be no living with her, you can't get
within*

*Sight, or come near her, or she flies into a
rage*

*And holds you at a distance like a bitch
with pups,*

*Cantankerous and cross with all the world.
It makes*

*No difference whether they are friends or
enemies.*

*No better thing befalls a man than a good
wife,*

No worse thing than a bad one.

*A woman thick around the ankles is no
good*

*Solon (c.630-550 BC), the great Athenian
reformer, used poetry to defend his political
reforms.*

*I gave the people as much privilege as they
have a right to:*

*I neither degraded them from rank nor
gave them free hand;*

*And for those who already held the power
and were envied for money,*

*I worked it out that they also should have
no cause for complaint.*

*I stood there holding my sturdy shield over
both the parties;*

*I would not let either side win a victory that
was wrong.*

*Theognis of Megara (c.650 BC) reflects the
Greeks' attitudes toward such things as
moderation, the love of one's city-state, and the
value of true friendship and revenge against
one's enemies.*

*Try for nothing excessive. The middle
degree is best. So*

*Kynos, you will win virtue, a difficult
thing to attain.*

*It is easier to make bad out of good than
good out of evil.*

*Never try to teach me. I am too old to be
taught.*

*I have been in my time as far as the land of
Sicily.*

*I have been to Euboea, where vineyards
grow in the plain,*

*And Sparta, the shining city by the reedy
banks of Eurotas;*

*And everywhere I was met with enthusiasm
and love,*

*But my heart has taken no joy from the
attentions of strangers.*

*A man's own country is dearest. This is the
truth in the end.*

*May wide and towering heaven collapse
upon me in all its*

*Bronze and terror, catastrophe to the
peoples of earth,*

*On that day when I no longer stand by my
companions,*

*On that day when I cease to harry my
enemies.*

Alcman represents Sparta before it was transformed from a cultural leader into a military camp.

Counterbalanced against the iron is the sweet lyre-playing.

Pindar of Thebes (522-443 B.C.) was considered by the Greeks second only to Homer among poets. So great was his stature that when Alexander the Great sacked and burned Thebes, Pindar's house was the only building he spared besides the temples. Although primarily famous for his odes to victorious Olympian athletes, he also had some valuable insight into war.

*War is sweet to those who have not tried it.
The experienced
Man is frightened at the heart to see it
advancing.*

[Back to flowchart](#)

THE PERSIAN WARS (510-478 B.C.E.)

"In winter, on your soft couch by the fire, full of food, drinking sweet wine and cracking nuts, say this to the chance traveler at your door: 'What is your name, my good friend? Where do you live? How many years can you number? How old were you when the Persians came...?'"-- Xenophanes

To the Greeks, there was one defining event in their history: the Persian Wars. Even today, we see a good deal of truth in this assessment, for the Greek victory in the Persian Wars triggered the building of the Athenian navy, which led to the Athenian Empire, the expansion of the concept of democracy, and the means to develop Greek civilization to its height.

Two main factors led to the Persian Wars. First, there was Persian expansion into Western Asia Minor, (bringing Ionian Greeks under their control) and into Thrace on the European side of the Aegean in search of gold. Second, Solon's reforms and Peisistratus' seizing control of Sigeum had made Athens especially sensitive to any threats to its grain route from the Black Sea. Further complicating this was the fact that several Athenian nobles held lands in the North Aegean. The spark igniting this into war with Persian was a revolt of the Ionian Greeks.

The Ionian Revolt (510-494 B.C.E.). The Ionian Greeks had peacefully submitted to Persian rule and lived under Persian appointed Greek tyrants since the time of Cyrus the Great. Then in 510 B.C.E., they raised the standard of revolt and drove their tyrants out. Realizing they needed help against the mighty Great King, Darius, they appealed to their cousins across the Aegean for aid. Sparta, ever wary of a Helot revolt, refused to help. However, Athens and another city-state, Eretria, did send ships and troops who joined the Ionians, marched inland, and burned the provincial capital, Sardis, to the ground. After a Persian force defeated the Greeks as they were returning from Sardis, the Ionian Greeks decided to stake

everything on a naval battle at Lade (494 B.C.E.). Unfortunately, the combination of disunity in their ranks and Persian promises of leniency caused the naval squadron of one polis after another to defect to the Persians and Ionian resistance quickly collapsed. Miletus, leader of the revolt was sacked and the rest of Ionia fell back under Persian sway.

Athens alone (494-490 B.C.E.). The Athenians and Eretrians had eluded the Ionian disaster, but not Darius' notice. After finding out who the Athenians were, Darius supposedly appointed a slave to remind him of them daily until he had punished them. In 492 B.C.E., an expedition set sail, but much of it was shipwrecked off the coast of Thrace and the rest of it was forced to return home. Nothing daunted, Darius prepared another invasion force that set out in 490 B.C.E.

Persian ambassadors had preceded the army to demand earth and water as signs of submission from all the Greeks. Most gave in rather than face the might of the Great King. However, the Athenians supposedly threw them into a pit and told them to take as much earth as they wanted, while the Spartans, equally defiant, gave them their water by throwing them into a well. Not a good thing to ambassadors who traveled under the special protection of the gods.

Later that year, a Persian force of some 20,000 men landed at Marathon in Attica. Unfortunately, the Spartans, being as superstitious as they were defiant, could not march before the end of a festival on the full moon. Thus the Athenians were left to face the might of Persia all alone, or nearly alone, since the tiny city-state of Plataea sent its army of 1000 men to stand bravely by Athens. The Greeks still faced an army twice as numerous as theirs and reputedly invincible in battle. Therefore, they did the last thing the lightly clad and overconfident Persians expected: they charged.

Persian armies relied on the traditional use of skirmishing with arrows and javelins). Such troops were brave, but unprepared

for the charge of a heavily armored Greek phalanx. One Athenian general, Miltiades, realized this weakness from previous experiences with the Persians and urged the Athenians to exploit it. But he was only one of ten Athenian generals who rotated command on a daily basis. Luckily, the Athenian general, Callimachus, agreed to Miltiades' plan on his day to command and ordered the attack. Greek phalanxes were normally 8 men deep. However, the Athenians had to weaken the center of their line to half that to keep from being outflanked by the Persians

When the Greeks charged, the Persians hardly had time to unleash a volley of arrows before the phalanx was upon them. The shock of this heavily armored human tank crashing into their lines sent them reeling back and scurrying for their ships. The Persian fleet made a quick dash for defenseless Athens, only to find the Athenians had doubled back to meet them. Having lost their stomach for anymore fighting, they sailed for home.

Huge disparities in ancient battles were common. Most of the losers' casualties took place during their panicked flight after the real fighting was finished, their undefended backs being easy targets for the pursuing enemy. In addition, many would be trampled to death by their own comrades in the rush to get away.

Xerxes' invasion (480-478 B.C.E.). The Athenians and other Greeks knew they had little cause for celebration, for the Persians would surely be back. It took ten years for the next invasion to materialize, because Egypt rebelled, as usual, and then Darius died. His son and successor, Xerxes, needed a decade to set his house in order and create a new army to invade Greece. Hoping to crush the Greeks by weight of numbers, this new army was nearly ten times as big as the one that lost at Marathon.

Greek preparations were more thorough this time. For one thing, many, although by no means all, the city-states banded together in a defensive league with Sparta as its leader. The Athenians let their leader, Themistocles convince them to use the extra money from a large lode of silver found at Laurium in Attica to pay for a larger fleet, believing sea power would be the key to victory. It was one of the most fateful budget decisions in all history.

The Greeks sent an advance force of some 7000 men under the Spartan king Leonidas to hold the narrow pass of Thermopylae in northern Greece. Nearby was a Greek fleet holding the narrow straits of Artemesium. Fighting in such narrow spaces would prevent the Persians from using their superior numbers to advantage.

The 300 Spartans accompanying Leonidas were handpicked with the special provision that they all had sons to succeed them. This ensured that none of their family lines would be wiped out if they were killed. This, along with the Pythia's prophecy that Sparta or one of her kings must perish, indicates that this may have been a suicide mission to save Sparta.

Strange death rites. Upon arriving at Thermopylae, Xerxes sent scouts to observe the Greeks. They reported the Spartans were combing and oiling their long hair. When Xerxes laughed at such effeminate behavior, Demaratus, an exiled Spartan king at his court, told him that **these Greeks were Spartans, that they were preparing for battle and they would sell their lives dearly. Not being impressed, Xerxes waited several days for the Greeks to run away. They didn't leave.**

For several days, the Greeks, led by the Spartans, severely repulsed any Persian assaults at Thermopylae and threatened to stall Xerxes' whole invasion. Unfortunately, treachery accomplished what frontal assaults could not, for a local

shepherd showed the Persians another path behind the Greeks. Before the trap was closed, most of the Greeks escaped. However, Leonidas and his picked guard of 300 Spartans along with 700 troops from Thespis chose to stay.

The Greeks fought and died to the last man, selling their lives dearly in the process. When Thermopylae fell, the Greek fleet defending nearby Artemesium had to retreat after some hard fighting.

“So much the better, we shall fight in the shade.” --the Spartan Deineces when told the Persian arrows would be so numerous that they would blot out the sun.

“Go, stranger, and tell the Spartans we lie here according to their laws”--epitaph for the Spartans who died at Thermopylae. It’s impossible to tell for sure how many Persians died at Thermopylae, but some estimates put the toll as high as 20,000.

As the Persian multitude spread southward, city after city surrendered or was abandoned, until the Peloponnesus was about the only part of Greece left free. Even the Athenians had to evacuate their population to the nearby island of Salamis and watch their city go up in flames as they waited for the decisive battle to decide the issue. That battle took place in the strait of water between Salamis and Attica. The Greeks, led by the Athenian, Themistocles, lured the Persians into the narrows where they were ambushed, crushed together so they could not maneuver, and destroyed ship by ship.

Themistocles’ trickery. The Athenian leader, Themistocles realized the best chance for victory lay in luring the Persian navy into the narrows of Salamis where they couldn’t use their superior numbers. He just had to convince the other Greek leaders, many of whom wanted to make their stand off the coast of the Peloponnesus. To thwart this, he sent a messenger to Xerxes warning him that the Greeks would try to escape out the backside of the Strait. Believing this

message, Xerxes sent part of his navy to cut off the Greeks’ escape. This accomplished two things. First, it forced the Greeks to fight where Themistocles thought they had the best chance of victory. Secondly, it removed part of Xerxes’ fleet from the battle.

Dual victories. Supposedly on the same day as Salamis, the Greeks in Sicily, led by Syracuse, won a major battle at Himera, crushing a Carthaginian invasion launched in conjunction with Xerxes’ expedition to keep the Greeks in Italy and Sicily from helping their comrades in the East.

After the Greek victory at Salamis, Xerxes went home, leaving part of his army to finish the job of conquering Greece. However, the next year (479 B.C.E.) the Greeks crushed the Persian army at Plataea, with the Spartans carrying off the honors for valor. That same year the remainder of the Persian fleet was caught and destroyed at Mycale, leading to a second, more successful Ionian revolt. It also left the way open for the Greeks to destroy Xerxes’ bridge of boats across the Hellespont from Asia into Europe. The destruction of that bridge signaled the end of the Persian wars, although no one at that time could assume the Persians would not come back.

A fitting war trophy. Having dismantled Xerxes’ bridge of boats, the Greeks returned home towing the huge rope cables used to hold the bridge together.

THE ATHENIAN EMPIRE (478-431 B.C.E.)

Formation of the Delian League. We can well imagine the Greeks' incredible feelings of pride and accomplishment in 478 B.C.E. after defeating the Persian Empire. The Athenians felt that they in particular had done more than their part with their army at Marathon and their navy at Salamis and Mycale. It was this incredible victory which gave them the self-confidence and drive to lead Greece in its political and cultural golden age for the next half century.

However, victory had been won at a heavy price. Fields, orchards, and vineyards lay devastated throughout much of Greece, and it would take decades for the vineyards and olive groves in particular to be restored. Athens itself was in ruins, being burned by the Persians in vengeance for the destruction of Sardis during the Ionian Revolt. Therefore, the Athenians immediately set to work to rebuild their city, and in particular its fortifications. The Spartans, probably through fear or jealousy of Athens' growing power, tried to convince the Athenians not to rebuild their walls. They said that if the Persians came back and recaptured Athens, they could use it as a fortified base against other Greeks. The Athenian leader, Themistocles, stalled the Spartans on the issue until his fellow Athenians had enough time to erect defensible fortifications. (This was later extended by what was known as the Long Walls to connect Athens to its port, Piraeus, so it could not be cut off from its fleet.) By the time Sparta realized what was happening, it was too late to do anything. One could already see bad relations starting to emerge between Athens and Sparta. In time, they would get much worse.

Since the Athenians and other Greeks could not assume that the Persians would not come back, they decided the best defense was a good offense, and formed an alliance known as the Delian League. The League's main goals were to liberate the Ionian Greeks from Persian rule and to safeguard the islands in the Aegean from further Persian aggression. The key to doing this was sea power, and that made Athens the natural leader, since it had by far the largest navy and also the incentive to strike back at Persia. At first, Sparta had been offered leadership in the league because of its military reputation. However, constant fear of Helot revolts made the Spartans reluctant to commit themselves overseas. Also, their king, Pausanias, had angered the other Greeks by showing that

typical Spartan lust for gold. As a result, he was recalled, leaving Athens to lead the way.

The Persian navy, or what was left of it, was in no shape to halt the Greek advance after taking two serious beatings from the Greeks in the recent war. Ionia was stripped from the Great King's grasp, and the Persians were swept from the Aegean sea island by island. Within a few years, the Delian League controlled virtually all the Greeks in the islands and coastal regions of the Aegean.

From Delian League to Athenian Empire. At first each polis liberated from Persia was expected to join the league and contribute ships for the common navy. However, most of these states were so small that the construction and maintenance of even one ship was a heavy burden. Therefore, most of these states started paying money to Athens which used their combined contributions to build and man the League's navy. This triggered a feedback cycle where Athens came to have the only powerful navy in the Aegean, putting the other Greeks at its mercy. Athens could then use its navy to keep league members under control, forcing them to pay more money to maintain the fleet which kept them under control, and so on.

The changing nature of the league became apparent a decade after the defeat of the Persians when the island states of Naxos (469 B.C.) and Thasos (465 B.C) felt secure enough to try to pull out of the League. However, Athens and its navy immediately pushed them back in, claiming the Persian threat was still there. The Naxians and Thasians could do little about it since the only navy they had was the one they were paying Athens to build and man. And that was being used to keep them *in* the League so they could keep paying Athens more money. The Delian League was turning into an Athenian Empire.

A tightening grip. By 445 B.C.E., the only league cities still keeping their own navies were Lesbos, Chios, and Samos.

The cycle supporting Athens' grip on its empire also supported (and was itself reinforced by) another feedback loop that expanded and supported the Athenian democracy. It started with the empire needing the fleet as its main source of power and control. Likewise, the fleet needed the poor people of Athens to serve as its rowers. Since these people, even more than the middle class hoplites, were the mainstay of Athens' power, they gained political

influence to go with their military importance, thus making Athens a much more broadly based democracy. The poor at Athens in turn needed the empire and its taxes to support their jobs in the fleet and their status in Athens. This fed back into the empire needing the navy, and so on.

The Athenian democracy likewise strongly enforced collection of league dues to maintain what in essence was now an "imperial democracy. Thus the navy was the critical connecting link between empire and democracy, holding the empire together on the one hand, while providing the basis for democratic power on the other. The Athenian democratic leader, Pericles, especially broadened Athenian democracy by providing pay for public offices so the poor could afford to participate in their polis' government.

Athens further tightened its hold on its empire by settling Athenian citizens in colonies (*cleruchies*) on the lands of cities it suspected of disloyalty, making their subjects come to Athens to try certain cases in Athenian courts, thus supplying them with extra revenues, and moving the league treasury from its original home on the island of Delos to Athens where the Athenians claimed it would be safer from Persian aggression. Athens installed or supported democracies in its subject states, feeling they would be friendlier to Athenian policies since they owed their power to Athens. It also allowed the minting and use of only Athenian coins. This provided the empire with a stable and standard coinage as well as exposing everyone in the empire to Athenian propaganda every time they looked at a coin and saw the Athenian symbols of the owl and Athena.

When Pericles came to power in 460 B.C.E., the Athenians were trying to extend their power and influence in mainland Greece while also supporting a major revolt against the Persians in Egypt. However, Athens overextended itself in these ventures that, after initial successes, both failed miserably. Sparta led a coalition of Greeks to stop Athens' expansion in Greece, while the Persians trapped and destroyed a large Athenian fleet on the Nile by diverting the course of the river and leaving the Athenian ships stuck in the mud. As a result, Pericles abandoned Egypt to the Persians, left the rest of mainland Greece to the other Greeks, and restricted Athens' activity to consolidating its hold on its Aegean empire. By 445 BC, peace Persia and Sparta, recognizing each others' spheres of control

allowed Athens to concentrate on more cultural pursuits which flourished in a number of areas.

A cultural golden age. In sculpture, the *severe classical* style succeeded the stiffer Archaic style after the Persian Wars. One key to this was the practice, known as *contrapposto*, of portraying a figure with its weight shifted more to one foot than the other, which, of course is how we normally stand. The body was also turned in a more naturalistic pose and the face was given a serene, but more realistic expression. The severe style was quite restrained and moderate compared to later developments, expressing the typical Greek belief in moderation in all things, whether in art, politics, or personal lifestyle. The overall result was a lifelike portrayal of the human body that seemed to declare the emergence of a much more self assured humanity along with Greek independence from older Near Eastern artistic forms. Other art forms showed similar energy and creativity.

Wingless victory. While most statues of Nike, the goddess for victory, had wings, the Athenians dedicated a statue to her without wings so that she could never leave Athens.

In architecture, Pericles used the surplus from the league treasury for an ambitious building program, paid for with funds from the league treasury to adorn Athens' Acropolis. This also provided jobs for the poor, resulting in widespread popular support for Pericles' policies. Foremost among these buildings was the Parthenon. Constructed almost entirely of marble (even the roof) it is considered the pinnacle of Classical architecture with its perfectly measured proportions and simplicity. Ironically, there is hardly a straight line in the building. The architects, realizing perfectly straight lines would give the illusion of imperfection, created slight bulges in the floor and columns to make it *look* perfect. Although in ruins from an explosion in 1687 resulting from its use as a gunpowder magazine, the Parthenon still stands as a powerful, yet elegant testament to Athenian and Greek civilization in its golden age.

Another important, if less spectacular art form that flourished at this time was pottery. Around 530 B.C., the Greeks developed a new way of vase painting known as the red figure style. Instead of the earlier technique of painting black figures on a red background (known as the black figure style), potters put red figures on a black background with details painted in black or etched in with a needle.

This technique, combined with the refined skills of the vase painters' working on such an awkward surface, gave Athenian pottery unsurpassed beauty and elegance, putting it in high demand throughout the Mediterranean.

In addition to its artistic value, Athenian pottery provides an invaluable record of nearly all aspects of Greek daily life, especially ones of which we would have little evidence otherwise, such as the lives of women, working conditions and techniques of various crafts, and social (including sexual) practices. Given these themes and the large number of surviving pieces, Greek pottery also reflected the more democratic nature of Greek society, since it was available to more people than had been true in earlier societies where high art was generally reserved for kings and nobles with the power and wealth to command the services of artisans.

Possibly the most creative expression of the Greek genius at this time was in the realm of tragic and comic drama, itself a uniquely Greek institution. While still sacred to the god of wine and revelry, Dionysus, Greek drama at this time developed into a vibrant art form that also formed a vital aspect of public discourse on contemporary problems facing the Athenian democracy. However, being part of a state supported religious festival still overtly concerned with religious or mythological themes, the tragedians' expressed their views indirectly by putting new twists on old myths. This kept discussion of the themes treated in the plays on a more remote and philosophical level. That, in turn, allowed the Athenians to reflect on moral issues that were relative to, if not directly about, current problems that they could then understand and deal with more effectively.

For example, Sophocles' *Oedipus the King* on one level was about flawed leadership which, no matter how well intentioned, could lead to disastrous results, in this case a plague afflicting Thebes for some mysterious reason. However, this play was produced soon after a devastating plague had swept through Athens and killed its leader, Pericles, who had led Athens into the Peloponnesian War. It must have given the Athenians watching it reason to reflect on their own similar problems and what had caused them.

Greek comedy was best represented by Aristophanes, sometimes referred to as the Father of Comedy. Whereas Greek tragedians expressed their ideas with some restraint, comedy cut loose

practically all restraints in its satirical attacks on contemporary policies, social practices, and politicians. Where else, in the midst of a desperate war, could one get away with staging such anti-war plays as *Lysistrata*, where the women of warring Athens and Sparta band together in a sex strike until the men come to their senses and end the war?

Such freedom of expression was also found in the realm of philosophy. We have seen how the most famous philosopher of the time, Socrates, "called philosophy down from the skies" to examine moral and ethical issues. In addition to Socrates, there arose a number of independent thinkers, referred to collectively as the Sophists, who were drawn to Athens' free and creative atmosphere. Inspired by the rapid advances in the arts, architecture, urban planning, and sciences, they believed human potential was virtually unlimited. One Sophist, Protagoras, said that, since the existence of the gods cannot be proven or disproven, Man is the measure of all things who determines what is real or not. This opened the floodgates to a whole variety of new ideas that also challenged traditional values. In his play, *The Clouds*, Aristophanes mercilessly satirized the Sophists as men who boasted they could argue either side of an argument and make it seem right. This belief that there is no real basis for truth would especially affect a younger generation of Athenians. Some of them, ungrounded in any sense of values, would mistake cleverness for wisdom and lead Athens down the road to ruin.

It is incredible to think that Western Civilization is firmly rooted in this short, but intense outpouring of creative energy from a single city-state with perhaps a total of 40,000 citizens. However, Athens' golden age would be short-lived as growing tensions would trigger a series of wars that would end the age of the polis.

Athenian Democracy and Justice in Action

Athenian jurors' ballots. Hollow ones stood for innocent, solid ones for guilty.

After 461 B.C.E., the popular assembly, which all citizens could attend, was made the main law-making body of Athens. Earlier, Themistocles had gotten a law passed that chose by lot all Athenian officials, except the

ten generals. All 700 officials served for one year and without pay. Thus, it was likely an Athenian citizen would have to do some sort of public service several times in his lifetime.

Preparing business for the Assembly was the Boule, a committee of fifty men chosen by lot from one of Athens' ten tribes who served for one-tenth of the year, giving way to fifty men from another tribe, and so on. The head of the Boule and state was one man chosen by lot for one day. When a mob unjustly wanted to try Athens' generals for dereliction of duty, the head of state happened to be a man named Socrates who vetoed the proceedings for his day as "president". Unfortunately, people didn't cool down in the following twenty-four hours and the next "president" allowed the trial to proceed with disastrous result.

Athenian law courts, depending on the seriousness of the case, would have up to 1001 jurors on a case and chosen by lot in order to prevent bribery. Judges probably voted along with the jurors. There were no lawyers and few rules in Athenian courts. Litigants might bring in their families dressed in rags to win the jurors' sympathy, often having speeches written for them by professional speechwriters. Speeches were limited in time by a simple water clock, known as the *clepsydra* (below). Athens had 6,000 paid jurors, mostly poor and elderly citizens, a system somewhat like welfare. Imperial tribute and the rule that all law cases in the empire had to be tried in Athens ensured the poor and elderly Athenian citizens had employment and income.

Punishment included confiscation of a convicted defender's property, exile, fines, or the loss of civil rights. In capital cases,

execution was done by stoning, crucifixion, or, in Socrates' case, with a poison known as hemlock. (This induced vomiting and severe convulsions, not numbness as in the account by Plato, who probably wanted to preserve Socrates' dignity.) Accusers failing to win one-fifth of the jurors' votes had to pay heavy fines.

In cases of murder, if the criminal couldn't be found, a scapegoat or the murder weapon was found and sentenced to exile. There was even a special court for those already exiled for homicide and then charged with first-degree murder. It was held at sea with the defendant pleading his case from a boat.

Daily Life and the Cost of Living

A Greek boy learning his lessons. The Greeks were excellent artists, even mastering perspective, but apparently unable to get the right proportional size of a child's head to his body. Either that or people used to be born with tiny heads.

The official view we get of Athens is the splendid Acropolis, agora, but most of the city was quite squalid. Houses were modest, even for the rich, usually having no more than a few cubicles. Drapes served as doors between rooms, giving one very little privacy. In fact, personal privacy was much less valued, social and public life being seen as the natural way to live. The Greek word for privacy could also imply insanity (from isolation), showing how much more social society was then.

Floors were either mud for the poor or stone for the rich. Furniture was sparse and moved as needed, sometimes having only

three legs to accommodate uneven floors. At dinner men reclined on couches, while women sat upright in chairs. Roofs were flat, so people could sleep on them during the heat of summer. Cooking was done on an open brazier with a hole in the roof or a clay pipe (for the rich) to let out smoke.

Sanitation was minimal, with most streets being nothing more than narrow filth infested alleys. As a result, men spent as most of their time away from home exercising in the gymnasium or hanging out in the agora, an open public square which might be filled with flimsy booths, stalls, and workshops. Women were generally stuck at home.

Cost of living. Life was simple, but also cheap, although calculating the cost of living from one era to the next is extremely tricky. For example, in 600 B.C.E when coinage was in its infancy and quite rare, one sheep or medimnos (1.5 bushels) of grain would cost a single drachma (a silver coin roughly the size of a dime). Two centuries later, the medimnos had doubled in price and a sheep would cost 10-20 drachmae.

However, just to give some idea of the cost of living, let's use wages and prices from the fifth century B.C.E. at the height of Athenian power. The average laborers, jurors, and rowers in the navy made about three obols (half a drachma) per day, while a hoplite on active duty was paid 1 full drachma. Thus the average yearly income for most Athenians seems to have been around 180 drachmae.

The average annual cost of living for a married couple with two children was an estimated 75 drachmae for grain, 45 drachmae for other foods (fish, vegetables, fruit, etc.), 16 drachmae for clothes and

shoes, 36 drachmae for rent, and 8 drachmae for other expenses.

Greek religion was primarily a public affair handled by the state, once again privacy and personal beliefs being of secondary importance. Therefore, priests were usually state officials, the idea being a very economic one where society gave offerings to the gods in return for their favors. Sacrifices should be of domesticated animals, the ox generally seen as being the best, but others might be favored by various gods (e.g., the pig by Demeter). The Olympics were opened with a sacrifice of 100 bulls to Zeus, which must have been a real mess.

The sacrificial knife was hidden in a basket under barley leaves. The priest would wash his hands with sacred water and sprinkle some on the sacrificial victim. If it shook its head, that would be a sign it was ready to be sacrificed. The victim would first be stunned with a mallet and then its throat slit to the sound of women's ritual screams. The priest held the victim's head up so its blood would spurt onto the altar. It was then butchered, with the heart and other entrails roasted and sacrificed along with the thighbones covered with fat. However, most of the meat was boiled in cauldrons and given to the public, a trick that the titan Prometheus supposedly taught people to shortchange the gods.

Childhood, especially the first five years, was an extremely dangerous time until very recently, mainly because of diseases. The ideal family consisted of one boy and one girl to prevent dividing the inheritance.

Birthing involved the father's family smearing pitch around the house during labor.

The mother and her helpers were isolated with a midwife only used if complications

developed. Childbirth was dangerous for mother and child alike, with an estimated one in ten women dying in the process. The birth of a boy was announced by hanging an olive wreath over the door, that of a girl with a strip of cloth.

The baby was wrapped tightly in long strips of linen called swaddling, the purpose being to correct deformed limbs while the baby's bones were still soft. A child's first few days were the most dangerous when poor health or cost of another mouth to feed might lead to it being left to die, often at a temple in an earthenware jar with some sort of bracelet or necklace to serve as identification if the baby were adopted and survived. Such babies were typically rescued by childless women or someone needing a slave. Most boys escaped such a fate, and although it was illegal to kill girls, exposing them in such a manner and abortions were not.

A week after birth the family held an *Amphidromia*, which involved a ritual cleansing of the mother and any helpers and the formal acceptance of the child. After this it was illegal to abandon the child. At ten days, there would be a banquet involving presents for the baby, including amulets against demons. The baby was also named, boys usually being named after the paternal grandfather. His full name would consist of his given name, patronymic (father's name) and the deme and tribe of the polis to which he belonged.

Before being potty-trained, children would go naked or in a tunic without underwear. After all, there were no disposable diapers before the 1970s and washing any clothes, including diapers, was extremely labor and water intensive. Also, this was a culture with a dry climate and no running water.

Education. Boys and girls were raised together until being separated at age six (seven by the Greeks' reckoning since they counted time in the womb as the first year. Girls would stay home with their mothers, learning the domestic arts. In the city, a slave, known as a pedagogue, taught a boy manners, accompanied him to school, and could even punish him for misbehaving. All but the poorest boys went to school, with public education being provided for orphans of veterans who had died in battle.

Teachers were badly paid and treated, and usually held classes in their homes. The school day lasted from one-half hour after daybreak to one-half hour before dusk. It was illegal to take boys to and from school in dark. A student practiced writing on a wax tablet. Besides basic reading, writing, and arithmetic, boys studied Homer, music (which taught rhythm and movement), singing, and playing a stringed instrument known as the lyre. Homer's *Iliad* and *Odyssey* were considered the core of an education, since they taught lessons essential to being a good citizen of the polis: war, ethics, peace, and politics. Afternoons were devoted to sports and physical education, which conditioned boys for war.

Much as in Sparta, things got rougher at age twelve, when *Paidotribes*, austere men in purple cloaks and armed with a long two-branched stick took over. They taught gymnastics and physical education in the *palaestra*, an open area surrounded by a covered colonnade. Boys stripped, and rubbed themselves down with oil and fine sand or dust to protect them against the chill. After warming up to music, they practice throwing the discus and javelin, running, jumping, and wrestling. Afterwards they went to the bathhouse where a slave would rub them down with oil and scrape off any dirt with a metal instrument known as a *strigil*.

At age 18, the young man took the Ephebic oath of loyalty to the polis and began two years of military training and service. He remained liable for military service anytime after that until age fifty.

Metics. Athens' wealth and opportunities attracted many skilled artisans and merchants from all over the Greek world. These men, known as *metics*, controlled much of the commercial and industrial life of Athens. Since citizenship in the polis was seen as a closed family, metics were not eligible for naturalization, but many were apparently willing to endure that stigma in return for the economic opportunities Athens offered.

Out of an estimated population of 250,000, only about 40,000 of Attica's population were citizens. In addition to women, children, and metics, the rest were slaves, who were the foundation upon which Greek culture and democracy were built. Except for a few with skills, most were confined to domestic work (the lucky ones), farm labor, industry (such as pottery or making armor), and (worst of all) mine labor.

Rich Athenians might have 50 slaves, while even poor farmers usually had at least one. They had virtually no rights; could be bought and sold at will and punished severely, although killing them was illegal. Since it was assumed they always lied, they had to be tortured for their testimony in a court case for it to be legal. However, some skilled slaves led prosperous lives and held important positions as secretaries and overseers.

Attitudes toward women as seen in Greek literature

A Greek wedding vase showing the bride being led to her husband's home by the wrist like a captive of war. Girls were married off as early as age fifteen to men twice their age. This was not unknown in other pre-industrial cities. For example, in *Romeo and Juliet* set and written in the Renaissance, Juliet at age fourteen is set to be married to Paris, who is thirty. For example, in *Romeo and Juliet* set and written in the Renaissance, Juliet at age fourteen is set to be married to Paris, who is thirty.

The Greeks, may have invented democracy, but not for women. Unfortunately, women's status in Greece, was all too similar to, if not worse than, the status in most other societies. Hesiod (c.700 B.C.) his book, *Works and Days*, tells how Zeus, angry with Prometheus ("Son of Iapetos") for giving men fire, has the gods fashion Pandora, the first woman, as a curse to men:

*"Then, stirred to anger, Zeus of the Storm Cloud, addressed him as follows:
'Son of Iapetos, you who surpass all others in planning,
you rejoice in your theft of my fire and in having deceived me,
being the cause of great pain to yourself and men in the future.
I shall give them in payment of fire an evil which all shall
take to their hearts with delight, an evil to love and embrace.'
Thus the Father of Gods and Men addressed him, and laughed.
And he commanded far-famed Hephaistos immediately to make it*

*out of water and clay, and give it the voice of
a human and
put in it strength and cause it to look like a
goddess immortal,
having the lovely, desirable shape of a virgin.
And then he
ordered Athena to teach her the skill of
intricate weaving.
And Aphrodite the Golden he ordered to shed
on her charm and
make her an object of painful love and
exhausting desire.
And he ordered Hermes the Guide, the
Slayer of Argos,
to put in her mind a dog's shamelessness and
the deceit of a thief.
Thus spoke their king, Zeus, son of Kronos,
and they obeyed him...."*

Semonides of Amorgos compares women to different animals and their qualities:

*"In the beginning God made various kinds of
women
with various minds. He made one from the
hairy sow,
that one whose house is smeared with mud, and
all within
likes in dishevelment and rolls along the
ground,
while the pig-woman in unlaundered clothing
sits
unwashed herself among the dunghills and
grows fat.*

*God made another woman from the
mischievous
vixen, whose mind gets into everything. No act
of wickedness unknown to her; no act of good
either, because the things she says are often bad
but sometimes good. Her temper changes all
the time...*

*Even the wife who appears to be the best
behaved
turns out to be the one who lets herself go
wrong.
Her husband gawps and doesn't notice;
neighbors do;*

*and smile to see how another man gets fooled.
Each man will pick faults in someone else's
wife
and boasts of his own each time he speaks of
her. And yet
the same thing happens to us all. But we don't
see.
For women are the biggest single bad thing
Zeus
has made for us; a ball and a chain; we can't
get loose
since that time when the fight about a wife
began
the great War, and they volunteered and went to
Hell"*

Women's status was neither enviable, visible, nor remarkable compared to other ancient societies. However, male authors as far back as Homer did give them a voice through very prominent and strong characters, with such goddesses as Athena and Hera, Hector's wife, Andromache, who portrays the plight of women caught in war, and Penelope, whose repeated weaving and unraveling of a burial shroud to stall the evil suitors, is every bit as clever as the trickery done by her quick-witted husband Odysseus. Plato even advocated complete equality for women in *The Republic*.

In an age when nearly everyone wore clothes made at home, either by the women of the house or their slaves, nearly all women needed to be skilled at spinning wool and weaving it. Thus a major part of a woman's education was learning this art.

Greek women were expected to stay at home as a safeguard to their reputations (and husbands' "property". In Western culture, it was considered improper for women to "let down their hair" in public until the twentieth century. Even into the 1960s, "proper" women always went out in public wearing a hat.

Strong characters and points of view especially surface in Greek drama. There are the spurned and vengeful women, such as Clytemnestra in Aeschylus' *Agamemnon* and the title character in Euripides' *Medea*. There is the frightening transformation of the mild mannered Theban housewives into the wild maenads in Euripides' *Bacchae*. It is a woman, Sophocles' title character, Antigone, who performs the first act of civil disobedience in Western literature by giving her brother a decent and religious burial in defiance of the king. (Interestingly, it was an Athenian priestess, Theano, who committed the first recorded act of civil disobedience some years later by defying the state's order to use her religious authority to curse Alcibiades.) There is the powerful statement about the plight of Andromache, Cassandra, and Hecuba as victims of war in Euripides' *Trojan Women*. And never have women so successfully or humorously made their point about the senselessness of war as in Aristophanes' *Lysistrata* when they go on a sex strike to end the Peloponnesian War.

Women could neither write nor act in Greek plays, although they could attend them since they were part of public religious rites. However, just as these plays, albeit written

by men, have survived and influenced subsequent ages, so too have the women's voices contained within them survived. The Greek playwright, Euripides, captures the plight of Greek women through his title character, Medea:

*"Of all beings who breathe and have intelligence,
we women are the most miserable creatures.
First we have to buy a husband at a steep price,
then take a master for our bodies.
This second evil is worse than the first, but
the greatest struggle turns on whether we
get a bad
husband or a good one. Divorce is not
respectable
for a woman and she cannot deny her
husband.
Confronting new customs and rules,
she needs to be a prophet, unless she has
learned
at home how best to manage her bedmate.
If we work things out well and the husband
lives with us without resisting his yoke,
life is enviable. Otherwise it is better to die.
A man when he is tired of being with those
inside
goes out and relieves his heart of boredom,
or turns to some friend or contemporary.
But we have to look to one person only.
They say we have a life secure from danger
living at home, while they wield their spears
in battle.
They are mistaken! I would rather stand
three
times beside a shield than give birth once."*

Aristophanes play, *Lysistrata*, also gives the female point of view:

*"All the long time the war has lasted, we
have endured in modest silence all you
men did; we never allowed ourselves to
open our lips. We were far from satisfied,
for we knew how things were going; often
in our homes we would hear you
discussing, upside down and inside out,*

some important turn of affairs. Then with sad hearts, but smiling lips, we would ask you: Well, in today's Assembly did they vote Peace?--But, "Mind your own business!" the husband would growl, "Hold your tongue, do!" And I would say no more...but presently I would come to know you had arrived at some fresh decision more fatally foolish than ever. 'Ah! my dear man,' I would say, 'what madness next!' But he would only look at me askance and say: 'Just weave your web, do; else your cheeks will smart for hours. War is men's business!'

In his play, *Tereus*, Sophocles gives some insight to the transition from being a carefree girl to the responsibilities of married life with a man much older than herself:

"Now outside [my father's house] I am nothing. Yet I have often observed woman's nature in this regard, how we are nothing. When we are young in our father's house, I think we live the sweetest life of all humankind; for ignorance always brings children up delightfully. But when we have reached maturity and can understand we are thrust out and sold away from the gods of our fathers and our parents, some to foreigners, some to barbarians, some to joyless houses, some full of reproach. And finally, once a single night has united us we have to praise our lot and pretend that all is well."

Euripides' *Melanippe* states women's prominence in religious matters.

*"Men's blame and abuse of women is vain-
- the twanging of an empty bowstring.*

*Women are better than men and I will prove it...
They manage the house and guard within the home goods from the sea. No house is clean and prosperous without a wife. And in divine affairs-- I think this of the first importance-- we have the greatest part. For at the oracles of Phoebus women expound Apollo's will. At the holy seat of Dodona by the sacred oak the female race conveys the thoughts of Zeus to all Greeks who desired it. As for the holy rituals performed for the Fates and the nameless goddesses, these are not holy in men's hands; but among women they flourish, every one of them. Thus in holy service woman plays the righteous role. How then is it fair for the race of women to be abused? Will not the empty censure of men cease; and those who think all women should be blamed alike if one is found erring? Let me make further distinctions. There is nothing worse than a bad woman, and nothing better than a good one. Only their natures differ..."*

The Parthenon: More than meets the eye

Similarly, the Propylaea, the ceremonial gateway at the top of the Acropolis, was damaged by a lightning strike a few years earlier when it was being used by the Turks as a gunpowder magazine. That's why they moved their gunpowder to an even higher place of storage, the Parthenon.

[Back to flowchart](#)

Although the Parthenon is seen as the perfect expression of Greek architecture, there is hardly a straight line in the building. The architects, realizing perfectly straight lines would give the illusion of imperfection, created slight bulges in the floor and columns to make it *look* perfect. Therefore, an object placed on the floor at one end could not be seen from floor level at the other end. Its pillars also lean in at a 1° angle, so that, if the columns on opposite sides were extended up they would cross after around 2.2 km. Columns at opposite ends would meet about 5 km up.

Instead of the normal 6 columns by 13 columns used in Doric temples, the Parthenon is 8 columns by 17, each column having 20 shallow vertical flutings.

Its dimensions are: Width = 30.88m., Length = 69.5m., and Height = 13.72m., which gives a 9:4 ratio of length to width. Using these dimensions, the following equations are approximately true.

$$r * H = W$$

$$r * W = L$$

$$r^2 * H = L$$

The Parthenon has actually weathered the forces of nature remarkably well down through the centuries. Its main damage came from a direct hit by a Venetian shell during a siege in 1687 when the Turks were storing their gunpowder there.

HISTORY AS TRAGEDY: THE PELOPONNESIAN WAR (431-404 B.C.E.)

The conflict that triggered the long collapse of the polis was the Peloponnesian War. It started when Athens, wanting to control trade to the west with Southern Italy and Sicily, helped Corcyra in a dispute with its founding city, Corinth. In retaliation, Corinth helped another of its former colonies, Potidaea, in a revolt against Athens and also turned to Sparta for help. This prompted Athens' leader, Pericles, to issue the Megarian Decree, cutting off all the empire's trade with another Spartan ally, Megara. As Megara joined Corinth in pressuring Sparta to take action against Athens, war fever grew on both sides.

In 431 B.C.E., as war with Sparta loomed, Euripides (485-406 B.C.E.), the third of the great tragic playwrights staged *Medea*. Its title character, the barbarian princess who had helped Jason get the Golden Fleece, is rejected by Jason in favor of a more desirable marriage to a princess of Corinth. Medea exacts a grisly revenge, murdering, not only Jason's new bride, but her own children to keep them from her enemies. At the end of the play, however, she is granted asylum in Athens. Did *Medea* represent the Athenians' own ruthlessness as they prepared for war, or possibly the civil strife in Corcyra that Athens had recently allied with against its enemy, Corinth? Either way, Euripides' closing lines warn the Athenians against the uncertainty of the future: "**Many things are determined by Zeus on Olympus, and many wishes are unexpectedly granted by the gods. But many things we expect to happen do not come to pass, for the gods continue to bring about what we did not expect.**" Euripides' warning went unheeded and war was declared.

Our main source for the period is Thucydides, whose *History of the Peloponnesian War* set the standard for historical accuracy and impartiality until the modern era. His history is especially valuable for its portrayal of the psychological effects of war on the human spirit. And just as the plays of the time let us use tragedy as history, Thucydides' account of the prolonged agony of the Peloponnesian War presents history as a form of

tragedy. His history along with the tragic dramas of the time and Aristophanes' satirical comedies chronicle the long descent into madness that seemed to overtake the Athenians as the war dragged on.

Since Sparta was a land power and Athens was a naval power, Pericles, decided to rely on the navy to protect the empire and raid the coasts of the Peloponnesus. When the Spartans marched into Attica, he would pull the rural population inside the Long Walls, abandoning the countryside to the enemy until they left. As long as its grain routes were open, Athens should be able to hold out until Sparta tired of the war and gave up.

It was not easy to convince the Athenians to leave the countryside and passively watch from the Long Walls as their homes and fields went up in flames. However, Pericles' policy might have worked except for one thing that he had not counted on. In the second year of war, an epidemic broke out in Athens. Ordinarily, any epidemic would have been bad enough, but the crowded and unsanitary conditions of Athens under siege in the heat of summer intensified its effects. Thucydides gives a frightening account of the disease:

"The crowding of the people out of the country into the city aggravated the misery; and the newly arrived suffered most. For, having no houses of their own, but inhabiting in the height of summer stifling huts, the mortality among them was dreadful, and they perished in wild disorder. The dead lay as they had died, one upon another, while others hardly alive wallowed in the streets and crawled about every fountain craving for water. The temples in which they lodged were full of the corpses of those who died in them; for the violence of the calamity was such that men, not knowing where to turn, grew reckless of all law, human and divine. The customs that had hitherto been observed at funerals were universally violated, and they buried their dead each one as best he could. Many, having no proper appliances, because the deaths in their household had been so frequent, made no scruple of using the

burial-place of others. When one man had raised a funeral pyre, others would come, and throwing on their dead first, set fire to it; or when some other corpse was already burning, before they could be stopped would throw their own dead upon it and depart.

"There were other and worse forms of lawlessness which the plague introduced at Athens. Men who had hitherto concealed their indulgence in pleasure now grew bolder. For, seeing the sudden change, how the rich died in a moment, and those who had nothing immediately inherited their property, they reflected that life and riches were alike transitory, and they resolved to enjoy themselves while they could, and to think only of pleasure...for offenses against human law no punishment was to be feared; no one would live long enough to be called to account. Already a far heavier sentence had been passed and was hanging over a man's head; before that fell, why should he not take a little pleasure? (II,48-49; 52-53)

The combined misery of epidemic and watching their homes and farms going up in flames was too much for many Athenians who now blamed Pericles for their troubles. This was the sort of mob scene that haunts any politician's nightmares.

A lesser man would have run away. However, Pericles, who himself had lost two sons to the epidemic, faced the mob head-on, telling them they had voted for the war and only had themselves to blame for what it brought. If they didn't have the stomach to persevere, then they could make peace. However the fault lay with them, not him.

His speech had the effect of calming the mob and keeping Athens on course in the war.

Only a man of Pericles' caliber could talk to a mob like that and get away with it.

Among the epidemic's victims was Pericles whose moderate and reasonable leadership would be sorely missed by Athens. Afterwards, men of much narrower vision would guide the polis on less trustworthy paths, and eventually to ruin. Soon afterwards, Sophocles staged *Oedipus the King*, considered by many as the greatest of Greek tragedies. Taking place in Thebes that is also suffering from a mysterious plague, an oracle says the murderer of the previous king, Laius, must be found and punished. The present king, Oedipus, who does not realize he himself unwittingly had killed Laius years before, launches an investigation. When Oedipus finally realizes he is the killer, he blinds himself and goes into exile to free Thebes from the curse. Given the time it was written, one could see Sophocles comparing Pericles to Oedipus, both being great leaders with the best intentions for their respective cities. However, some fatal unforeseen flaw in each leads, however unjustly, to disaster. The play ends with a somber warning by the chorus on the uncertainty of life:

*"People of Thebes, my countrymen, look on
Oedipus*

*He solved the famous riddle with his brilliance,
he rose to power, a man beyond all power.*

*Who could behold his greatness without envy?
Now what a black sea of terror has overwhelmed
him.*

*Now as we keep our watch and wait the final day
count no man happy till he dies, free of pain at
last."*

The first phase of the struggle, known as the Archidamian War, lasted ten years and became increasingly vicious the longer it lasted. Athens brutally put down revolts by the city-states, Mytiline and Skione, totally destroying the latter when it fell. Likewise, Thebes besieged and finally destroyed Athens' ally, Plataea, which had bravely stood by Athens at the Battle of Marathon sixty

years earlier. Thucydides gives a grim analysis of the effects of war and the resulting civil strife within the various city-states:

"In peace and prosperity, both states and individuals are more generous, because they are not under pressure; but war, which cuts down the margin of comfort in daily life, is a teacher of violence, and assimilates ordinary people's characters to their conditions.

"Revolution now became endemic;... even the former prestige of words was changed. Reckless daring was counted the courage of a good party man; prudent hesitation cowardice in disguise; moderation, a cover for weakness, and the ability to see all sides, inability to do anything...The bitter speaker was always trusted, and his opponent held suspect. The successful conspirator was reckoned intelligent, and he who detected a plot more brilliant still, but he who planned not to need such methods was accused of splitting the party and being afraid of the enemy...

"The tie of party took precedence over that of the family;...Most people would rather be called clever knaves (if knave is what they are) than honest fools; they are ashamed of the latter label, but proud of the former.

"The cause of the whole trouble was the pursuit of power for the sake of greed and personal ambition...Leaders everywhere used honorable slogans--'political equality for the masses' or 'the rule of a wise elite'; but the commonwealth which they served in name was the prize that they fought for...And moderate men fell victims to both sides...And the cruder intellects generally survived better; for conscious of their deficiencies and their opponents' cleverness, and fearing that they might get the worst of it in debate and be victims of some cunning plot if they delayed, they struck boldly and at once; but the others, contemptuously sure that they could see danger in time and had no

need to take by force what they could get by wit, were more often caught off their guard and destroyed."

At this time, comic drama, also sacred to Dionysus, was becoming increasingly popular in Athens, with two annual festivals, also sacred to Dionysus, being devoted to comedy. Whereas tragic drama skillfully veiled its messages in myth, Aristophanes, the most prominent of the comic playwrights, blatantly attacked his targets head-on, whether they be the war (during which he wrote numerous anti-war plays), social and political ills, specific public figures, or the Athenian democracy itself. Aristophanes, a conservative upset with the disturbing trends of the times, pulled no punches and, to the Athenians' credit, got away with it all. One of his favorite victims was the popular, but crude and brutal politician, Cleon the Tanner, whose character and tactics Thucydides seemed to be specifically describing in the passage cited above. Supposedly, when no actor could be found with the nerve to play Cleon in *The Knights*, Aristophanes himself played the role.

In Aristophanes' oldest surviving play, *The Acharnians* (425 B.C.E.), Dicaeopolis, a farmer ruined by the war, makes a separate peace with Sparta. The resulting prosperity (including wine and dancing girls) for Dicaeopolis and his neighbors is contrasted with a returning general who has only wounds to show for his efforts.

The Knights (424 B.C.E.) raked both Cleon and the Athenian democracy over the coals. Lord Demos ("Democracy") has two slaves, Nicias and Demosthenes (two conservative politicians) who are ruled by the cruel overseer, the Paphlagonian leather monger, an obvious reference to Cleon the Tanner. The two slaves recruit a crude sausage seller, Agoracritus, who engages Cleon in a shameless bribery contest for the favor of Lord Demos, offering cheap fish, fresh rabbit meat, pillows for the stone assembly seats, and even world dominion. Agoracritus finally wins by offering the aged Lord Demos renewed youth. Thus the democracy is revived as young, energetic, and statesmanlike just as in the good old days. This

appeased the democratic audience that had been portrayed as old, conceited, and easily fooled. Cleon was not so lucky, being accused in the play of bribery, slander, lies, threatening opponents with the charge of treason, and false accusations. Coming at the peak of Cleon's popularity after he had won a victory over the Spartans at Sphacteria and then arrogantly refused to make peace, *The Knights* helped deflate his ego and won Aristophanes first prize in the dramatic competition

In *The Wasps* (422 B.C.), Aristophanes took on the addiction many Athenians had to serving as jurors in the courts. He also lambasts Cleon who had raised the jurors' pay, largely funding the raise with fines and legal fees paid by political enemies whom he brought to court. As the chorus tells the jurors, "*You deprive yourself of your own pay if you don't find the accused guilty.*" At another point the character, Philocleon ("Lover of Cleon"), himself a chronic juror, says "*We are the only ones whom Cleon, the great bawler, does not badger. On the contrary he protects and caresses us; he keeps off the flies...*" Philocleon's son, Bdelycleon ("Hater of Cleon") finally breaks his father's addiction to the courts by letting him stage mock trials at home. In one he tries the family dog, Labes, for stealing some cheese. A second dog testifies against Labes, saying he refused to share the cheese. Bdelycleon, defending Labes, brings in her puppies, urging them to "*yap up on your haunches, beg and whine*" to win the court's sympathy (a common tactic then). Philocleon at last acquits the dog.

Disaster and Collapse (421-404 B.C.E.). At this point, a dynamic Spartan leader, Brasidas, emerged. In very un-Spartan fashion, he was a skilled diplomat as well as soldier who even commanded the loyalty of the Helots fighting for him. Believing the best defense is a good offense, he marched north to encourage Athens' subjects around Thrace, in particular Amphipolis, to rebel. With Brasidas threatening their power in a very sensitive area, it was Athens' turn to ask for peace and the Sparta's turn to refuse.

Therefore, the Athenians sent Cleon north to deal with the situation. In the ensuing battle, Brasidas

defeated and killed Cleon, but also died in the fighting. Finally, in 421 B.C.E. both sides were ready for peace. In the resulting Peace of Nicias, neither side gained anything, supposedly returning any lands taken during the war. However, neither side abided by these terms, keeping tensions high and the likelihood of a lasting peace correspondingly low.

In 417 B.C.E. Athens attacked the small island state of Melos for no good reason. When Melos fell in 415 B.C.E. the Athenians mercilessly slaughtered the men and enslaved the women and children. Euripides expressed his outrage at this reckless abuse of power in *The Trojan Women*, possibly the most powerful statement until modern times on the senseless suffering caused by war. The scene is Troy after its brutal destruction as seen through the eyes of the victims, the various Trojan women being parceled out as slaves to different Greek warriors. One by one, they learn of their individual fates, including the murder of Hector's baby son, Astyanax. Poseidon at the start of the play utters a grim warning to the Greeks for their sacrileges in the sack of Troy, but one that could as well apply to the Athenians for their recent actions: "***How are ye blind, ye treaders down of cities, ye that cast temples to desolation and lay waste tombs, the untrodden sanctuaries where lie the ancient dead; yourselves so soon to die!***"

Convincing the Athenians to carry out the horrible massacre of the Melians was Alcibiades, a young man who was totally unscrupulous in his pursuit of power and publicity, at one point entering seven chariots in the Olympics and at another buying a very expensive dog and cutting off its tail so people would talk about him.

The Sicilian Expedition. In 415 B.C.E. Alcibiades convinced the Assembly to invade Sicily, blinding them to the realities and difficulties of the undertaking with the lure of untold riches. Therefore, the Athenians, sent a large fleet and army under Alcibiades and Nicias (who was opposed to the expedition to start with).

Some good advice backfires. Nicias, who was opposed to the Sicilian adventure, tried to scare the Assembly from voting for it by saying it would require a huge expedition. Not only did the Assembly vote for such a huge force, it made Nicias one of its generals because he gave them such good advice.

Alcibiades might have carried out the whole scheme if he had been allowed to. However, he was summoned home on what were probably trumped up charges of defacing some statues sacred to Hermes. Instead of facing a hostile jury, he jumped ship, went to Sparta, and convinced it to declare war on Athens while it was occupied in Sicily.

All this left Nicias in command in Sicily. Considering his lack of enthusiasm and slow-moving, superstitious ways, he made remarkable success, besieging Syracuse and almost cutting it off from outside help. However, Nicias' failure to act quickly let the Syracusans turn the tables on him, and soon it was the Athenians who were in danger of being cut off from escape. A second army and fleet came to relieve Nicias' force, but soon they too found themselves in a trap that was quickly closing. Unfortunately, a lunar eclipse caused the superstitious Nicias to wait twenty-seven days before letting the Athenians make their move. By then it was too late. After a desperate and futile effort to break out of Syracuse's harbor, the Athenians abandoned their waterlogged fleet and tried to escape overland. The army, demoralized by defeat and decimated by hunger, thirst, and disease, came to an end in a pathetic mob scene where the desperately lapped up water in the Assinarus River while the Syracusans mercilessly slaughtered them.

When the day dawned Nicias led forward his army, and the Syracusans and the allies again assailed them on every side, hurling javelins and other missiles at them. The Athenians hurried on to the river Assinarus. They hoped to gain a little relief if they forded the river, for the mass of horsemen and other troops overwhelmed and crushed them; and they were worn out by fatigue and thirst. But no sooner did

they reach the water than they lost all order and rushed in; every man was trying to cross first, and, the enemy pressing upon them at the same time, the passage of the river became hopeless. Being compelled to keep close together they fell one upon another, and trampled each other under foot; some at once perished, pierced by their own spears; others got entangled in the baggage and were carried down the stream. The Syracusans stood upon the further bank of the river, which was steep, and hurled missiles from above on the Athenians, who were huddled together in the deep bed of the stream and for the most part were drinking greedily. The Peloponnesians came down the bank and slaughtered them, falling chiefly upon those who were in the river. Whereupon the water at once became foul but was drunk all the same, although muddy and dyed with blood, and the crowd fought for it."

Nearly all the Athenians were either killed or captured by the Syracusans. Because of their great number, the prisoners were kept in a quarry where exposure to the elements killed most of them off. Some who could recite passages from Euripides' plays, which were popular in Syracuse, were rescued by rich families. These who eventually returned home made a point of thanking Euripides for saving their lives..

Descent into madness: Athens' comeback and final fall (413-404 B.C.E.). Hardly an Athenian family was left untouched by the Sicilian disaster, while Athens itself had lost two fleets and armies. Now trouble piled on top of trouble as much of Athens' empire rose up in revolt. Thanks to Alcibiades, the Spartans now continuously occupied a fort in Attica to keep the Athenians huddled behind their Long Walls. Worst of all, Alcibiades had arranged for the Spartans to ally with Persia, getting Persian money and ships in return for promising to turn Ionia over to the Great King. An oligarchic revolution even briefly replaced Athens' democracy.

Despite these adversities, the Athenians bounced back, scraping together enough money and men to build a new fleet and carry on the war for nine more years. Alcibiades even returned to the graces of the Athenians and led their fleet to several decisive victories that at least partially restored Athens' crumbling empire. On two different occasions, Sparta even asked for peace, and was twice turned down by the Athenians, a foolish response since Persia could easily rebuild any Spartan fleets the Athenians destroyed.

In the midst of all this Aristophanes produced possibly his most outrageous, and profound statement on the war, *Lysistrata* in 411 B.C.E. In it the main character, Lysistrata ("she who disbands armies") organizes the women of Athens and Sparta, who are all sick of the war, to stage a sex strike and seize the treasury on the Acropolis until the men agree to make peace. The lowly women, who abound in common sense, triumph, and peace is happily made. Unfortunately, in real life, the war went on.

Another crisis erupted when an old drinking friend of Alcibiades, whom he had irresponsibly left in command of the fleet during his absence, offered battle against orders and was defeated. The Athenians, blaming Alcibiades, exiled him a second time. With him went Athens' best chance to win the war. In 406 B.C.E., stormy conditions after an Athenian victory at Arginusae prevented the rescue of several thousand shipwrecked Athenians. The mob blamed the six Athenian generals in charge of the fleet and had them tried and executed.

In the midst of their troubles, when the comic poet, Eupolis, drowned, the Athenians voted to ban any more playwrights from having to serve in the army or navy.

These events inspired Euripides' frightening portrayal of human madness, *The Bacchae*, produced a year after his death in 406 B.C.E. In it Dionysus returns to Thebes and incites wild frenzies in the forest by the local women who become his followers, the Maenads. When the king, Pentheus,

who represents civilized rationality, tries to save Thebes from the wild irrational Dionysiac rites, he is torn apart by the Maenads. Madness reigns supreme as his own mother returns to town with his head on a stick, thinking it is a lion. Greek audiences must have been especially shaken as they watched the one thing on which they especially prided themselves, their moderate rationality, drowning in a sea of madness, whether on stage or in war.

Unlike the earlier days when the playwrights could help guide the democracy on a wise course, it seemed they could no longer offer guidance through the morass of problems Athens had gotten itself into. Now they could only point out the shocking failure of its leaders and assembly in the policies they pursued. And after the deaths of Euripides and Sophocles, there seemed to be no playwrights with the talents to do that.

Therefore, in Aristophanes' play, *The Frogs*, Dionysus goes down to Hades to retrieve a good playwright from the dead. A poetry contest between Aeschylus and Euripides, with the verses weighed on a cheese scale, ensues to decide who gets to return to earth. Aeschylus wins first place and Sophocles gets second, even though he is not even in the contest. The play ends with the chorus of frogs escorting Aeschylus back to earth, urging him to "*heal the sick state, fight the ignoble, cowardly, inward foe, and bring us peace.*"

However the Athenians continued to ignore the wiser counsels of their playwrights. In 405 B.C.E. they built one last fleet, paying for it by stripping the gold from the temples and statues. However, a clever Spartan general, Lysander, lulled the Athenian generals into a false sense of security and then destroyed their fleet in a surprise attack at Aegospotami. Athens fell the next year after a long desperate siege. The Long Walls were torn down and its empire was stripped away, although Sparta did spare the city from destruction, probably as a counterweight against the rising power of Thebes. The democracy was replaced by an oligarchy of thirty men led by another of Socrates' old students, Critias, who conducted a vicious reign of terror.

Several years later, the Athenians were able to restore their independence, democracy and even the Long Walls. However, peace was no more in sight than it had been twenty-seven years before. In 399 B.C.E., Socrates was tried and executed for corrupting the youth of the city with his teachings. That event, as much as any, symbolized the end of Athens' cultural golden age.

Casual Match: The Coming of War (431 B.C.E.)

Big wars and other man-made disasters have a way of starting with small incidents that quickly escalate in small increments and get out of control before anyone realizes it or can do anything about it. For the Greeks started in a remote polis in northwestern Greece, Epidamnus, when the democratic faction drove out the oligarchs.

The oligarchs replied by joining local tribes in an attack on Epidamnus.

To protect themselves, the democrats first appealed for help to their *metropolis* (founding city), Corcyra.

When Corcyra refused help, the Epidamnian democrats appealed to *Corcyra's metropolis*, Corinth, which sent a force to help restore them to power.

Corcyra then attacked and defeated the Corinthian force sent to Epidamnus, so the Corinthians started building a large fleet to get revenge against their former colony.

Corcyra, feeling the heat, appealed to Athens for an alliance. Athens had recently founded the colony of Thurii in Southern Italy and wanted to expand its influence even more in those parts, traditionally the realm of Corinthian trade and influence.

However, not wanting to antagonize Corinth's ally, Sparta, the Athenians agreed to only a defensive alliance with Corcyra and sent a squadron of 10 triremes north with instructions to help only if Corcyra was losing the battle. As luck would have it, the Corinthians started driving back the Corcyraeans, thus bringing the Athenian squadron into the battle. When 20 more Athenian triremes appeared on the horizon, the Corinthians retreated, but even more determined to get revenge.

At this point things really got out of hand. First, the Corinthians incited another of their old colonies, Potidaea, to rebel against Athens.

The Athenian leader Pericles retaliated by decreeing a trade embargo cutting off all the empire's trade with another Spartan ally, Megara. So Megara joined Corinth in pressuring Sparta to take action against Athens, and war fever grew on both sides.

Sparta, which up to now had kept clear of this crisis, now found itself pressured by two of its Peloponnesian allies, Corinth and Megara, into acting against Athens. The Corinthian delegate's speech, as reported by Thucydides, tried to shame the Spartans into declaring war, stressing the differences between the two cities:

"You have no idea what sort of people these Athenians are, how totally different from yourselves. They are always thinking of new schemes, and are quick to make their plans & to carry them out: you are content with what you have, and are reluctant to do even what is necessary. They are bold, adventurous, sanguine: you are cautious, and trust neither to your power nor to your judgment. They love foreign adventure, you hate it: for they think they stand to gain; that you stand to lose something. When victorious they make the most of it; when defeated, they fall back less than anyone. They give their bodies to Athens as if they were public property; they use their minds for Athens in the most individual way possible. They make a plan; if it fails, they think they have lost something; if it succeeds, this success is nothing in comparison with what they are going to do next. It is impossible for them either to enjoy peace and quiet themselves or allow anyone else to." — Thucydides II, 40

The Mytilenean revolt (428-427 B.C.E.). When the Athenians put down a revolt by the city-state, Mytilene, they voted to put all the men to death and enslave the women and children. Fortunately, cooler heads prevailed the next day as the politician, Diodotus, convinced the assembly to kill 1000 ringleaders but spare the rest of the city on the grounds that to destroy Mytilene was to destroy future revenues.

However, the ship carrying the first sentence had a day's jump on the ship carrying the milder one. Mytileneans in Athens offered a huge reward if the second crew could get there in time. While the second crew rowed continuously in shifts, even taking its meals at the oars, the first crew was in no hurry to carry out the death penalty for an entire city. Still, they got to Mytilene first and had read the city's death sentence when the second ship arrived to stop the slaughter.

Skione, another polis rebelled in 421 B.C.E.

However, it wasn't so lucky as Mytilene. The Athenians wiped it off the map when it fell.

The destruction of Plataea (429-427 B.C.E.). Luck also ran out on Plataea, the tiny polis which had bravely stood by Athens at the Battle of Marathon sixty years earlier. Caught between Athens and Thebes, it constantly relied on the former for protection from the latter. However, Athens' current distractions elsewhere offered the perfect opportunity to finish it off.

For two years, the Spartans and Thebans besieged Plataea before launching a final assault on the city using a dirt siege mound reinforced with a lattice-work of logs. The Plataeans tried to counter this by raising the height of their wall with bricks taken from demolished houses. But, it was to no avail as the Spartans finally broke in and destroyed the city.

In 417 B.C.E. Athens attacked the small island state of Melos for no good reason. Thucydides'

In the end, war was declared, triggering a collective agony that would embroil the entire Greek world, with few breaks, for 27 years. A whole generation of Greeks would grow up knowing nothing but war and its evils.

Descent into Brutality (428-431 B.C.E.)

Thucydides continues the theme of the moral decay war brings by describing the brutal methods that both sides increasingly used as the war dragged on.

dialogue between Melian and Athenian delegates reveals how deeply the Athenians had become corrupted by power:

Athenians: Well, then, we Athenians will use no fine words; we will not go out of our way to prove at length that we have a right to rule, because we overthrew the Persians; or that we attack you now because we are suffering any injury at your hands. We should not convince you if we did; nor must you expect to convince us by arguing that, although a colony of the Lacedaemonians (Spartans), you have taken no part in their expeditions, or that you have never done us any wrong. But you and we should say what we really think, and aim only at what is possible, for we both alike know that into the discussion of human affairs the question of justice only enters where the pressure of necessity is equal, and that the powerful exact what they can, and the weak grant what they must...And we will now endeavor to show that we have come in the interests of our empire, and that in what we are about to say we are only seeking the preservation of your city. For we want to make you ours with the least trouble to ourselves, and it is for the interest of us both that you should not be destroyed.

Melians: It may be your interest to be our masters, but how can it be ours to be your slaves?

Athenians: To you the gain will be that by submission you will avert the worst; and we shall be all the richer for your preservation.

Melians: But must we be your enemies? Will you not receive us as your friends if we are neutral and remain at peace with you?

Athenians: No your enmity is not half so mischievous to us as your friendship; for the one is in the eyes of our subjects an argument of our power, the other of our weakness.

Melians: But are your subjects really unable to distinguish between states in which you have no concern, and those which are chiefly your own colonies, and in some cases have revolted and been subdued by you?

Athenians: Why, they do not doubt that both of them have a good deal to say for themselves on the score of justice, but they think that states like yours are left free because they are able to defend themselves, and that we do not attack them because we dare not. So that your subjection will give us an increase of security, as well as an extension of empire. For we are masters of the sea, and you who are islanders, and insignificant islanders too, must not be allowed to escape us."

When Melos fell in 415 B.C.E. the Athenians mercilessly slaughtered the men and enslaved the women and children.

The lights of Greek civilization were being snuffed out one by one.

Pylos and Sphacteria (425 B.C.E.)

Athenian politics also took disturbing turns as politicians of narrower vision than that of Pericles assumed precedence. The most notable of these was Cleon the Tanner, whom both Thucydides and the comic playwright, Aristophanes, depicted as a crude rabble rouser.

It was Cleon, for instance, who had convinced the Athenians to vote to destroy Mytilene. He was also the first speaker in the Assembly to shout, curse, and gesticulate wildly, as well as use ruthless intimidation to get his way. Aristophanes, in particular, lampooned Cleon mercilessly in several of his plays.

In 425 B.C.E., the Athenians trapped a force of Spartans on the island of Sphacteria off the south-western coast of the Peloponnese. However, as efforts to force them to surrender

dragged on, Cleon led the outcry against this delay until his oligarchic opponent, Nicias, suggested he take command.

Trapped by his own bluster, Cleon took command on Sphacteria. As luck would have it, a brush fire had swept fire and smoke across the island. Therefore when the Athenians attacked, the Peloponnesian force, weakened by smoke and hunger, quickly surrendered. Amazingly, among the prisoners were 120 Spartans.

The capture of 120 Spartans was a shocking event that shattered the aura of Spartan invincibility. Also as long as these hostages remained in Athenian hands, the Spartans, who definitely wanted their comrades back, couldn't afford to raid Attica. The Spartans even asked Athens for an end to the war, but the Athenians, convinced by Cleon, refused, and the war dragged on.

THE DECLINE OF THE POLIS (431-338 B.C.E.)

If the Persian Wars were the great epic of Greek history, the century of conflict between Greek poleis from 431 to 338 B.C.E. was its great tragedy. During this time, the Greeks wasted their energies fighting one another and left the way open for an outside power, Macedon, to come in and take over. There were three main lines of development that led to the final fall of the polis in the fifth and fourth centuries B.C.E.

Economic and military changes. First of all, the Persian wars exposed the Greeks to a wider world of trade as well as different military tactics that could threaten the powerful, but largely immobile hoplite phalanx. Athens especially adapted to these new challenges, relying more on trade, foreign grain, and a money economy, along with the navy and Long Walls to protect its empire. Growing fear of Athens and the resulting Peloponnesian War would force other poleis to adapt in order to be able to compete with Athens. Sparta, in particular, built a navy and, after the Peloponnesian War, relied increasingly on mercenaries to bolster its power. In addition, lightly armed troops known as peltasts were used to give Greek armies more flexibility.

As a result, more and more Greeks were drawn from the countryside by the lure of riches to be made as traders and mercenaries. Trade and a money economy grew in importance compared to the small family farms that had previously been the mainstay of the polis' economy. Also, warfare became professional, sophisticated, chronic, and expensive. This contrasted sharply with the previous style of cheap, amateur, and less destructive warfare waged by hoplite farmers over the last 250 years. Rising taxes to support this new style of warfare put increasing burdens on the farmer hoplites who started to decline economically, militarily, and politically. Gradually, large estates worked by tenant farmers or slaves would replace the small family owned farms worked by independent farmers. And once these farmers, the backbone of the traditional polis, went into decline, so did the polis itself. The Greeks were still a dynamic people, but the polis itself was starting to decay.

The spread of Greek civilization by way of its colonies to peoples outside of Greece triggered the second long term process affecting the polis. Many of these people assumed at least a veneer of Greek

culture and built quasi-Greek states that mimicked the Greeks in their organization, military institutions, and culture. Most notable of these states was Macedon, a region to the north of Greece that had acted as a buffer against aggressive tribes further north. In 359 B.C.E., one of these tribes, the Illyrians, killed a Macedonian king in battle. It was his successor, Philip II, who would build a strong kingdom on the ruins of this disaster. Like the economic changes then taking place, this spread of Greek civilization to Macedon would contribute to the downfall of the Greek polis.

Chronic warfare, beginning with the Peloponnesian war, was the third reason for the decline of the polis. There were three basic causes for this war which itself would trigger a self-destructive cycle. First, there was a basic underlying fear other poleis had of the dominant Greek state, which at this time was Athens. Second, there was the mutual hostility between individual poleis such as Corinth against Corcyra, Athens against Megara, and Thebes against Plataea. Finally, there was a fatal flaw infecting Greek diplomacy at this time. Since most poleis were tied to either the Peloponnesian League (Sparta's alliance) or the Athenian Empire, any conflict between individual members of the opposing alliances could eventually drag the whole Greek world into a much larger and more destructive war. It was such a flaw of interlocking alliances that would pull all of Europe and eventually much of the world into World War I in 1914.

All these factors led to an unfortunate pattern of wars that also would eventually destroy the polis. Triggering this pattern was a tendency of the poleis to gang up against the most powerful Greek state at that time. This would bring about not only the downfall of that state, but also the rise of another polis to dominance, causing the other poleis to gang up on *that* state, and so on. This cycle would repeat itself three times: first in the Peloponnesian War to bring down Athens, next in a series of wars that wrecked Sparta's power and brought Thebes to pre-eminence, and finally in the struggle against Thebes that would leave all of Greece open to attack by the growing Macedonian kingdom to the north.

Continuing warfare after the Peloponnesian War (404-355 B.C.E.). We have already seen in detail how Sparta defeated Athens in the Peloponnesian War. However, Sparta's victory hardly meant

peace for the Greek world. Many of Athens' subjects had joined Sparta, believing they would be free to run their own lives. Instead, the Spartans installed pro-Spartan oligarchies that were watched over by Spartan governors and garrisons in many poleis. Sparta also failed to turn over Ionia to Persia in return for its aid against Athens. Naturally, such high-handed actions angered both Persia and most other Greeks. Leading the way were the Athenians who replaced the repressive Spartan-backed oligarchy of The Thirty with a new democracy.

All this led to the Corinthian War (395-387 B.C.E.). The Spartans in Ionia could more than hold their own against the Persian forces there. However, what Persian armies could not accomplish, Persian gold could by funding Athens, Thebes, and Corinth against Sparta, which drew the Spartan forces out of Ionia and back to Greece. Persia also gave Athens a navy that crushed the Spartan fleet, sailed to Athens, and oversaw the rebuilding of the Long Walls. Sparta's gains from the Peloponnesian War were quickly slipping away.

Faced with such a powerful coalition, Sparta made peace with Persia, handing Ionia over in return for help against the other Greeks. In 387 B.C.E. Persia dictated a treaty called the King's Peace to all the Greeks, taking Ionia for itself, and putting its ally Sparta back on top of the Greek world. The irony of it all was that the Persians, without striking a blow, had accomplished what Xerxes' huge army had failed to do a century before.

Naturally, the Greeks, did not abide by this decision for long, with Thebes and Athens leading the resistance against Sparta. The Thebans drove the Spartan garrison from their citadel and formed the Boeotian League in direct defiance of Sparta and the King's Peace.

More than a lap dance. In 382 B.C.E., Sparta had treacherously seized the Cadmea, Thebes' acropolis, in a surprise move to control the city. Three years later, a group of Theban men, disguised as dancing girls, entertained and then murdered their unsuspecting Spartan guests and regained Thebes' freedom.

At Leuctra in 371 B.C.E., the Theban general, Epaminondas stacked one flank of his phalanx 50

ranks deep, crushed the opposing Spartan wing, and then rolled up the rest of their army. A similar battle at Mantinea nine years later destroyed the mystique of Spartan invincibility, and with it most of Sparta's power and influence. Unfortunately for Thebes, Epaminondas was killed, and with him died Thebes' main hope to dominate the Greek world.

Although Thebans had a reputation as brawlers and “fire eaters”, Epaminondas' 50-deep formation used against Sparta must have required some training with the drill-and-march. Another of his innovations was greater use of cavalry, almost totally neglected by the Greeks till now, since nobles, unpopular with the democrats, filled their ranks. Despite this, Epaminondas actively enlisted their support, giving Thebes' army another edge. On the sidelines watching all this was a young hostage, Philip II of Macedon, who would later use these reforms to build his own army.

Meanwhile, the Athenians had formed a second Delian League with various Aegean states, promising to treat them better than they had treated the first Delian League. But Athens soon reverted to its old imperialist behavior. This triggered a revolt known as the Social War that ended Athens' imperial ambitions once and for all. Thus by 355 B.C.E., after 75 years of almost constant warfare, Athens' empire was gone, Sparta's army and reputation were wrecked, and Thebes' hopes for dominance were virtually laid to rest with Epaminondas. The polis' resulting exhaustion combined with the long-range forces undermining the polis due to the Persian Wars and Greek colonization left the polis in serious decline opened the way for a new power to step in.

The rise of Macedon (355-336 B.C.E.). Macedon was a country north of Greece inhabited by tribes speaking a dialect related to Greek. While the Greeks considered them barbarians, the Macedonians liked to think of themselves as Greeks, and had played a minor role in Greek history from time to time. However, Macedon had never been a strong power until Philip II came to the throne in 359 B.C.E. after invading tribes from the north had killed his predecessor.

Philip was one of the most remarkable figures in Greek history, only being overshadowed by his son

Alexander. He was a shrewd, ambitious, and unscrupulous politician who knew how to exploit the hopes, fears, and mutual hatreds of the Greeks to his own advantage. The key to much of Philip's success was control of the gold mines of Amphipolis, which gave him the money to do three things: build roads to tie his country together, bribe Greek politicians, and build up his army. Philip was an outstanding organizer and general who built what was probably the best army up to that point in history. Its main striking arm was an excellent cavalry, but it also utilized a phalanx armed with thirteen-foot long pikes (spears) and lightly armed peltasts. Together, these gave him the flexibility and coordination to deal with almost any situation on a battlefield.

Preferring diplomacy to fighting whenever possible, Philip was able to work his way into the confidence of various Greek states to undermine their resistance to him when he finally decided to strike. For example, he gained a foothold in Greece by defending Delphi from another city-state, Phokis. He also undermined Athens' power by taking and then freeing one of its allies and posing as the champion of all Greek liberties. Bit by bit, Philip worked his way southward, with only a few Greeks recognizing what was happening. Among these was Demosthenes, probably the greatest orator of the ancient world. In a masterful series of speeches known as *Philippics*, he repeatedly warned the Athenians of the danger to the north, but they did little.

A bit obsessive compulsive? While growing up, Demosthenes reportedly shaved half his head so he wouldn't be tempted to go out to play and neglect his studies. He also supposedly put pebbles in his mouth to help himself speak clearly, and developed a strong voice by speaking over the sound of the surf by the seashore.

Historians through the ages have blamed the Athenians for their failure to react well to the Macedonian threat. However, in all fairness, the Athens faced a difficult dilemma, since acting against Philip could have been as ruinous as not moving to stop him. On the one hand, failing to act against Philip would allow him to conquer Greece. However, on the other hand, without an empire to provide it with the full treasury it had the previous century, Athens could no longer sustain a prolonged war against such a power as Macedon.

Therefore, fighting such a war very likely would have wrecked Athens' finances and given Philip the victory anyway.

Athens and Thebes did finally band together to meet the Macedonians at Chaeronea in 338 B.C. A tricky back-stepping maneuver by the Macedonian phalanx lured the Athenians out of position, exposing the Thebans to the decisive cavalry charge led by Philip's eighteen-year old son, Alexander. Demosthenes and others fled the field, leaving their shields and Greek liberty in the dust. For all intents and purposes, the age of the Greek polis was dead. The age of Alexander the Great and the Hellenistic kingdoms was about to dawn.

The March of the Ten Thousand

Rhodian slingers hold off harassing Persian cavalry as the 10,000 Greeks try to fight their way out of the Persian Empire

One of the epic events in ancient history, known as the March of the Ten Thousand, was the journey of a force of Greek mercenaries out of the heart of the Persian Empire in an attempt to get home.

It started around 400 B.C.E., when Cyrus the Younger, a Persian prince, rebelled against his brother and king, Artaxerxes. By this time, the reputation of Greek mercenaries had made them eagerly sought after by Greek and non-Greek rulers alike, so Cyrus hired a force of 13,000 of them in his bid for the throne, but not telling them his real goal. Since the mercenaries had no real sense of Persia's interior geography, he was able to lead them along, not revealing his intent to overthrow his brother until they were already facing the Great King's army in Mesopotamia at a place known as Cunaxa. The Greek mercenaries won their part of the battle, easily plowing through and panicking the lightly armed Persian militia, but Cyrus was killed and the Greeks

found themselves stranded in the middle of the Persian Empire surrounded by hostile forces.

When Artaxerxes demanded their surrender, the Greeks replied by demanding *he* surrender to *them*, since they had won their part of the battle. Faced with this standoff, the Persians invited the Greek generals to dinner to talk, and then treacherously murdered them, leaving the Greeks both leaderless and stuck in the middle of a hostile land far from home with no real idea of how to get back.

Nothing daunted, the Greeks elected new generals and resolved to march and fight their home, striking north along the Euphrates. When harassed by Persian cavalry, they mobilized some makeshift cavalry and Rhodian slingers to protect their foragers. Leaving Mesopotamia, they then had to fight their way through Kurdistan, still inhabited by the fiercely independent Kurds, and struggle through the snows of Armenia, suffering from snow blindness. Finally, one day a cry went up: “Thalassa! Thalassa! (The Sea! The Sea!)” Having made it to the Black Sea, they knew they could find their way home.

After this, they signed on to fight for Sparta in the wars still raging in Greece. Their exploits were recorded by one of the participants, the Athenian Xenophon. That book, the *Anabasis*, became a “best seller” of sorts in Greece, pointing out the internal weaknesses of the Persian Empire and inspiring Alexander the Great (who always kept a copy close at hand) to conquer the Persian Empire for himself.

Athens Wins Back its Freedom

Thrasyboulos leads his fellow democrats against the regime of Critias and The Thirty in the battle between Athens and the Piraeus.

Critias, leader of the oligarchy of the Thirty, was a particularly nasty ruler who purged people largely on hearsay and to confiscate their property. Among his victims was Lysias, a metic (resident alien) and speechwriter for the courts. We still have his frightening account of being arrested by the Thirty and charged with treason, and of his harrowing escape from Athens after bribing a guard.

Thebes, which was starting to turn against Sparta, was a major refuge and gathering spot for a growing number of Athenian exiles led by a man named Thrasboulos. Having gathered enough strength in Thebes and support at home, they made moveD on Athens. Unfortunately for Critias and the Spartans who supported him, Sparta had torn down the Long Walls, leaving the way into Athens wide open. The democrats first rallied the people in Athens’ port, Piraeus, and then moved against the government. The two sides met between Athens and the Piraeus. Critias was overthrown, the garrison of 700 Spartans in the Acropolis was allowed to go home, and the Athenians reestablished their democracy.

Soon afterward, Conon, the one Athenian general at Aegospotami with the presence of mind to save six ships from the Spartans, showed up with a Persian-funded fleet. Having a navy once again, the Athenians rebuilt the Long Walls to secure contact between Athens and its port of Piraeus.

Socrates' trial and death

Jacques Louis David's painting of the death of Socrates

In 399 B.C.E. Socrates was tried for corrupting Athens' youth. This was largely an attempt to find a scapegoat for Athens' recent defeat by Sparta and Critias' subsequent reign of terror, since two of Socrates' students, Alcibiades and Critias, had been involved in the city's recent troubles. When convicted and asked to propose a punishment, Socrates suggested free meals for life and a state pension for his time and efforts in trying to improve society. The jurors were not amused and sentenced him to death by drinking hemlock.

While waiting for the final sentence to be carried out, Socrates refused an offer from followers to help him escape, saying he had lived under Athens' laws for seventy years, so who was he to go against them when they didn't suit him. Therefore he took the poison and died peacefully, although not as peacefully and painlessly as Plato would have us believe in his dialogue, *Crito*, where the hemlock produces a gradual numbness that creeps up from the extremities to the vital organs. In reality, hemlock produces violent convulsions before finishing off its victim. It's still better than crucifixion, which was also used as a form of execution.

The New Warfare

Athenian peltasts (left), led by Iphicrates, ambush and wipe out a Spartan force at Lechaemum in 391 B.C.E. using hit and run tactics.

The Persian Wars had taught the Greeks the value of light-armed troops, causing them to increasingly use *peltasts*. Originally the term peltasts referred to the light crescent shaped shields and the lightly armed Thracian troops who carried them, but later it denoted any light-armed Greek troops.

A blow to Spartan invincibility. In 391 B.C.E. at Lechaum near Corinth, a force of Athenian peltasts led by a general, Iphicrates, ambushed and wiped out a force of 600 Spartan hoplites whose heavy armor and tight formation kept them from coming to grips with their enemy.

Greek hoplites' shields and armor (below left) also got lighter in the fourth century B.C.E., with more open helmets replacing the all encasing Corinthian helmets, layers of linen glued together replacing bronze for body armor, and boots, known as *iphicratids* (named after an Athenian general), replacing the bronze greaves (shin guards). While this gave hoplites more mobility, it also gave them less protection and probably led to higher casualty rates in Greek battles. The only compensation was a longer spear to keep the enemy at bay. But this was only useful if used in large numbers in a tightly drilled formation, which the increasing use of mercenaries did allow.

Over time, there was an increasing convergence between the hoplite and peltast (below right) as the peltast's shield became larger, he assumed a helmet and light armor, and also carried a thrusting spear in addition to javelins for hand to hand combat.

Epaminondas and the Brief Ascendancy of Thebes

Although Thebans (above) had a reputation as brawlers and “fire eaters”, Epaminondas’ 50-deep formation used against Sparta must have required some training with the drill-and-march. Another of his innovations was greater use of cavalry, almost totally neglected by the Greeks till now, since nobles, unpopular with the democrats, filled their ranks. Despite that, Epaminondas actively enlisted their support, giving Thebes’ army another edge. On the sidelines watching all this was a young hostage, Philip II of Macedon, who would later use these reforms in building his own army.

Epaminondas of Thebes (c.418-362 B.C.E.), along with another man, Pelopidas, would lead Thebes to its brief moment of glory. A follower of the Greek philosopher, Pythagoras, he was an ascetic who owned only one cloak (which kept him at home naked on laundry day), was vegetarian, and believed in reincarnation and equality for women. He spurned wealth, women (never

marrying), wine, and rich foods, seen in antiquity as the four main sins. He was a visionary leader who organized the region of Boeotia around Thebes into a democratic federation, trained its army in new tactics, and made it believe it could even beat Sparta. After four uncontested invasions by Sparta, Epaminondas finally convinced the Thebans and surrounding Boeotians to face them at Leuctra in 371 B.C.E.

The place of honor in Greek phalanxes was traditionally the right flank, since a hoplite’s right side was unshielded and most exposed to danger. However, with both sides typically putting their best troops on the right, it was troops on the left that faced the enemy’s toughest hoplites. At the Battle of Leuctra, to show the rest of the Boeotians that the Thebans, who usually fought on the right, were willing to take the greatest risks, Epaminondas put them on the left opposite the Spartans. To even the odds, he stacked this phalanx 50 ranks deep.

He also placed the Thebans in advance of the rest of the Boeotian army so they could finish off the Spartans first. Although the Spartans were a bit drunk and overconfident, not having lost a hoplite battle in living memory, they fought well, but there was no way they could withstand the onslaught of a 50-deep phalanx. Once they were defeated, their Peloponnesian allies, who were less than enthusiastic in fighting for Sparta anyway, broke and ran.

One thousand Spartans, including 400 of the rapidly dwindling full *Spartiate* class had died, and with them perished the aura of Spartan invincibility. When news of the crushing defeat at Leuctra reached Sparta, the women whose men had died fighting walked with their heads proudly held high, while those whose men had survived hung theirs in shame.

Epaminondas realized that to crush Sparta once and for all, he must destroy its power base. Therefore, he invaded the Peloponnesus, inciting revolt among Sparta's reluctant allies. In Arcadia he founded Megalopolis, whose great theater and walls survive today. (It would become the capital of the Achaean League in the Hellenistic era.) Picking up more support, he invaded Messenia and Laconia, freeing thousands of Helots, whose one wish, according to the historian Xenophon, was to eat the Spartans raw. The Spartans holed up in their city, refusing to come out and fight an invading force that may have been 70,000. However, the Spartans' reputation prevented Epaminondas from invading the city.

In 362 B.C.E., Epaminondas again defeated the Spartans, now allied with the Athenians, at Mantinea. However, Epaminondas was killed in the battle, depriving Thebes of its great leader and one chance to emerge as the great power in Greece. That left the way open for Philip of Macedon.

Philip II's Military Reforms

The Macedonian phalanx, being 16 men deep and using 13-foot long pikes known as *sarissas*, was like a human porcupine.

The army with which Philip II conquered Greece and his son Alexander conquered Persia was largely the culmination and synthesis of the various military innovations taking place in Greece at the time: peltasts, cavalry, siege engines, and a new twist on the phalanx. The genius of Philip and Alexander was how they welded

all these elements into an army that was greater than the sum of its individual parts, since it could adapt to any situation.

The Companion cavalry may have been history's first shock cavalry, using the impetus and shock of the horse's charge to drive back an enemy. The trick was to keep from flying backward off the horse upon impact, because the stirrup, which helps the rider keep his place, had not been invented yet. One theory is that the Macedonians were trained to release their lances at the moment of impact. While this would reduce the impact of the lance hitting an opponent, it was probably adequate since most cavalry then wore little or no armor.

The Macedonian phalanx. Phalangites (members of the phalanx) wore light or no armor, but were protected by their longer pikes which, when leveled would project more than five rows forward, making a virtually impenetrable wall of iron. The back ranks would twirl their upraised pikes to deflect incoming arrows and javelins. Obviously, something this coordinated required endless training compared to the much simpler Greek phalanx. The phalanx was largely the anvil for the cavalry's hammer, its main task being to hold pin down the opposing part of the line while the cavalry turned its flanks.

Siege engines. Philip also adopted torsion-powered siege engines that used the energy stored in and released from twisted ropes to propel arrows and stones. It seems that Dionysius of Syracuse pioneered these new contraptions around 400 B.C.E. Philip further developed them and made them easily dismantled so the parts could be loaded on pack animals and reassembled when needed. Philip's son, Alexander, would make great use of these devices, sometimes to psychologically unnerve opponents who had never seen such things.

The End of the Polis: Philip II conquers Greece

Wax image of Philip II of Macedon based on an ivory head found in his grave

After the death of Epaminondas in 362 B.C.E., there was no one power to stop the encroachment into Greece by Philip II. He got his foot in the door with the Third Sacred War (356 BC- 346 BC). This was caused by the Greek polis, Phocis, seizing Delphi and using its treasures to support a large army of mercenaries. When the Phocian leader, Onomarchus defeated Thebes and the Boeotians, Philip came to the “rescue” by defeating the Phocians and recovering the holy site of Delphi. Having interjected himself into Greek politics, he never left.

Guns or butter: Athens’ dilemma in Fighting Philip II of Macedon. As Philip kept expanding southward, the Athenian orator Demosthenes kept calling for a major military buildup action to stop the Macedonian king. This would involve a Rapid Deployment Force (RDF) of 50 triremes and 10,000 troops always ready to more plus another 10 triremes and 2000 men always fighting Philip.

However there was a major problem with this: money. Demosthenes’ proposed RDF would cost 160 talents of silver each year and the smaller force another 92 talents. At the height of Athens’ power in the fifth century B.C.E., its revenue had been about 500 talents of silver per year. However, after its defeat in the Peloponnesian War and subsequent loss of both empire and business in general, yearly revenues by 355 B.C.E. had dropped to 130 talents, not

nearly enough to pay the 252 talents Demosthenes’ proposed force would cost.

To revive its economy, Athens set up the Theoric Fund in the late 350s to develop its harbor and trade, and by 339 B.C.E. its annual income was back up to 400 talents. This could fund the proposed force of 12,000 mercenaries and 60 triremes, but could Athens afford such a drain on its economy? And even if it could, a force this size would be no match for Philip, who had 32,000 soldiers at the Battle of Chaeronea in 338 B.C.E. Most likely, such a force in a prolonged war with Macedon would have quickly depleted Athens’ treasury. Whether it fought or sat back and saved its money for more peaceful pursuits, Athens would probably have fallen to Macedon. Even adding what meager forces other *poleis* could and were willing to contribute, and the story would still be the same. The days of the independent polis were numbered. *The final blow* came at Chaeronea in 338 B.C.E. against the combined forces of Athens, Thebes, and various other allies and showed the advantage of a professional army over part-time citizen hoplites. Philip began with a tricky feigned retreat by his phalanx (something only well-drilled professionals could pull off without losing order). This drew the Athenians and allies out of position, leaving a gap in their line that exposed the Theban left flank. Philip’s 18 year old son, Alexander charged with the Companion cavalry into this gap taking the Thebans from the flank & rear. Seeing their Theban allies defeated, the other Greeks broke and ran. Only Thebes’ Sacred Band of 300 (below) stood their ground where they fought & died to a man.

Philip realized he couldn't rule the Greeks as a king. So he formed a supposedly free association of Greeks (except Sparta), the League of Corinth, whose avowed purpose was to wage a war of vengeance against Persia, thus giving the Greeks a common cause for which to fight. Unfortunately for Philip, he was murdered in 336 B.C.E. as he was about to set out on this campaign. Succeeding him was his even more remarkable son, Alexander III, known to history as Alexander the Great.

For all intents and purposes, the age of the polis had ended.

[Back to flowchart](#)

ALEXANDER THE GREAT AND THE HELLENISTIC AGE (336-31 B.C.E.)

The period of the Greek polis before the Macedonian conquest of Greece and Alexander the Great's conquests is known as the *Hellenic Age* and is concerned primarily with the narrow world of Greek poleis in Greece and the Aegean. The three centuries following Alexander's death are known as the *Hellenistic Age*, during which period Greek influence was spread across Asia far beyond the Greek homeland.

Alexander the Great (336-323 B.C.E.). Philip of Macedon was smart enough to realize that it would be wise to rule the Greeks as leniently as possible. Therefore, instead of occupying Greece, he formed all the poleis (except Sparta which he left alone) into a league whose purpose was to invade Persia and supposedly avenge Xerxes' invasion from 150 years before. He even called it the Corinthian League to make the Greeks think it was for their benefit. But, with Philip as president, everyone recognized quite well who was in charge and that the era of the free polis was over, at least for the time being. Then, in 336 B.C.E., the opportunity for revolt suddenly presented itself when Philip was assassinated.

Philip's successor was Alexander III of Macedon, known to us as Alexander the Great. Few figures in history have inspired so many tales of romance and adventure. This is easy to understand when one looks at a map of Alexander's empire, and considers it took him only eleven years to conquer it.

When Alexander came to the throne, he was only twenty years old, although he had excellent training and experience for someone so young. He had received a tough, almost Spartan, training from a man named Leonidas. Then, at age thirteen, he was tutored by the Greek philosopher, Aristotle, who trained Alexander's intellect as intensively as Leonidas had trained his body. Largely because of his education, Alexander displayed both an incredible physical toughness and intellectual genius. Those qualities, combined with early campaigns against northern tribes and at the battle of Chaeronea, made the young king more than ready to assume power. However, the various Greek city-states did not realize this until it was too late. Almost immediately after Philip's death, the Greeks, led by Thebes and Athens, raised the standard of revolt. The young king was at their

gates so quickly that they could not believe it was really Alexander. A quick surrender saved them this time, but a second revolt by Thebes upon a rumor that Alexander had died while campaigning against tribes in the north led to a second rapid descent by the Macedonian king and the destruction of Thebes as a warning to other Greeks.

Alexander then prepared to pursue his father's plans to conquer Persia. For the next eleven years, from 334 to 323 B.C.E., he carried out one of the most amazing campaigns of conquest in history, only being rivaled by the Mongols under Chinghis Khan. During that time, his army marched over 21,000 miles, covering terrain ranging from the hot plains of Mesopotamia to the Hindu Kush Mountains and the hot humid environment of India. He even conquered Bactria, modern Afghanistan, something Soviet forces failed to do in the 1980's using advanced modern weaponry. Such feats required Alexander's brilliant and flexible mind. Whether faced with the massive armies of Darius III, the island fortress of Tyre, the mountain stronghold known as the Sogdian Rock in Bactria, or crossing the rain swollen waters of the Jhelum River in the face of a hostile Indian army, Alexander could always come up with an ingenious, and usually unexpected solution to the problem.

Alexander's success was also largely due to his charismatic personality. He knew thousands of his troops by name, and shared the dangers of battle and the fruits of victory equally with them. He could put down a mutiny with a mere speech reminding his soldiers of their shared exploits, or shame his troops to action by leading an assault alone. Ironically, in the end, the only army that halted his advance into Asia was his own. Tired from years of marching and fighting, and thousands of miles from home in the hot, humid plains of India, they refused to go any further. It was only then that Alexander turned around and went back. Soon afterwards in Babylon, he died, struck down by fever. Although on his deathbed, he let his troops file through his tent for one last farewell to their dying king and comrade. He was only thirty-three years of age when he died.

Various factors besides his personality aided Alexander. His father left him an excellent, well-drilled army that Alexander constantly experimented with to adapt to the changing conditions of his campaigns. The Persian Empire at that time was also in a state of decay and ruled by a timid king, Darius III, whose tendency to panic in

battle cost him two large armies and his empire. Still, Alexander met some fierce resistance, especially in Bactria and India, and had to prove his abilities as a general constantly. In the end, Alexander's immortality was assured by his early death that gave rise to a wealth of romantic legends surrounding this handsome young man who conquered most of the known world.

Alexander's successors and the establishment of a new order (323-c.275B.C.E.). Alexander died leaving only a mentally unfit half brother, Philip Arrhidaeus, and a pregnant wife, Roxanne, who eventually gave birth to a son, Alexander IV. Neither of these was capable of ruling, which left the job of organizing and ruling Alexander's empire to his generals. Rarely, if ever, has a more capable and ambitious group of men been gathered in one place with such an empire at stake. As one might expect, a long and bitter struggle for control of the empire ensued.

The basic pattern of these wars was that one general would gather a large amount of power into his hands, which would drive the other generals to unite against him before he took everything and destroyed them. As a result, no one was able to control all of Alexander's empire, which had fragmented by 275 B.C.E. into three large kingdoms: Antigonid Macedon, Seleucid Asia, and Ptolemaic Egypt.

The first of these kingdoms, Macedon, was ruled by the Antigonid dynasty. The Antigonids also tried to maintain control of Greece, but were only able to hold onto various strategic cities from time to time. Opposing the Antigonids and each other were the Aetolian and Achaean Leagues, which commanded the allegiance of most of the cities in Greece. Greece during this period saw a confusing and continuous power struggle between these leagues, Macedon, and various independent city-states such as Athens and Sparta. In the end, no one gained control and everyone was worn out from all this constant bickering. This set the stage for Rome to come in and finally establish long lasting peace and stability through its conquest of Greece in 146 B.C.E.

The bulk of Alexander's Asian lands were united under the Seleucid dynasty, founded by Seleucus I. Because of the size of their Empire, the Seleucids did what they could to attract Greek and Macedonian soldiers, artisans, and merchants to settle in their realms. Although many Greeks and

Macedonians were willing to abandon their poorer homelands for the promise of wealthier horizons to the east, they were still few in number compared to the native population they ruled. Most Greeks and Macedonians coming to settle in Asia were concentrated in the many Greek style poleis founded by the Hellenistic monarchs. The Seleucids in particular were great founders of cities, seeing each one as an island of Greek power and culture in the midst of a hostile Asian sea. Outside of these Greek cities, native culture continued, largely untouched by Greek civilization. Most of these colonies were concentrated in the western parts of the empire, especially in Asia Minor and Syria, the most famous being the Syrian city of Antioch. In the vast interior of the eastern part of the empire, the cities were few and far between, and the influence of Greek culture was confined to the cities, reaching very little into the countryside. Even in the western parts of the empire, Greek influence rarely spread outside of the cities.

Such a widespread realm had virtually no cohesion, making it very difficult to hold together. Almost immediately after Seleucus I founded his dynasty, the fringes of the empire started to splinter. Seleucus first let his Indian lands go to the great Indian king, Chandragupta, in return for 500 war elephants. Asia Minor also started to fragment when Attalus, king of the city-state of Pergamum, started to carve out a kingdom in the western and southern parts of the peninsula. Soon other states such as Bithynia, Pontus, and Cappadocia were also emerging in Asia Minor. This left Syria, Palestine, and the Asian heartland to the Seleucids. A new tribe, known as the Parthians, invaded from the northeast and kept chipping away at the Seleucid lands until all that remained were the lands around Antioch in Syria. In 64 B.C.E., the Roman general, Pompey, finally put an end to these pathetic remnants and replaced Greek rule in the East with that of Rome.

The last, most successful, and longest-lived kingdom was in Egypt, founded by another of Alexander's generals, Ptolemy. He clearly saw that no one would be able to hold all of Alexander's empire together. Therefore, he went for a more realistic and limited goal, taking Egypt, which was rich and fairly isolated from invasion. All the kings of this dynasty were named Ptolemy and ruled much as the pharaohs had done for centuries. They were absolute rulers over a highly centralized state. All land was owned by the king and worked by the peasants for his benefit. Government monopolies

on grain, oil, metals, glass, and papyrus also swelled the king's treasury, making Ptolemaic Egypt the richest of the Hellenistic kingdoms.

The Ptolemies copied the pharaohs of old by practicing brother-sister marriages. Thanks largely to that, the last ruler of the dynasty, Cleopatra VII, was pureblooded Macedonian. She was also the only Ptolemaic ruler in 300 years to learn to speak the Egyptian language of her subjects.

The showpiece of the Ptolemaic kingdom was Alexandria, which was founded by Alexander in 330 B.C.E. and destined to be the greatest of all Hellenistic cities. It was here that the Ptolemies established possibly the finest library and university up to that point in history. The library had an estimated 700,000 scrolls and was the largest collection of books in the ancient world. Unfortunately, it was destroyed by several fires set off by wars and riots that occasionally rocked Alexandria throughout its history. There is no telling how much ancient knowledge was lost as a result.

The Museum, or university, in Alexandria was also another splendid example of royal patronage. It had some 14,000 students along with botanical gardens, a zoological park, and a medical school. It was here that many of the greatest minds of the day converged to develop and show off their talents. As a result, ancient Greek science saw many of its greatest advances in Alexandria during this period. Finally, there was the Lighthouse of Pharos, which was 100 feet tall and cast a beacon for 30 miles. It supposedly had a steam-powered foghorn and a system of mirrors much like a periscope, so that people on ground level could survey the horizon from the perspective of being on top.

One primary feature of Hellenistic cities was urban planning, pioneered by the 5th century architect, Hippodamus of Miletus, who laid out his city in a rectangular grid. The Romans would inherit this style of urban planning and use it for their cities. It is still the dominant layout for our cities and towns.

The Ptolemies' main rivals were the Seleucid rulers of Asia. These two powers clashed constantly for a century over control of Syria and Palestine, with the Seleucids finally winning the struggle. The Ptolemies also built a large navy and had political

and economic interests in Asia Minor. Egypt's wealth and stability made it the last of the Hellenistic kingdoms to fall, as with the others, at the hands of Rome. In 31 B.C.E., in a naval battle at Actium off the coast of Greece, the combined fleets of the Roman general, Marc Antony, and Cleopatra were destroyed by another Roman, Octavian. This marked the end of Hellenistic Egypt, and also the Hellenistic era, although to a large extent, Roman civilization was a continuation of Hellenistic civilization.

The Ptolemies experimented with training Egyptian peasants in phalanx tactics, using them at the battle of Raphia in 217 B.C.E., one of many battles between the Seleucids and Ptolemies over Syria and Palestine. Although the Egyptians fought well, their new status as soldiers encouraged them to agitate for more rights, thus destabilizing the Ptolemaic state for the next 200 years.

Hellenistic civilization differed in several respects from that of the preceding age of the polis and was characterized by three features. First of all, Hellenistic civilization was on a much larger scale than that of the polis. For example, Hellenistic armies were much larger than the armies of the old Greek city-states. Whereas before, a Greek army of 10,000 hoplites was considered large, Hellenistic armies often totaled 60-70,000 men. There were also many non-Greek elements in Hellenistic armies, in particular large stables of war elephants whose purpose was to overpower and trample enemy formations much like modern tanks do. However, the heart of the Hellenistic army was still a phalanx of Greek and Macedonian troops. Navies were also larger in size and number. The limited numbers of skilled rowers led to a return to boarding and grappling tactics that required less skill and finesse than ramming and clipping.

Along these lines, trade was on a much larger scale than in the old Greek world centered around the Eastern Mediterranean and Aegean Seas. Alexander's conquests largely fused the Greeks' Mediterranean centered economy with the Asian centered economy of Persia. Commerce flourished between the Greek and Persian worlds, with trade links being established as far east as India and China, creating a virtual world economy. The volume of trade was also large. Ptolemaic Egypt was able to export an estimated 20,000,000 bushels of grain each year. This made Hellenistic

civilization much richer than the older Hellenic civilization, which made much more money available for the patronage of cultural pursuits. The best example of this was in Alexandria, the capital of Ptolemaic Egypt, already discussed above.

The second feature of Hellenistic Civilization caused by its large scale was the large number of older cultures it ruled over and was subsequently influenced by. Babylonian math and Egyptian medicine were the most notable examples of this influence. However, the fusion of cultures took place as far away as India and Bactria, where an interesting dialogue was written down between a Buddhist monk and Menander, the Greek ruler of a Greek kingdom which controlled Bactria and Northwest India in the third and second centuries B.C.E. Greek sculpture also had its influence on the Gandharan style of Buddhist sculpture as seen by the portrayal of curly haired Buddhas, even though the Greeks were the only ones in the area with curly hair. This influence even filtered as far east as China where the curly haired motif of Buddhas showed up.

The third aspect of Hellenistic civilization to note was that Greek influence was dominant and spread widely across Alexander's empire, especially throughout the Middle East as seen in the widespread use of Koine (common) Greek in the cities there. For example, the New Testament of the Bible was written in Koine Greek rather than Hebrew since it could reach more people that way. However, as mentioned above, the small numbers of Greeks and Macedonians compared to the numbers of peoples they ruled meant that they stayed concentrated in the cities and their cultural influence rarely reached the peasants in the countryside.

Pitch to stress accents. Some believe that before the Hellenistic period, Greek was spoken with tonal, instead of stress accents. However, the spread of the use of Greek across the Hellenistic world led to Koine Greek, which used stress accents that were easier for non-Greeks to learn and speak.

Hellenistic accomplishments. Because of the expansion of trade, its wealth, and contact with other cultures and ideas, Hellenistic civilization flourished in a variety of areas. Prominent among these were medicine, philosophy, math, and

mechanical science. In medicine, the center of research and development was Alexandria, where researchers came up with several new findings. They used dissections to show the distinction between arteries and nerves. They learned to use the pulse for diagnosis and saw the heart as a pump with valves. They were even able to control bleeding with tourniquets and surgically remove hernias, bladder stones, and hemorrhoids.

Despite these findings, there was still no comprehensive understanding of how the human body operates as an integrated system of organs. For example, Greek physicians thought the heart only pumped blood out of the heart and had no concept of the circulatory system, believing the body produced new blood rather than recirculating and oxygenating it in the lungs. It would not be until the 1600's that serious progress would be made beyond the Greeks in our understanding of human anatomy and physiology.

In philosophy, several new ideas emerged. One of these, Stoicism (named after the colonnaded walkway, or *stoa*, in which it was taught in Athens), stressed, among other things, doing one's duty and bearing up under hardship. Even today, the term *stoic* is used to denote someone who bears adversity with strength and courage. The other major new philosophy to emerge was Epicureanism. This said our main goal in life is to avoid pain. Many people misinterpreted this to mean we should live a hedonistic, "eat, drink, and be merry" lifestyle. The term *epicurean* still denotes this sort of attitude. However, Epicureus, the founder of this philosophy, saw such a lifestyle as ultimately destructive, and therefore exactly the opposite of what he was striving for. Rather, we should live moderate sensible lives. This and his idea that God exists, but is totally detached from events on earth, would have a profound influence on the philosophy of Deism during the Enlightenment in the 1700's.

There were also considerable accomplishments in mathematics and mechanical science during the Hellenistic Age. Greek mathematicians mainly excelled in geometry, since they did not have place value digits or the zero, both of which are needed for higher level computations. Euclid wrote a geometry book whose proofs are still used in schools today. Eratosthenes, another mathematician working in Ptolemaic Egypt, accurately calculated the circumference of the earth by measuring the different lengths of shadows of two sticks two hundred miles apart at high noon on the summer

solstice. However, Eratosthenes' calculation was ignored in favor of a much smaller estimate of the earth's size. This was important, since the smaller estimate of the size of the globe would give captains the courage to sail the high seas during the Age of Exploration.

In mechanical science, the steam engine was invented by Hero of Alexandria and used for various toys and tricks to amaze people, such as opening temple doors. However, people having plenty of cheap slave or poor labor, found few practical uses for steam power, and it was eventually forgotten until the 1600's in Western Europe when there was a need for labor saving devices. Finally, there was Archimedes of Syracuse who demonstrated the properties of water displacement. He also defended his city from a besieging Roman army by designing catapults and fantastic machines, such as giant cranes for picking up and dropping enemy ships beneath Syracuse's walls. Thanks largely to Archimedes' devices, Syracuse held out for two years before the Romans broke in. Archimedes died in the sack of the city, totally absorbed in a math problem and oblivious to the havoc going on around him.

Conclusion. If one looks only at how many people were directly affected by Greek culture during the Hellenistic Age, then the Greeks would seem to have failed to spread their culture. However, looking at numbers alone to assess the success of the Hellenistic Greeks is deceptive. While Greek culture was largely confined to Greek cities, the high culture of most civilizations was also confined to their cities as well. It is true that Greek culture had little lasting impact in Mesopotamia and farther east. However, its impact in Asia Minor, Syria, Palestine, and Egypt was quite profound. The fact that Koine Greek became the common language spoken throughout the Eastern Mediterranean cities and was the original language of the New Testament says a great deal about Greek influence.

Just as important, if not more, the Romans, coming into contact with the Hellenistic East, would adopt Greek culture as their own and pass it on to our culture developing in Western Europe. The Romans' successors in the East, the medieval Byzantines (Greeks), would also pass Greek civilization directly on to Western Europe and to the Muslim Arabs. They, in turn, would add to Greek math and science and then pass it on to Western Europe through Muslim Spain. Thus Europe received its Greek heritage from three separate

sources. That alone should show the importance of the Greeks to our own culture, and how, thanks to the diffusion of Greek culture during the Hellenistic Age, the Greeks are still very much with us.

Why Alexander the Great?

What, if anything, earned Alexander III of Macedon the title the "Great"? The most obvious answer is the huge empire he conquered in only 11 years, marching with his army across 23,000 miles of some of the planet's most difficult terrain.

From Alexander's point of view he was following the heroic tradition of his ancestor, Achilles. His first stop in Asia was at Troy to visit the tomb of his heroic ancestor. For many of his Macedonian followers, that and Alexander's own exploits in battle were enough to count him great.

In addition, a whole body of romantic legends grew up around Alexander, linking him to other cultures, making it even harder to separate fact from myth. Persian legends had him exploring the depths of the sea in a diving bell. Into the 20th century, Afghan tribes would claim any child with blue eyes was descended from Alexander or that their horses were descended from Alexander's horse, Bucephalus.

However, Alexander's campaigns killed untold thousands, many of them innocent civilians. To them, he must have seemed to be nothing more than a thug or power mad lunatic.

His campaigns did transform the world that came afterward, but so did the careers of Mao, Stalin, and Hitler, the three biggest killers in history (in that order), but we don't call them great...yet. There are people even now who yearn for the good old days of those dictators, so who knows how future historians will judge them? Keep in mind that Peter I of Russia was largely hated in his day for the brutal methods he used to modernize Russia, and today he is also called the Great.

So, in the end, what made Alexander "Great"? In the narrow sense, he was a remarkable general and leader who successfully took his

army on the most epic march in history and got at least some of them back home so they could build his legend. Also, he died young, so that image of a fallen Achilles cut down in the bloom of youth remained frozen in people's minds. Therefore, it's easy to see why this wildly successful young warrior is remembered as "the Great" as long as we forget the thousands of corpses on which that legend was built..

Except that good history should never let us forget.

Alexander's Early Years (356-336 B.C.E.)

Alexander and his horse,
Bucephalus

The taming of Bucephalus. One of the most famous legends about Alexander was how, at age nine, he tamed a horse so wild that Philip, Alexander's father, was about to have it destroyed. Alexander made a deal with his father that if he could tame the horse he could keep it. Seeing the horse was afraid of its shadow, he turned it toward the sun and then mounted it without any trouble. That horse, Bucephalus ("Ox-head") was Alexander's primary war charger until it died of wounds in India, nearly 20 years later.

The Persian ambassadors. Another story of the young Alexander concerned some Persian ambassadors visiting his father's court. Instead of asking them childlike questions about such things as elephants and their funny clothes, he interrogated them about the size of their empire, its roads, its form of government, its king, its army, and so on, as if he were already planning its conquest. Maybe he was.

Alexander had excellent training and education. At age thirteen, after a tough, almost Spartan, training from a man named Leonidas, the Greek philosopher, Aristotle, tutored him, training his intellect as intensively as Leonidas had trained his body. As a result, Alexander displayed both incredible physical toughness and intellectual curiosity. Those qualities, combined with early campaigns against northern tribes and leading the decisive charge at the battle of Chaeronea, made him more than ready to assume power.

Alexander's parents also strongly influenced his character. His charismatic and mystical side came from his mother Olympias, a princess from Epirus and devotee of Dionysus who kept snakes as part of her rites. His father, Philip, gave him his cool analytical talents. Together, they made him a brilliant and charismatic leader able to inspire his men to follow him to the ends of the earth.

Olympias and Philip had a stormy relationship, mainly over his various politically motivated marriages, which sparked her fear for Alexander's position as heir to the throne. She even told her son that he was really the son of Zeus who came to her in the form of a snake one night. This seriously damaged Alexander's relationship with his father, although his only conceivable competition for the throne was a mentally unfit half-brother, Philip Arrhidaeus. Rumor had it that Olympias had poisoned him as a child to damage his brain. Even if she didn't, she probably wasn't above such things.

Things came to a head at one of Philip's weddings when the bride's father offered a toast that Philip's new wife would give him a *legitimate* heir, probably referring to Olympias' non-Macedonian origins. An argument ensued between Alexander and Philip who staggered drunkenly toward his son with a spear, but fell flat on his face. After remarking how Philip wanted to conquer Persia, but couldn't even cross the room Alexander left the court for several months before finally returning.

But Alexander had certainly been groomed for the throne. At age 16, Philip left him in charge as regent while away, during which Alexander launched a campaign against some northern tribes and then founded a city named after himself, the first of some 25 such Alexandrias. At 18, he led the decisive cavalry charge at Chaeronea, the battle that gave Philip control of Greece, Philip supposedly remarking he was sorry he couldn't leave a kingdom big enough for his son.

Diogenes the Cynic. After Chaeronea, Alexander had the honor of returning the ashes of the fallen Athenians to Athens. On this, his only visit to Athens, he met the Cynic philosopher, Diogenes, whose life was an ongoing protest against society's corruption. The term cynic supposedly came from the Greek word for dog (cynos), since they shamelessly lived on the streets like dogs.

Diogenes supposedly lived in a large tub, going about Athens with a lantern in the daytime, claiming to be looking for an honest man, but never finding one. Alexander found him sitting in a hole in the beach and asked what he could do for him. When Diogenes told him to stop blocking his sunlight, Alexander said if he were not Alexander, he would want to be Diogenes.

In 336 BCE, Philip was assassinated during the procession for his daughter's marriage. The assassin was immediately killed, causing some to suspect Alexander was behind the murder and had the assassin killed to keep him from revealing the details of the plot. The debate

continues. Whatever his involvement in Philip's murder, Alexander moved quickly to secure his claim to the throne, gaining support from the army and generals.

Philip's death sparked revolts by both Greeks and the northern tribes against the young king. Alexander and his army moved with such speed that neither the Greeks nor northern tribes had time to prepare for his arrival. When Thebes led a second revolt, Alexander had the city destroyed as a warning to other Greeks, sparing only its temples and the house of the poet Pindar. Having secured his throne, he was now ready to embark on the great adventure across Asia.

God of War (334-330 B.C.E.)

Alexander leads the Companion Cavalry across the Granicus River in his first major battle in the conquest of Persia.

In 334 BCE, Alexander launched his invasion of Persia, officially to avenge the Persians' burning of Athens 150 years earlier. He landed with an army of some 35,000 Macedonians and Greeks at Troy, where his supposed ancestor, Achilles, had fought in the legendary Trojan War. Alexander, who supposedly slept with a dagger and a copy of Homer's *Iliad* under his pillow, performed a ritual dance at Achilles' tomb to mark his entry into Asia.

For the Macedonians, who liked to claim Greek heritage but were still very tribal and locked into a more old-fashioned heroic tradition, this probably had greater significance than it did for the Greeks, who were more urbane and looked down on the Macedonians as barbarians more than as Greeks. However, that might not have been so true of the Greek mercenaries in the army, who were by and large uneducated and more open to a macho heroic tradition.

Alexander's first major battle was against Persia's western satraps at the Granicus River in 334 B.C.E. Seeing the Persian cavalry perched on the edge of the opposite bluff where it was too steep for them to charge down against him, Alexander led his Companion Cavalry and light infantry across the river.

A furious melee ensued as the Macedonian cavalry slammed into the Persians. However, the Macedonians' longer lances and heavier armor, combined with the fury of Alexander in the lead, scattered the Persian cavalry, leaving the Persians' Greek mercenaries isolated and surrounded.

Alexander let any Persians surrender, since they were just obeying their king. However, he saw the Greek mercenaries as traitors and had all but 2000 of them killed, the survivors being sent to a hellish life in Macedonia's mines.

After the Granicus, Asia Minor lay open to Alexander, who liberated the Ionian Greeks, a stated goal of his campaign. One major problem was defeating the Persian navy to secure his supply lines and communications with home. However, he had no real navy with which to combat the Persians. Then, one day he was watching an eagle flying over the sea but always returning to land, just as Persia's flimsy galleys regularly had to seek harbors for protection and supplies. This gave him the idea of defeating the Persian navy from land by methodically reducing the coastal cities of the Eastern Mediterranean.

The Gordian Knot. At Gordium Alexander was confronted with the Gordian knot. Legend said whoever could undo the knot would rule all Asia. What it looked like is anyone's guess, but it was apparently tied in such a way that both ends were hidden, making it very difficult to unravel by hand. Reportedly, after pondering the knot, he took out his sword and cut it in half. However true this story is, it shows how Alexander could cut to the heart of any complex problems for a solution.

While crossing the Gates of Cilicia, which connect Asia Minor and Syria, Alexander became ill. At this time a message came to him that Darius was trying to bribe Alexander's physician, Philip, to poison his king. When Philip came to give Alexander his medicine, the king handed him the note about the plot. Philip looked up in horror, only to see Alexander had already taken the medicine, showing his complete faith in the doctor. This was another popular story among the troops, since it showed the tight bond between Alexander and his men.

Alexander's charisma. Alexander knew thousands of his troops by name, and shared the dangers of battle and the fruits of victory equally with them. He could put down a mutiny with a mere speech reminding his soldiers of their shared exploits, or shame his troops into action by leading an assault alone. Ironically, in the end, the only army that stopped him would be his own. Tired from years of marching and fighting, and thousands of miles from home in the hot, humid plains of India, they refused to go any further. Only then did he turn around and go back.

The Battle of Issus (333 B.C.E.). The next year, the Persian king, Darius III came looking for Alexander with a huge force. By chance, the two armies passed within fifteen miles of one another with an intervening mountain range concealing each other's movements. Unfortunately, a camp of wounded Macedonians left behind by Alexander fell into the hands of the Persians who mutilated and massacred them. News of this atrocity only enraged Alexander and the Macedonians. They would get their revenge on the plain of Issus.

At Issus, Darius had an overwhelming number of men, but chose a narrow place for battle where he couldn't use those numbers effectively. Seeing this, Alexander ordered his left and center to grimly hang on, while he and his Companion cavalry slammed into the massed Persian infantry on his right, scattering them in a panic that spread to the support troops behind them.

Turning to his left, Alexander then led a wild charge against Darius in the center of the Persian line. Seeing the Macedonian king bearing down on him like some sort of madman, Darius panicked and fled. As word of the Great King's flight spread, the rest of the Persian army fell apart. Thousands died in the ensuing rout, many trampled by their own comrades in the rush to get away.

Among the spoils of battle was Darius' family. When Alexander entered their tent, they mistook his best friend, Hephaestion, as the king since he was taller. Despite this honest mistake, Alexander treated them well. So well, in fact, that when Persian troops came to rescue them during the battle of Gaugamela, Darius' mother reportedly refused to go with them, preferring Alexander to her own son..

The siege of Tyre (332 B.C.E.). After Issus, Alexander proceeded to reduce the coastal cities of Syria and Phoenicia to neutralize the Persian fleet. His greatest challenge came from Tyre, an island city that had resisted sieges by the Assyrians and Babylonians for 7 and 13 years respectively. Alexander solved this problem by building a dirt causeway (mole) connecting Tyre to the mainland.

The Tyrians' counter-siege techniques held up the Macedonians' efforts to build the mole for seven months. They would pour boiling sand onto anyone at the foot of the walls and snatch any Macedonians they could with grappling hooks, hauling them to the top of the walls, and torturing them in front of their comrades. When the mole was completed, Alexander could assault the city by both land and sea, putting siege towers on pairs of ships lashed together for stability. Its defenders paid a heavy price for their previous atrocities, as thousands of them were massacred and even more enslaved. The seven months Alexander needed to take Tyre was the longest time he spent in one place during his entire reign. Even today, Tyre remains connected to the mainland by Alexander's mole.

Tyrian fireships try unsuccessfully to burn the siege towers at the head of the Macedonian mole approaching their city.

The next Phoenician city, Gaza, held out for another two months. When it fell, Alexander had taken the last Persian naval base, thus forcing the Persian navy to disperse, thus securing his own communications with Greece and Macedonia.

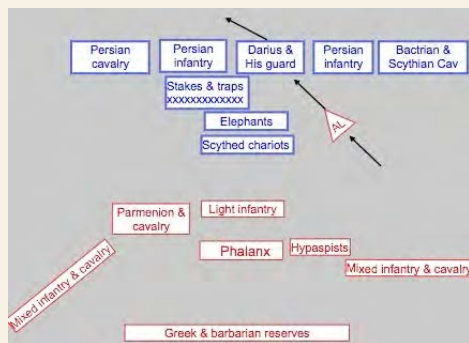

At this time, Alexander received a message from Darius offering him the Western half of his empire and 10,000 talents of silver in return for peace and his family. Alexander's old general, Parmenio, said if he were Alexander, he'd accept. Alexander replied, "and if I were Parmenio, I'd accept too. But I'm Alexander, and we keep on advancing."

After Gaza, Alexander entered Egypt. This was more a triumphal march than an invasion since the Egyptians hated Persian rule so much. While in Egypt, Alexander crossed the desert to a famous oracle at the oasis of Siwa. The priests there proclaimed him the son of their primary deity, Amon. Coins of Alexander, probably struck after his death, showed him wearing the lion skin of Heracles and ram's horn of Amon on the obverse. On the reverse is a seated Zeus, whom the Greeks often equated with the Egyptian Amon. The question is whether Alexander took these claims of divinity seriously or just used them for propaganda purposes.

Meanwhile Darius was waiting with a huge army at Gaugamela in Mesopotamia, even having slaves clear out a flat area for his hordes of Asiatic cavalry. As Alexander approached, he handled the swiftly flowing Tigris River by placing cavalry upstream to break the current and more cavalry downstream to catch anyone swept away. As a result he lost no one in the crossing.

The night before the battle there was a lunar eclipse, the cause of which Alexander had learned from Aristotle. However, to calm his more superstitious troops, he sent seers to tell them the eclipsed moon was Persia. Supposedly, the Persians, fearing a night attack, stayed up all night. By contrast, Alexander slept so well he had to be awakened in the morning.

To prevent being outflanked by Darius' overwhelming numbers, Alexander formed oblique wings and reserves that could collapse into a box to meet an attack from anywhere. To protect himself against another direct attack by Alexander, Darius had placed elephants, stakes, and traps along with his personal bodyguard in front of himself. In reaction, Alexander unexpectedly marched his army to the right, forcing the Persians to do the same to avoid being outflanked.

Having drawn Darius away from the stakes and pits, Alexander and his Companion cavalry suddenly charged obliquely across the field straight at Darius. Before the Persians could react, the Companion cavalry hit the Great King's bodyguard. As at Issus, Darius fled, and his army started to disintegrate.

But it took time for panic to work its way across the whole field.

Meanwhile, the rest of Alexander's army had to hang on desperately. In the center of the line, chariots with scythes attached to the axles charged. The phalanx opened lanes to let them through while peltasts and archers shot the drivers, causing the chariots either to retreat or pass through harmlessly.

However, the tight order of the phalanx was disrupted, which allowed the Persian infantry to get in among the phalangites and do some serious damage. This in turn forced Alexander to abandon his pursuit of Darius in order to save the rest of his army. When it was over, the carnage at Gaugamela was even more horrific than at Issus, the vast majority of the casualties coming in the panicked flight when Darius left the field.

After Gaugamela, Alexander triumphantly entered Babylon, still a resplendent city with its fabled Ishtar Gate and Hanging Gardens. Here he gave his soldiers a much needed month long rest.

But their labors had hardly begun.

Ever Onward: the Eastern Satrapies (330-327 B.C.E.)

After Babylon, Alexander continued to the Persian capital, Persepolis, which surrendered with 150,000 talents (4950 tons) of silver. One night, after some heavy drinking, the Macedonians burned the city in revenge for the burning of Athens in 480 BCE. The story goes that Alexander let a Greek *hetaira* start the fire, saying it took a whole Persian army to burn Athens, but only one Greek woman to burn Persepolis.

The destruction of Persepolis signaled the end of the League of Corinth's commitment to follow Alexander. Many Macedonian troops thought this was the end of their campaign as well, but as Macedonian subjects, they were still obligated to follow their king further eastward.

After Gaugemela, the Macedonians continued their pursuit of Darius. As they closed in on him, his general, Bessus, killed him and proclaimed himself the new Persian ruler. Nonetheless Alexander continued his pursuit eastward into Bactria, now to get Bessus.

Bactria, modern Afghanistan. The furthest reaches of the Persian Empire. A harsh land that bred harsh men. An entire British army perished here in 1845. The Russians did no better in the 1980s. The 19th century British poet, Rudyard Kipling, may have best described what it was like to fight here:

*"When you're left for dying on Afghanistan's plains
And the women come out to cut up what remains
Just roll to your rifle and blow out your brains."*

In relentless pursuit of Bessus, Alexander plunged ever deeper into this land of hopelessly entangled tribal feuds. Eventually Bessus' men wore out and betrayed him to Alexander who had him mutilated like a commoner before executing him. This cleared the way for Alexander to claim the title of Great King

Still, he pressed on.

Bactria confronted Alexander with a whole new style of warfare that forced him to divide his army into five columns to sweep across the country.

One column was nearly wiped out in an ambush and had to be rescued.

Alexander himself took an arrow in the leg, a stone to the neck and another to the head. In addition he almost died from drinking bad water.

Alexander spent three years here bringing its various tribes to heel, the longest it took him to conquer any territory.

The Sogdian Rock . At one point, he faced a mountain fortress known as the Sogdian Rock whose defenders laughed that the Macedonians would have to grow wings to take it. Alexander picked 300 volunteers, offering 12 talents of silver to the first one to scale the cliffs above the Sogdian Rock, 11 talents to the second, and so on. The next morning, the Bactrians awoke to find 300 of the enemy perched above them ready to attack.

After that, Bactrians would surrender at the mere word of Alexander's approach.

From king to King of Kings. With each new conquest, Alexander faced the growing problem of reconciling his old Macedonian position as first among equals with the his Persian subjects' view of him as King of Kings, an absolute monarch. Increasingly, he adopted Persian clothes, officials, and court customs to meet the expectations of his new position.

One issue that especially annoyed the Macedonians was the custom of *proskynesis* (groveling before the king), which at first only Persian subjects were required to perform. However, when he tried to get his Macedonian officers to perform this rite, the court historian, Callisthenes, refused, ruining the ceremony. Alexander dropped the matter after this.

All the tensions from extended campaigning in Bactria and new court rituals finally boiled over at one of the Macedonians' infamous drinking bouts. Cleitus the Black, an old soldier who had saved Alexander's life at the Granicus River, started shooting his mouth off about Macedonians lost in an ambush in Bactria, blaming Alexander's generalship. Meanwhile his friends exalted his exploits over those of Alexander. This drunken quarrel turned into a shouting match with friends having to hold them both back. Alexander threw an apple.

Cleitus replied with a snide remark about saving Alexander's life.

At that, Alexander ran him through and killed him.

Shocked by his own action, Alexander went into mourning, refusing to eat, drink, or sleep for three days. Finally, his friends convinced him to come out and lead them again.

But they weren't going home yet.

India and the Ends of the Earth

A map of the Greek concept of the world showing its one land mass surrounded by Ocean

But Alexander wasn't through yet. In 327 B.C.E. he led his army across the Hindu Kush Mountains into India, a land the Greeks believed only Dionysus and Heracles had seen. Now Alexander would add his name to that list.

Descending from the mountains, the Macedonians came across Aornus," the Birdless Rock", a 7000 foot plateau that commanded local passes and supply lines. Legend said even Krishna couldn't take it.

So Alexander had to.

Therefore, he built a huge mound for his catapults, something the Indians had never seen and totally panicked them. As the catapults cleared the ramparts, Alexander led the assault over the walls. Another great victory and the legend kept growing.

After that, the Macedonians plunged into the Punjab, an area with a complex network of city-states ruled by princes. Alexander exploited the situation whenever possible by playing princes off against one another. One prince he had to fight was Porus, a seven-foot giant whose army waited across the Jhelum River.

It was the height of the monsoon season, so the river was swollen and particularly difficult to cross. Alexander played a game of stockpiling a huge supply of food for Porus to see, making him think the Macedonians were willing to wait out the monsoon. Likewise, Alexander would stage fake night attacks with lots of noise to wake the Indians. Soon Porus tired of reacting to each of these moves. Then one night Alexander exploited a heavily wooded bend in the river to slip part of his army across. As Porus rushed to meet this threat, Alexander hurried to get the rest of his army across.

The battle that followed was probably the most brutal and desperate the Macedonians ever had to fight.

Indian armies used two especially deadly weapons. One was a type of longbow. The other was war elephants, giant organic tanks that could trample through the enemy, knocking some men aside with their trunks while crushing others.

The Macedonian phalanx tried to hold these beasts at bay with its wall of pikes while others showered them with missiles to panic them and still others would try to get under or behind them to chop at their hamstrings.

In addition, it was raining, making this battle a loud chaotic scene of trumpeting elephants, drums, gongs, thunder, and screaming men all bathed in mud and blood.

Eventually, Macedonian training and discipline wore down the elephants and turned the tide of battle. Supposedly, Porus kept fighting even while wounded until his elephant knelt down and forced him to surrender. When Alexander met Porus, whose courage he respected, he asked

how he would like to be treated. Porus' reply was short and to the point: "Like a king." Alexander agreed, making Porus his vassal king.

It was at this time that Alexander's war charger, Bucephalus died of wounds. Alexander founded a city, Bucephalia, in honor of the horse that had taken him through so many battles.

A map of the Greek concept of the world showed an outer ring of Ocean surrounding the one land mass. Supposedly, Alexander wanted to march all the way to the shores of Ocean. However, his troops, suffering from homesickness, India's hot humid conditions, poisonous snakes, rotting leather, corroding arms and armor, and uncertainty of how far it was to the Ocean, finally refused to go any further.

After pouting for a while, Alexander agreed to go back.

In the end only one army had stopped Alexander: his own.

Death...and Immortality (327-323 B.C.E.)

The Malloi. Although Alexander agreed to return home, the route there was not the same they had taken to India. Instead, he plunged further south into India to the Arabian Sea. From there he would cross the Gedrosian Desert back to Babylon. Unfortunately, this involved more hard fighting. The Macedonians, not wanting to die on their way home, were naturally reluctant to risk their lives in assaulting these cities. Things came to a head at the city of the Malloi, where Alexander, frustrated with his soldiers, seized a ladder and scaled the walls with only two comrades. Amazingly, he clawed his way to the top and cleared the nearby ramparts of defenders while

his stunned soldiers scrambled to follow him. However, before they could get to him, an arrow from an Indian longbow found its mark in Alexander's chest.

Overwhelmed with terror for the one man who could get them home and shame for letting him down, the Macedonians tore apart the city of the Malloi. Meanwhile, Alexander was carried back to his tent where surgeons extracted the barbed arrowhead that took with it a good part of his lung. Alexander's troops anxiously waited outside his tent all night. When the rumor spread that he had died, Alexander struggled to his feet and walked out to show his men he was still alive. Then, so all his men could see him, he mounted a horse. As the forest resounded with his soldiers' cheers, he returned to his tent and collapsed.

March through the Gedrosian Desert. Although not completely recovered from his wound, Alexander led his men homeward. Half of the army would march through the Gedrosian Desert while the rest of the army would sail along the coast to supply them. However, things did not work out as planned.

The Gedrosian Desert was a virtual hell on earth, providing the Macedonians with neither food nor water for the 60 days it took to make the passage. The heat was so intense that the army had to march at night. One day, a flashflood from a rainstorm upstream washed through their camp, which was in a dry riverbed, wiping out most of the camp followers, who were predominantly women and children. Alexander's tent was also washed away, but he was away on business. Horses, mules, and men floundered and sank in the deep sand, while a long string of abandoned equipment, pack animals' bones, and the lifeless bodies of men, women, and children marked the army's tortuous path.

The last drop of water. The story goes that one day, a soldier presented Alexander with a helmet of water, the only water to be found in

the area. Holding the helmet up for the whole army to see, Alexander poured out all the water, showing that if the army couldn't drink, neither would he. The historian Arrian relates it was as if the whole army had been given a drink. Finally, the remains of the army reached the end of the Gedrosian Desert, which may have claimed three-fourth's of those who had left India. Gedrosia was at once Alexander's greatest tragedy and greatest triumph.

Having returned to Babylon, Alexander, who had already married a Bactrian princess, Roxane, now married Barsine, a daughter of Darius, thus securing a stronger legal claim to the Persian throne. In addition, seeing there were too few Greeks and Macedonians to administer such a huge empire by themselves, Alexander arranged to marry 10,000 of his soldiers to Persian women. The wedding feast lasted five days and took place in a pavilion 800 yards long with jeweled & gilded columns 30 feet tall.

Likewise, realizing he needed the Persians' help in defending his empire, Alexander had arranged for 30,000 Persian youths to be trained in Macedonian tactics. Upon reviewing these newly trained troops, he declared them his successors, an unguarded remark which his veterans took badly.

After all, they, not these Persian upstarts, were the men who had fought at Granicus, Issus, Gaugamela, & Jhelum River, had stormed a 1000 cities such as Tyre, Gaza, and Thebes & marched through Gedrosia where all others had failed. So now these battle-hardened veterans saw themselves being replaced by Alexander's Persian "successors".

This came to a head at Opis as Alexander was addressing veterans being discharged so they could go home. As he was thanking them for their loyal service, they started yelling insults and complaints, telling him to go back to his "successors."

This was the type of ugly scene that would overthrow many Roman emperors unless they put it down with a bloodbath of decimations. What ensued was possibly the most remarkable of all Alexander's achievements.

First he jumped from the platform, had the ringleaders arrested, and then addressed the troops.

He reminded them how his father had brought them up from rude shepherds and taught them how to fight, making them masters of Greece and Macedonia.

He recounted the conquests he had led them in, making them masters of the known world, and how he had shared all their dangers and hardships.

He tore open his tunic to show all his wounds, and how they were all in front.

He reminded them how he had selflessly shared the plunder with his men, making them each wealthy beyond their wildest dreams, and how he was now sending them back to a comfortable retirement after all these years.

And this was how they were repaying him-- with a mutiny.

Then all right, they could go home with their wealth and reputations and tell everyone how they had abandoned him in Asia.

Then, turning toward his tent, he left them with one last word: "Go!"

His men, stunned by this speech, at once rushed Alexander's tent, begging him to take them back.

Alexander soon emerged from his tent, and the soldiers were tearfully reconciled with their king.

Only Alexander could deal with a mutiny in such a way.

Alexander's death. In 323 B.C.E., while at Babylon, Alexander came down with a fever that got progressively worse. When it became apparent that he wouldn't survive, he let his soldiers file through his tent to say their final farewells, using what little strength he had left to gesture in reply. After they had gone, his generals crowded around him wanting to know to whom he was leaving his empire. Supposedly with his dying breath, in a barely audible voice, he said "To the strongest." He was not yet 33 years old when he died.

It was said on that night a shooting star suddenly appeared, cutting brightly through the heavens, and then just as suddenly burned out and disappeared. To people of that time, it seemed neither Heaven or Earth would ever be the same again.

The Logistics of Alexander's Army

Even the most scholarly texts ignore the day-to-day logistics of such things as how to get an army of thousands of soldiers, camp followers, cavalry horses and pack animals from one place to the next. Where and how did they get enough food and water to sustain them? How did they traverse various physical barriers like rivers and mountains? What were the roads like, how many men could walk abreast on them, and how far did the army on the march stretch? Of course, spending as much time discussing these issues in proportion to how much time people in real life had to spend solving them would be inconvenient and boring. But it's important to occasionally take the time to look at them so we can fully appreciate what an accomplishment it was for someone like Alexander to take an army from Greece all the way to India and back.

Our sedentary lifestyles today dictate we should consume no more than 2000 calories a day. However, the hard physical labor typically done by our ancestors required an estimated 6000-6500 calories, including 70 grams of protein *each day*.

The staple of a soldier's diet in Alexander's army was grain (wheat, barley, and millet) that was stored dry to prevent rapid spoilage. Without refrigeration, meat, fish, fruit, and vegetables were rarely given unless found in quantity on the march. Therefore, each soldier needed a minimum of 3.9 pounds of wheat, which would yield 3.5 pounds of bread and 3600 calories *each day*. However, this was really stretching it for soldiers marching with heavy loads all day in the hot sun. A more realistic figure would be five pounds of wheat daily to keep the army from dropping dead from hunger. That means that an army of 50,000 men would need 250,000 pounds (125 tons) of grain *each day*.

They also needed water. In the arid conditions of the desert a man would need 9 quarts of water each day, leading to a total of 450,000 quarts a day for the army as a whole *each day*.

But recent studies show that animals then also needed to eat and drink, the average horse requiring about 10 pounds of grain, 10 pounds of forage, and 8 gallons of water *each day*. Figuring there were 10,000 cavalry horses, that comes to 100,000 pounds of grain, 100,000 pounds of forage, and 80,000 gallons of water *each day*.

But wait! Carrying food and water also required thousands of pack animals and servants (that I imagine also liked to eat and drink *each day*). A reasonable estimate would be one servant and one pack animal for every four soldiers and 50 soldiers respectively to carry non-comestible supplies (tents, etc.), which adds 12,500 men and 1300 baggage animals to the total. (I won't even mention camels, which were used extensively after Egypt and consumed 4 pounds of grain, 50-60 pounds of straw, and 10 gallons of water *each day*.)

Each pack animal could carry 250 pounds (including 10 pounds per day for its own grain). Adding a second day of food reduced the amount of non-comestibles it could carry to 230 pounds, and so on. Thus carrying 25 days supply for themselves would mean they were only carrying enough for themselves to eat and nothing more, making their very presence less than worthless. And that's for an area *with* water and forage for horses.

Therefore, the number of pack animals needed to carry 1 day's food supply (269,000 pounds grain) for 50,000 men and 10,000 horses would be 1121 (269,000 divided by 240, which was the carrying capacity of one animal minus 10 pounds of its own grain for 1 day).

If two days' rations were carried, that would be 538,000 pounds divided by 230 (250 minus 20), requiring 2340 more animals.

The army would need 40,350 pack animals to carry 15 days' of supplies, 107,600 animals for 20 days, and so on.

A realistic upper end would be 10 days' supply, requiring 17,933 animals.

But it gets even better, because the much smaller crop yields back then meant the army had to draw supplies from a much bigger area, which would require more animals to carry grain *to* the army. But we won't even count that.

Marching through terrain with water, but neither food nor forage meant the army must bring 343,000 pounds of food and forage for one day. Divide that by 230 (250 pounds minus 20 for each pack animal's own grain *and forage*), and the army would need 1492 animals to carry just one day's supplies. Carrying more than 12.5 days' supply would be impossible since the pack animals will need all of it for themselves.

Marching through a desert *without food, forage, or water*, would dictate carrying 1.26 million pounds divided by 150 (250 minus 20 for food and 80 pounds of water at 10 pounds per gallon). The army would then need 8400 animals just to

carry 1 day's supply. At that rate, pack animals could only carry enough to supply themselves alone for 2.5 days. If each person carried 30 pounds of supplies (in addition to his own equipment), the army could last 4 days in the desert with 11,400 pack animals.

The length of the baggage train also must also be considered. At 5 yards per animal (animals apparently need their space, too), traveling single file (such as through mountain passes), an army with 27,000 animals (17,000 of them carrying 10 days' supplies) and 62,500 men (soldiers and servants) would stretch 30 miles. Since the Macedonian army probably only marched on average 15 miles per day (much less in rough terrain such as mountain passes), that means the front of the army would be reaching the next night's campsite two days before the end of the army even started. Even walking 10 abreast (an optimistic figure), the army would stretch three miles, creating a very vulnerable target for raiders.

Yet Alexander did make this 11,000-mile march, traversing deserts for more than 4 days between resupplying, which begs the question: how did he do it? Of course the time and expense of writing with quills on papyrus was so great that ancient historians couldn't bother themselves with such mundane issues. In other words, we don't know how Alexander did it. Maybe that's why they called him the Great.

Alexander's Successors and the Battle for his Empire (323-301 B.C.E.)

As with most paintings of what we imagine the Colossus of Rhodes looked like, this shows it as impossibly big.

Alexander's generals, called the Diadochoi (Successors) were an exceptionally talented and ambitious group of men. (Great generals usually have an almost equally talented group of officers capable of understanding the nuances of their orders and carrying them out effectively.) Therefore, once Alexander's strong hand was removed, it was to be expected these men would fight tooth and nail to grab as much power for themselves as possible. The result was nearly a half-century of wars between the Diadochoi and their successors (Epigonoι) before a fairly stable political situation emerged by c.275 B.C.E. Since this is such a complex period of wars and intrigue, it would be best to just present some of the main events to give a flavor of the times.

The Lamian War. Almost immediately upon news of Alexander's death, the Greeks, led by Demosthenes and Athens, rose up in revolt. After some initial victories against Antipater, Alexander's general in Greece, Macedonian reinforcements arrived and crushed the revolt. Demosthenes, upon being tracked down, took poison rather than fall prisoner to the Macedonians.

The Bactrian mutiny. Meanwhile, some 23,000 troops, left to garrison Bactria (Afghanistan) in the farthest reaches of the empire, decided to march home. A Macedonian general, Peithon, rounded them up but, instead of returning them to Bactria, massacred them. Given the small number of Greeks and Macedonians available to garrison the empire, was an especially irrational thing to do.

Ptolemy and Egypt. The Macedonian general, Ptolemy, had taken Egypt as his share of the empire upon Alexander's death. To add to his prestige, he diverted Alexander's body from its destination in Macedon to Alexandria, claiming it had been Alexander's wish to be buried there. Perdikkas, the regent for Philip III Arrhidaeus and the young Alexander IV, took this as an act of rebellion and invaded Egypt. However, when

a number of his men were swept away while trying to cross the Nile and another thousand supposedly eaten by crocodiles, Perdikkas' officers murdered him.

Eumenes, the one Greek involved in these wars, had no prior military experience but proved to be as brilliant a general as his Macedonian opponents. At one point, when faced with a mutiny by his troops, Eumenes had them stand before Alexander's empty throne (at least he said it was Alexander's) and convinced them they should obey him as if Alexander were still alive and sitting there. However, when part of his army switched sides in the middle of a battle, allowing his camp to be plundered, Eumenes' soldiers, who were Macedonians and didn't like Greeks anyway, betrayed him to the enemy general, Antigonus the One-eyed, in return for their baggage. Antigonus had him executed, despite the pleading of his son, Demetrius, to spare Eumenes' life.

The end of Alexander's family. Except for his sister, Thessaloniki, the rest of Alexander's family met grisly ends, being little more than pawns caught in the wars between his generals. First of all, Alexander's mother, Olympias, murdered his half-brother, Philip Arrhidaeus, to secure the throne for her grandson, Alexander IV. Right after that, one of Alexander's generals, Cassander, killed Olympias. Six years later, when Alexander IV was almost of age to assume the throne in his own right, Cassander had him and his mother Roxanne murdered. With all the males of the royal family eliminated, Alexander's generals started assuming royal titles for themselves.

Truly Winged Victory. In 306 B.C.E. Antigonos' son, Demetrius Poliorcites ("besieger of cities"), dedicated the famous statue of Winged Victory to commemorate defeating Ptolemy in a huge naval battle. Next year, however, Demetrius was defeated after an epic siege of Rhodes. Maybe he should have left the wings off his statue of Victory like the Athenians did with theirs.

The Helepolis was a massive siege tower built during the siege of Rhodes (305-4 B.C.E.) and for which Demetrius earned his nickname, "Besieger of Cities". It was ten stories tall, armed with catapults, and plated with iron on three sides. In addition to men pushing it from behind, it required 200 men inside to drive a capstan attached by belts to a mechanical device, to move it. The Rhodians stopped it by flooding the land in front of their walls so it couldn't support the tower.

The Colossus of Rhodes was a huge statue built by the Rhodians as their own victory trophy, buying the bronze and iron needed for it with money from the sale of the armaments Demetrius Poliorcites had left behind after his unsuccessful siege. Although supposedly so tall that ships could sail between its legs, it was most likely much smaller, but was still considered one

of the Seven Wonders of the Ancient World. Toppled by an earthquake in 222 BCE, it lay in Rhodes' harbor for 900 years, still a major tourist attraction, before being sold as scrap metal. Not a piece remains.

Pachyderm power. The battle finally determining that Alexander's empire would not be reunited took place at Ipsus in 301 B.C.E., pitting Antigonos the One-eyed and his son Demetrius Poliorcites against two other Macedonian generals, Seleucus and Lysimachus. The decisive element was a corps of 480 Indian war elephants traded to Seleucus by Chandragupta Maurya in return for Alexander's lands in northwest India. In the battle, the elephants turned Antigonos' flank and then trampled through his phalanx. Antigonos went down fighting at the age of 80.

Demetrius Poliorcites survived the Battle of Ipsus and made his way to Macedon, where he seized power by murdering the two sons of Cassander (who himself had earlier murdered Alexander's mother and son). Demetrius, not the most stable of personalities, quickly lost Macedon and was finally captured by Seleucus, who let his prisoner slowly drink himself to death. Demetrius' son, Antigonos Gonatus ("knock-knees") retook Macedon where he established the Antigonid Dynasty.

The Galatians were Celtic Gauls who invaded Greece around 275 B.C.E. Luckily for the Greeks, Antigonos Gonatus defeated them and drove them out. They eventually settled in Asia Minor (modern Turkey), giving their name to the region known as Galatia and a book in the New Testament.

Alexandria: Queen of Hellenistic Cities

A view of how Alexandria probably looked in the Hellenistic era, showing its layout into a rectangular grid (a design the Romans would adopt and pass on to the West), the lighthouse (top) and the jetty connecting it to the mainland and dividing the harbor into two parts, one for regular commerce and the other just for grain, Egypt's primary export.

Under the Ptolemies, it was said that when one left Alexandria he was leaving Egypt. In fact, it was more like entering Egypt, since Alexandria was such a thoroughly Hellenized city that the real Egypt and Egyptians only existed in the countryside beyond its walls. The city also had so much white stone that it was supposedly blinding in the daylight and incapable of being burned. Its streets were laid out in a rectangular grid to take advantage of the cool daily sea breezes.

Whenever a ship came into Alexandria's harbor, government officials would confiscate any books not found in the library. Scribes would copy the books and give the copies back to the original owners, since each generation of hand-copied books would have more mistakes than the last. Therefore the library of Alexandria had the best versions of thousands of books. Too bad it burned down.

Organic Tanks and Fire Pigs

Probably the best Hollywood portrayal of how to combat war elephants is the Battle of Pellennor Fields in the fantasy film, *Return of the King*, although the "oliphants" are much bigger than real elephants.

"Organic tanks". Hellenistic rulers especially valued war elephants, which could be effective in panicking the enemy's cavalry and trampling its infantry. However, they in turn could be panicked by fire, loud blasts of trumpets, or showers of javelins, making them just as prone to trample their own troops as those of the enemy. In such circumstances, the mahouts (drivers of the elephants) would kill them by driving stakes into the bases of their skulls. Soldiers would also try to slash their tendons, although getting under one of these beasts to do that must have been especially risky.

Firepigs? Pigs were presumably used in ancient warfare to panic elephants with their squealing. Later sources refer to "firepigs" which were coated with tar and oil and then set on fire to stampede enemy elephants or cavalry and disrupt opposing infantry formations.

They were also used in the final stage of sapping (undermining) enemy walls. After a tunnel was dug under a part of the wall and propped up by flammable timbers, flaming pigs would be sent in to set the supports on fire to collapse the tunnel and hopefully the wall above, creating a breach into which besieging forces could enter the city or fort.

Obviously, these critters wouldn't last too long, but may have provided the victors with a ready-made dinner after a hard day of fighting.

Behemoths of the Sea

Behemoth ships. The shortage of skilled rowers encouraged Hellenistic monarchs to substitute size for speed and mobility. However, ships referred to as hepteres (“sixers”) or septiremes (“seveners”) did not refer to the number of banks of oars, as previously thought, but to the number of rowers per vertical row of oars. For example, a septireme would most likely have two banks of oars with four rowers on the top oar and three on the bottom. Modern research indicates that the maximum number of rowers an oar could accommodate was eight. Thus ancient references to “30s” and “40s” were probably pure fantasy or mistranslations of original sources.

The mother of all behemoths (top) was a 420-foot long twin-hulled warship built by the Ptolemies that carried a crew of 1,000 rowers and 3,000 marines on its deck. However, it proved too large for using in battle and was mainly used for show. Its peacetime counterpart was a huge 300-foot long pleasure barge (belwo) with columns that towered sixty feet above the water. Obviously, such a top-heavy monster was not sea-worthy, so was towed up the Nile by dozens of galleys, largely for the purpose of over-awing the Ptolemies’ Egyptian subjects.

Ptolemy IV’s “fun behemoth” (matched any of today’s superrich as far as showy over-indulgence was concerned. (Also available for weddings and bar mitzvahs)

Hellenistic Philosophy

During the classical period, the small personal nature of the polis encouraged a belief in the individual’s ability to find truth on his own and to make a difference in society. The philosophies of Plato and Aristotle especially reflected this. However, after Alexander, the huge scale of Hellenistic kingdoms and the more absolute nature of their monarchies made people feel less in control of their own lives and fates. Tyche (above), the goddess of chance or fortune, became especially popular as a symbol of this sense of helplessness at the hands of the universe. The philosophies of the age also reflected this, showing less concern for civic affairs (since they were out of our control anyway). Instead, they stressed attaining personal inner peace in the world as it is rather than trying to change it.

Stoicism, was started by Zeno of Citium, a Phoenician town on Cyprus. It got its name from the covered porch (stoa) where Zeno met with his students. Thus the term Stoics literally meant “porchers”. Zeno said the Cosmos was organized along rational principles (logos), and that we attain peace when we learn to accept life as it is and live according to its logos. While Zeno’s philosophy stressed bearing up under hardship and doing one’s duty, it did not advocate working for empty honors or trying to change the system. Stoicism was especially popular during the Roman Empire, helping people make sense of their lives under the autocratic rule of the emperors.

Epicureanism, started by Epicurus of Samos took a different view of the universe, saying it was beyond rational understanding, that the gods were totally detached from our affairs, and that there may or may not be an afterlife. Therefore, our goal in this life should be to avoid pain. This has been misunderstood as advocating a

hedonistic lifestyle, as seen in our use of the word *epicurean* for someone who especially enjoys fine foods. However, Epicurus said such excesses ultimately lead to pain and thus should be avoided. Epicureanism, with its total absence of any sort of divine involvement in this world, has been seen as the first truly humanistic philosophy. It experienced a revival of interest in the 1700s in the form of Deism, a philosophy popular with such founding fathers as Thomas Jefferson and Ben Franklin.

Hellenistic Art

Statue of a child and a goose

Hellenistic art, while continuing the Classical period's more natural and realistic portrayals of people, expanded its approach from just showing idealized images of the male nude to more realistic and, at times, unflattering views of all sorts of people: old men and women, children, dying barbarians, and even drunks. Roman sculpture would carry on the Hellenistic age's brutally honest approach to sculpture rather than the classical ideal.

Statue of a dying Gaul and a boxer

Statue of an old drunken woman and old woman in a market

Aphrodite of Melos (AKA Venus de Milo) c. second century B.C.E. There were no statues done of female nudes until the 4th century B.C.E. since the male figure was seen as the only standard of beauty. Thus the portrayal of the female nude may indicate a slightly higher status for women.

INTRODUCTION TO THE RISE OF ROME

Introduction. When we think of the Greeks, we think of a bold, intelligent people who gave us so much in the way of art, architecture, drama, democracy, science, and math. When we think of the Romans, we think of empire builders. They were a more down to earth people who may have done little that was original compared to what the Greeks did. But they built and maintained an empire that peacefully embraced the entire Mediterranean Sea for some two centuries, an accomplishment unparalleled in history. The Romans also spread civilization into Western Europe. In that sense, they were the bridge between the older cultures of the ancient Near East and our culture, known as Western Civilization.

There is probably no story that better illustrates what the early Romans were all about than that of the founding of Rome by the twin brothers, Romulus and Remus. According to this legend, there was disagreement over where to found the city. When omens from the gods failed to settle the dispute, Romulus just started digging the *pomerium* (sacred boundary) of Rome where he thought the gods wanted it. Remus mockingly leaped over this trench and Romulus killed him, declaring that such a fate should befall all who dared to breach the walls of Rome. The story of Romulus and Remus shows that the Roman sense of honor, duty, and loyalty to Rome ran even deeper than family and kinship ties. Other Roman legends also had this theme of honor and duty running through them: the story of Horatius, who single-handedly defended a bridge against invading Etruscans in order to buy his city time to prepare a defense; the consul Brutus who had his own sons executed for plotting treason against Rome; and Lucretia, who committed suicide rather than live with dishonor to herself and Rome. Such stories idealize the Roman character, but also raise the question of what factors shaped it and pushed Rome to greatness. And, of course, the first place to look is the environment surrounding Rome and its people.

Geopolitics. At the time of its founding around 750 B.C.E., there was little to hint that Rome and Italy would be the center of the greatest empire in antiquity. Italy did have good soil along with some

resources and good harbors in the South. These features attracted Greek colonists whose culture would exercise an immense influence on Roman civilization. Also, Italy's soil tended to make its people farmers rather than artisans and merchants.

These factors, in particular the close ties to the soil, largely molded the Romans' personality as a people. While it is dangerous to stereotype a whole people's character, there are certain values and circumstances that any people as a whole share which helps define how they think and act. The quick-witted Greeks, whom the sea and lack of resources forced into becoming clever and resourceful traders, looked upon the agricultural Romans as slow and dull. But there were several characteristics that would help the Romans become great empire builders.

First of all, being farmers bred a certain ability and willingness to persevere through hardships. Nothing shows this better than Rome's dogged perseverance and eventual victories in its first two wars against Carthage, wars which dragged on for 23 and 17 years respectively.

The Romans' reputation for perseverance especially shows up in the story where a delegation came to a Roman general about to besiege their city. After boasting they had ten years worth of food stockpiled, the Roman general calmly announced, "Then I guess the city will fall in the eleventh year." The city surrendered the next day.

Agriculture tended to make the Romans somewhat more conservative and wary of change. They were also a tightly knit society, more willing to submit to the rule of law than the quarrelsome Greeks ever were. This Roman discipline produced magnificent soldiers and the most efficient and effective armies in the ancient world. It also produced an intense desire for the rule of law that made the Romans possibly the greatest lawgivers in history. Many Western European countries today base their law codes directly on earlier Roman law codes.

One other characteristic marked the Romans for greatness: a willingness to adapt other peoples' ideas for their own purposes. All people borrow ideas, but few have been so adept at it as the

Romans. Their art, architecture, technology, city planning, and military tactics all owed a great deal to other peoples' influences. Indeed, there was little that the Romans did that was totally original. But the sum total of what they did was uniquely Roman and marked them out as one of the most remarkable peoples in history.

The Romans especially adapted weapons and techniques of warfare from their neighbors and enemies. Along with urban planning on a rectangular grid, which they applied to their military camps, they got the Greek phalanx from the Etruscans. Later, they traded this for the more flexible manipular tactics of their Samnite enemies. From the Greeks they got siege weapons, while from the Gauls they got chain mail and from the Spaniards the short sword which would be their primary close order combat weapon.

Italy's topography also had an impact. The Alps to the North provided some protection, although occasionally invaders, such as the Gauls and Carthaginians, did break in. Another mountain range, the Apennines, ran along the length of the peninsula much like a backbone. While this had the effect of dividing Italy into various city-states, it was not nearly to the extent that Greece was broken up by its mountains. These two factors, plus the Roman character, allowed Rome to unite Italy relatively free from outside interference

Finally, Italy's location favored it in two ways. It had a strategic position that divided the Mediterranean into western and eastern halves. Also, it was far enough away from the older civilizations of antiquity to allow it to develop on its own without too much outside interference. Therefore, once Italy was unified, its geographic position allowed Rome to unite the Mediterranean under its rule.

The Aeneid

Aeneas escaping with his family from Troy

For the origins of the Romans, as with any ancient people whose beginnings go back before they kept written records, we must rely partially on legends. We typically refer to such stories as myths, but for those telling them, they were history lessons containing the combined collective wisdom of that society and invaluable lessons on life. For us, they are valuable on two accounts. First, there is typically some historical fact to be derived from such tales, as long as we are careful in how we interpret them. Secondly, they tell us a lot about the values of the people relating them.

For the Romans, their history began with Aeneas' story as told in the *Aeneid*, an epic poem trying to tie Roman mythology and history with that of the Greeks. Although it emulated the *Iliad* and *Odyssey*, it was not the product of an oral tradition evolving over a long time. Rather Vergil wrote it as a finished work centuries later for his patron, the emperor Augustus. Its hero, Aeneas was the son of Aphrodite and a Trojan prince. His son, Iulus, would give rise to the Julian clan, whose descendants would include Julius Caesar and Augustus.

In Book II Aeneas recounts the story of the Trojan Horse and the sack of Troy, which is our main source for details of that story. After leading a heroic but doomed defense of his city, he escapes with a number of followers and his son while carrying his aged father, Anchises, on his shoulders.

After various adventures largely paralleling the wanderings of Odysseus, the Trojans are cast ashore at the recently founded city of Carthage where Aeneas meets Dido, the Queen of Carthage, with whom he has a love affair. However, the gods beckon Aeneas to find a homeland for his people, causing the heartbroken Dido to commit suicide when he leaves. This sets the stage for the epic struggle between Rome and Carthage centuries later. Interestingly enough, Carthage was probably founded shortly before Rome.

The Trojans finally reach Italy, where Aeneas meets the Sibyl, a prophetess who foretells all the wars he must fight. She then escorts him to the underworld, much like Odysseus' journey there in *The Odyssey*. In the underworld Aeneas talks with many of the dead, including his father, Anchises, who foretells Rome's greatness and shows him future great Romans, including Aeneas' descendants, Julius Caesar and Augustus. Aeneas, now sure of his destiny, determines to settle in Italy

In Italy, Aeneas meets Latinus, king of the Latins, who, to avoid a horrible prophecy that his daughter, Lavinia, will be the destruction of her people, marries her off to Aeneas. However, she is already betrothed to another Latin prince, Turnus, which triggers a war between the Trojans and Latins. After many heroic deeds, *The Aeneid* ends with Aeneas slaying Turnus to end the war.

Rome's Foundation Myth: Romulus and Remus

Statue of the Capitoline Wolf nursing Romulus and Remus

According to legend, Aeneas' son, Iulus founds a new city, Alba Longa. Twelve generations later, Iulus' descendant, Numitor, inherits the throne,

which is usurped by his evil brother Amulius, who drives out Numitor and kills his male relatives. He also forces Numitor's daughter, Rhea Sylvia, to become a Vestal Virgin (priestess of Vesta) so she can bear no children. But she gets pregnant anyway, claiming she was raped by the god Mars. Numitor has her imprisoned and orders her twin boys, Romulus and Remus, drowned. However, the man entrusted with this awful task cannot carry through with it, so he leaves the boys on a river bank, hoping floods will do his dirty work.

Instead, they are found and nursed by a she-wolf and fed by a woodpecker under a fig tree, all sacred symbols. Later, a shepherd, Faustulus finds them, so he and his wife raise them as their own sons. The boys grow up and form a band of shepherds, attacking brigands and sharing their take with Faustulus. However, during a festival of Pan, brigands capture Remus and take him to Amulius, claiming he was raiding the king's lands. Faustulus tells Romulus his origins, who then breaks into the city, frees Remus, and restores Numitor to his rightful throne of Alba Longa.

Romulus and Remus then decide to found their own city, but disagree over the site. Looking for omens Remus sees six vultures first, but then Romulus sees twelve. When Romulus starts to dig the sacred *pomerium* (city boundary), Remus jumps over it and mocks it. Romulus then kills his brother with the words "So perish whoever else shall overleap my battlements." Thus Rome was founded with the bloodguilt of fratricide.

Other Roman legends also had this theme of honor and duty running through them: the story of Horatius, who single-handedly defended a bridge against invading Etruscans in order to buy his city time to prepare a defense; the consul Brutus who had his own sons executed for plotting treason against Rome; and Lucretia, who committed suicide rather than live with dishonor to herself and Rome. Such stories idealize the Roman character, but also raise the question of what factors shaped it and pushed Rome to greatness.

Folding Alps, Land Bridges, and Dwarf Elephants

A dwarf elephant and hippo next to a modern African elephant

The name Alps probably derives from the Latin word, *albus*, meaning white. They were formed by a collision of the African and European tectonic plates, which folded the land in between into mountains. The same collision of the African and European tectonic plates that formed the Alps also formed the Apennines, although it was a gentler collision, if that can be said about any collision of tectonic plates.

During the Ice Ages, when more water was locked up in the icecaps, there was a land bridge connecting southern Italy to Sicily and then North Africa, thus cutting the Mediterranean in two.

One natural curiosity once seen in Sicily and Southern Italy were dwarf elephants, which stood only about three feet tall and were native to the Mediterranean. These creatures may have reached Sicily and Southern Italy by the aforementioned land bridge or swimming - a hypothesis supported by the fact that modern elephants swim well. Once on shore, the unique ecological factors of islands, such as small land area, limited resources and absence of large predators, pushed natural selection in the direction of reduced body size - a process known as insular dwarfism. Unfortunately, these animals were probably extinct by historical times. They would have made great pets.

THE ETRUSCANS AND THEIR IMPACT ON ROME (C.650-500 B.C.E.)

Although there is evidence in Roman myth and archaeology of various shepherd villages on Rome's seven hills, the city's history really started with the Etruscans. The origins of this mysterious people are obscure. Some ancient sources liked to trace them back to Asia Minor because of their religious practices such as augury (reading flights of birds to tell the future), style of dress (in particular their pointed shoes which resembled those of the Hittites), their use of the arch in architecture, and their obscure language. However, even to this day, the origins of the Etruscans remain a mystery.

The Etruscans were organized into a loose confederation of city-states to the north of Rome. Around 650 B.C.E., they took control of the site of Rome, with its defensible hills and location on a ford of the Tiber River. They did a number of things to transform this crude collection of shepherds' huts into a true city. For one thing, they introduced rectangular urban planning. They also drained the surrounding marshes and built underground sewers. They built public works using the arch and vault, and laid out roads and bridges. They promoted trade, the development of metallurgy, and better agriculture in and around Rome.

Clearing the air. Among the most useful skills the Etruscans taught the Romans was that of drainage engineering. Vertical shafts would be dug in low-lying land that would drain standing water to a channel (cuniculus), which in turn would lead down to the nearest river or stream. Besides turning low-lying swamps and marshes into useful farmland, such drainage projects also eliminated malaria by driving off the anopheles mosquito. Ironically, they had no idea of what caused malaria, which in Latin means bad air.

The Etruscans, being heavily influenced by the Greeks, also introduced the Greek alphabet, thus introducing Greek influence into Roman culture. In fact, Roman nobles during this period would send their sons to be educated in Etruscan schools much as they would later send their sons to Greece for an education. The dark and gloomy Etruscan religion, in particular the custom of gladiators fighting to the death at the funeral of a king or noble, also had a significant impact on Rome. This is seen much

later in Christian images of demons that seem to be modeled after Etruscan demons. Overall, the Romans owed a great deal to the Etruscans. The genius they would show for urban planning, road and bridge building, and civil engineering projects such as public aqueducts and baths, was a direct result of the legacy left by the Etruscans.

Those “fascist” Romans. The Romans also adopted a number of Etruscan symbols of power and authority: the military standard of the eagle, the scarlet military cloak for generals, and the purple-bordered togas denoting nobility. They also used the custom of preceding an official with *lictors*, men who bore the *fascies*, a bundle of rods with an ax, which symbolized the official's power of life and death. (Inside the city's *pomerium* there was no ax in the bundle, indicating more limited power.) It is from *fascies*, a symbol of power, that we get the word fascist.

By 500 B.C.E., the Etruscans had made Rome most important city in the central Italian region of Latium. This enabled it to dominate its close neighbors, the Latins and finally encouraged it to rebel against its masters and shake off Etruscan rule, the traditional date being 509 B.C.E. However, Rome was still in a precarious position. Etruscan aggression from the north remained a serious threat, while hill tribes from the east were also attacking, and the Latin tribes to the south saw this as a chance to rebel against Roman rule, now that it had lost Etruscan support.

The Etruscans made a concerted effort to restore their rule over Rome. The story of the Roman hero, Horatius, single-handedly defending the bridge to Rome against an Etruscan surprise attack reflects this effort. However, the Etruscans' loose organization into a confederacy of independent city-states made them vulnerable to attack by the Greeks in South Italy who were their rivals for trade and sea power. In 474 B.C.E., the Greeks, and peoples of Latium allied to defeat the Etruscan navies at Cumae. After this Rome was able permanently shake off Etruscan rule.

The way Rome dealt with the Latins anticipates its success as a ruler in the future. Having beaten them at the Battle of Lake Regillus, Rome formed the Latin League, with itself as leader, but treating the Latins more as allies than subjects and sharing joint conquests 50-50 with them. As a result, the Latins

were some of Rome's staunchest allies, especially in the dark days of the Second Punic War against Hannibal.

Rome dealt with the hill tribes, the Aequi, Volsci, and Hernici in a more clever and devious way. First, it allied with the Hernici who were in the center, thus isolating the Aequi and Volsci from each other. As a result, Rome and the Hernici could defeat the Volsci, and Aequi one at a time. Then, with the Aequi and Volsci under control, Rome could turn against the Hernici.

Except for one brief interlude with invading Gauls from the North, Rome was now secure enough to embark upon the conquest of Italy.

Those Wild Etruscan Women

Etruscan women had relatively high status, as seen by statues of men and women reclining together on dining couches. Greeks and Romans alike, such as the Greek historian Theopompus of Chios, had some very pointed ideas about this: *"...Further they dine, not with their own husbands, but with any men who happen to be present, and they pledge with wine any whom they wish. They also drink excessively and are very good looking. The Etruscans rear all the babies that are born, not knowing who the father is in any single case..."*

The Sibylline Books: Rome's Books of Prophecy

The Sibyl offers the remaining three books for quadruple her original price for nine books

The story goes that one day, the Etruscan king of Rome, Tarquinius Superbus, was approached by an old woman who offered to sell him a set of nine books for an outrageously high price. When Tarquin turned her down, she burned three of the books and doubled her price. Tarquin, thinking her crazy, refused this offer. So she burned three more books and doubled the price again for the remaining three. Amazed at her behavior, Tarquin accepted this last offer, buying what turned out to be books with prophesies about Rome's future.

Whenever the Romans faced a crisis, they would consult these books for clues on what to do. Like the Oracle of Delphi, the Sibylline Books gave answers that were somewhat cryptic and ambiguous, thus making it virtually impossible to prove them wrong. One can't help but wonder what was in the six books she burned. Probably just recipes.

A good example of how the Romans used the Sibylline Books occurred when they were faced with a Gallic invasion. The Sibylline Books said Rome must twice be held by enemies. Having been taken once before by the Gauls in 387 B.C.E., the Romans were desperate to avoid a second conquest. The solution was ingenious. They took two Gallic slaves and buried them alive, so they were holding Roman soil, thus fulfilling the prophecy with minimum pain to Rome.

Tales of Roman Honor

**Rembrandt's painting of Lucretia
killing herself to preserve her honor**

A woman's honor. According to Roman legend, the rape of a Roman woman, Lucretia, by Sextus Tarquinius the son of the Etruscan king triggered the revolt against the Etruscans. To prove her sincerity and virtue, Lucretia killed herself after announcing the rape to her kinsmen, who overthrew Etruscan rule to avenge her death. By the way, the name Sextus just meant Sixth, and had nothing to do with his libido.

Lefty. Another story of Roman courage concerns Gaius Mucius. When the Etruscans were besieging Rome, Mucius sneaked into the enemy camp, intent on murdering the Etruscan king, Lars Porsenna. Unfortunately for Mucius, he mistook another official for the king and killed him instead. He was immediately apprehended and taken to the real king. To show his contempt for pain and death, Mucius thrust his right hand into a fire and burned it off. The Etruscan king was so impressed with Mucius' courage that he let him return to Rome. Ever after, Mucius had the nickname Scaevola, meaning "Lefty".

Cincinnatus is the subject of another popular story of Roman civic virtue. When the Volsci had trapped a Roman army, the Senate offered a citizen named Cincinnatus the office of dictator, giving him absolute power for the duration of the emergency. After performing his duty, Cincinnatus gave up his powers and returned to the simple life of a farmer, showing the selfless patriotism that Romans idealized and expected of their citizens. In the early days of the American Republic, patriots wanting to keep alive the ideals of their revolution, founded the Society of the Cincinnati, which still exists.

THE ROMAN CONQUEST OF ITALY (c.400-265 B.C.E.)

In 390 B.C.E. Rome took the important Etruscan city, Veii, on its own without any help from the Latins, thus allowing it to claim this prize entirely for itself. This further established Rome's dominant position among the Latins, seriously weakened the Etruscans in the north, and made Rome the dominant power in Central Italy. Then disaster struck.

The siege of Veii supposedly lasted ten years, just like the siege of Troy, and, also like that siege, ended with trickery. According to the story, an oracle told the Romans to drain a nearby lake from which they dug a tunnel into the city. Just as they were to emerge inside an Etruscan temple, they heard the Etruscan king about to make a sacrifice, saying whoever made this sacrifice would win the war. The Romans burst out and seized the sacrificial knife to complete the ritual, thus taking the city and winning the war.

In 387 B.C.E. an invasion of Celtic Gauls descended on Italy. Having gotten involved with defending the Italian town of Clusium from these invaders, the Romans met the Gauls at the battle of the Allia River with disastrous results. The Gauls' wild charges panicked the Romans who fled to Rome, which the Gauls besieged Rome for seven months before finally being paid to leave. Many of them settled in northern Italy, which came to be known as Cisalpine (this side of the Alps) Gaul. Although they recovered quickly from it, this incident left serious psychological scars on the Romans who from this point feared the barbarian giants from the north. Caesar's conquest of Gaul in the 50s B.C.E. needs to be seen in light of the relief to the Romans that removing these barbarians signified to them. Except for the brief interruption of the Gallic disaster, Roman expansion in Italy was almost uninterrupted in the period 400-265 B.C.E.

Rome's pattern of conquest. It gave much of this land to poor Roman citizens, which set into motion a recurring pattern that would eventually help Rome conquer Italy. Since more Romans had land, they could now afford the arms and armor to serve in the army. This gave Rome a larger army, which meant it could conquer more land, distribute it to more citizens, further increase its army, and so on.

Two other Roman practices came out of this cycle and led back into it to help Rome in its path of conquest. One was the practice of founding colonies to gain and secure their hold on a region. The other was the building of roads to help Roman armies move more quickly and easily than their enemies to threatened areas.

After the fall of Veii, Rome would sweep from one conquest to another, first crushing a revolt by its Latin allies, next conquering the Samnites and Campania in two hard-fought wars, and finally defeating the Hellenistic army of Pyrrhus of Epirus to bring the Greeks in Southern Italy under control. And with each conquest, more Romans would get land, buy arms and armor, and increase Rome's army, conquests, etc.

Rome's campaigns of conquest (387-265 B.C.E.). Rome's recovery from the Gallic invasion was swift. It quickly put down a revolt of the Latin allies and then replaced the Latin League with separate treaties between Rome and each Latin state, thus tying each city to Rome alone.

Rome's victory now got it involved in affairs in Campania. When southern hill tribes, known as Samnites, started threatening the rich cities of Campania, they looked to Rome for help. This touched off the Second Samnite War (326-304 B.C.E.). The Romans quickly ran into serious problems fighting the Samnites in the hills. Up to this point they had used the Greek style phalanx as their main tactical unit. This was ill suited to fighting in mountain passes. An entire Roman army was even captured in a pass known as the Caudine Forks. The Roman, being ever adaptable, copied their Samnite enemies who used more open and flexible formations with soldiers equipped with throwing javelins, swords, and lighter armor. These formations, called *maniples*, were arranged in a checkerboard fashion that allowed the Romans to advance fresh troops into battle and withdraw tired ones through the gaps in the checkerboard. The new Roman legions might bend, but they rarely broke. Not only did they win the Samnite wars and Italy for Rome, but, with a few modifications, they would eventually conquer the entire Mediterranean.

The Second Samnite War was a long, hard fought affair that saw Rome initiate two other policies: road building and colonies. In 312 B.C.E., the Romans built the first of their military roads, the Appian Way, to move troops quickly in times of war. However, the Appian Way and other such

roads would also be highways of trade and commerce in peacetime. Eventually, there would be 51,000 miles of paved roads linking different parts of the Roman Empire together. Rome also founded colonies to cut Samnite supply lines and communications and established firm Roman control in the area.

Because of their military reforms, roads, and colonies, the Romans finally defeated the Samnites in 304 B.C.E. They were lenient with their defeated enemies, but this allowed the Samnites to start a third war (298-290 B.C.E.). However, the Roman system of maniples, roads, and military colonies on their enemies' borders gradually strangled the Samnites into submission once again.

Except for Cisalpine Gaul, only the Greeks in the very south were now free of Roman control. Growing increasingly nervous about Rome's intentions, the most powerful of these cities, Tarentum, went to war with Rome in 280 B.C.E. Tarentum had great wealth, but little fighting spirit. Therefore, it had the unusual habit of hiring foreign kings to fight its wars. In this case, it called in Pyrrhus, a cousin of Alexander the Great and ruler of the kingdom of Epirus, northwest of Greece. For the first time, the Romans were up against a military system more sophisticated than their own, using the dreaded Macedonian phalanx and war elephants. The more flexible maniples fought bravely on the plains of Heraclea and Ausculum, but were beaten. However, Pyrrhus' victories were so costly compared to what he gained that even today we refer to such victories as "pyrrhic". In the face of such defeats Roman perseverance shone forth, the Senate refusing to make peace until every last Macedonian had left Italian soil. Pyrrhus did leave Italy for a while, fighting Carthage, now allied to Rome, for control of Sicily. Although militarily successful, he accomplished nothing lasting and thus returned to Italy. In 275 B.C.E., the Romans beat the Macedonian phalanx at Beneventum by luring it onto hilly or broken ground. Pyrrhus went back to Epirus, and Italy now belonged to Rome.

Conquering a region is one thing. Ruling it is another. And it was here that the Romans showed their true greatness. Instead of ruling like tyrants, they offered various grades of Roman citizenship and the chance to share the benefits of Roman rule with the Italians in return for their loyalty. Newly conquered cities were made allies that had trade and marriage privileges with Romans. As a city gradually proved its loyalty to Rome, it would receive the status of partial, or Latin, citizenship.

Eventually, a city proving its loyalty over a long period of time would be granted full Roman citizenship. All of Rome's subjects were expected to supply troops for war and give up their independent foreign policies. However, Rome did let them keep their local governments and customs, but they tended to resemble those of the Romans more and more with the passage of time. Rome also kept building roads and founding colonies. Colonies with Latin citizenship were especially popular, since they were a bit more independent than full Roman colonies, while still providing Rome with troops.

The value of Rome's system for governing Italy should be obvious. Instead of constantly worrying about rebellions, it had a reliable source of loyal manpower and resources to help increase its power. The greatest test of this was when Hannibal tried to conquer Italy, thinking the Italians would flock to his standard against the Roman tyrant. Instead, most of Italy, especially the parts under Roman rule the longest, stood fast by Rome, despite the fact that Hannibal's army was in Italy for sixteen years. The Romans would continue this policy of offering citizenship to their subjects. In fact, in 212 A.D., the Roman emperor, Caracalla, completed this process by offering Roman citizenship to all freeborn men in the empire.

By 265 B.C.E., Rome had a strong stable government and Italy firmly under its control, secured by the lure of citizenship, a growing network of military roads and colonies, and probably the best-trained and most efficient army of its day. Given such a large, well organized, and energetic power, it should come as no surprise that Rome was ready for further expansion. Across the narrow strait of water to the south beckoned Sicily. Expansion there would mean war with a great naval power, Carthage, and the start of the road to empire.

28.A Rome's wars of Conquest in Italy.

Flowchart 28.A is included for one purpose: to show how Rome was constantly at war during this period, many times on more than one front.

Climate Change and Ancient Rome

The Apennines today

Climate change, including that caused by human factors, is nothing new. For ancient Italy, the roots of climate change seem to lie with inheritance patterns. The Romans and other Italian peoples didn't practice primogeniture (giving all the land to the eldest son). Since they split their lands, family farms got progressively smaller as the population grew, with the size of the average Roman farm bottoming out at between 1.5 and 5 acres. This led to soil exhaustion, causing some people to move into the hills where they would graze sheep and goats. Unfortunately, the sheep and goats would eat the shoots of new trees, causing deforestation. As trees (which transpire water into the atmosphere) died, the climate got hotter and drier. Based on ancient agricultural manuals, planting was moved two months earlier to avoid the hotter drier summers, so that crops previously harvested in August are now harvested in June.

Just to put into perspective how significant forests can be, temperatures over forested areas can be up to twenty degrees Fahrenheit cooler than unforested areas at similar latitudes and altitudes. One cypress tree can transpire 5000 gallons of water into the atmosphere a day.

Disaster at the Caudine Forks (321 B.C.E.)

Samnite soldiers watch Roman prisoners pass beneath the yoke after their capture at the Caudine forks

During the Second Samnite War, a false report that an ally was being besieged led the Romans to march rashly into a mountain pass, known as the Caudine Forks, where the Samnites trapped an entire Roman army and forced it to surrender. After the humiliation of being forced to crawl one by one under the yoke, the consuls negotiated the release of all but 300 prisoners in return for a promise of peace. However, the Roman Senate had to agree to the peace and one of the consuls convinced it to repudiate the treaty, thus condemning the 300 hostages to death. For a society that probably didn't even number one million people at the time, this was a huge sacrifice as well as statement about the Romans' determination to win the war.

It was also the impetus for the Romans to reform their army so it could adapt to rough ground not suited to phalanx warfare.

Rome and the Celts

Supposedly, the Celts entered Italy because a man, wanting vengeance for his wife's rape, lured the Gauls into Italy by giving them wine and telling them there was plenty more in Italy.

More likely, they were lured in to serve as Dionysius of Syracuse's mercenaries.

The Gauls' wild battle tactics (i.e., charging naked except for their jewelry and long hair, waving long swords and screaming blood curdling battle cries) terrorized more orderly civilized armies not used to them. The Romans eventually learned that if they could withstand the Gauls' initial onrush, their energy would diminish and Roman discipline and training could turn the battle around.

However, in their first major encounter at the Battle of the Allia River, the Romans were so panicked that they neglected to shut the gates to Rome. Suspecting a trap, the Gauls cautiously entered the city and came to the Senate house where the senators (from *senes*=old men) were sitting as still as statues. To see if they were alive, one Gaul stroked the beard of a senator who immediately struck him with his cane, triggering a massacre of the entire Senate.

The Gauls then laid siege to the surviving Romans on the Capitoline Hill. At one point, a sneak attack at night up the Capitoline was only detected by the sacred geese of Juno whose honking woke Marcus Manlius. Just in time he knocked the first Gaul back down the steep hill, creating a tumbling effect that took the following Gauls down as well. Finally, the Gauls agreed to leave for 1000 pounds of silver and gold. When the Romans discovered the scales were fixed, Brennus, the Gallic leader, threw his sword on them with the words: "Woe to the Vanquished." The Romans tried to cover up this humiliation with a story about the Roman hero, Camillus, saving the city at the last minute, but that seems quite unlikely.

Unlucky holiday. Since the Battle of the Allia River took place on July 16, the Romans considered that day unlucky and made it a holiday where no business could take place.

The Celts (AKA Gauls)

Among the Celtic Gauls' more curious customs was an obsession with keeping enemy heads, believing they would keep their owners' spirits from coming back to haunt them. Some prominent heads were preserved in cedar oil and displayed to visitors who might even try to buy them to increase their own power. The Celts also believed in reincarnation, being known to burn letters on funeral pyres for the dead and to take out loans that were repayable in the next life.

Druids were the priestly class that presided over the Celts' religion. The Romans suppressed them in later centuries and little is known about them. In addition to priestly duties, they also served as judges and scholars. Their religion was both polytheistic and animistic, revering various aspects of nature as the tops of hills, bodies of water, plants (in particular mistletoe) and trees, such as oak and hazel. Fire was regarded as a symbol of several divinities and was associated with cleansing. Ancient writers claimed the druids practiced human sacrifice, although it's not clear whether this is true or just made up for its shock value.

The Roman Way of War

In the aftermath of the disaster at the Caudine Forks, the Romans totally redesigned their army, modeling it mainly after the more mobile and flexible tactics of their Samnite enemies. The main Roman army lined up in three ranks offset

from one another in checkerboard fashion (below). In front of it were lightly armed skirmishers called *velites* (grey) drawn from the poorer classes that could not afford heavier armor. Much like Greek *peltasts*, they would throw their javelins to disrupt enemy formations and protect their main army from similar actions by the enemy.

When they were finished, the *velites* would retreat through the gaps left in the ranks behind them. Next came the *hastati* (red and top), consisting mainly of younger, untried soldiers. Each unit, known as a *maniple*, was divided into two centuries of 60 men each, one arranged behind the other to leave gaps for the retreating *velites*.

Once the *velites* had passed through, the rear centuries of the *hastati* would close the gaps to present a solid battlefront. As they advanced, they would throw their *pila* (javelins) to further disrupt the enemy. They would then close in and fight the enemy, using short swords suited for fighting in close quarters. If the enemy didn't break, the *hastati* would retreat through gaps left between the maniples of the next rank (green) of seasoned veterans in the prime of life. These men, known as the *principes*, would close ranks and repeat the pattern of the *hastati*.

If the *principes* failed to break the enemy, they would retreat through gaps left by the third rank, the *triarii* (blue and below). The *triarii* were armed with long spears and still fought as a phalanx. However, their job was usually to cover the army's retreat or let the *hastati* and *principes* regroup to renew the fight.

The manipular system's checkerboard formation solved two problems. First, it let the Romans constantly throw fresh troops against the enemy who were often packed too tightly to relieve their own front line troops as they wore down. Second, its flexibility allowed the Romans to adapt to changing circumstances and rough terrain that could break up the more solid phalanx. It was this system, with some later modifications, that would conquer the Mediterranean for Rome.

Maniple comes from the Latin word *manus*, meaning hand, because the Roman army was flexible like the fingers of a hand.

But the Romans did more than fight battles. They waged war, approaching it strategically in ways that went far beyond the battlefield, in particular in the use of roads and colonies. While the Greeks used colonies to get rid of excess population and gain access to remote resources, the Romans used them to increase the number of citizens available for the army, secure their hold on conquered lands, and serve as staging areas for future campaigns. They especially did this during the Second Samnite War (326-304 B.C.E.), planting colonies just inside Samnite territory to control strategic roads and passes and provide early warnings of impending Samnite attacks. Once Rome had secured control over this new area, it would repeat the process, founding more colonies and further encroaching on the remaining Samnite territory, gradually strangling the enemy into submission. This might take time, but the Romans were nothing if not persistent and in it for the long haul.

The Pyrrhic War (280-275 B.C.E.)

As scary as war elephants were, the Romans quickly learned they could be panicked by showers of spears and forced back to stampede their own troops. They also didn't like fire-pigs, greased pigs set on fire and driven toward the elephants, another tactic the Romans reportedly used.

Tarentum was the only colony founded by Sparta. Apparently, during the prolonged absence of the Spartan men during the Second Messenian War (685 to 668 B.C.E.) a bunch of sons were mysteriously born to the Spartan women. When they grew up, these mysterious young men wanted land of their own, so Sparta sent them to Southern Italy where they founded Tarentum. In time, it became one of the region's most powerful and prosperous Greek poleis.

An impolite gesture. The Pyrrhic War had its roots in Tarentum's nervousness at the Roman conquest of Thurii (282 B.C.E.), which ironically was a colony of Sparta's arch-rival, Athens. Shortly afterwards, when the Romans sailed illegally into Tarentine waters with ten ships, the Tarentines sank five of them and then drove the Romans from Thurii. When a Roman envoy demanded justice, one of the Tarentines urinated on him, which was apparently as rude then as it is now. The Roman vowed to wash out the stain with blood, and the war was on.

Pyrrhus of Epirus (above) was a distant cousin of Alexander the Great. His ambition was to conquer an empire in the West to rival that of the Macedonian king. He got his opportunity when Tarentum offered to buy his services in their war against Rome. He was a good, if not brilliant general, who brought the full panoply of Hellenistic warfare, including war elephants, to Italy. His perseverance and constancy of purpose might be questioned, since, after beating the Romans twice in battle, he went to Sicily for several years to fight the Carthaginians. This gave Rome a chance to regroup and eventually defeat him when he came back.

Prize winning "cattle". When the Romans first encountered war elephants, they called them Lucanian oxen, apparently thinking the cows in Southern Italy were really big and weird looking. As terrifying as these beasts were initially, the Romans quickly learned how to panic them by showering them with javelins and flaming arrows, often sending them rampaging back into their own ranks.

Nerves of steel. That's how one might describe Gaius Fabricius, an envoy sent to ransom Roman prisoners from Pyrrhus. After failing to bribe him, Pyrrhus supposedly sneaked an elephant up behind Fabricius (a good trick in itself) and had it trumpet in his ear to test his nerves. Fabricius didn't flinch. When Pyrrhus' doctor approached Fabricius offering to poison his king for a price, Fabricius turned him over to Pyrrhus, apparently being as incorruptible as he was unflappable (or deaf).

Pyrrhus' death came a few years later during a street fight in Argos when an old woman threw down a roof tile that hit him in the head and killed him.

AN OVERVIEW OF ROMAN EXPANSION IN THE MEDITERRANEAN (264-133 B.C.E.)

Introduction: pattern of conquest. Just as Rome got caught up in a cycle of expansion that led to the conquest of Italy, it experienced another such cycle that led to their dominance of the Mediterranean. In this case, what triggered the pattern was the mere fact that each new conquest brought Rome into contact with a new set of neighbors. This would lead to new opportunities for conquest, but also mutual fears and suspicions on each side. Either way, Rome would get drawn into a new set of wars, which it would eventually win with new conquests. This, of course, would present Rome with some more new neighbors and the pattern would repeat itself until Rome had conquered the Mediterranean.

The first phase of this expansion involved Rome in two desperate wars against Carthage (264-241 & 218-201 B.C.E.). Initially, this struggle was over Sicily, since it was rich, very close to Italy, and Rome had to protect the trade of its Greek subjects in Southern Italy against Carthaginian encroachment. Rome's victory in these wars made it a major naval power controlling Sicily and dominating the Western Mediterranean. Feeding back into the cycle of expansion, this also led to contact and conflict with new peoples in the Eastern and Western Mediterranean.

In the West, Rome got involved in wars with Carthage and the Celts in Spain, both of whom Rome feared from previous wars. Therefore, Rome conquered and destroyed Carthage in 146 B.C.E. and the Spanish Celts by 133 B.C.E., both of them in rather brutal and treacherous fashion.

In the East, Rome was more reluctantly drawn into wars against Antigonid Macedon and Seleucid Asia by two main factors. For one thing, Macedon, suspicious of Rome since it had crushed the Illyrian pirates close to Macedon's shores, had declared war on Rome during its darkest days of the Second Punic War. While nothing much came of this First Macedonian War (215-205 B.C.E.), Rome was naturally suspicious of Macedon. Feeding this suspicion was the second factor, various Greek states running to Rome for protection, at first against Macedon and the Seleucids, and later against each other. As Rome was drawn increasingly into affairs in the East, its frustrations grew until it annexed Macedon (149 B.C.E.), Greece (146 B.C.E.) and Pergamum in Asia Minor, which was willed to Rome by its king in 133 B.C.E.

By 133 B.C.E., Rome was the dominant power in the Mediterranean. Unfortunately, having an empire would put stresses and strains on Roman society, including the creation of ambitious generals looking for new opportunities for conquest, plunder, and glory. Therefore, the Roman tide of conquest continued after 133 B.C.E. In the West, an ambitious general named Julius Caesar would push the barbarian threat even further north by conquering the Celts in Gaul. Eventually, the rest of North Africa would fall under Roman rule to round out control of the Western Mediterranean. Meanwhile, in the East, Mithridates of Pontus attacked Rome's provinces in Asia Minor. Rome won both of these Mithridatic wars, and its generals, most notably Pompey, progressively annexed the rest of Asia Minor, Syria, Palestine, and Egypt. Thus by the early Christian era, the entire Mediterranean was firmly under Roman rule.

However, this empire would bring serious problems that would plunge Rome into bloody civil strife.

How to declare war Roman style.

The Romans, being very religious and superstitious, had a strict ritual for declaring war that involved *fetial* priests who would demand restitution for some injustice from a neighbor. They would then wait up to thirty-three days for an answer before returning to Rome. If the neighboring state refused Rome's demands, the military assembly, known as the *Comitia Centuriata* would vote on war. Formal declaration of war required the fetial priests to return to the neighboring territory, wearing sod on their heads for the magical protection of their own soil, make a ritual speech and throw a charred spear of cornel wood into enemy territory. Roman armies could not move until all this had been done.

When Rome started fighting overseas enemies, the time and distances involved in carrying out this ritual became cumbersome. To solve this and keep the gods happy, the Romans took slaves from the land they wanted to attack, gave them land in Rome that they could declare the enemy state's territory, and planted the charred spear there.

ROME VERSUS CARTHAGE: THE PUNIC WARS (264-201 B.C.E.)

Rome's struggle with Carthage (264-201 B.C.E.).

Rome's first overseas wars were against Carthage on the coast of North Africa, the largest, most prosperous, and aggressive of the Phoenician cities. The prize they fought for was the island of Sicily, which for centuries had been a constant battleground between Carthage and various Greek colonies. Neither side had won a decisive victory, and when Rome got involved, the island remained divided between Carthage in the western end of the island and the Greeks in the east. Rome's relations with Carthage down to 264 B.C.E. had been friendly. The two powers had even allied around 500 B.C.E. against the Etruscans. By this treaty Rome recognized the Mediterranean as Carthage's sphere of influence, and Carthage even claimed a Roman could not wash his hands in the sea without its permission. As long as Rome was just a land power preoccupied with conquering Italy, this arrangement was fine. However, in 264 B.C.E., with Italy firmly under control, the Romans first got involved in Sicilian affairs.

There were several reasons for this war. For one thing, both Rome and Carthage saw Sicily as a natural extension of their respective territories. Similarly, the Greeks in Southern Italy felt Sicilian trade and resources were rightfully theirs to exploit and probably put pressure on Rome to protect their interests there. The immediate cause of this war was a group of Italian mercenaries called the Mamertines ("Sons of Mars") who had seized the strategic port of Messina just across from Italy. The Romans, seeing the port as vital to the security of Italy, helped the Mamertines when Carthage moved to take the city, and this led to war.

The First Punic War (264-241 B.C.E.) resembled the Peloponnesian War between Athens and Sparta, in that each conflict pitted a land power against a sea power where one side would have to attack the other side's strength. In each case, it was the land power that built a navy. Roman experience with a navy up till now had been limited, which seems surprising considering how much coastline Italy had to defend. However, probably with the help of

Greek shipwrights in the south, the Romans built a fleet with which to challenge Carthage.

The Romans realized they could not match Carthage's centuries of experience in naval warfare. As a result, they adapted an Athenian device left over from the siege of Syracuse in 413 B.C.E. It was a 36-foot long boarding bridge that swiveled on a pivot to come down on its intended foe. The spike for locking the ships together reminded the Romans of a crow's beak, so they called it the crow (*corvus*). The idea was that even if the Romans got rammed, they could swivel the *corvus* around to slam down on the enemy deck, storm across and take their ship. To further ensure success, the Romans added 80 soldiers to the usual complement of 40 marines. In essence, the Romans were turning a sea battle into a land battle. As ridiculous as it seemed, it worked. Time and again, Roman fleets crushed Carthaginian fleets and were steadily sweeping Carthage from the seas. However, Rome had one very powerful enemy that evened things out: Mother Nature. It seemed that for every Carthaginian fleet the Romans destroyed, a storm would rise up to demolish a Roman fleet. Thousands of lives were lost on each side with neither Rome nor Carthage making any headway or willing to quit.

For twenty years the war dragged on, bleeding each side white. Finally, in 241 B.C.E., the Romans mounted one last supreme effort to build a fleet, this time without the heavy *corvus* to weigh down the ships. As luck would have it, they caught the last Carthaginian fleet loaded down with supplies and destroyed or captured most of it. Carthage had had enough and sued for peace. Rome took 3200 talents (211,200 pounds) of silver and three-fourths of Sicily, leaving its ally Syracuse with the other quarter. Sicily became Rome's first province, having little prospect of Roman citizenship since, in Roman eyes, the Sicilians were too different to be able to share in the benefits of Roman rule.

Rome was quite active in the years after the First Punic War. To the north, it conquered the Gauls in Northern Italy, known as Cisalpine Gaul ("Gaul this side of the Alps"), thus extending Roman rule all the way to the Alps. To the east, the Romans crushed the Illyrian pirates operating in the Adriatic

Sea. Although this was done mainly to protect the shipping of the Greeks in Southern Italy, the Macedonian king, Philip V, viewed it as an act of aggression by Rome in his home waters. Another power getting concerned about Roman power was Syracuse, which found itself hemmed in by Roman rule in most of Sicily.

Then there was Carthage. In 238 B.C.E., when Carthage was still weakened from the First Punic War, Rome seized Sardinia and Corsica, two islands off the west coast of Italy that it saw as a threat if they remained in Carthaginian hands. However, the Carthaginians were a resilient people who were not about to accept Rome's victory for long. Soon after the war, Carthage's most capable general, Hamilcar Barca, set off for Spain to carve out a new empire for his city. Over the next twenty years, Hamilcar, his son-in-law Hasdrubal, and Hamilcar's own son Hannibal, brought most of Spain, with its plentiful silver and mercenaries, under Carthaginian rule.

As Carthaginian power revived in the West, Rome became increasingly nervous. Finally, war broke out when Hannibal attacked the Spanish city of Saguntum, which was an ally of Rome. The Second Punic War (218-201 B.C.E.) would be an even more desperate struggle than the first war with Carthage.

The Carthaginian general, Hannibal, was a brilliant commander who figured the best way to beat Rome was to invade Italy so Rome's subjects would desert to his side. Since the Roman navy was too strong for him to risk an invasion by sea, Hannibal took the only remaining route, over the Alps. This march, which involved taking some 40,000 men and 37 war elephants through hostile Gallic territory and treacherous mountain passes, certainly ranks as one of Hannibal's most remarkable achievements.

Only some 25,000 men and one elephant survived this march, and the Romans immediately moved north to finish off Hannibal's sick and exhausted army. However, it was Hannibal who, over the next two years, dazzled the Romans with an array of tricks and strategies that trapped and destroyed one army after another. The most devastating of these battles, Cannae (216 B.C.E.), was a masterpiece of strategy using a collapsing center to draw the

Romans in and then envelop their flanks. The ensuing slaughter cost Rome 35,000 men.

Cannae unleashed a virtual avalanche of problems on Rome as other states, nervous about Roman power, flocked to Hannibal's standard. Syracuse joined the Carthaginian side. Philip V of Macedon, fearing Roman encroachment in the Adriatic, also allied with Hannibal against Rome. In Italy, both the Gauls in the north and the Greeks in the south defected to Carthage's side. However, Hannibal was disappointed that the overwhelming revolt against Rome never took place. Instead, the central core of Italy stood fast by Rome, producing more armies as Rome pursued new strategies.

In their darkest hour after Cannae, The Romans displayed incredible spirit and determination. They defiantly refused to ransom soldiers who had surrendered at Cannae and forbade any talk of peace or even public mourning that might lower morale. They quickly put Syracuse under siege, found allies in Greece to keep Philip V of Macedon too busy to be able to help Hannibal in Italy, and raised armies to invade Spain and deprive Carthage of its main resource base. In Italy, Roman armies gradually pushed Hannibal into the South, while being careful not to test his wizardry in open battle. Instead, the Romans, using superior manpower and resources, gradually wore Hannibal down while chipping away at his supports elsewhere.

It was a slow exhausting strategy that required remarkable perseverance. But in time it bore fruit. Macedon was neutralized. Syracuse fell after an epic two-year siege. Spain was gradually stripped from Carthage's grasp. And two relief armies sent to Hannibal's aid were destroyed in the north before reaching him. Hannibal managed to hang on tenaciously in southern Italy as he saw even his Italian allies melting away under growing Roman pressure. Finally, the Romans mounted an invasion of Africa that forced Hannibal to return home. At Zama, the brilliant Roman general, Scipio, used Hannibal's tactics against the old master to crush his army and bring Carthage to its knees. Rome deprived Carthage of Spain, most of North Africa, 10,000 talents (660,000 pounds) of silver, all its war elephants and all but ten warships. Its African lands went to Rome's ally Numidia, while Spain remained

to be conquered. The quarter of Sicily around Syracuse also fell to Rome. Rome had arrived as the dominant power in the West.

Carthage: Early History and Legend

A map and view of how Carthage probably looked, showing how it was nearly surrounded by water and how its naval harbor was protected by a very narrow approach.

By all accounts, Carthage was founded by a woman. The Jews knew her as Jezebel. To the Romans, she was Dido. In Carthaginian accounts she was Elissa who led her people into exile from the Phoenician city of Tyre. When she found an ideal spot in North Africa, the natives said she could have as much land as she could cover with a cowhide. Supposedly, Elissa cut a cowhide into thin strips and laid them end-to-end to encompass the land she wanted. Carthage was born.

The Romans said Dido killed herself over a broken heart when the Trojan hero, Aeneas, left her to pursue his people's destiny to found Rome. The Carthaginians also said she committed suicide, but for a very different reason. When a native chief wanted to marry Elissa to seal peace between the two peoples, Carthaginian nobles, scared to tell her the real proposal, said they had been asked to marry local women for the same reason, but that they didn't want to.

When Elissa scolded them for not being willing to do that for the good of Carthage, they told her the truth, that the local chief

wanted to marry her. Trapped by her own words, but unwilling to go through with the proposed marriage, she made a pyre of all her possessions, set it on fire, and threw herself on it.

As with other Phoenician cities, Carthage's main sources of wealth were trade and manufacture. However, it is hard to identify Carthaginian workmanship since they, like other Phoenicians, made cheap copies of other cultures' goods that allowed them to undersell the competition. They were especially influenced by the Greeks, as seen in this coin depicting their goddess, Tanit.

One of the more persistent (and spurious) stories the Romans, a very hostile source, liked to tell was how the Carthaginians cruelly sacrificed infants to their god Moloch.

Carthage ruled the coast of North Africa, southern Spain, and the western end of Sicily. Control of that strategic island would have secured the markets and riches of the Western Mediterranean, but the Carthaginians faced a race of sailors and merchants just as determined as they were to control Sicily: the Greeks.

Over the centuries, a pattern of wars emerged where Carthage would mount a huge offensive and nearly conquer Sicily, until a leader, usually from Syracuse), would emerge to save the Greek cause. Then each side would recover for a few years and start all over again. Thus a series of Syracusan leaders Gelon (480), Dionysius (early 300's), and Agathocles (late 300's), and Pyrrhus of Epirus (270's), a king from north-western Greece, each saved the Greek cause in turn. Ironically, a people

with little or no experience at sea, the Romans, would be the winner.

Carthage also clashed with the Greeks and Etruscans in the waters around Italy. In 535 B.C.E., the Carthaginians and Etruscans defeated the Greeks at Alalia, allowing Carthage to drive the Greeks from Sardinia, Corsica, and Spain. However, the Etruscans and Carthage were also rivals, as seen in early treaties of alliance (c.500 and 348 B.C.E.) between Rome and Carthage, to fight the common Etruscan enemy.

One major difference between Rome and Carthage was how they fought their wars. While Rome was a land power whose citizens filled the ranks of its army, Carthage was a sea power, with Carthaginians rarely serving in the army. Instead, it relied on mercenaries recruited from North Africa, such as Numidian horsemen (below right) and Libyan spearmen. Carthaginians rarely served in war except in the cavalry and the navy, which was their real source of strength. The two soldiers to the left also show Greek influence on Carthage.

Rome Takes to the Sea

Rome's naval background. While the Romans liked to claim they had no prior naval experience, there is some evidence to the contrary. For one thing, colonies of 300 Roman citizens dotted the coastline, leading to speculation that each of these was meant to supply and man one warship. In 310 B.C.E., a fleet of twenty Roman ships was sent, without success, against pirates near Pompeii. In 280 B.C.E., Rome's war against Tarentum and Pyrrhus started when the Tarentines sank five of ten Roman warships that had sailed into Tarentine waters. Given their naval record up to the First Punic War, maybe one could say the Romans were starting from scratch.

A Roman quinquireme with the corvus (boarding bridge) at the front of the ship.

The main ship-of-the-line then was the quinquireme, meaning there were five rowers per vertical bank of oars. Such a ship would either have three levels with two rowers each on the top and middle oars and one rower on the bottom row or two levels of oars with three rowers on top and two on the bottom.

In combat, sails and masts would be lowered, since, with all the turning and maneuvering, what was a beneficial wind at one point could be an adverse wind a few minutes later.

How to build a fleet really fast. When the Romans finally decided to build a navy they did it in a uniquely Roman way. Supposedly, they didn't have a single warship on which to model their navy until a Carthaginian ship chasing a Greek merchant ship carelessly ran aground and was captured. Using this as a template, the Senate ordered that a fleet of 120 warships modeled on it be built in 60 days. As the Greek historian, Polybius put it, *"Thus a nation that possessed not a single warship without any resources at all, and without having ever entertained an idea of naval war was called upon to build 100 quinquiremes and 20 triremes within 60 days."*

Somehow, they did it, if not in sixty days, at least very quickly. But how?

Marine archaeologists may have found the answer: parts of Carthaginian ships marked with what seem to be part numbers. Apparently ancient states would mass-produce warship parts and quickly put together fleets using an assembly line process. In addition, Greek shipwrights in Southern Italy could help Rome build a navy.

For trained crews, the most essential ingredient in becoming a naval power, the Romans supposedly drafted some 30,000 Italian farmers and trained them to row in time by using mock rowing decks set up on dry land. However, even with such training, they still would be no match for Carthage's trained crews. They needed something to quickly give them an edge. They found it in Syracuse, although it was apparently a leftover Athenian invention from their siege of the city in 413 B.C.E.

It was a 36' long boarding bridge that swiveled on a pivot to come down on its intended foe. The spike for locking the

ships together reminded the Romans of a crow's beak, so they called it the crow (*corvus*). The idea was that even if they got rammed, they could swivel the *corvus* around to slam down on the enemy deck, storm across and take their ship. To further ensure success, the Romans added 80 soldiers to the usual complement of 40 marines.

The first test of this new tactic came when the Romans encountered a Carthaginian fleet of 130 ships at Mylae in 260 B.C.E. At the sight of these bulky warships, crammed with troops and unwieldy top-heavy devices, the Carthaginians must have laughed. Seeing the Romans as sitting ducks, they swept down on them like pirates, not even forming a battle line.

That was a mistake.

The Roman consul, G. Duilius, determined to make this a land battle, headed straight into center of the enemy fleet and, as the Carthaginian galleys struck, the *corvuses* descended, crashing onto Carthaginian decks like giant fists, locking ship to ship in a hail of javelins and arrows. Then the Roman legionaries stormed across, two by two with shields locked, onto the enemy decks, overwhelming the lightly armed, shocked, and bewildered Carthaginians. As the historian Polybius described it: *"Some of the Carthaginians were cut down, while others surrendered in bewildered terror at the battle in which they found themselves engaged."*

It was exactly like a land fight, which suited the Romans just fine.

The Carthaginians reeled back, losing 30 ships, including the admiral's ship. They then regrouped and advanced, this time in order, trying to outflank the Romans. But the Romans, now with the numerical

advantage, formed a double line so the second line struck the enemy as they struck the first line. Once again, the corvuses crashed down and the legionaries charged across. The Carthaginians fled, losing 44 ships and 10,000 men.

Keeping with custom they crucified their admiral for losing a battle.

The Romans were so proud of their victory they nailed the captured prows (*rostra*) of enemy ships as trophies to the speaker's platform in the Roman forum. Our word for a speaker's platform, *rostrum*, still reflects the Romans' first naval victory at Mylae in 260 B.C.E.

The Carthaginians figured it was just a fluke. It wasn't.

In 258 B.C.E., the Romans beat Carthage again....and once again the next year.

But then things started going wrong.

Disaster and Deadlock (255-242 B.C.E.)

"It is a peculiarity of the Roman people as a whole to treat everything as a question of main strength; to consider that they must of course accomplish whatever they have proposed to themselves; & that nothing is impossible that they have once determined upon...But to contend with the sea & sky is to fight against a force immeasurably superior to their own." —Polybius, Greek historian

"Hide we away these painful gifts of the lord Poseidon"

--Greek sailor's epitaph

In 256 B.C.E. after several stunning naval victories, the Romans felt confident enough to invade North Africa with a fleet of 250 warships accompanying 40,000 soldiers on 80 transports. At Ecnomus they met a fleet of 240 Carthaginian blocking their way. In the ensuing battle the Romans captured 64 ships and sank 30 more, while losing only 24.

With the road to North Africa now open, the Roman consul, Regulus, landed with 25,000 infantry and 500 cavalry. After defeating a Carthaginian army, he made outrageous demands for peace, which Carthage refused. Instead it hired a Spartan mercenary captain, Xanthippus, to train their army in the latest Hellenistic tactics.

The next spring (255 B.C.E) Xanthippus led out the refurbished Carthaginian army, which, with war elephants and eight times as much cavalry as their foes, caved in the Roman flanks and massacred their army. Only 2,000 Romans escaped, while Regulus and 500 others were captured. A Roman fleet coming to rescue the surviving Romans sank 16 and captured 114 more Carthaginian ships in another crushing victory. However, the fortunes of war at sea now took a dramatic turn.

Having rescued the 2000 Romans, the fleet set out with 464 ships (including captured ones), which probably were undermanned by Roman sailors and over-packed with soldiers. Despite the advice of his Greek pilots, the Roman commander insisted on sailing along the harborless southern coast of Sicily. As he had been warned, a storm struck off the craggy coast of Camarina, washing soldiers and sailors off the decks and flooding the oarsmen below.

Aggravating the problem were the corvuses, which made the ships front and top-heavy, causing violent pitching and

rolling. Other ships were dashed against the rocks "where they went to pieces and filled all the seaboard with corpses and wreckage." The captured Carthaginian ships probably suffered even worse since they were undermanned. Scores of transports, 384 out of 464 warships, and some 100,000 Romans were lost, making this one of history's worst sea disasters.

With dogged perseverance, the Romans built 140 new ships and methodically proceeded to reduce Sicily's coastal towns (254-3 B.C.E).

Then another storm struck (253) destroying three-fourths of their navy along with 1000's more men.

In 250 BCE, with both sides bled white by the war, Carthage sent a peace proposal by way of their prisoner, Regulus, who promised to return to captivity if Rome refused Carthage's terms. After delivering the proposal, Regulus persuaded the Senate to reject its terms. Then, true to his word, he returned to Carthage and certain death.

And the war dragged on.

By 250 BCE, the Romans had built 120 more ships and were besieging the Sicilian town of Lilybaeum. Inspired by the speed of a Carthaginian blockade-runner, they had made their new ships sleeker and without the cumbersome corvuses. However, the next year when they met a fleet of 100 Carthaginian ships at Drepanum, everything went wrong for them.

First of all, when the sacred chickens wouldn't eat (a bad omen), the Consul said let them drink and then threw them overboard, much to the horror of the superstitious Roman rank and file.

Then, as battle was joined, the Carthaginians drew the Romans into one harbor entrance and out the other. As they emerged from the narrow harbor entrance, the Carthaginians swooped down on their disordered line. Lacking both the corvuses and the Carthaginians' skill at seamanship, they fell easy prey to the enemy's skillful ramming and clipping tactics.

Although the consul escaped, the sacred chickens weren't so lucky. Neither were 97 of their ships and crews.

Furthermore, the Carthaginians intercepted another 120 Roman ships, drove them against the shore as a storm approached and took shelter in a cove while the storm destroyed the Roman fleet.

Once again, Carthage ruled the seas.

Rome would build no new navy for five years.

Victory at Last (241 B.C.E.)

Even without a navy, the Romans continued to reduce Sicilian cities until only two remained. However they faced a new problem: a Carthaginian general, Hamilcar Barca, who waged relentless guerilla warfare from Mt. Eryx while being supplied by the Carthaginian navy. As long as he was being supplied, the Romans couldn't bring down his mountain fortress.

So the Romans decided to build one last fleet of 200 ships, financed by private loans that would only be repaid if Rome won. As

luck would have it, they intercepted 170 Carthaginian ships loaded down with supplies giving their ships, now without corvuses, the advantage of speed and mobility. In the ensuing battle, the Romans sank or captured 120 ships.

Carthage, unable to produce any more ships, sued for peace, agreeing to evacuate Sicily, return all prisoners, and pay 2200 talents of silver over the next 20 years. However, the Comitia Centuriata, the Roman Assembly that decided matters of war and peace, raised this to 3200 talents over 10 years.

Rome also took three-fourths of Sicily, leaving the rest to its ally, Syracuse. However, rather than making their Sicilian subjects fight in Roman armies and work for citizenship, Rome ruled Sicily as its first province, charging taxes instead of military service. At first, Roman government of Sicily was fair and kept the Sicilians loyal through the Second Punic War. Later, that would change drastically.

Truceless War, Bloody Peace (241-218)

Hamilcar Barca, Hannibal's father who crushed the mercenary revolt after the First Punic War and conquered much of Spain to revive Carthage's power.

The "Truceless War" (241-238 B.C.E.) The end of the First Punic War only brought Carthage new troubles in the form of the "Truceless War" a brutal revolt of 20,000 unpaid mercenaries along with native Libyans and Numidians. When the rebels tortured 700 Carthaginian prisoners to death, the revolt degenerated into a war of barbaric severity.

To aggravate the situation, some Italians were supplying the rebels. When Carthage protested this, Rome did clamp down on the Italians providing aid to the mercenaries. However, when North Africa was pacified and Carthage prepared to move against rebels in Sardinia, the mercenaries there called on Rome for help. Seeing Sardinia as too close to Italy for a foreign power to hold, the Romans declared war on Carthage, forcing it back down.

After a difficult pacification campaign Rome turned Sardinia and Corsica into its second province, exploiting Sardinia's lead mines in an operation that became infamous for its brutality.

Rome and the Gauls (again). Rome was busy on other fronts as well. In northern Italy, the threat of a Gallic war sparked a census across Italy to see how many men were available for military service. According to the census, Rome had 250,000 citizen infantry and 23,000 cavalry along with 350,000 allied troops available.

The Romans, always concerned about the northern barbarians, consulted the Sibylline Books for advice on how to deal with this crisis. The books said Rome must be held two times by a foreign enemy. Hoping to thwart another Gallic conquest while fulfilling the prophecy, the Romans buried two Gauls and a Greek alive so they were indeed holding Roman land while still alive.

The final showdown with the Gauls came in 225 B.C.E. at the Battle of Telamon. Roman discipline and strategy prevailed over the wild Gallic tactics as the Romans caught the Gauls from two sides, forcing them to fight back to back. In the ensuing massacre, the Romans killed 40,000 Gauls and captured 10,000 more. By 218 B.C.E., the Romans had finally subdued Cisalpine

Gaul, just in time for another epic war with Carthage.

Meanwhile, pirates from Illyria (modern Yugoslavia) were preying upon Greek and Italian shipping and then hiding in Illyria's coves and rocky coasts. However, when they made the mistake of raiding southern Italy and killing a Roman envoy, Rome sent 200 ships to crush the pirates. However, Philip V of Macedon, seeing Roman forces operating so close to his kingdom, started looking for an opportunity to strike back at Rome.

Carthage resurgent in Spain. Needing new lands to exploit after the loss of Sicily, Carthage sent its old general, Hamilcar Barca, to conquer Spain with its silver & mercenaries. Hamilcar took his 9-year old son, Hannibal with him, supposedly making him swear on the altar of Moloch that he would never be a friend to Rome. Whether or not the story is true, Hannibal would remain true to that oath and be a scourge, both real and imaginary, to Rome for decades. Roman mothers would even scare their children into behaving with threats that Hannibal would get them at night.

Under Hamilcar's brilliant leadership, the Carthaginians gradually conquered Spain and founded several cities, including Barcino (modern Barcelona). When Hamilcar was killed while crossing a river (228 B.C.E.), his son-in-law, Hasdrubal, took over and continued expanding Carthaginian power, largely through peaceful means such as marriage (228-221).

At first, Rome had been willing to see Carthaginian activity in Spain, since it would help pay the war indemnity. However, it was getting increasingly nervous about a resurgent Carthage. In 226 B.C.E. the two sides signed a treaty limiting Carthaginian expansion to the Ebro River and guaranteeing the safety of

Rome's ally, the city of Saguntum, 80 miles south of the Ebro.

In 221 B.C.E. Hasdrubal was assassinated, and Hamilcar's son, Hannibal, took over. Two years later he attacked Saguntum. As the city was about to fall, some of the Saguntines burned themselves and their possessions rather than let them fall into Carthaginian hands.

Meanwhile, a Roman embassy had gone to Carthage to demand it recall, or at least rein in Hannibal. When the Carthaginian senate said it couldn't do such a thing, the Roman held out two folds of his toga, saying one fold represented War, the other for peace, and that the Carthaginians should choose. When the Carthaginians told him to choose, he threw down the fold representing war.

"So be it; we welcome it," the Carthaginian senators said. Once again, Rome and Carthage were at war.

If the First Punic War had been Rome's first test as a big power, the Second Punic war would be its life and death struggle.

Hannibal crosses the Alps (218 B.C.E.)

At the start of the Second Punic War, Rome seemed to have an overwhelming advantage with some 600,000 men of military age and 220 ships against Carthage's 80,000 men and 100 ships. Assuming Roman rule was as oppressive to the Italians as Carthage's rule was to its neighbors, Hannibal figured he could beat Rome by invading Italy and raising the Italians in revolt. However, Rome's control of the sea left only one,

uninviting, route open to Italy: over the Alps.

The army Hannibal took was an extremely diverse one that he and his father had welded into an extremely loyal and effective fighting force. Hamilcar and Hannibal, besides conquering many Spanish tribes, had also won their trust through stern, but fair treatment making their Celtiberian Spanish troops among their most loyal followers. Spanish infantry had javelins made entirely of iron, which the Romans would apply to their own pila in modified form. They would also adopt the Spanish short sword that was better for close quarters cutting and thrusting than longer, more cumbersome models.

A major advantage Hannibal had over Rome was superior cavalry from Spain and Numidia in North Africa. Numidians rode bareback without reins, using knee and leg pressure to control their horses. Supposedly, they could throw their javelins with either hand. Not until Scipio enlisted the aid of his own Numidian cavalry could Rome fight on even terms with Carthage.

Hannibal took 37 elephants with him. In order to get them to board rafts for crossing the Rhone River, he had his men spread sod over the rafts to make them look like dry land. Only one elephant, named Cyrus, survived the crossing of the Alps, and he died soon afterwards. As a result, elephants played only a minor role in the Second Punic War.

When confronted with large boulders blocking their path, Hannibal had his men burn piles of wood around the boulders to heat them up and expand. He then poured vinegar on the boulders, causing them to contract and crack. Making Hannibal's feat even more remarkable was resistance from local tribes to his passing through, even

trying to stop him with avalanches of boulders.

Of the 35-40,000 soldiers Hannibal led out of Spain, only 26,000 survived. Furthermore, the survivors that made it into Italy were tired and sick. Expecting to have the element of surprise on his side, Hannibal was in turn surprised to find a Roman army had doubled back 1000 miles from Spain to protect Italy.

At the resulting Battle of the Trebia River (December, 218), the Carthaginian cavalry feigned retreat in a skirmish to draw the Romans into the river's icy waters. When the freezing and hungry Roman troops emerged from the river they found Hannibal's whole army waiting. The Carthaginians' superiority in cavalry helped them cave in the Roman flanks, while another force of 2000 men hiding in nearby hills emerged to attack the Roman rear.

Of 30,00 Romans only 10,000 were able to cut their way out, convincing the Gauls, recently conquered by Rome, to join Hannibal, thus replenishing his depleted ranks. For all intents and purposes, Cisalpine Gaul (northern Italy) was lost.

Disaster Heaped Upon Disaster (217-216 B.C.E.)

To face Hannibal's invasion after the defeat at the Trebia River, Rome raised 11 legions in 217 B.C.E.: four in N. Italy, five as reserves around Rome, and two in Spain. They also abandoned N. Italy, which was

already lost anyway, relying on the hillier terrain in Central Italy to neutralize Hannibal's advantage in cavalry. Despite that, Hannibal entered Central Italy, hoping to raise revolts there as he had among the Gauls in Northern Italy.

Although Hannibal had lost the sight in one eye after the crossing of the Alps, it was the Romans who traveled blindly, not having adequate cavalry for scouting ahead. Consequently, the consul Flaminius walked into a trap at Lake Trasimene, where there was only a narrow defile between the lake and surrounding hills. That, plus a morning fog made this the perfect place for an ambush.

First came a barrage of javelins and lead sling bullets.

Then the rest of Hannibal's army rushed down from the hills and out of the fog against the bewildered Romans. Hannibal by then had closed off both ends of the road along the lake, trapping the Romans who were cut down by the thousands.

Two entire legions were wiped out along with an advance guard of 4000 men.

Having suffered two major disasters, the Romans figured it best not to meet Hannibal in open battle. Therefore they made Quintus Fabius Maximus dictator, an office bestowing absolute power for six months on one man during an emergency. If the emergency persisted, it might be renewed for another six months.

Fabius' strategy, which earned him the nickname Cunctator (the Delayer), was to harass Hannibal while avoiding pitched battles. It was a sensible strategy, but it would take time and a lot of patience for it to take full effect. Even today, we use the term Fabian tactics to describe a strategy of stalling for time.

One story at this time concerned a critical pass held by Fabius that Hannibal needed to get through. To draw the Romans off his path, Hannibal put torches on the horns of 2000 oxen and drove them off in one direction while he escaped the other way. Supposedly, Hannibal also spared Fabius' estate to make him look like a traitor, which fuelled a growing clamor for an attack on Hannibal.

Therefore, in 216 B.C.E. Gaius Terentius Varro led a huge Roman army of 50,000 men to crush Hannibal once and for all. Command of the army alternated daily between the two consuls: the cautious Paulus and the reckless Varro. Hannibal even abandoned his camp and possessions to make it look like he had fled, while waiting in ambush in the hills above. He even left campfires burning. But scouts said it looked too contrived, with silver lying all about.

The Romans caught up with Hannibal at Cannae. Despite bad omens (a beehive over the consul's tent and the sacred chickens' refusal to eat again), Varro got his way and attacked.

Being heavily outnumbered, Hannibal laid a trap drawing the bulk of the Roman infantry into a collapsing center, while the flanks of his infantry held, thus hemming the Romans in on three sides.

Meanwhile the Carthaginian cavalry on the flanks beat the opposing Roman cavalry, then swung around to hit the exposed rear of the Roman line, thus surrounding the main body of Romans on all sides. From that point on, it was just a massacre.

In the ensuing slaughter Roman soldiers were packed in so tightly they had no room to raise their arms to defend themselves. So great was the potential for killing that Hannibal's cavalry would cut the tendons of Roman soldiers and leave them lying helpless until they had the time to come back and finish them off.

Some 25,000 Romans fell at Cannae, while another 10,000 were captured. 15,000 Romans fought their way out. Carthaginian losses were about 5700, a cost not easily made up this far from home. Among the Roman survivors was Varro, the consul responsible for this disaster. The Senate thanked him for not despairing of Rome and killing himself.

And even darker days still awaited Rome.

Avalanche: Rome's Darkest Hour...and Comeback (216-212 B.C.E.)

A fanciful painting of an Archimedes claw capsizing a Roman ship during the siege of Syracuse.

"Never, never, never surrender."--Winston Churchill

The disaster at Cannae brought an avalanche of misfortunes down on Rome:

- The Greeks, Samnites and Campanians in Southern Italy rebelled.
- So did Sardinia.
- Philip V of Macedon, worried about Roman power in the Adriatic, declared war on Rome.
- Syracuse turned on Rome when its king, Hiero, died in 215 B.C.E.
- And in Spain Hannibal's brother, Hasdrubal launched an offensive against the Romans.

However, against Hannibal's expectations, Central Italy stayed loyal to Rome. And that was the basis for one of history's great comebacks.

Even more amazing was how Rome responded to this crisis:

- They never considered the possibility of peace & forbade even discussing it.
- They prohibited public mourning for loved ones since it brought morale down.
- The Senate even refused to ransom Romans captured by Hannibal.
- By the war's end, the number of legions in service would increase from 8 to 25.

To the Romans, failure was not an option....ever. Bit by bit, they started to come back, starting in Sardinia where they drove off Carthaginian reinforcements for the rebels and crushed the revolt.

Macedon seemed to be a less imminent threat, especially after the Romans swept the Macedonian navy from the Adriatic, depriving Philip V of any practical way to invade Italy. As a result, they were content to ally with the Aetolian League and other Greeks to keep Philip V tied down. The First Macedonian War (215-205), as it is called, fizzled out when Rome's Greek allies, probably frustrated that Rome gave them no effective help, made a separate

peace with Philip in 206 BCE. The following year, Rome followed suit by signing the Peace of Phoenice. However, Rome did not forget what it saw as Philip's treachery and would deal with him in due time.

Spain, Carthage's primary resource base in the war, has always been a forbidding land where "large armies starve and small armies are beaten." Fighting there successfully required three things:

- 1) Command of the sea;
- 2) Control of the coast road; and
- 3) A good supply base.

Napoleon, the greatest general of his day, lost big time for failing all to attain all three of these. He called it the "Spanish Ulcer", since it constantly ate away at his army, gradually draining its strength much as an ulcer does to a human being. The Romans would come to understand that in the years to come.

Publius Cornelius Scipio the elder was the general in charge of depriving Carthage of its primary base of power. In 217 B.C.E., the combined fleets of Rome and Massilia beat a larger Carthaginian fleet, thus depriving Hannibal of reinforcements from Spain. Later, at the battle of Ibera, when Hannibal's brother, Hasdrubal, tried to copy the tactics of Cannae, his center collapsed before he could turn the Roman flanks and his army was badly beaten. As a result, instead of sending badly needed reinforcements to Hannibal, they went to save Spain.

In 212 B.C.E., the Romans took Saguntum, thus giving them a supply base. However, the next year, Hasdrubal defeated the separate Roman armies and killed Scipio. Only disagreement over what to do next kept the Carthaginian generals from exploiting this victory. So the fate of Spain continued to hang in the balance.

Syracuse's defection (215 B.C.E.) to the Carthaginian side was another blow to Rome. However, an energetic Roman general, Marcellus, using an army partly made up of the disgraced survivors of Cannae, drove the Syracusans into the city and started a siege that would last two and a half years.

The siege of Syracuse was an epic event matching Roman perseverance against one of history's most brilliant and innovative mathematicians and engineers: Archimedes. Time after time Marcellus' land and sea assaults were repulsed by catapults that covered every square inch in front of the city walls, making the area a deadly killing field. For defending the sea walls, Archimedes designed grapnels that stood ships on end and dropped them. Legend had it that he even created giant mirrors that would concentrate the sun's rays on enemy ships and set them on fire.

The Romans quickly learned to keep their distance and just wear the city down. Luckily for them, the Carthaginian fleet failed to even try to relieve Syracuse, while Carthaginian soldiers in the city were decimated by disease. Then one night, during the drunken revelry of a festival, the Romans stormed the heights of Epipolae overlooking the city. Supposedly Marcellus wept, both for joy at his achievement and in sorrow for the Syracusans' fate. Despite orders to spare Archimedes, Roman soldiers, probably caught up in the frenzy of sacking the city, killed him when he yelled at them for disturbing his sunlight while in the middle of a math problem.

Roman perseverance. In Italy the Roman strategy was to retake the Greek cities with half their army while hemming in Hannibal elsewhere to slowly strangle him.

This would take a lot of time and a lot of legions. But Rome was determined to win, no matter the cost in men, money, and time. So it raised the number of its legions from 14 to 20. When Rome couldn't afford to pay its sailors, rich citizens assumed the burden. At one point Rome auctioned off the land where Hannibal was encamped. It went for the full value of real estate; so sure and determined were they that they would take it back.

They even enlisted slaves to fill their ranks. To prove they had fought well, Gallic slaves fighting for Rome would cut off the heads of defeated enemies and run back in the middle of battle to show them to the Roman general.

In 215 BCE, Hannibal tried to relieve the siege of Cumae, only to be repulsed by Romans entrenched in their siege-works.

So he struck at Nola only to be repulsed by another Roman army there.

Hannibal's attempt to march into Campania was driven back.

A Roman fleet beat Hannibal in a race to seize Tarentum.

In 212 B.C.E. the Romans besieged Capua (second only to Rome in size), building a double line of fortifications with one line of trenches facing in, the other facing out against any relief force. When Hannibal was repulsed at the outer trench, he marched on Rome, hoping the

Romans would raise the siege of Capua to rescue their capital. But the Romans at Capua stayed put while the Roman Senate manned their walls with boys and old men. Rome stood and Capua soon fell.

When Hannibal divided his army to meet these multiple threats, the Romans seized the opportunity and crushed the force led by Hannibal's lieutenant, Hanno.

Like a pack of wolves after a stag, the Romans would keep nipping at their prey until he dropped from exhaustion.

Bit by bit Hannibal was being pushed out of Italy.

However, it was events elsewhere that would prove decisive.

Scipio and Spain (210-206 B.C.E.)

Scipio's decisive victory for the conquest of Spain at Ilipa (206 B.C.E.) by Igor Dzis

After the death of Scipio the Elder, Roman holdings in Spain shrank behind the Ebro River. However, in 210 BCE, Claudius Nero repulsed a Carthaginian attack. And the next year, a new leader emerged, son of the recently killed general, Publius Cornelius Scipio

The younger Scipio was a natural leader, a man of action with an almost mystical

charisma that inspired his men with the confidence they would need to defeat Hannibal. At the age of 25, he became the first private citizen of Rome ever given proconsular imperium (power)

Like Hannibal, he was a master of the unexpected.

Instead of waiting for the enemy to move, he attacked Cartagena, Carthage's main base in Spain. Just then, all three Punic generals were away, never expecting such a move from such a young commander. Besides, Cartagena, being well fortified and surrounded on three sides by water, should hold out long enough for help to come.

Scipio began his attack on one side to draw attention from lagoon side during a storm that drove away the water there. Before the Carthaginians knew what had happened, Scipio had stormed the undefended wall, seizing the city and the Punic treasury.

In 208 BCE Scipio beat Hannibal's brother, Hasdrubal, who nonetheless slipped out of Spain and followed his brother's route into Italy. The Carthaginians left in Spain used Fabian tactics to hold off Scipio until the news of Hasdrubal's death in Italy drove them to challenge Scipio to a showdown.

It came at Ilipa in 206 BCE. For several days both armies came out with their best troops in the center, but didn't fight. Then, one day Scipio sent his cavalry to draw out the Carthaginians who emerged again in their old formation only to be met by Romans with their best troops on the wings. The Romans outflanked the Carthaginians and cut them to pieces.

Scipio had taken Spain from Carthage.

North Africa now beckoned.

Hannibal at Bay (208-203 B.C.E.)

In 208 BCE, Marcellus, one of Rome's best commanders was killed in an ambush. Hannibal buried him with full honors, but kept his signet ring to gain entry into the town of Salapia.

The Salapians let in 600 Carthaginians, but then dropped the portcullis, massacring Hannibal's troops now trapped in their town.

The next year, Hannibal's brother, Hasdrubal slipped out of Spain, crossed the Alps into Italy, and recruited enough Gauls to bring his army up to 30,000 men.

In response Rome raised the number of legions from 21 to 23, using 1 army to hold Hannibal and another to meet Hasdrubal before he could join up with his brother. By chance, the Romans captured Hasdrubal's dispatch rider, so they knew his plans while Hannibal didn't.

Claudius Nero rushed North with 6000 troops and joined the other consul, concealing their rendezvous by the two armies sharing tents. Not until the next morning, when a double bugle signaled the presence of 2 consuls, did Hasdrubal realize what he was up against.

By then it was too late.

Hasdrubal and his army met their fate at the Metaurus River. As the Romans panicked the enemy elephants, the mahouts (elephant drivers) had to drive spikes into the skulls of the beasts to keep them from trampling their own army.

Hannibal got news of his brother's death when a Roman threw a bag containing Hasdrubal's head into his camp.

In 205 BCE, another of Hannibal's brothers, Mago, landed in Northern Italy hoping to recruit the Gauls. However, few Gauls joined him, feeling abandoned by Hannibal, whom they hadn't seen for ten years, and less confident in Carthage after Hasdrubal's defeat and death at the Metaurus.

Two years later, Mago's army of 30,000 men was defeated.

Soon afterwards, Hannibal left Italy upon news of Scipio's invasion of Africa.

Scipio vs. Hannibal

The climactic battle at Zama in 202 B.C.E

Having destroyed Carthaginian power in Spain and confined Hannibal to Southern Italy, a political fight now erupted in Rome between old time Fabians, who only wanted Hannibal out of Italy but didn't want to get Rome involved in the world beyond, and Scipio who wanted to take the war to Africa and break Carthage for good. In a compromise, Scipio only got 2 legions and the still-disgraced survivors of Cannae who were eager to redeem their honor. In addition he raised 7000 volunteers and got ships & supplies from various Italian cities. With these elements, he trained a first class army of 30,000 men.

The next year, Scipio sailed for North Africa where he gained an ally in the Numidian chief, Masinissa. For the first time, the Romans would have cavalry able to match any the Carthaginians could field.

When confronted by superior forces, Scipio launched a surprise night attack on the enemy camp by setting it on fire and cutting down the Carthaginians in the confusion. Scipio destroyed another army of 20,000 men by suddenly showing up w/12,000 men and using his Hastati for cover while pulling his second and third ranks out to attack the enemy flanks.

After this, Carthage sued for peace and even ratified a treaty stripping it of Spain, Gaul, 5000 talents of silver, and all but 20 ships. However, Hannibal and Mago returned with their armies and war resumed. Scipio and Hannibal met for a parley, but were unable to agree on terms of peace. The decisive battle took place at Zama.

For once, the Romans had the advantage in cavalry, their Numidian allies defeating the Carthaginians on the flanks and chasing them off the field. After panicking Hannibal's elephants with trumpets, the battle then turned into a desperate brawl between the opposing infantries until the Numidians returned from the pursuit and hit Hannibal's army from behind. By the end of the day, Hannibal's army was gone and Carthage had no alternative but to surrender.

The resulting treaty was not kind.

- Carthage lost all but its local territory, including Numidia, all its elephants & all but 10 ships.
- It had to pay an indemnity of 10,000 talents silver over the next 50 years.
- It also lost its independent foreign policy, even having to ask Rome for permission

to defend itself against attack.

**Copy of the treaty ending
the Second Punic War**

Rome was now the supreme power in the Mediterranean and poised to extend its reach for empire.

Hannibal's fate. After the war, Hannibal assumed control of Carthage (which he hadn't even seen in forty years. He proved to be as brilliant an administrator as he was a general, reviving Carthage's prosperity so quickly that it paid off the war indemnity in 10 years instead of 50.

It was that prosperity that proved his final undoing, since Rome's bitter memories of the recent war made it extremely paranoid of a resurgent Carthage led by Hannibal. As a result, when Rome ordered him turned over, he fled to the Seleucid monarch, Antiochus III, whom he advised until the Romans defeated him at the battle of Magnesia in 189 B.C.E.

Once again, Hannibal had to run for his life. Finally, as Roman troops were closing in on him in Bithynia in Asia Minor, he took poison rather than fall into their hands. His tomb (below) is still there.

[Back to flowchart](#)

ROME IN THE MEDITERRANEAN (201-133 B.C.E.)

Further Roman expansion (201-133 B.C.E.) Like it or not, (and many Romans did not), Rome was now a Mediterranean power. This involved it in an ever-widening circle of affairs that it found itself less and less able to avoid contact with. As a result, the next seventy years saw Rome's power and influence growing throughout both the Western and Eastern Mediterranean.

Much of Rome's expansion was tied in with the nature of Roman politics, which were both highly competitive and expensive. A Roman's public career consisted of rising through a tight mixture of military and civil offices, with success in war being the most important factor. Military victories brought a Roman glory, status (which heavily affected his success in politics), and money (which helped him pay for his political career). Therefore, after 200 B.C.E., when Romans found themselves outside of Italy and far from the control of the Roman Senate, they were often tempted to attack foreign peoples to gain the money and glory needed to continue their careers back home. Although Romans might be eager to win fame and riches, they were generally reluctant to conquer new lands, since that would involve the trouble and expense of actually ruling those new provinces. Therefore, while Rome's power was clearly dominant in the Mediterranean by 133 B.C.E., a map of the Mediterranean at that time would hardly reflect that power as the Romans during this period often passed up opportunities for conquest.

Despite the harsh treaty imposed in 201 B.C.E., Carthage bounced back to regain its prosperity, although not its power. This still worried some Romans who recalled the trials and tribulations of two previous wars with Carthage. One of these Romans, Cato the Elder, was so fearful of Carthage that no matter what the topic of his speech in the Senate, he always ended it with "Carthage must be destroyed." Finally, in 149 B.C.E., the Romans listened to Cato, and tricked the Carthaginians into disarming before demanding the complete destruction of their city. This was too much, and the Carthaginians somehow managed to rearm and put up a furious defense. The resulting siege of Carthage, known as the Third Punic War, lasted three years (149-146 B.C.E.). In the end, the Romans stormed Carthage's walls and leveled it to the ground. This destroyed Rome's most dangerous enemy, but also put a serious blotch on its record for fair play. However, Rome still left most of North Africa to Numidia rather than taking it for

itself, showing it was probably motivated against Carthage more by fear than greed.

Rome's wars with Celtic tribes in Cisalpine Gaul (Northern Italy) and Spain were also brutal. However, it was largely cultural differences, especially over their respective concepts of the state, that triggered disastrous misunderstandings between Rome and the Celts. The Romans saw the state as being the totality of the people in a society, as expressed in their motto "The Senate and the Roman People" (SPQR). Therefore, any treaty signed by legal representatives of the Roman state was considered binding on all Romans. On the other hand, Celtic peoples, especially those in Spain, were much more loosely organized into tribes. And even if a tribe's leaders signed a treaty with Rome, other members of the tribe, especially those with their own war bands personally loyal to them, might not agree with it and continue fighting. In the Romans' eyes, this was a clear violation of the treaty and merited retaliation. Unfortunately, since the Romans could not tell who was guilty or innocent, they often struck against tribesmen who were abiding by the treaty, seeing them all as equally guilty since they were all bound by the same treaty. Naturally, the wrongly accused Celts would strike back, confirming Roman opinions of them and triggering a cycle of hatred and violence that was very hard to break.

Therefore, the Roman conquests of Cisalpine Gaul and Spain were especially brutal, involving ambushes, massacres, and broken treaties by both sides. It took the Romans half a century to pacify Cisalpine Gaul and nearly seventy years to conquer most of Spain. The final conquest of north-western Spain would not be finished until 19 B.C.E.

Roman involvement in the East was more reluctant, especially after two exhausting wars with Carthage. However, Rome had already been involved there in suppressing pirates in Illyria and in the war that Macedon had declared on it during the struggle with Hannibal. To some powers, such as Macedon and the Seleucid kingdom, the rising power of Rome seemed a threat. But to others, such as Rhodes and Pergamum, it seemed like salvation from aggression by Macedon and Seleucid Asia. When they appealed to Rome for help, they portrayed their enemies as a threat to Rome as well, pointing out how Philip V had attacked Rome in the midst of its life and death struggle against Hannibal.

Reluctantly, the Roman people agreed to declare what is known as the Second Macedonian War (201-196 B.C.E.). After a slow start, the Romans finally met the Macedonian phalanx at Cynoscephalae. As

in the war against Pyrrhus a century before, the legions' flexibility proved decisively superior to the phalanx's rigidity, and Rome won the war. Rome's settlement shows its reluctance to get involved in the East beyond securing Italy's flanks. Rome took no land and only 1000 talents (66,000 pounds) of silver to cover the costs of the war. Either as a generous move or in order to further weaken Macedon, Rome declared all Greeks free from foreign intervention, and by 194 B.C.E. its own troops were gone from Greek and Macedonian soil.

However, Rome's troubles with Macedon and the Seleucid Empire were far from over. The Greeks, as always, kept squabbling with each other. This opened the way for the Seleucid king, Antiochus III, to invade Greece. Appeals from various Greeks and the advance of Antiochus' army into Greece led to the Syrian War (192-189 B.C.E.). The Romans turned Antiochus' defenses at Thermopylae Pass, drove him from Greece, and tracked him into Asia Minor. For the first time, Roman troops crossed into Asia. After crushing Antiochus' phalanx and army at Magnesia, Rome made peace, claiming no land for itself, but taking 15,000 talents of silver to pay for the war and giving land to its ally, Pergamum.

Of course, Rome's involvement could not end that easily. More squabbling between Macedonians and Greeks led to the Third Macedonian War (171-167 B.C.E.) with the same basic result. Again, the legions tore up the Macedonian phalanx. And again, Rome took no land, but it did break Macedon into four separate and weak states. By now, Roman patience was at an end. A revolt in 149 B.C.E. led to Rome finally annexing Macedon as a province. And more Greek quarreling led to war, the sack of Corinth, and turning Greece into a Roman province in 146 B.C.E.

In 133 B.C.E., the king of Pergamum died and willed his kingdom to Rome, probably thinking annexation was only a matter of time. Two other kingdoms, Bithynia and Egypt, would also be willed to Rome in the next half-century, showing the dominance of Rome in the Mediterranean. Even those areas not directly under Roman rule increasingly felt its presence and would eventually fall. However, as remarkable as the rise of Roman power was, it also brought serious problems that would plunge Rome into bloody civil strife.

Rome's "Vietnam": The Iberian Wars

Rome's wars in Spain, much like America's war in Vietnam, were especially vicious. For example, when an Iberian chieftain named Viriathus successfully led a revolt, the Romans assassinated him. This led to the Numantine War (154-133 B.C.E.), during which Rome broke two treaties and committed two more massacres. Adding to Rome's frustrations was its army's poor training, morale, and leadership.

The most notorious event in the Numantine war was the capture of an entire Roman army in 137 B.C.E. The Roman general, Mancinus, accepted terms of peace for the release of his army. However, the Roman Senate revoked the treaty and returned Mancinus naked and in chains. Finally, Scipio Aemilianus, the conqueror of Carthage, whipped the army into shape and besieged Numantia, which fell and was destroyed in 133 B.C.E. Rome's final conquest of Spain wouldn't be completed until 19 B.C.E. during the reign of the emperor Augustus.

An Iberian warrior

Three Battles that brought down the Hellenistic East

The Battle of Cynoscephalae (197 B.C.E.) started when advance units of the Roman and Macedonian armies inadvertently stumbled upon one another and a full-blown battle developed. The Roman legions could make little progress going head to head with the Macedonian phalanx's solid wall of pikes (below). However, when the Macedonian elephants were driven off, a Roman military tribune pulled several maniples out of line to circle around and hit the exposed Macedonian flank. Once again, the flexibility of the Roman legions proved superior to the rigidity of the Macedonian phalanx.

Heavily armored cavalry, known as *cataphracts* that would be a mainstay of cavalry in the Near East for centuries to come.

At Magnesia (190 B.C.E.) an army of 30,000 Romans and their Pergamene allies faced a force possibly twice its size under the Seleucid monarch, Antiochus III. Antiochus opened with a charge of scythed chariots, a nasty weapon with curved blades attached to the axles in order to cut up opposing troops. However, the charge seems to have gone awry and disrupted Antiochus' left flank more than it did the Romans.

Antiochus led a cavalry charge that routed the Roman right, but then pursued them off the field in a vain attempt to take and loot the Roman camp. It was really the Pergamene king,

Eumenes, who saved the day, attacking the Seleucid left already disrupted by its own chariots. This allowed the Romans and Pergamenes to surround Antiochus' phalanx and destroy it, exposing the right wing of his phalanx, which was arranged 32 men deep with war elephants between every 10 columns.

By the time Antiochus returned, his army was lost. Two years later, in the Peace of Apamea, Rome stripped him of Asia Minor, leaving its ally, Pergamum, the main power there while giving the Romans an opportunity for further intervention in Seleucid affairs.

At Pydna (168 B.C.E.) the Romans once again squared off against the Macedonian phalanx under its king, Perseus. The Roman general, Lucius Aemilius Paullus described the approach of the enemy phalanx as the most terrifying sight he had ever witnessed. Unable to get under the wall of pikes or hack off their ends, the legions executed an orderly retreat onto uneven ground that broke up the tight Macedonian formation. Able to get at close quarters using their longer swords and big shields, the legionaries cut the phalanx to pieces. Out of 40,000 men, the Macedonians lost 32,000 in the ensuing panic.

A true show of power. In 167 B.C.E., the Roman envoy, Popilius Laenus, armed only with the news of Rome's recent victory over Macedon at Pydna, confronted the Seleucid ruler, Antiochus IV with the Roman Senate's demand that he turn back from invading Ptolemaic Egypt. Drawing a circle around the king, Popilius demanded he give his answer before stepping out of it. Antiochus was so taken aback by this lone Roman's brazenness that he turned back.

THE PROBLEMS OF EMPIRE

Success often carries with it the seeds of its own destruction, and that was certainly the case with the Roman republic by the late second century B.C.E. "Superpower" status wrought far-reaching changes affecting all levels of Roman society. Unfortunately, the conservative Romans had great difficulty adapting to such rapid changes. The result was a century of political and social turmoil during which Rome kept trying to patch up these new problems with the same old solutions. Fortunately for Rome, it was still dynamic and energetic enough to survive and even expand during this period of social decay and political and military turbulence. Rome faced serious problems in three areas: the fate of its peasants, the government of its provinces, and its army.

For Rome's peasants, the fruits of empire were bitter indeed. The Second Punic War against Hannibal had devastated many fields in Italy. The other wars of the third and second centuries B.C.E. had left many fields ruined by years of neglect while the farmers were off campaigning. When the farmers came home, two things came with them. First of all, thousands of prisoners of war flooded Roman slave markets. This influx of cheap slave labor let rich Roman senators set up huge estates that competed with the free peasants already struggling to revive their farms. Added to this was an influx of cheap grain from Sicily (also from estates worked by slaves). Faced with such competition, thousands of peasants lost their farms and migrated to the cities, especially Rome.

Life in the cities was little better. Slaves there had also taken many of the jobs the peasants might have hoped for. Thus the dispossessed peasants became an idle urban mob dependant on various politicians for food and rent in return for political support. This led to untold squalor and the occasional cheap spectacles of gladiatorial fights and chariot racing, the proverbial "bread and circuses" of ancient Rome. Because of this, Roman politics became corrupt, violent, and split into two factions, the *Optimates* who drew their support from the Senate and other nobles, and the *Populares* who relied on the Tribal assembly and mob for support.

Provincial government was no better. The root of the problem was that Rome was trying to rule a large empire with an amateur city-state government. At first, extra praetors (judges), and later pro-consuls (ex-consuls) and pro-praetors (ex-praetors) were created to run the provinces for terms of one year. However, one year was not nearly enough time to learn about a foreign culture and how to govern it. Therefore, such governors were untrained, unsupervised, and unpaid. Being unpaid forced them to cover their expenses through corruption. Being unsupervised let them get away with almost anything they wanted. Being untrained meant they were usually incompetent. Even the creation of permanent extortion courts to try corrupt ex-governors only encouraged more corruption so they could bribe the jurors who were also their senatorial colleagues who hoped for similar leniency in the future when they were tried for corruption.

In addition there were no professional Roman bureaucrats to run the daily machinery of provincial government. Instead, governors brought personal friends and slaves. Tax collection was done through tax farming, a system where rich businessmen, known as *equites*, bought the right to collect the taxes of a province, paying the state the agreed sum and then over-taxing the provinces to cover their expenses and more.

These problems with dispossessed peasants and corrupt provincial government led to two problems with the army. For one thing, Rome's army of peasant militia had been fine when Rome's wars were close by and campaigns ended in time for harvest. However, long terms of service in overseas wars had ruined many farms through neglect, leaving fewer recruits able and willing to go to war, lowering the army's morale and efficiency. Second, the yearly turnover of governors led to inexperienced generals who suffered frequent military defeats.

This led to two reforms. First, generals created a long-term professional army by recruiting the dispossessed peasants, promising them land after the war as an inducement to enlist. They also had to supply them with their equipment since the Senate

still felt only those who could afford to equip themselves should serve in the army. Therefore, the soldiers were more loyal to their generals than to the state (probably seeing little distinction between the two). The second reform was to extend the terms of provincial governors from one year to as many as five. This resulted in a few experienced, ambitious and rival generals.

These reforms triggered a vicious cycle where those few governors with armies had more scope for long-term campaigns and outright conquest of new lands. This upset the balance of power in the Roman Senate, between a small number of rich and powerful men and the majority of senators who had few opportunities for glory and riches. The combination of all these social, economic, administrative, and military problems bred a century of political turmoil, administrative unrest, and civil wars between rival generals.

State Contracts and Clientes

In addition to auctioning the right to collect taxes to the equites, Rome also auctioned off the right to carry out various other state functions, such as running state-owned mines and minting its coins. Equites who bought the contract for minting coins for a particular year typically put their names and/or some picture identifying them on the coins. The coin above bears the name of Lucius Flaminius who had the state contract for minting Rome’s coins for the year 106/105 BCE.

The denarius below was struck by Sextus Pompeius Fostlus, an eques who had the contract for minting coins in 137 B.C. Since Fostlus claimed descent from Faustulus, the shepherd who raised Romulus and Remus as his own sons, the reverse shows Fostlus’ ancestor finding the she-wolf nursing the twin founders of Rome.

***Clientes* were urban poor who sold their votes and political support to rich politicians in return for food, rent, and cheap entertainment, the proverbial “bread and circuses.” Part of a client’s duties involved showing up at his patron’s home in the morning to greet him and follow him with the other clientes in a virtual parade to the Roman forum. Whoever showed up with the largest parade won.**

Roman Blood Sports

Leon Jerome's 19th century painting of how people imagined ancient gladiatorial games.

Gladiators. If there is one thing Hollywood has imbedded in our collective impression of ancient Rome, it is gladiators. Indeed this was a major form of public entertainment from c.100 B.C.E. to c.200 C.E., although its origins go back several centuries before this period, and they continued even under Christian emperors, the last games being performed shortly before 500 C.E.

Older traditions ascribed the origins of gladiatorial matches to Etruscan funeral games to honor a dead noble or king. However, recent evidence points to Campania, south of Rome, since that is the site of the first gladiatorial schools and the earliest depictions of gladiators on fresco paintings. The first Roman gladiatorial games, involving three pairs of gladiators, were held in honor of a dead Roman noble, Brutus Pera, in 264 B.C.E., the first year of the Punic Wars. Over time, such games involved progressively larger numbers of gladiators: twenty-two in 216 B.C.E. and 120 in 183 B.C.E. In addition, there were numerous smaller private games given in honor of dead nobles.

However, in 105 B.C.E., Roman consuls put on the first state-sponsored games. From that time this became a popular way of currying favor with the mob, each politician trying to outdo his competitors in the lavishness of the games and number of gladiators involved. In 65 B.C.E., a rising politician, Julius Caesar, put on games with 320 pairs of gladiators in silvered armor. He wanted more, but the Senate, still shaken by

the Spartacus revolt (73-70 B.C.E.) and leery of popular young politicians like Caesar having private armies in Rome, limited his games to 320 pairs.

Even with the graphic simulated violence increasingly watched in video games, movies, and TV, we still have a hard time figuring out the appeal or justification for such games. From the Romans' point of view, it was supposedly to harden their sons to the sight of death and violence in preparation for real war.

There were three main sources of gladiators: prisoners of war, slaves condemned of certain crimes, and free volunteers. Such volunteers may have made up half or more of Rome's gladiators, despite the fact that they had to give up their free status to participate. However, for the poor, being a gladiator offered the possibility of fame and fortune, regardless of their low status. Those condemned to the arena for their crimes, but not considered fit to fight as gladiators, might be put in the "warm-up" games pitting them against wild animals, which the animals usually won.

Gladiators typically used arms and armor representing armies from various regions. The Romans liked to pit "armies" of different nations against one another to see who would win such a war, sort of an ancient version of fantasy sports leagues. The most popular types of gladiators were the "Samnites" and "Thracians", whose teams inspired devoted fans from all social classes, including emperors.

In the early empire, as demand for gladiators exceeded supply, there was a tendency to show mercy, especially to gladiators popular with the mob. One factor keeping the death toll of these matches down was the high cost of training gladiators, which made those in charge of putting on (and paying for) the games reluctant to indiscriminately slaughter every gladiator unlucky enough to lose his match. Contracts with gladiators' owners would even stipulate compensation if any of their gladiators were

accidentally killed. Of course, gladiators might secretly agree to put out less than their best efforts to kill each other. In the BBC production of *I Claudius*, a great fictionalized account of court intrigue during the early empire, the empress Livia gives a stirring “pre-game pep talk” to the gladiators she has hired, warning them against such nonsense, including the old pig’s-blood-in-a-bladder trick. This clip can be viewed on Youtube, but the whole series is well worth watching.

There were also female gladiators (*gladiatrix*, plural *gladiatrices*). Although Roman law forbade women from families of equites and higher status participating in such matches, there is evidence that upper class women volunteered for such events, probably as a form of thrill seeking. The emperor Nero staged the earliest attested such match. He also supposedly used children in his games in 66 C.E. as well as wives of senators forced into the arena, although it is not clear if they fought. The emperor Domitian reportedly liked to stage torch-lit matches between dwarves and women.

Canopies were hung from the posts along the outer edge of the arena to provide shade for the crowd. Our word *arena* comes from *harena*, the Latin for sand, which would be spread around to soak up the blood from the previous matches.

Animal fights, involving both different animals (e.g., lions, tigers, bears, and ostriches) against one another and humans against animals were another popular form of public entertainment. The Romans were constantly looking for more bizarre twists on their spectacles. In one case, they constructed a fake whale and brought it into the Coliseum filled with fifty hungry bears who were unleashed against whatever opponents were waiting outside.

Roman NASCAR: Chariot Racing

A slightly over-the-top scene from the classic chariot race in the movie *Ben Hur*. One thing to keep in mind: chariots had no shock absorbers.

Roman chariot racing was a rough and tumble sport with deadly accidents and pileups taking place, especially at the hairpin turns. Such *naufragia* (shipwrecks) rarely if ever exploded like their modern counterparts (although if you freeze-frame the DVD of *Gladiator* in the fight between “Rome” and “Carthage” you can spot some sort of smoke generator under the chariot that might have some potential for pyrotechnics).

The Romans adopted chariot racing from the Greeks, who ran such races as an Olympic event. However, there were significant differences. The drivers in Roman races were usually slaves who, instead of the owners as in Greece, were awarded a laurel wreath. They also earned prize money, with which they might buy their freedom. Greek races were twelve laps long, while Roman races were seven or five laps, so they could fit more races (typically twenty-four) into one day. This allowed more betting to take place. Roman races took place in a huge elongated track known as the Circus Maximus, which could hold 150-180,000 spectators.

Unlike Greek drivers who held their reins, Roman drivers had the reins wrapped around them, putting them in much greater danger in case of a wreck or the horses breaking away from the chariot and taking the driver with them. As a precaution, they wore a knife to cut themselves loose in such a case. Even so, chariot drivers typically had short careers.

There were four racing teams: reds, whites, blues, and greens. Several chariots from each team might compete in one race and cooperate to cut off opposing chariots, in particular, ramming them against the center median to wreck them, much like modern Roller Derby. That was all right, although it's unlikely the spiked axles used in the famous chariot race in the movie *Ben Hur* would have been legal.

In the late empire, the Greens and Blues emerged as the two main teams. Their fans developed what may have been history's greatest sports rivalry with heavy religious overtones, the Greens favoring the Monophysite version of Christianity and the Blues following the state-supported Orthodoxy. In 532 C.E., the two factions joined forces and tried to overthrow the emperor Justinian I in what is known as the Nike Riot (from *nike*, the Greek word for victory). By the time it was finally suppressed, up to 30,000 people may have died. After that chariot racing declined in importance, which is what happens when you kill off your fans.

THE FLOW OF POWER IN ROMAN GOVERNMENT IN THE LATE REPUBLIC

Many of the problems of the late Roman Republic came from how a small number of powerful men were able to manipulate power and turn what looked like a somewhat democratic government into an effective oligarchy. In a broader sense, it serves as a lesson about how power can be manipulated in any supposedly democratic constitution.

At the center of power was the Senate, an advisory body of 300 ex-office holders whose decrees (*senatus consulta*), while not technically laws, carried the virtual force of law, unless they specifically contradicted a law passed by the assembly. The Senate especially had jurisdiction over officials' budgets, the technical legality of treaties and laws, and assigning tasks to magistrates (e.g., which ex-officials ruled which provinces and for how long). A ruling principle for the senatorial oligarchy as a whole was to maintain its power as a group without letting any individual members gaining too much power. In addition, the Senate exercised control over three main areas of Roman government: popular assemblies, ex-officials, and religious and traditional ceremonies and procedures.

There were two popular assemblies that the Senate needed to maintain control over. The *Comitia Centuriata* was originally a military assembly that elected the top officials in Rome (consuls, praetors, and censors) and voted on war and peace. It was originally organized into 193 bloc votes known as centuries, with the rich making up more centuries and thus given more votes. This was to reflect the heavier burden the rich, who could afford full armor, faced in battle. The tribal assembly (*Comitia Tributa*), which actually passed laws, could only vote on bills proposed by officials, who were also members of the Senate. In both assemblies open ballots where senatorial nobles could keep tabs on how their dependents (clientes) voted.

The primary means of control the Senate had over officials was the fact that after their one-year terms of office, ex-officials all returned to the Senate. This made it unlikely they would go against the

wishes of their fellow senators. Therefore, the Senate controlled what laws were proposed and voted on through the consuls and praetors. Even the ten tribunes, who were supposed to protect the rights of the poor through the right to veto laws, had to go back and face the Senate after their year in office.

The Romans were religious, even superstitious people who placed great value on omens and doing things by the exact right procedure to keep the favor of the gods. It just so happened the Senatorial nobles also controlled the priestly offices, and virtually all government procedures involved religious rituals that could block or negate government actions. Reinforcing this was the *cursus honorum* (ladder of honors) that dictated the minimum age, number of times, and order one could hold offices. Every five years, the *Comitia Centuriata* chose two censors, whose job was to expel unworthy senators and fill empty senatorial seats. Naturally, only senatorial nobles served as censors, making sure that the exclusive club of the Senate contained maintained the purity of its membership and control of the state.

Senatorial Fun Facts

Ancient priests known as augurs trying to tell the future through observing the flights of birds.

***Senility.* The word senate comes from the Latin word *senes*, meaning old man, referring to the common custom of traditional societies being guided by the collective wisdom of their elders. Ironically, we get the word senile from it, although there is little evidence of senility in traditional cultures where the elders still have a function and command respect.**

Augury. For the Romans, who were very religious and legalistic, any public acts had to be preceded by a priest, known as an augur, reading the flights and actions of birds to determine if the gods favored business that day. We have already seen the impact of the failure of the sacred chickens to eat on two battles in the Punic Wars (chapter 29A). The very location of Rome was based on the legend of Romulus and Remus fighting over such omens, Remus first seeing six vultures (a good sign) followed by Romulus seeing twelve.

Our own word *inaugurate* derives from Roman practice, although we rarely consult the actions of pigeons on the Mall before swearing in a new president. Caesar's fellow consul for the year 59 B.C.E., Bibulus, was no match for his wily colleague. After the humiliation of having a basket of dung dumped on him, he stayed indoors, each day declaring the omens were bad, so there could be no government business that day. Thus most of the laws passed by Caesar that year were technically invalid. Not that anyone was paying close attention during what was popularly known as "the consulship of Julius and Caesar."

If nothing else, priests might stir up a flock of pigeons at a critical time, declaring bad omens. Even now, most people and public statues consider pigeons bad news.

The original filibuster. Senatorial meetings began at sunrise and ended by nightfall. Whatever issues brought up that day had to be resolved by the end of the day and could not carry over to the next day. Senators spoke in order of seniority, but every senator had the right to speak before a vote was taken, so opponents of a bill could discuss it until nightfall, and thus kill it. A bill could also be vetoed, usually by a plebian official known as a tribune. Bills of minor importance were voted on by a show of hands or voice vote. More important bills called for a physical division of the senators for and against the bill.

THE FALL OF THE ROMAN REPUBLIC (133-31 B.C.E.)

"The city's life is for sale, and it would kill itself if it could find a buyer"-- Jugurtha of Numidia

Pattern of decline. Rome's failure to adapt its city-state style government to ruling an empire triggered a century long pattern of events that would eventually lead to fall of the old oligarchy led by the Senate. Either out of genuine concern for reform, desire for personal gain and glory, or a combination of the two, an individual politician or general would introduce new, but also disruptive practices. These would weaken Roman customs, traditions, and institutions, especially the Senate. That would create the need and open the way for new figures to rise up that would introduce even more disruptive practices, and so on. Thus the cycle would keep repeating until the old order was destroyed. There were five main figures this process brought to the forefront of Roman politics and who in turn perpetuated the cycle, allowing the rise of the next figure: Tiberius Gracchus, Gaius Gracchus, Marius, Sulla, and Julius Caesar. Not until Caesar's nephew and heir, Octavian, seized power would the cycle be broken and a new more stable order established in place of senatorial rule.

First attempts at reform: the Gracchi. In 133 B.C.E., Tiberius Gracchus became tribune. He saw that many of Rome's troubles revolved around the decline of the free peasantry who were flocking into the cities. Therefore, he proposed a bill to give land to the idle mob and re-establish them on their own farms. The land he proposed using was public land owned by the state that, unfortunately, was controlled by rich and powerful senators who most likely would be reluctant to give it up.

Seeing that the Senate could well be hostile to his plan, Tiberius did several rather unheard of things. Although not necessarily illegal, his actions certainly flaunted the deep-seated traditions by which Roman government had operated for centuries. For one thing, Tiberius by-passed the Senate and went directly to the tribal Assembly where his bill had a better chance to pass. When the Senate bribed another tribune to veto the bill, Tiberius took the radical step of impeaching the

man. With that done, the land bill passed despite the fury of the Senate. In order to get money to start the peasants on their new farms, Tiberius had the assembly appropriate the treasury of Pergamum, which had just been willed to Rome. Financial and foreign matters were both the realm of the Senate, but Tiberius and the assembly just shoved that aside as well. Tiberius then tried to do away with one more tradition by running for re-election as tribune. This was too much, and in the discussion of its legality, a riot broke out that ended with the death of Tiberius and 300 of his followers. Civil violence was starting to be used to decide an issue in Roman politics.

Despite his good intentions, Tiberius' methods hastened the decline of the Republic more than they helped it. For one thing, he made the Tribal Assembly, which controlled the Urban Assembly, a major factor in Roman politics. Likewise, he weakened the senatorial nobles who had traditionally run Rome. This gave rise to factional politics of the Optimates and Populares, often causing Roman politics to degenerate into little more than bribery contests and street fights to win power. However, Tiberius' reforms also had some positive results as some 75,000 people were put back on farms in the decade after his death. However, there was still a lot of work to be done, and in 123 B.C.E. Gaius Gracchus, Tiberius' younger brother, became tribune.

An ardent reformer like his brother, Gaius passed a law guaranteeing cheap grain for the urban poor. Later politicians would make that grain free at state expense. Another move to weaken the Senate and gain allies was to give the *equites* (rich businessmen) control of the juries in the courts that tried Roman governors for corruption. While this prevented corrupt senatorial governors from relying on their senatorial friends to acquit them in the extortion courts, it hardly reduced corruption. Now equites who had bought the right to "farm" a province's taxes could threaten the governor with conviction in the extortion courts if he did not let them take all they wanted from the provincials. This also made the equites a new force in Roman politics, symbolized by special seats at the games and the right to wear distinctive rings. At the same time, it further weakened the Senate.

The Senate was understandably nervous about how far this new Gracchus would go, and tried to outbid him for popular support. Unfortunately, Gaius overstepped himself by proposing citizenship for the Italian allies. This was unpopular with the mob, which jealously guarded their citizenship as the only thing they had left to make them feel special. As a result, a riot broke out (probably with some help from the Senate), and Gaius was killed much as his brother had been.

Marius and the Roman army. The next issue facing Rome was a war in North Africa against the Numidian king Jugurtha. The war in itself was not too important except that it showed the further corruption of Roman politics, first by Jugurtha against his rivals, and then an ambitious man of equestrian rank, Gaius Marius, in a series of intrigues against his general, to get a leave of absence to get elected consul. He then had the Tribal Assembly give him command of the war in place of his former general, Metellus. Marius and an ambitious junior officer named Sulla finished off Jugurtha and Marius got the credit. This set him up for the next big step in his career.

For several years, the migrations of some Germanic tribes known as the Cimbri and Teutones had been wreaking havoc in the north. When they turned on Rome in earnest and mauled a Roman army in Gaul in 105 B.C.E., panic set in and Rome looked for a savior. That man, of course, was Marius, the conqueror of Jugurtha. He was elected to an unheard of six straight consulships to prepare the army for the northern menace.

Marius' main legacy was a long overdue reform of the army. Rome's extended campaigns required a long-term professional army to replace the reluctant and inefficient peasant draftees Rome had used till now. Marius took the final steps of making it just that, with volunteers serving instead of peasants hauled off their farms. Marius' recruits came largely from the unemployed mob lured by the promise of land after their service was over. This had three main effects. For one thing, since these recruits were too poor to supply their own equipment, the state had to supply it, thus making equipment and training more regular and the army

more efficient. Along these lines, professional soldiers could devote all their time to training which, combined with the proverbially tough Roman discipline, also made for a very effective army.

The third effect had to do with getting recruits. The main inducement to serve was that after his term of service, a veteran would receive a plot of land on which to start his own farm. However, since each general had to get a separate land bill passed by the Senate for his particular army, the soldier looked to his general for a land settlement. Therefore, the troops' loyalty tended to belong to the individual generals rather than the Senate. This meant that a new element, generals backed by their own armies, had become a factor in Roman politics.

However, Marius' recruiting and tactical reforms created a much more efficient and professional army, which is what Rome needed at this time. In Marius' sixth consulship, the Cimbri and Teutones finally got around to invading Italy after a leisurely rampage through Spain and Gaul. The newly reformed legions cleverly maneuvered the invaders into a bad position and then destroyed them under the hot Italian sun. Marius was the hero of the hour and acclaimed the Third Founder of Rome after the legendary Romulus and Camillus.

Marius may have been a good general, but he was a mediocre politician. When his ally, the tribune Saturninus, tried to seize power, a riot broke out. Marius thus found himself in the difficult spot of having to suppress his own rioting supporters. He did his duty, killed many of his followers, and lost most of his popularity as a result. After this, he retired from politics, waiting for a new opportunity for military glory.

Sulla and the First Civil War. For some time, one of the hot issues of the day in Rome was citizenship for the Italian allies. While the Romans had previously been fairly liberal in granting different allies full citizenship, lately they had been satisfied to grant only second class, or Latin, citizenship. Unfortunately, the Italian allies were not nearly as satisfied with this and were agitating for full rights. We have already seen how this issue cost Gaius Gracchus his life. When another Roman, Marcus

Livius Drusus, proposed full citizenship and was assassinated, Italian frustration boiled over into open rebellion. This revolt, known as the *Social War*, or war of the allies (91-88 B.C.E.), saw Rome faced with a formidable Italian enemy trained in Roman tactics. In fact, it was so formidable that the Senate did the one thing it could to defuse the rebellion: it granted full citizenship to any Italians who remained loyal or immediately laid down their arms. This clever move stripped the rebellion of much of its support. The Senate then called on two of its ablest generals, Marius and Sulla, to finish the job. In the end, the rebellion was put down, but the Italians had gained full citizenship, definitely a step forward for Rome and Italy.

The Social War had brought a poor, but very ambitious senatorial noble to the forefront of Roman politics, Lucius Cornelius Sulla. Always on the lookout for the opportunity for power and glory, he found it right after the Social War in the form of a new war in the East against Mithridates, king of Pontus on the Black Sea. Seeing widespread resentment against Rome for its corruption and mistreatment of the provincials in Asia Minor, Mithridates, stirred up a revolt that supposedly massacred 80,000 Italians in Asia Minor in one day. With Rome still preoccupied with the Social War, Mithridates overran Roman Asia and then crossed into Greece (90 B.C.E.). However, once the Social War was over, Rome was ready to tangle with the king of Pontus.

The problem was: which of Rome's generals, Marius or Sulla, should get command of the war? Sulla, who was the consul at this time, legally had the right and initially got it. But as soon as he set out for the port of Brundisium, Marius' followers seized power and gave Marius the command. Sulla then took the unprecedented step of marching on Rome with Roman troops to drive Marius' followers away in flight. However, once Sulla had left again for the East, Marius returned to Rome and seized power again. He was now a bitter old man who started a reign of terror so bloody that his own followers had to put an end to it. Several days into his seventh consulship, Marius died, but his followers remained in power and sent an army to relieve Sulla in the East.

Meanwhile, Sulla had been driving Mithridates from Greece. After two desperate battles and a long terrible siege of Athens, Mithridates fled to Asia Minor. Luckily, the Roman army and general sent to relieve Sulla concentrated more on Mithridates and let Sulla track him into Asia. Mithridates sued for peace and Sulla gladly granted it so he could turn on his enemies in Rome.

What followed was the First Roman Civil War (83-82 B.C.E.). Sulla's tremendous energy and drive made short work of his enemies, and he entered Rome in triumph. His first act was to massacre any of his enemies, including some 90 senators and 2600 rich equites. Among those narrowly escaping Sulla's wrath was the defiant young son-in-law of Marius, Julius Caesar. Sulla then became dictator, and reformed the government to put the Senate back in firm control of the state, just like in the good old days. A year later, Sulla abdicated his powers and retired to the luxury of his villa where he died soon afterwards (78 B.C.E.).

Sulla's settlement did little or nothing to solve Rome's real problems. And after his strong hand was removed, political turmoil returned in full force. The first man to take advantage of this situation was Pompey, one of Sulla's young army officers. Pompey's early rise to power was the result of some drive and energy, but also a good deal of luck. He held several military commands before holding public office. That was illegal, but apparently of little account anymore in Rome. Quite a bit of luck accompanied Pompey as he destroyed Marius' supporters holding out in North Africa and Spain. Also, by chance, as he returned to Rome from Spain, he encountered and mopped up the remnants of a great slave revolt led by a gladiator named Spartacus. Another of Sulla's former officers, Crassus "Dives" (the rich), had actually broken the back of this slave revolt that had terrorized Italy for two years. Nevertheless, Pompey claimed partial credit.

Nerves were on edge as the two potentially hostile Roman generals and their armies were poised on the outskirts of Rome. Luckily, Pompey and Crassus made their peace and together became consuls for 70 B.C.E. Pompey's star just kept rising. Soon afterwards he received an extraordinary command

to clear the Mediterranean of pirates who had infested its waters for years and were even threatening Rome's grain supply. After sweeping the seas clear of these pirates in an amazingly short time, Pompey received another important command. This time he was sent to fight Mithridates of Pontus who had revived his struggle against Rome. Once again luck was with Pompey, because another general, Lucullus, had already done most of the job. Still, it was Pompey who finally crushed Mithridates (who then committed suicide), and it was Pompey who got the credit and triumphal parade. He then spent the next few years marching through the Near East and reorganizing it along lines more favorable to Rome by creating new Roman provinces in Asia Minor and Syria (where he put a final end to the decrepit Seleucid dynasty) and establishing client kings loyal to himself and Rome in Asia Minor and Judaea. In 61 B.C.E., Pompey finally returned to Rome, but this was where his star began to wane.

The rise of Julius Caesar. Pompey, like Marius, may have been a good military man, but he was not much of a politician. Trusting in the power and glory of his name alone, he disbanded his army before he got a land settlement for his veterans from the Senate. When the Senate refused to help him out, Pompey found two allies with whom he formed the *First Triumvirate*, an informal political alliance designed to control Roman politics. One of these was his old colleague, Crassus the Rich. The other was a popular young politician, Julius Caesar. With Pompey's military reputation, Crassus' wealth, and Caesar's popularity with the mob, the Triumvirate should and could rule Rome effectively.

The first order of business was to elect Caesar as consul for 59 B.C.E. Once elected, he had a wild term of office where he ran roughshod over the Roman constitution. Using a good deal of intimidation, he got Pompey's troops their land and himself a lucrative military command in Gaul (modern France) where he was determined to gain a military reputation equal to Pompey's.

Caesar had little military experience before going to Gaul. However, one would never have known it by looking at the masterful way he brought it under Roman control in a mere ten years. We can hardly

imagine the sense of relief to the Romans now that the menace of the northern tribes was further removed from Rome. The Roman conquest of Gaul was also an important step in the process of civilizing Western Europe. Although Gaul was already showing major steps in that direction, the Roman conquest made it heir to the high cultures of the ancient Near East and Greece by way of Rome. It should be noted that, as in the case of Alexander, the glory of Caesar's victories obscured the butchery of countless thousands of innocent people and blurred the distinction of who was civilized and who was barbarian.

During his ten years in Gaul, Caesar also built up a highly efficient and intensely loyal army that could brag of exploits to rival and even surpass those of Pompey's army. Naturally, this caused jealousy and suspicion on Pompey's part. Crassus, whose influence helped keep the Triumvirate together, was killed fighting the Parthians, nomadic tribesmen who had taken much of the old Persian Empire's Asian lands from the now extinct Seleucid dynasty. The death of Julia, Caesar's daughter and Pompey's wife, removed another bond holding the two men together. Day by day, tensions grew as rival political gangs disrupted the streets of Rome with their clashes and the Senate started to back Pompey in opposition to Caesar. Caesar, fearing for his life after he gave up his army, led his troops into Italy and started another civil war (49-45 B.C.E.).

Pompey was no match for Caesar's quick, decisive, and brilliant generalship, and was crushed at the Battle of Pharsalus in Greece in 47 B.C.E. He fled to Egypt where Ptolemy XII who feared the wrath of Caesar murdered him. Soon afterwards, Caesar showed up in Egypt where he spent the next year supporting Ptolemy's sister, Cleopatra, in a civil war against her brother. He then set out to meet Pompey's other allies and followers. In a whirlwind series of campaigns in Pontus, North Africa, and Spain, Caesar crushed the Pompeian forces. By the end of 45 B.C.E., Caesar was the undisputed master of the Roman world and was appointed dictator for life.

Unfortunately, the problems plaguing Rome were too complex to be solved by mere military victories. Caesar did carry out several reforms. He extended

citizenship outside of Italy for the first time. He also changed the old Roman lunar calendar to the more efficient and accurate Egyptian solar calendar, which we still use today with some minor adjustments. However, even Caesar seemed to be at a loss for finding solutions to the deep-seated problems plaguing Roman society and instead planned a major campaign against Parthia. The prospect of Caesar gaining more military glory and becoming even more of a dictator worried a number of senators who formed a plot against his life. On March 15, 44 B.C.E., the eve of his setting out on his campaigns, the conspirators surrounded Caesar in the Senate house and brought him down with twenty-three dagger wounds. Ironically, he fell at the foot of the statue of Pompey.

Octavian, Antony, and two more civil wars (44-31 B.C.E.). Unfortunately, Caesar's death didn't solve Rome's problems as there were always new generals waiting to follow in the footsteps of Marius, Sulla, Pompey, and Caesar. In this case, two men emerged in that capacity: Marc Antony, one of Caesar's most trusted officers, and Octavian, Caesar's 19-year old nephew and chosen heir. Octavian was young, inexperienced in politics and military affairs, and somewhat sickly. No one much gave him much of a chance to survive in the vicious snake pit of Roman politics. Surprisingly, he proved himself quite adept at politics, playing the Senate off against Antony while the Senate thought it was using him in the same way. He then did an about face and allied with Antony and another general, Lepidus, to form the Second Triumvirate.

The first act of the new triumvirate was to clear its enemies out of Rome in a bloody purge. Among the victims was the great Roman statesman, orator, and philosopher, Cicero. We still have many of his speeches and letters that tell us a great bit about life and politics in the crumbling Republic. After this purge, there were still several of Caesar's murderers to contend with in Greece where they were building an army. In the third Roman civil war in less than 50 years, Antony and Octavian tracked down the conspirators, Brutus and Cassius, and destroyed their forces at Philippi (42 B.C.E.).

This put the Second Triumvirate in undisputed control of the Roman world. Lepidus was gradually

forced out of the picture, leaving Antony and Octavian to split the spoils. Antony took the wealthier eastern provinces and got involved in his famous romance with Cleopatra of Egypt. Octavian took the less settled West along with the Roman homeland and recruiting grounds of Italy. As one might expect, tensions mounted between the two men and finally erupted into another civil war. At the battle of Actium in 31 B.C.E., Octavian's fleet crushed the combined navies of Antony and Cleopatra. After a desperate defense of Egypt, both Antony and Cleopatra committed suicide, leaving Octavian as sole ruler of the Roman Empire. It seems ironic that a non-military man should emerge as the final victor in these civil wars and bring them to an end. However, as a non-military man, Octavian saw that the solutions to Rome's problems involved much more than marching some armies around. It would be Octavian, known from this point on as Augustus, who would bring order to Rome and inaugurate one of the most long lasting periods of peace and prosperity in human history: the Pax Romana, or Roman Peace.

The Jugurthine War (112-106 B.C.E)

Coin depicting Jugurtha

When Micipsa, king of Numidia in North Africa, died in 118 B.C.E., he divided his kingdom three ways between his two sons, Hiempsal and Adherbal, and his nephew, Jugurtha. In the inevitable quarrel that followed Jugurtha murdered Hiempsal and drove Adherbal from power. When he appealed to Rome, the resulting commission, after substantial bribes, gave the lion's share to Jugurtha, who then attacked Adherbal and besieged him in Numidia's capital, Cirta. However, when the city surrendered, Jugurtha's troops also massacred a number of Italian merchants there, leading to war with Rome.

Nothing daunted, Jugurtha bribed the Roman general sent against him to make peace, prompting the Senate to summon Jugurtha to Rome to account for himself. While there, he

bribed a tribune, had his rival to the throne killed, and smuggled out the murderer. It was here that he uttered his famous statement about Rome: *"The city's life is for sale, and it would die if it could only find a buyer."* The next year (110 B.C.E.), Jugurtha defeated a Roman army and forced it to pass under the yoke and leave Numidia.

While Marius was the one who pretty much won the Jurgurthine War by creating a new style Roman army and leading it to successive victories, it was one of his lieutenants, Lucius Cornelius Sulla, nicknamed Felix ("Lucky"), who ended it by getting Jugurtha's father-in-law, Bocchus, to betray the Numidian king to him.

Coin portraying Jugurtha's father-in-law, Bocchus (L.) betraying the Numidian king (r.) to the Roman general Sulla (seated)

Marius' "New Model Army"

One of "Marius' mules"

Rome's new professional legionaries were known as "Marius' mules" for the 65 pound load of equipment they had to carry on the march including armor, weapons, several pila, at least three days' field rations, mess kit, cooking spit, cooking pot, cup, spare clothes, water gourd,

section of 6-man tent, and either spade, saw, or sickle, and sometimes a load of firewood. Though burdensome, this eliminated the need for most pack animals, making the Roman army much more mobile.

Roman soldiers trained with double-weighted weapons to improve their strength and agility with such weapons during real battles. They were taught to use their shields as weapons, either as battering rams to knock enemies off balance or to slam down on an opponent's foot. Roman training was so tough that legionaries were said to beg their commanders to lead them into battle to avoid more drill and march. As the Jewish historian, Josephus, would put it: *"Roman drills were bloodless battles; their battles bloody drills."*

Roman legionaries were trained to march 20 miles a day with full gear on their backs. This made the Roman army both very mobile and physically fit. Even after basic training, Roman soldiers underwent four hours of daily training in formation, creating the most efficient army of antiquity. The cadence of the march itself created psychological bonds between legionaries that helped them stand their ground well beyond the point when opposing soldiers would break and run.

Roman discipline was legendary for its harshness, with the whip being used for what would seem to us minor offenses. Theft was punished by cutting off the culprit's hand. A unit running in battle was decimated, meaning one of every ten of its members was chosen by lot and executed by his comrades. Even a soldier caught sleeping on guard duty or building fortifications without wearing his armor and keeping his weapons nearby faced the death penalty.

Roman legionaries were as adept with the pick and shovel as the sword and pilum. At the end of each day's march, they built a fortified camp with streets laid out in a rectangular grid. During the Empire, when the legions were

guarding permanent frontiers, their camps attracted other settlers (merchants, women, retired veterans, etc.) and became the basis for permanent towns, also laid out in militarily precise rectangular grids. In Britain, town names ending in -chester or -caster (from *castra*, the Roman word for camp) reflect their origins as legionary settlements.

The smallest unit of the Roman army was the *contubernium*, a group of 8 men who carried and shared the parts of a 6-man tent, with two men always on guard duty.

Of course, it was in battle, that Roman legionaries really proved their worth. Their training and fighting in concert as a virtual gave them a huge edge in combat over enemies who fought as individual warriors. So did their ability to switch ranks at the sound of a trumpet so that fresh troops could always be brought to the front every twelve minutes, the amount of time they were at their fighting peak. Supposedly, since they covered each other's unshielded right side so well, at a signal, they could all stab at the opponent to their front and right's unshielded side, bringing down the enemy's entire front line in one stroke. One can only imagine the demoralizing effect of such a maneuver on the other side.

A Roman century on the attack. The first two ranks have thrown their pila and are closing in with their swords while the next two ranks throw their pila to cover the first two ranks' approach. The back ranks may throw their pila later or use them as thrusting spears.

Sieges. Although tedious, time consuming, and costly, siege warfare was something the Romans also excelled in. Combining Hellenistic siege machinery with their native perseverance, the Romans rarely started a siege without finishing it, and their enemies knew it. Each legion was equipped with various torsion-powered catapults to use against enemy fortifications. They might also be used to open a regular battle to disrupt and terrify the enemy. The Jewish historian, Josephus relates how, during the siege of Jotapa, a stone fired from one of these machines took off the head of a defender and carried it across the town.

Cities under siege had until “the ram touched the wall” to surrender without being sacked. Even before beginning the siege, Roman priests might perform a ritual called *evocatio* (calling out), where they would invite the enemy's gods to leave the doomed city and join their side. This was only offered to foreign gods that were deemed safe, not ones who were worshiped in wild orgiastic rites, like those of the Syrian sun god, Elagabal. As Philip Matyszak, author of the highly informative and entertaining book *Legionary* puts it, only the Romans would subject foreign religions to what amounts to a job interview.

Sulla and Friends

Left to right: Lucius Cornelius Sulla, Mithridates VI of Pontus, and Marcus Licinius Crassus

Mithridates VI of Pontus was one of a number of Hellenized kings who emerged in Asia Minor in the late Hellenistic period. As a child, he had to avoid all sorts of murder attempts, even by his own mother. To protect himself against poisoning, he experimented with various poisons, testing them on unwilling subjects and reportedly even taking small doses to build up his immunity to them. At the end of his life as Roman soldiers were closing in on him, he supposedly took poison he kept in a ring. Unfortunately, it didn't work, so he had to have a slave run him through.

Roman fire sales. Among the beneficiaries of Sulla's purges was Marcus Licinius Crassus, nicknamed Dives (the rich), who got much of his property at cut-rate auctions selling off the property of Sulla's victims. After all, who would bid against Sulla and his friends? Crassus also got property from Roman style fire sales. Since Rome had no public fire department, Crassus formed a private one manned by slaves. When a fire broke out, he would show up and offer to buy the burning property at an extremely cheap price. If the owner refused, Crassus would watch it burn a while and then lower his price. As bad as it was for the owner, the sooner he sold out, the better.

Spartacus and Slave Revolts in General

Typically, slave and peasant revolts were extremely desperate affairs that followed a remarkably similar pattern down through history. Since they were spontaneous and unplanned, the authorities were caught off guard, allowing the revolt to spread rapidly across the countryside and defeat what local forces were sent after them.

A lot of pent up anger translated into atrocities being committed against anyone who happened to get in the rebels' way, thus terrifying the local populace who fled to the cities. Eventually, the authorities would gather their forces and crush the rebels who typically were not professional soldiers and therefore were easily panicked. Retribution against the defeated rebels was every bit as savage as the rebels had been.

Spartacus' slave rebellion (73-70 B.C.E.) wasn't the first such affair the Romans faced, there being two massive servile wars in Sicily in the previous sixty years (135-132 and 104-100 B.C.E.). Spartacus' revolt began when he and about seventy gladiators escaped from the gladiatorial school in Capua. This immediately attracted thousands of slaves from surrounding *latifundia* (plantations). When it crushed two hastily assembled forces of militia sent against it, Spartacus' ranks swelled even more, possibly to as many as 70,000, although a number of these must have been women and children.

The goals of the rebels are not clear to us today, and may not have even been clear to them, since they first moved north and could have escaped across the Alps, but then turned south,

plundering along the way. Their numbers must have forced them to keep moving just to get enough to eat, and that may have dictated their erratic movements.

After losing two small forces, Rome took the revolt seriously, entrusting its richest citizen, Marcus Licinius Crassus, with a force of eight legions (40-50,000 men). After whipping this force into shape with particularly harsh discipline, Crassus penned up Spartacus' army in southern Italy and eventually destroyed most of it. However, a rival general, Pompey, mopped up the last of the rebels on his way back from Spain and claimed partial credit.

As a warning to any other potential rebels, the Romans crucified 6,000 survivors from Spartacus' uprising along the Appian Way.

Pompey "the Great"

Pompey "the Great" was a title Sulla bestowed by Sulla on the young Gnaeus Pompeius for defeating Marius' followers in Sicily and North Africa. Pompey repaid Sulla's favors and compliments with the snooty remark that more people worship the rising sun (i.e., him) than the setting sun (i.e., Sulla).

Pompey was often more *felix* (Latin for lucky) than great, profiting from situations others set up for him, notably mopping up the remnants of the Spartacus rebellion and taking over the Second Mithridatic War after Lucullus had paved the way to victory. Similarly, he crushed the revolt in Spain led by Marius' follower, Sertorius, through bribery of a follower to

murder him rather than generalship. (Sertorius, who had a white fawn that supposedly gave him advice from the goddess Diana, had a loyal following among the Spaniards and was reputedly unbeatable in battle.)

The Cilician Pirates were a problem going back to the second century B.C.E. when the Greek island state, Rhodes, angered Rome, its former ally. Therefore, Rome spitefully wrecked Rhodes' trade, especially in slaves, by making the nearby island of Delos a duty free port. Not only did this cripple Rhodes' economy, but also its ability to maintain a navy that had largely kept piracy down in the Eastern Mediterranean. The result was the growth of piracy, starting in Cilicia on the southern coast of Asia Minor, and eventually spreading throughout the Mediterranean. By 70 B.C.E., pirates were threatening Rome's grain supply and even marching 50 miles inland to take slaves.

At Rome, this led to the Gabinian Law giving some unnamed person (whom everyone knew would be Pompey) complete command of the sea and an area 50 miles inland all around the Mediterranean, 120,000 men and 500 ships for three years. Food prices fell back to normal even before Pompey was named. In a matter of months, he had divided the Mediterranean into 13 districts, each with a naval squadron, and then swept eastward through the Mediterranean crushing the pirates. He settled those who surrendered in inland colonies.

The Second Mithridatic War. Somehow, in all the confusion of Rome's civil war Sulla's treaty ending the First Mithridatic War had never been ratified, which naturally worried Mithridates about Rome's intentions. When his neighbor, Nicomedes of Bithynia, willed his kingdom to Rome (74 B.C.E.), Mithridates' worries only grew more, so he moved in to claim Bithynia as his own. Sulla's lieutenant in Asia, Lucullus, easily defeated Mithridates who fled to his brother-in-law, Tigranes of Armenia, with Lucullus in hot pursuit. However, Lucullus, a

strict disciplinarian, wouldn't let his soldiers or the equites with their tax farming contracts plunder Asia freely. So they used Lucullus' unpopularity with the troops to pass a law replacing him with Pompey who had just finished off the pirates.

Still, it was Pompey who finally crushed Mithridates (who then committed suicide), and it was Pompey who got the credit. He then spent the next few years marching through the Near East and reorganizing it along lines more favorable to Rome by creating new Roman provinces in Asia Minor and Syria (where he put a final end to the decrepit Seleucid dynasty) and establishing client kings loyal to himself and Rome in Asia Minor and Judaea.

Client kingdoms had the advantage of acting as a buffer against the Parthian Empire to the East without costing Rome anything to defend. A half century later, Augustus would directly annex these client kingdoms, thus completing Rome's conquest of the entire Mediterranean.

Felix no more. When in Judaea, Pompey insisted on visiting the Holy of Holies in the Temple, which was supposed to lead to instant death for whomever violated it. Although he walked out intact, the Jews were quick to point out that Pompey's fortunes went down from this point forward. Indeed, when Pompey finally returned to Rome 61 B.C.E., his star began to wane.

Catiline's conspiracy. In 63 B.C.E., during Pompey's absence in the East, a Roman noble, Catiline, conspired to overthrow the government and seize power. The lawyer and orator, Cicero, who was consul at the time, exposed the plot in a series of stirring speeches known as the Catilinarian orations. Cicero convinced the Senate to execute Catiline and four others without a trial during the emergency. The most prominent dissenting voice was that of Julius Caesar. Cicero's less than legal actions later got him briefly exiled thanks to the actions of the tribune and mobster, Clodius, who had a personal grudge against him for his testimony in a sacrilege trial.

According to Cicero, as his oration against Catiline progressed, all the members of the Senate left him sitting alone, not wanting to be affiliated with his conspiracy.

Caesarian Legends

"Many a Marius". One man who refused to knuckle under to Sulla during his reign of terror was Marius' nephew, the young Julius Caesar, a brash young politician with a gift for public speaking and popular with the common people. When Sulla ordered him to divorce his wife, the daughter of Cinna, one of Marius' main followers, Caesar refused and had to flee Rome to save his life. Eventually, Caesar's friends got Sulla to pardon him, the dictator supposedly remarking that he saw many a Marius in Caesar.

Caesar and the pirates. One of the best-known stories about Julius Caesar is when he was captured as a young man by Cilician pirates and held for ransom. However, instead of acting scared during his captivity, he treated the pirates like servants, ordering them around, demanding the best quarters, and even forcing them to sit and listen to him read poetry. The pirates, amused at such bravado, put up with this treatment. One day they asked Caesar what he planned on doing after he was released. He

replied that he was going to get some men and ships, come back and crucify them. While the pirates thought this was funny, when Caesar was ransomed, he proved to be true to his word: he got some men and ships, came back, captured the pirates, and crucified them.

Lucky at love. As a member of the Julian clan, Caesar was supposedly a descendant of Venus, the goddess of love, and it showed, as he had affairs with the wives of a number of the prominent politicians in Rome, thus supplying him with a lot of valuable inside information about his opponents that he used freely.

Put this on a family tree. When he married Caesar's daughter, Julia, Pompey became Caesar's son-in-law, even though Caesar was actually five years younger than Pompey.

Caesar's Conquest of Gaul

Caesar accepts the surrender of Vercingetorix, leader of the most serious revolt he faced during this campaigns in Gaul. He was kept prisoner in Rome for several years, waiting to be dragged in chains in Caesar's triumphal parade and then executed.

Caesar the forest ranger. Originally, the Senate had assigned Caesar the "hills & forests of Italy" for his proconsulship, basically making him a forest ranger. However, with a little arm-twisting, he got it changed to Gaul where he could win military glory.

Gaul at the time of Caesar. By Caesar's time the Gauls had changed considerably from their days as wild naked warriors, living

now in more settled and fortified hilltop communities and wearing pants on a regular basis. In fact, part of what gave Caesar the opportunity to intervene in Gaul would be pleas for help against more barbaric German tribes from east of the Rhine.

The Celts were splendid horsemen, something Caesar quickly recognized, recruiting them for his cavalry. Graves of Celtic nobles typically had horse trappings such as bridles, bits, harnesses, and spurs, showing the importance of the horse in their culture.

Among the Gauls' more curious customs was an obsession with keeping enemy heads, believing they would keep their owners' spirits from coming back to haunt them. Some prominent heads were preserved in cedar oil and displayed to visitors who might even try to buy them to increase their own power. The Celts also believed in reincarnation, being known to burn letters on funeral pyres for the dead and to take out loans that were repayable in the next life.

Caesar had little military experience before going to Gaul. However, one would never have known it by looking at the masterful way he brought it under Roman control in a mere ten years. Caesar's first major test as a general was at Bibracte in 58 B.C.E. where he turned back the Helvetian tribes trying to migrate through Gaul. Their assault broken, the Helvetians retreated to their wagons where the women reinvigorated the surviving warriors by joining the defense. It wasn't until midnight that Caesar could claim his first great military victory.

A master psychologist. Caesar also faced Ariovistus and his Germanic tribes from across the Rhine. Seeing his men were scared of the huge Germanic warriors, he said they could go home and he would just take the Tenth Legion (his favorite) and they alone would fight the invaders. The other legionaries' military pride being hurt, insisted to go, saying it was the junior officers (mostly politically appointed as officers to gain military experience) who were afraid.

Caesar's influence over his soldiers was so great that he once put down a mutiny with one word: addressing his soldiers as "civilians",.

Burning his bridge behind him. After beating Ariovistus, Caesar's men built a bridge over the Rhine, finishing it in 14 days, an engineering feat that alone must have overawed the Germans. After raiding their lands for several days, he returned to Gaul, burning his bridge behind him.

The legions stand fast. One of Caesar's closest calls in Gaul was a surprise attack by the Nervii while his army was building a camp. Caught completely off guard, the Roman legionaries showed their training by falling into line with other units. Although pressed so tightly in some places they could barely fight, they gradually gained the upper hand and routed the Nervii. That explains why legionaries always had to wear their armor.

In one siege, Caesar's men, trying to undermine the enemy walls, inadvertently tapped into their well, flooding their tunnel, but also mysteriously depleting the city's water. The Gauls, unable to explain this, thought it was a sign of divine disfavor and immediately surrendered.

Britain. In 55 and 54 B.C.E., Caesar invaded Britain, a place many Romans even doubted was real. Supposedly, no one wanted to be the first to land in the face of the fierce Britons waiting for them, until the aquilifer (eagle or standard bearer) plunged in. As a point of honor, wherever the eagle, which was sacred to the legion, went the legionaries followed. Besides being able to claim that he had invaded what (to the Romans) were the ends of the earth, Caesar accomplished little in his two invasions of Britain.

The Celts Caesar faced in Britain still fought from old fashioned two-man chariots. A warrior would throw his javelins from the chariot, then dismount to fight while the driver waited to pick him up when needed.

Vercingetorix' Revolt. Caesar's greatest challenge in Gaul was a major revolt led by Vercingetorix. The revolt climaxed at the siege of Alesia where Caesar's men constructed a massive double line of siege-works around Alesia to keep the defenders penned in and a relief army out. It had eleven miles of walls, ditches, spikes, and camouflage pits, and involved moving an estimated 2,000,000 cubic meters of earth.

A reconstruction of Caesar's fortifications at the siege of Alesia

The Caesar cipher was a simple code Caesar used that substituted a letter for one three letters later in the Latin alphabet.

Disaster at Carrhae (53 B.C.E.)

Parthian cavalry wheel around while maintaining a constant rate of fire against the more static Roman infantry at Carrhae.

During his ten years in Gaul, Caesar also built up a highly efficient and intensely loyal army that could brag of exploits to rival and even surpass those of Pompey's army. Naturally, this caused jealousy and suspicion on Pompey's part. In 53 B.C.E. the Triumvirate suffered a blow when Crassus, whose influence helped keep the Triumvirate together, was killed fighting the Parthians, nomadic tribesmen who had taken much of the old Persian Empire's Asian lands from the now extinct Seleucid dynasty. Traitorous scouts had led the Romans to where the heat and flat terrain created perfect conditions for the Parthians' style of warfare.

The Parthian army's core consisted of horse archers armed with the composite bow, a powerful weapon with a range of up to 250 meters and able to pierce bronze armor. The rider would control the horse with knee pressure, thus freeing both hands for using the bow. He could even fire an arrow while withdrawing from his enemy, a tactic, known as the Parthian shot although it was used by mounted nomads across Eurasia.

Nomadic tactics. Carrhae was typical of how nomads across Eurasia fought. They would charge the enemy in small groups, firing arrows as they approached (1). At 30-40 meters from the enemy, they would whirl to the right, continuing to pour arrows into the enemy ranks (2 and top picture). They would then retreat, still firing "Parthian shots" behind them. Meanwhile, new groups of horse archers would be charging forward to take

the first groups' place and keep the enemy under a constant hail of arrows (3).

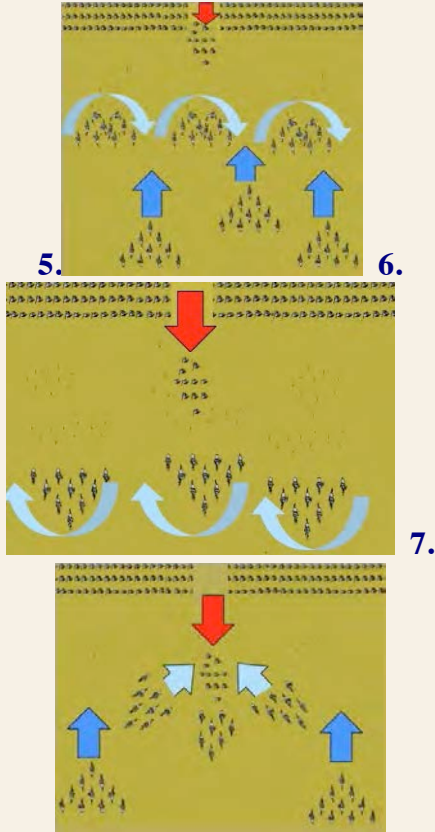

This pattern would keep repeating as those returning from the fight would regroup for new attacks (4). In order to maintain this attack pattern all day, the Parthians had brought extra arrows on a camel train, which they displayed openly to demoralize the Romans.

This tactic was also meant to draw inexperienced enemies (5, red arrow) from their ranks in pursuit of the retreating cavalry. However, this was the worst thing to do, because the Parthians would quickly circle around (6), some of them

cutting off the pursuing enemy (7) while others (dark blue arrows) would keep attacking the main body of the enemy to keep them from rescuing their comrades. This is how the Roman cavalry, led by Crassus' son, died at Carrhae.

Cataphracts. The Parthians also had heavily armored cavalry known as *cataphracts* that would wait until the enemy seemed disrupted and charge headlong into their broken ranks and ride them down. For the Romans, this presented a serious dilemma. They could maintain a more open formation to minimize damage from the Parthian horse-archers, but leave themselves open to the massed charge of the cataphracts. However, if they kept a tight formation for repelling the cataphracts (horses don't like charging headlong into tightly packed lines of spears), they made an easier target for the horse-archers.

Throughout the day, the Roman legions maintained discipline and kept their ranks intact until Crassus was forced by his decimated army to attend a parley with the Parthians, who treacherously murdered him. Supposedly they killed him by pouring molten gold down his throat, saying he had thirsted for gold all his life, so he should drink his fill.

The exhausted remnants of his army surrendered along with their eagles (legionary standards). There was no greater disgrace to the Romans than to lose their legions' eagles, and the issue of retrieving Crassus' those standards from the Parthians was a major focus of Roman policy in the East for decades.

Politics as Usual in Rome

The body of the gang leader, Clodius, is brought to the Roman Senate, which his followers burned as his funeral pyre.

You can't make this stuff up. Since Caesar was Pontifex Maximus (high priest of Rome), his wife was responsible for hosting the rites of the Bona Dea (Good Goddess), a women-only event where they even covered male statues and supposedly drove out any male mice. In 62 B.C.E., as a practical joke, a degenerate patrician, Clodius, who was rumored to be having an affair with Caesar's wife, infiltrated these rites dressed as a woman. However, he was discovered, triggering a big scandal, which caused Caesar to divorce his wife, saying Caesar's wife must be above suspicion.

A Short History of Our Calendar

At the sacrilege trial, Clodius claimed he was out of town the day of the festival, but Cicero shot his alibi to pieces by saying he had seen Clodius in Rome that very day. Although Clodius was acquitted, he was furious at Cicero, whom he taunted with his acquittal despite Cicero's testimony. Cicero replied that at least his jurors trusted him while Clodius' jurors demanded payment in advance, which further embarrassed and angered Clodius, who was now bent upon revenge.

Clodius decided to run for tribune, but he was a patrician (noble) and only plebians could hold that office. So he found some old plebian whom he paid to adopt him, thus making him a plebian, got himself elected tribune, and passed a law exiling anyone who had ever illegally killed another Roman citizen. Everyone knew this referred to the Catilinarian conspiracy when Cicero as consul had executed several of Catiline's co-conspirators without a trial. As a result, Cicero lost his property and went into exile until he could get the law repealed and return to Rome.

This was all done with Caesar's blessing, because Caesar had made his peace with Clodius and hired his services as a politician and gang leader to keep things stirred up in Rome while he was conquering Gaul.

Clodius' end. During Caesar's absence in Gaul, Roman politics degenerated into virtual street warfare between Caesar's gang leader, Clodius, and Pompey's thugs led by Milo. When Clodius was killed in a fight between the two gangs, his followers took his body to the Senate house and burned it down as Clodius' funeral pyre.

Fixing the calendar. The old Roman calendar was a lunar calendar consisting of 12 lunar months and an intercalary month of 22 or 23 days inserted every 2 years to get in line with the solar cycle. Romans called the first day of each month *Kalendae* or *Kalends* from the Latin word *calare* (to announce solemnly or call out). Our word calendar comes from this word. As pontifex maximus (high priest) it was Caesar's job to keep adjusting the calendar. However, thanks to all his campaigns and political activities, he had neglected this duty and the Roman calendar had fallen behind by eighty days, nearly a whole season. In 46 B.C.E., Caesar added the lost days making that "the Year of confusion" since it had 445 days, probably the longest year in history.

Then Caesar adopted the Egyptian solar calendar, which is basically the same as our Gregorian calendar with one bit of fine-tuning. A year isn't quite 365.25 days long, so that by the 1500s people noticed the calendar seemed to be several days off. Therefore the new Gregorian calendar (named after pope Gregory XIII who oversaw its implementation) does not have a leap year three out of four century years. For example, 2000 was not a leap year, but 2100, 2200, and 2300 presumably will be, although I don't plan on being around to confirm it.

It took several centuries for different countries to adopt this modification. For example, Russia by 1900 was a full 14 days off from everyone else's calendar, which is why what they call the October Revolution occurred on November 7th on our calendar. After the Revolution, the Bolsheviks adopted the Gregorian calendar, possibly the only thing they ever did to cooperate with the West.

In 153 B.C.E., the Romans moved the first of the year from March 1st (when military campaigns start) to January 1st (when the new officials took office), but didn't change the months' names. This explains why September, our ninth month, means seventh month in Latin; October, our 10th month means eighth, and so on.

However, not everyone started their year on January 1st. For example, some people in medieval France started the year on April 1st. Others thought this was foolish: thus April Fools Day.

The Romans made February the shortest month of the year because, of course, it's so unlucky.

Octavian vs. Antony (44-31 B.C.E.)

The Battle of Actium (31 B.C.E.) was almost anti-climactic, as Cleopatra quickly deserted Antony with her Egyptian squadron through a gap in the enemy center, followed by Antony soon afterward. With his desertion, the rest of his fleet's effort collapsed and Octavian found himself undisputed master of the Roman world.

In the chaos following Caesar's death, most people probably would have bet on his former commander, Marc Antony, as the winner in the coming power struggle. He was an experienced soldier, brave in battle, and popular with the troops. But he was also impetuous, over-confident, and prone to wasting time and opportunities with too much partying.

By contrast, his main opponent, Octavian, was only nineteen years old with no political or military experience. He did have an unusually quick and perceptive mind and would prove incredibly adept at outmaneuvering Antony time and again. Also, as the late dictator's

chosen heir, he had Caesar's name. Although historians typically refer to him as Octavian, he always made a point of being called Caesar, as a constant reminder of his ties to Julius Caesar. As it would turn out, Caesar's choice of heir may have been his greatest legacy to Rome and history.

Cicero's Philippics. Antony wasn't the only one to underestimate young Octavian. The orator and statesman, Cicero, thought he could take him under his wing and guide him along. Thinking he had Octavian and his legions on his side, Cicero gave a series of scathing speeches against Marc Antony, known ever since as *Philippics*, after Demosthenes' speeches against Philip II of Macedon. Unfortunately, when Octavian did an about face and allied with Antony in the Second Triumvirate, Antony's proscription list included Cicero. The famous orator tried to escape, but bad winds drove him ashore, so he met death bravely. Antony's wife supposedly put Cicero's head on a pedestal and stuck pins in the tongue that had delivered the *Philippics*.

After crushing Caesar's assassins at Philippi (42 B.C.E.), Antony took the empire's eastern half. There he took up with Cleopatra, who bore him twins, and largely squandered his resources and opportunities, even portraying himself as the god Dionysus. After his lieutenant, Ventidius Bassus, repelled a Parthian invasion of Syria, Antony decided to win some glory for himself at the Parthians' expense and also avenge the humiliating defeat at Carrhae. Matters started well enough, with Antony taking Jerusalem and installing Herod as king of Judaea.

However his invasion of Parthia in 36 B.C.E. proved almost as disastrous as Crassus' campaign fifteen years earlier. Despite leading a huge force, he was beaten in battle, thwarted in trying to take Parthian strongholds, and deserted by his Armenian allies. In the long winter retreat that followed, he lost a quarter of his army and was lucky not to lose it all.

In a later campaign, he did save some face with a successful invasion of Armenia, which he celebrated in a mock Roman triumph in Alexandria. He then announced the Donation of Alexandria (34 B.C.E.), a document whereby Antony gave the provinces of Syria, Cyprus, Cilicia, Cyrene, and Armenia to Cleopatra's children, including Caesarion, her son by Caesar whom Antony had adopted. This especially angered most Romans, since he was giving away Roman provinces to foreign royalty, thus providing Octavian with great propaganda material against him. Octavian was also irked because Antony's adoption of Caesar's son gave him a claim as Caesar's heir. This provided the final break between Octavian and Antony and led to a fourth Roman Civil War in less than fifty years.

Largely thanks to the insistence of Cleopatra, whose forces he needed in addition to his own legions, Antony fought the decisive battle at sea of the Greek coast near Actium (31 B.C.E.). Cleopatra's rapid desertion with the Egyptian squadron, followed by Antony's desertion, turned the battle into a fiasco, and Octavian emerged as the sole ruler of the Roman world.

. AUGUSTUS' NEW ORDER: THE PRINCIPATE

Octavian's victory over Antony and Cleopatra ended a century of civil turmoil and decay. When he returned to Rome in triumph in 29 B.C.E., everyone anxiously wondered how he would use his victory. The Roman people and Senate heaped all sorts of honors on him: triumphal parades, political offices, and titles, including that of Augustus ("revered one"), by which title he has been known ever since.

Augustus saw that there were two basic needs he had to satisfy in order to avoid the pitfalls of the past century. For one thing, the civil wars and turmoil of the last century clearly showed the need for a strong one-man rule backed by the army. Second, the traditional and conservative nature of the Romans made it mandatory that he make any reforms at least *appear* to be like the good old days of the Republic with its elections and many political offices. Satisfying these two needs required a politician cleverer than Marius, Sulla, and even Caesar himself. Luckily for Rome, it had such a man in Augustus who founded a new order known as the Principate after his honorary title of *princeps* (first citizen).

Augustus' solution was to take the army and law-making powers and disguise them with harmless sounding Republican titles. Out of all the Republican offices he took only two main offices, or more properly powers without the offices: those of tribune and proconsul (provincial governor). Having special tribunician powers allowed him to propose laws to the Senate and assembly. Being just a tribune, one of the humblest offices in Rome, made Augustus look like a man of the people and their protector. However, his title of princeps gave him the right to speak first before all other officials instead of having to wait his turn like other tribunes.

Proconsular power gave Augustus all the strategically placed provinces with armies, thus giving his tribunician powers the clout to pass any laws he wished with a minimum of resistance. In order not to appear too greedy, Augustus gave the Senate control of the non-military provinces. In

fact, one or two of these even had a legion with which the Senatorial governors could play soldier. In such a way Augustus took effective control of the laws and army while leaving the Republic intact, at least on the surface.

Although his own position was secure, Augustus still had to provide for a smooth succession so his system would continue peacefully after he died. He needed to appoint a successor much like a king would, but once again, make it look like the Republic. He solved this with typical Augustan shrewdness by having his chosen successor assume the powers of tribune and proconsul while he was still alive. Therefore, when Augustus died, the new emperor would already hold the important offices to guarantee a smooth transition of power. Over time, the memories of the Republic would fade and it would be taken for granted that the emperor's son or chosen successor should be the next emperor, even if he did not already hold the appropriate powers.

Having secured his own position, Augustus still had to provide for three things in order to rule the empire effectively: honest and efficient provincial governors, an honest and efficient bureaucracy to help them, and a loyal and efficient army to defend the frontiers instead of making trouble in Rome. He did two things to ensure honesty and efficiency in his governors. First, he paid officials regular salaries instead of leaving it up to them to make up for their own losses at the expense of the provincials. This at least eliminated the more blatant need for corruption. Augustus also had his own personal agents, called *procurators*, to keep an eye on officials in the provinces. Any corrupt governors would be tried by the Senate. However, it was unlikely that a governor's fellow senators would be so lenient with him as before, because Augustus kept a close eye on these proceedings to ensure justice. Together, these reforms gave Augustus the efficient and honest governors he needed.

Augustus ensured more efficient governors by reviving the old *cursus honorum* (ladder of honors), whereby aspiring senatorial politicians would gain necessary experience and training by serving in the army and then holding a sequence of old Republican offices. At the same time, it maintained

the fiction that the Republic was still functioning by making good use of the old Republican offices.

He obtained trained middle level officials from the rich business class of the equites. They had their own *cursus honorum* to go through before being eligible for various lucrative positions such as command of the fleet, Rome's grain supply and fire brigades, the Praetorian Guard (the emperor's own personal regiments), and the governorship of Egypt (kept as Augustus' private domain).

Augustus also needed trained bureaucrats to do the daily work of running the empire. Previously, senatorial governors would take their friends and slaves to fill these positions, which led to all sorts of inefficiency and corruption. Augustus replaced this system with a professional class of tax collectors and record keepers who held their jobs for extended periods. He also ended tax farming, where the government auctioned off the right to collect the taxes. This had been one of the worst sources of abuse under the Republic. These reforms provided the provinces with a more honest, efficient, and stable government.

There were two issues to resolve with the army: its loyalty and expense. In terms of loyalty, since Augustus' proconsular powers gave him control of the provinces and the armies within them, there was technically only one commanding general (imperator) of nearly all the Roman armies: himself. Obviously, any emperor, especially a non military man like Augustus, would have to appoint men to lead at least some of the troops spread out along Rome's vast frontiers. However, the troops stayed loyal to Augustus, not their immediate generals, for one good reason. It was Augustus now, not the generals, who paid soldiers their regular pay and pension, generally with coins that bore the emperor's image as a constant reminder of who took care of the troops. The central government, meaning Augustus, once again had control of its armies. Occasionally, the troops would rediscover the fact that they held the key to power and would revolt to put their own generals on the throne. For the most part, they stuck to the business of guarding the frontiers and left governing to the emperors in Rome.

Finally, in order to increase efficiency and cut costs, Augustus reduced the army from 60 legions to 28. He generally placed these along the frontiers most threatened by invasion: the Rhine and Danube Rivers in the north and the Euphrates River in the east. An equal number of auxiliaries (light infantry and cavalry) were also maintained there. The total number of troops Rome had amounted to roughly 250-300,000 men defending an empire of possibly 50,000,000 people. Such a small force for so large an empire had to be efficient, and it was. The Roman legions during the Principate comprised the most tightly disciplined and efficient army of antiquity, and everyone knew it. It was their reputation as much as their swords that defended the frontiers and gave the Mediterranean two centuries of peace. Rome was also lucky in two ways at this time. First it faced no major threats on its borders. Second, the Mediterranean, as the central geographic feature of the empire, allowed much faster communications and reaction time during emergencies.

The Empire after Augustus. Augustus died in 14 C.E., but his work lived on long afterwards. For nearly two centuries, the Roman world would experience peace such as it had never known before or since. Its government was well trained, efficient, and honest, while its legions kept the frontiers and interior provinces secure. Roman political history during this time is not very exciting, because relatively little happened besides a few palace scandals in Rome.

The empire expanded very little during this time, just rounding out its control of the Mediterranean and invading Britain and Dacia north of the Danube. Occasional wars would flare up in the East with the Parthians and in the north with various Germanic tribes, but there were no serious threats to the Empire. The vast majority of people in the empire never experienced war and invasion. Even the troops on the frontiers often saw so little action that they were kept busy and in shape by building the vast network of roads Rome is so famous for. Peace and prosperity brought trade, both within the empire's borders and beyond with such exotic places as India and China far to the east. Merchants traveled the legionary roads and the Mediterranean free from fear. Peasants harvested their crops

undisturbed by war. And the legionary camps on the frontiers grew into permanent cities.

This was certainly a golden Age for civilization. However, even times of peace and prosperity can carry within them the seeds of their own decay. That was true of the Roman Empire in the second century C.E., although few if any people recognized the problems within their society. At the same time, pressures were starting to mount against the northern frontiers. Together, these internal problems and external pressures would combine to destroy the Roman Empire and begin the transition from the ancient world to the Middle Ages.

Establishing One-Man Rule

Statue of Augustus, emphasizing his military prowess, although he wasn't much of a soldier and left military matters to his right-hand man, Marcus Agrippa.

The powers Augustus needed to establish one-man rule over the empire were all constitutionally available, but traditionally spread out over a number of offices held by a variety of men to prevent one man establishing a dictatorship. In order to avoid the appearance of being a dictator, Augustus had to be careful to take only the most essential offices while leaving the rest to others (usually his appointees anyway). The Republic's major offices and duties in ascending order of importance were:

- Quaestors (finance officials) *or*
- Tribunes who proposed laws and posed as protectors of peoples' rights

- Aediles who supervised public works and games
- Praetors who were the main judicial officials
- Consuls: Rome's top officials who ran Rome and proposed laws, but no longer had armies since Sulla's reforms
- Proconsul (ex-consuls) who ran provinces and commanded their armies. It was mainly as ex-consuls with armies that generals had risen to power during the turmoil of the last century. However, while pro-consular powers and armies had been the key to success, it was the office of consul had offered the most prestige.
- Pontifex Maximus was high priest of Rome's state religion, still a position of high prestige among Romans. It always helps to be able to tell people they will suffer divine wrath if they don't do what you say.

The Senatorial Cursus Honorum ("ladder of honors"). Of course, Augustus needed qualified help ruling the empire. For upper level positions he restored the sequence of Republican offices that a noble Roman would have to go through to qualify for the most prestigious provincial governorships and military commands. This would give his governors valuable experience and make the Republican offices actually worth something. It went as follows:

- Military service, usually as *tribuni militum*
- Lesser city magistrates such as city engineers or police commissioners for one year
- Quaestors: finance officials, some of whom served outside Italy. This office also earned a seat in the Senate
- Aediles who ran public works and the games; or tribune who protected the poor
- Praetors (judges)
- Various praetorian posts in provinces
- Consul (age 33, though most wait till 42)

For those wanting to qualify for high-ranking "middle level" positions there was the Equestrian *cursus honorum*:

- Military service for 10 years), first as commander of a cohort (around 500 men); next as a military tribune; and finally as

- commander of auxiliary cavalry
- Procurators who served either as the emperor's fiscal agent/spy (like the Persian king's ears) or as governor of a minor province (e.g., Pontius Pilate, who tried Jesus Christ, was the procurator of Judaea)
- Prefects who were in charge of such things as Rome's traffic, grain supply, and fire brigade (*vigiles*), as well as the fleet, the Praetorian Guard, and the governorship of Egypt. This was the emperor's private domain that even senators needed the emperor's written permission just to enter.

Upper level equestrian posts were so lucrative that many eligible for senatorial careers followed this *cursus honorum* instead

Vigiles Urbani (watchmen of the city, from which we get the word *vigilant*) were cohorts established by Augustus to provide much-needed public police and fire protection in Rome. They were meant to replace the system of private fire departments, such as that of Crassus, but were also paramilitary units stationed inside Rome to keep order there. This technically stayed within the law forbidding an army inside Rome's sacred *pomerium* (boundary)

Emperors as gods. In 13 B.C.E. Augustus dedicated the *Ara Pacis* (Altar of Peace) to his own *pietas* (piety) and the *Pax Romana* he had established. Its relief sculptures were done in the style of Periclean Athens in the fifth century B.C.E., an era that Augustus and his age unquestionably emulated. In the center was Augustus, his head covered to indicate his role of *pontifex maximus* (high priest) and his special relationship with the gods.

Along these lines, Augustus had his adoptive father, Julius Caesar, deified. This opened the way for himself and all succeeding emperors to be deified as well, an important factor in ensuring the loyalty and obedience of all Roman subjects.

This is especially seen on coins, which started portraying emperors instead of traditional gods on the obverse side. Julius Caesar seems to have started this, and Marc Antony followed suit, also associating himself with the god Dionysus on the reverse (above left). Augustus' coins used the phrase *divi filius* (above right), meaning son the deified one, instead of *dei filius* (son of god). This left it open as to whether or not he was claiming to be a god. It also left it open for the Senate to declare him a god when he died, and that set the tone for all succeeding emperors. It is doubtful that Augustus took himself seriously as a god, but it was very useful for propaganda purposes, especially since that let him and succeeding emperors put their images on coins, the one form of mass propaganda in the ancient world.

Dynasties and Inbreeding (27 B.C.E.-161 C.E.)

The Teutoburg disaster. In 9 C.E., three Roman legions commanded by Publius Quinctilius Varus were ambushed and massacred by Germanic tribesmen in the Teutoburg Forest. This disaster convinced Augustus that the empire had reached its furthest practical limits at the Rhine, Danube and Euphrates Rivers, and he advised his successors against any further expansion. Supposedly, he would wake up at night screaming "Varus, give me back my legions."

Imperial inbreeding. The difficulty Roman aristocrats had in producing healthy sons to succeed them during the late Republic and Empire highlights a more general problem often faced by ruling classes: inbreeding. Typically, royalty and nobles only want to marry within their own narrow class. However, over time, the pool of eligible candidates gets increasingly narrower as their bloodlines are all mixed together and they start marrying relatives, a bad idea if one wants to produce healthy offspring, or any offspring at all. Roman nobles often dealt with this by adopting other nobles' sons, which provided heirs in the short run, but didn't address the long-term problem.

One of the best-known examples of this in more recent times was the Hapsburg Dynasty whose habit of marrying first cousins and aunts finally produced Charles II of Spain (1661-1700), whose aunt was also his grandmother. Charles could not talk until age four and was eight years old before he could walk.

Following is a brief rundown of the emperors of the Pax Romana.

The Julio-Claudian Dynasty. Finding Augustus' successor turned into a virtual soap opera, best covered by Robert Graves' fictionalized account of the early emperors, *I Claudius* and the BBC television adaptation of it. At first Augustus used his old general and son-in-law, Agrippa, to help rule with shared powers until Agrippa's sons, Gaius and Lucius, were grown. After Agrippa died, Augustus used Tiberius, his wife Livia's son (from a previous marriage), to help rule with shared powers while he groomed Gaius and Lucius for the succession.

Tiberius, feeling passed over as second best, got disgusted and retired from public life. However, after both Gaius and Lucius died young, Augustus once again turned to Tiberius, who took over as sole emperor when Augustus died. By this time, he was somewhat bitter and left a reputation as something of a madman, although we should remember that our main source,

Tacitus, was hostile to the emperors in general. Whatever the truth about Tiberius, the government of the empire continued smoothly during his reign (14-37 C.E.).

Gaius (37-44 C.E.) was Tiberius' successor, nicknamed Caligula ("little boot") by the troops from when he was a little boy. Ancient historians branded him a total madman. Considering that he supposedly made his horse a consul, they were probably right.

Claudius (44-54 C.E.). After the murder of the worthless Caligula, the Praetorian Guard found his cousin, Claudius, hiding behind a curtain and declared him the new emperor. Supposedly Claudius had played dumb to escape notice (and execution) in the unpredictable world of court politics. In fact, he was well educated in literature, and the empire continued to prosper under his rule. During his reign, Rome finally conquered Britain, the next to last province to come under Rome's rule, and second to be abandoned.

Nero, emperor from 54-68 C.E., came to the throne at age 17. He was initially a good ruler, but later on turned into something of a tyrant. Among Nero's antics was taking part in the chariot races in the Olympic Games, which, of course, he won. After his death, officials at Olympia purged the record of this travesty. One of his better tricks was a collapsible boat designed to murder his overbearing mother, Agrippina. Unfortunately for Nero, the "accidental" shipwreck didn't work and his men had to finish off Agrippina the messy way with their swords.

During Nero's reign a massive fire destroyed much of Rome (64 C.E.). Archaeologists have found an iron gate melted down by the heat of the blaze. Tacitus, a very hostile source, tells us that many people suspected Nero of setting the fire, so he deflected blame on a new religious sect, the Christians. While he did persecute the Christians, as Hollywood emphasized in the 1950s, there were too few of them in Rome or the

empire to amount to much at the time. The really serious persecutions did not take place until the late third century.

After Rome's great fire, Nero rebuilt his palace, christening it the Golden House. It was said to be so luxurious that rose petals would drop from the ceiling onto partiers below, causing Nero to exclaim "At last I can live like a man."

Nero also fancied himself quite the artist, supposedly forcing people to listen to him sing and play the lyre. Tacitus wrote that they would jump to their deaths from the top row of seats rather than endure this punishment, possibly inspiring Douglas Adams' digression about Vogon poetry in *The Hitchhiker's Guide to the Galaxy*. When rebels led by the general, Galba, were closing in on Nero, he committed suicide, exclaiming "What an artist in me dies." Despite his little quirks, imperial government ran smoothly during his reign.

The Year of Four Emperors (69 C.E.). Nero's death marked the end of the Julio-Claudian dynasty and triggered a 4-way struggle for the throne. In quick succession, Galba, Otho, and Vitellius (an obese glutton who ate four banquets a day) rose and fell. Finally, Vespasian, (ruled 69-78), a general of the eastern legions, seized power and established the Flavian Dynasty, re-establishing strong stable rule for the empire.

The Jewish Revolt. In 66 C.E., the Jews rebelled against Rome. After a desperate three-year siege, Jerusalem fell to the Romans who sacked and burned the Second Temple (the first being destroyed by the Babylonians in 586 B.C.E.). The Roman general in charge of putting down the revolt, Vespasian, left early to claim the throne after Nero's death. His son, Titus, finished the siege and took Jerusalem. He displayed the plunder from the temple in his triumph at Rome.

Titus (78-80 C.E.) is mainly remembered for the building of the Roman Coliseum.

Domitian (80-96), Titus' successor, was especially hated by Tacitus, who claimed he was so sadistic that he would spend his time catching flies and pulling off their wings.

Nerva (96-98) was the first of the so-called "Five Good Emperors" who were chosen for their ability and appointing their successors on the same basis. The last of these emperors, Marcus Aurelius (161-180), finally broke the pattern by having his son, Commodus, succeed him with unfortunate results.

Trajan (98-117), Nerva's chosen successor, conquered Dacia north of the Danube River. It was the last province to come under Roman rule and would be the first province to be lost when the legions abandoned it during the anarchy of the third century. Trajan's Column in Rome, with its imposing spiral relief sculpture depicting his Dacian campaigns, is one of our best sources of information about the Roman army's campaigns, tactics, and equipment during the Pax Romana.

Trajan also defeated the Parthians. By now, the Romans had adapted to the Parthian horse-archer tactics, using a combination of hidden pits to trip the enemy horses and light infantry armed with javelins to finish them off. By his death, Trajan had defeated the Parthians and added Mesopotamia to the empire, briefly bringing it to its greatest extent.

Hadrian (117-138), thinking Trajan had overextended the empire, quickly gave up Mesopotamia and concentrated on securing the empire's borders. He is probably best remembered for Hadrian's Wall, the line of fortifications he built across northern Britain to keep out the Celtic Picts.

Antoninus Pius (138-161) continued to oversee the Pax Romana, with nothing dramatic happening during his reign. However, his successor, Marcus Aurelius (161-180) would see what would prove to be the beginning of the end for the Roman Empire.

THE SPREAD OF ROMAN CIVILIZATION IN WESTERN EUROPE DURING THE PAX ROMANA

One of the greatest legacies of the Pax Romana was the spread of Roman culture to Western Europe. Roman rule in the semi-civilized areas of Western Europe (Gaul, Britain, and Spain) and Augustus' establishment of peace during the Pax Romana meant that there were Roman troops permanently stationed in the provinces. This helped Romanize and civilize the provinces in the West in three ways. First, as the legionary camps became permanent settlements, merchants, families, and other sorts of camp followers settled down around them. In time, these army camp settlements became towns and cities, whose military origins are still reflected in Britain in such place names as Winchester and Lancaster (from the Latin word for camp, *castra*). After they were discharged from the army, legionaries, who were Roman citizens, and auxiliaries (non-citizen soldiers who received Roman citizenship after their terms of service) would often settle in these towns, marry local women, and raise their children as Roman citizens.

Along these lines, the peaceful conditions brought on by the Pax Romana, promoted the growth of native towns into cities. Those cities whose leading citizens copied Roman styles of dress, language, architecture, and local government would earn Roman citizenship for their towns. The poorer citizens would then follow the leading citizens' leads, thus encouraging the spread of Roman civilization that way. Finally, with extended periods of peace, the Roman army spent much of its time building an excellent system of some 51,000 miles of paved roads stretching across the empire. While these roads' original purpose was to facilitate the rapid movement of Roman troops to trouble spots, they also promoted trade and the influx of Italian merchants into the towns of the western provinces.

In these three ways, the western provinces saw the heavy Romanization of their towns and also nobles on country estates who felt they had some incentive to copy Roman ways for personal advancement. However, there were limits to Romanization. For one thing, it only happened to any great extent in Gaul, Britain, and Spain where there was no long

established civilization in place before the Romans came. By contrast, the Eastern provinces were already heavily influenced by Greek culture in the cities and native cultures in the countryside. In a sense, the Roman Empire was a bi-cultural empire, with Greek language and culture dominant in the East and Roman language (Latin) and culture and dominant in the West. (Coins in the East were even struck with Greek inscriptions.) In both East and West, the influence of these respective cultures was mainly limited to the cities and barely touched the countryside.

However, despite the serious decline of cities in the West during the Middle Ages, Roman culture would survive in the Eastern Roman (Byzantine) Empire and thanks to the efforts of monks in the West who copied many works of Roman literature. As a result, there would be a resurgence of Roman culture during the Italian Renaissance where it would reassert itself as the foundation of Western Civilization.

Roman Cities

The city of Arles in Gaul (modern France) as it appeared during the Pax Roman

The Romans were nothing if not great city builders, founding many cities, especially in Italy and the less urban western provinces. Whether they started out as colonies or were outgrowths of Roman military camps, they typically were planned with Roman thoroughness and shared certain features. First of all, much like Hellenistic cities and Roman camps, they were laid out in a rectangular grid with a main North-South street called the *Cardo* and East-West street called the *Decumanus* meeting near the center of the city. Aerial photographs of farmland on the site of one a Roman city in

Britain, Silchester (below), still show its old grid pattern of streets even after centuries of farming.

Founding a Roman city started with a dedication ritual where a priest cut a furrow for the sacred *pomerium* (boundary) of the city walls with a plow drawn by white bull and white cow. Since it was a sacrilege to cross the *pomerium*, the priest lifted the plow where the city gates were to be.

The Romans set aside space for a public forum, amphitheater, theater, and markets. Probably the most impressive aspect of a Roman city was an excellent system of aqueducts, corner fountains, public baths, and sewers to provide it with an adequate water supply and drainage.

In order to ensure adequate sunlight, building codes stipulated that no buildings were to be more than twice as high as the street's width. However, all owners of buildings on main streets also had to build shelters over the sidewalk from the sun and rain. The Romans would also put the taller apartment blocs, known as *insulae* (from the Latin word for island) in the northwest corner of the city to block the cold winter winds from that direction.

Human squirrel cages. Building stones were lifted out of a quarry by a crane powered by men walking inside a big wheel that turned an axle.

Roman speed bumps. Roman streets often had stepping-stones for pedestrians at intersections. These also could serve to discourage speeding in a cart or chariot. Ruts worn in the pavement between such bumps at Pompeii suggest Roman vehicles were built with a standard axle gauge. Otherwise, they wouldn't all be able to fit over the bumps. Interestingly, the Romans' standard gauge was four feet and 8.5 inches, the same gauge for British and American Railroads and even the width of the Space Shuttle's booster rockets. But that's another story.

Fast food Roman style. Roman cities didn't have MacDonalD's, but they did have street-front stalls where one could buy bread and wine. Unlike our bread, Roman bread was baked in flat round loaves. Presumably that would take less time to bake and save fuel.

While poor people lived in large apartment blocs called *insulae* (islands), middle class shop owners typically lived in two-story buildings with their living quarters upstairs, their shops below, and a courtyard in back for working.

Visitors to a rich Roman's home would first enter the atrium. A hole in the roof, the *compluvium* let in light and had a basin below it to catch rainwater, which was fresher than that from aqueducts. Street-front rooms might be rented out as shops or be used as the kitchen and bathroom to insulate residents from street noise. In the back was the *peristyle*, an open area often with a garden to provide some sense of being outside. Columns around it were painted red because the Romans liked red and it would alert playing children to keep them from crashing into them and doing brain damage. Surrounding the peristyle were the bedrooms, which might also be painted with idyllic scenes of the countryside to help relieve the stress of urban living.

Roman painting, like that of the Greeks, was highly accomplished and seems to have mastered perspective, a technique lost in the middle ages and rediscovered during the Italian Renaissance. Unfortunately, besides some striking portraits preserved from Roman Egypt, we have few examples of Roman painting. However, many Roman mosaics have survived, which also exhibit amazing levels of technical virtuosity.

The city dump. Archaeological finds keep producing more evidence of the gigantic scale of production and trade during the Pax Romana. Mt. Testaccio in Rome is a mound made up entirely of discarded broken oil amphorae from southwestern Spain during the 100s and 200s C.E. It is 50 meters high and contains an estimated 53,000,000 amphorae that collectively could hold 6,000,000,000 liters of oil.

Roman Roads and Bridges

Roman bridge in Alcántara, Spain

Roman roads, which had to be built 16-24 feet wide, were surveyed using an old Etruscan instrument, the groma. This was a pole four feet high with a horizontal cross on top from which were hung lead-weighted strings (known as plumb lines from *plumbum*, the Latin word for lead, chemical sign Pb). When all the plumb lines were parallel to the groma, the engineers

knew it was perpendicular to the ground and they could accurately survey the road.

The Romans then dug two rows of ditches into which they set curbstones. Next they dug a deeper ditch between the curbs and filled it with various grades of stone, topping it off with flat, carefully fitted stones and filling the spaces in between with smaller stones or scrap metal. Like our modern streets and roads, the middle of the Roman road was slightly raised for drainage off to the sides.

The Roman term for building a road was *munire viam*, literally meaning to fortify a road, reminding us of both their original military use and the fact that they were built to last. Some stretches of Roman roads have survived centuries of wear and tear from nature and humans stripping them of their materials for other building projects. One major difference between Roman and modern roads is that Roman roads followed a much straighter path between cities. This is because they were designed for foot and animal traffic that can climb a much steeper gradient than modern cars and trucks, which can only climb a 6° gradient.

Roman bridges were another engineering marvel. The first step in building a Roman bridge was constructing pontoon bridges to provide platforms from which men worked. Their pile drivers combined muscle power and pulleys to raise stones and then drop them onto piles made from tree trunks to drive them into the riverbed. A tight circle of these piles, called a cofferdam, would be drained and sealed to provide a dry place in the middle of the river from which the bridge's piers could be built. Piers were made from rough-cut stones and mortar mixed together, except for nicely cut outer facing stones, and built to a height ten meters over the

river. Pre-fab arches were hoisted up into place between the piers. Next, a wooden road was nailed to the arches and then covered with dirt. The finished bridge was twenty meters above the river to provide clearance for sailboats.

Particularly busy Roman bridges would have more permanent stone arches and roadways constructed on them, many of them surviving into the twentieth century. Unfortunately, during World War II, the German army retreating through Italy, blew up a number of these bridges to slow the advance of pursuing allied troops

Roman concrete. Much of the key to the durability of Roman engineering was they had a formula for concrete that, like modern concrete, could set under water, making it possible to build bridges and harbors. The key to this was a volcanic ash called pozzolana. Concrete, being both lighter and stronger than limestone, also made possible such innovative monuments as the dome, most notably that of the Pantheon in Rome, which has a diameter of 43.3 meters (142 ft). If it were extended to a full sphere, it would just touch the floor.

For anyone interested, the chemical notation for a pozzolanic reaction is:

Unfortunately, the secret of Roman concrete was lost during the middle ages and not rediscovered until the nineteenth century.

Roman Hydraulic Engineering

Roman aqueduct near Arles France, one of the best preserved examples of Roman hydraulic engineering

Roman aqueducts were probably the most impressive of their engineering achievements. Running from hill and mountain springs, they had to be high enough to reach their destinations just from the force of gravity. This involved knowing the natural viscosity of water, which the Romans figured to be a drop of at least one meter for every 200 meters in length.

While our image of Roman aqueducts is of massive arched bridges for spanning gorges, such as the Pont du Garde in France, recent research indicates a different, even more ingenious way to accomplish this by channeling water down into the valley and back up the other side. Before entering the valley, the water was funneled into nine separate lead pipes, because, if all the water were kept in one pipe, it would burst from the water pressure at the joints where the water turned at the bottom of the valley. As long as the source side of the valley was higher than the receiving side, the water would make it up the other side and keep flowing.

On average, about 80% of an aqueduct's length was built under ground. If a hill or mountain were in the way, the Romans would tunnel through it. First they would survey the land to

make a profile map, then sinking shafts from different points on the hill or mountain to the desired depth. Workers operating from one shaft would dig according to the profile map to meet crews working from different shafts. There's no information on how often they missed, but they must have been pretty accurate, since the aqueducts are still there as evidence.

Rome, with a population of up to one million, had eleven aqueducts totaling 359 miles in length and capable of supplying the city with 25-50,000,000 gallons of water a day. When the water reached the city, it would be stored in big reservoirs for later distribution. An ongoing maintenance problem was silt brought in with the aqueduct water. This would build up in the reservoir and require occasional cleaning. Reservoirs often had holes at ground level that may have been to slow the build-up of silt in the reservoir by allowing silt-laden water to slowly drain from the reservoir. This would leave drier silt with a smaller volume, thus requiring less frequent dredging.

A model of ancient Rome showing the Claudian Aqueduct working its way through the city

There were three main uses of this water: corner fountains to supply the people with basic needs, public baths, and water running to private homes for an extra charge. During water shortages, private homes would be cut off first, and then the baths. One could find a water tower and adjacent fountain at every corner of Rome's more pre-planned cities. The water would run continuously, the excess draining into the

extensive sewer system below street level. Similarly, the water for toilets in private homes would run continuously.

The public baths might also be massive monuments. Taking a bath Roman style first involved taking a hot bath in the *caldarium*, then a warm bath in the *tepidarium*, and finally a cold swim in the *frigidarium*. Air channels, known as *hypocausts* (below right), ran under the floors from the furnace to heat the successive stages of bathing and keep the building warm in winter. The bath house was a popular meeting place, often having a library, a *palaestra* for exercising, an outside pool for cleaning and cooling off, and porticoes where teachers might hold classes.

Bringing in all that water also required getting rid of much of it, so Roman cities had sewers and drainage systems to meet that need as well. The streets, like the roads, were sloped down from the middle to take rain and wastewater to gutters that fed into sewers under the streets. There were also manholes for workers to do repairs beneath the city streets. The sewers would lead to larger sewers that would typically empty into a nearby river or stream. In Rome the main sewer that fed into the Tiber River was the Cloaca Maxima (Great Sewer). It supposedly was big enough that one could sail a ship in it, but I wouldn't want to.

Roman Trade with the East

Roman merchant ships plying the Mediterranean and Arabian Seas all the way to India had square sails and bowsprits for fine-tuning their courses

Roman trade links reached all the way to India and China. Trade with India for spices and gems especially flourished when sailors learned how to navigate the monsoons in the Arabian Sea. Trade with China was harder and more expensive because of the distance overland along the Silk Road and the numerous middlemen who each raised prices to cover the previous middleman's profits. Rome and the Han dynasty ruling China finally established direct contact in the mid second century C.E., just as both civilizations were about to go into decline, ironically because of firmer contacts across Eurasia that could spread disease.

Another negative effect of Rome's trade with the East was the drain of gold and silver from the empire. Romans paid for silk with its weight in gold. To spread the supply, they would unravel the silk and re-weave it into a much looser, nearly transparent material that the Chinese would hardly even recognize. The cumulative effect of the drain of gold and silver for this precious cloth would contribute to economic problems for the empire in the third century and help lead to its decline and fall.

Defending the Empire During the Pax Romana

Hadrian's Wall, which guarded Rome's northernmost frontier in Britain

Except during emergencies, all Roman soldiers during the Pax Romana were volunteers. Citizens, who served in the heavy infantry known as legions, served for 25 years. Over time the number of non-Italian citizens in legions grew. During the Pax Romana, there were few major wars disturbing the frontiers, although there might be local raids and skirmishes with tribes to the north. Many legionaries might serve a full term of enlistment without any serious fighting. To keep busy, they built roads and bridges.

In the first century C.E., legionaries received 75 denarii upon enlistment and earned 300 denarii per year, while centurions earned 450 and senior centurions earned 600. Members of the elite (and pampered) Praetorian guard earned 900 denarii a year along with bonuses upon the accession of new emperors and at other times just to keep their loyalty. For example, they got 75 denarii from Augustus and Tiberius, five years' pay from Marcus Aurelius and ten years' pay from Claudius and Nero.

Legionaries were trained to fight in various formations depending on the situation: single and double lines, wedge, circle, square, and the *testudo* (tortoise), a siege formation, with overlapping shields used for approaching enemy walls (below). Supposedly, an officer would test its strength by driving a chariot on top of it.

Non-citizen auxiliaries (light infantry and cavalry), served for 25 years, earning only half the legionaries' pay. However, at the end of their term of service, they were also awarded Roman citizenship.

As the frontiers became stationary and permanent, the legionary camps evolved into permanent stone forts. The most notable set of Roman fortifications was Hadrian's Wall, which ran along an east-west path for eighty-four miles and cut across Britain at one of its narrowest points. Although not the Great Wall of China, it was still an impressive structure.

Rome's prosperity and safety during the Pax Romana relied on keeping a small, tough and highly disciplined army. Throughout the Pax Romana, Rome never faced a large two-front war. Therefore, if a major threat appeared, Rome could pull troops from the other quieter frontiers, hoping they wouldn't erupt into trouble as well. During the Pax Romana, Rome was just plain lucky it didn't have to fight any major two-front wars, largely because the Northern barbarians weren't organized enough to coordinate such attacks on a large scale.

Not until the late second century C.E. did Rome face such a threat, and that would be the beginning of the end.

[Back to flowchart](#)

THE NEAR COLLAPSE OF THE ROMAN EMPIRE (161-284 C.E.)

"Enrich the troops...Nothing else matters"-- Advice from the dying emperor, Septimius Severus, to his sons

Why a society goes into decline and eventual oblivion is one of the most complex, interesting, and important questions one can ask in history. The decline and fall of the Roman Empire has especially fascinated historians down through the centuries. How could the most powerful empire in antiquity just come apart at the seams and disintegrate? While historians have focused on various causes ranging from barbarian invasions and moral decadence to the influence of Christianity and lead poisoning, the fact is that many factors combined to lead to the downfall of Rome and open the way into the Middle Ages. Furthermore, these different factors fed back on one another to aggravate the situation and also to make the process of decline more complex to trace.

Mounting problems (161-235 C.E.). The first signs of trouble came in the reign of Marcus Aurelius (161-180 C.E.), the last of the so-called "Good Emperors". When he came to the throne, the Roman Empire still seemed to be experiencing a golden age. The government was efficient, fair, and honest. The army secured the frontiers from invasions. And the economy was healthy in both the countryside and cities. However, during Marcus' reign things started to fall apart. There were five major problems feeding into Rome's decline.

Two problems were of an especially long-range nature dating back to the time of Augustus. One was that few new provinces were added to the empire during the Pax Romana, thus providing Rome with few new sources of revenue. Another drain on the economy was the growing volume of trade with the East for such luxury goods as silks and spices. Silk came all the way from China through a multitude of middlemen and cost its weight in gold, causing a tremendous amount of gold and silver to leave the empire to pay for these luxuries.

A third problem was a devastating epidemic spread throughout the empire by victorious legions returning from a war with the Parthians in the East. Historians then, having little understanding of such phenomena, concentrated mainly on individual people rather than on larger forces, such as disease, affecting history. Therefore, we have little information on what this plague was (possibly smallpox), what its symptoms were, and how many people were affected. If the plague destroyed a significant part of the population, say 10% or more, then it may have been an important factor in the decline of the Roman Empire. Since this was not a mechanized society, most of its labor and energy came from people. If many of those people were lost, society was in trouble. The greater number of labor saving devices such as waterwheels being used from this time on seem to indicate there was a serious population loss. Disease would be a major candidate for its cause.

The fourth major problem Marcus Aurelius faced was barbarian invasions. Apparently population pressures were building among the various nomadic and semi-nomadic tribes beyond Rome's frontiers. At the same time, extended contact with Rome had taught many of these tribes how to combine into larger more effective confederations for fighting Rome. The result was a massive invasion by a tribe known as the Marcomanni across the Danube frontier, with some of these invaders even making it all the way into Italy. The problems of defense were complicated by the fact that the legions were weakened by sickness. The effort to drive the invaders out was so desperate and recruits were so hard to find that even slaves were enlisted. Eventually, the frontier was restored, broken through again several years later, and restored again. By Marcus Aurelius' death in 180 C.E., the empire's population, army, and economy were exhausted by the tremendous efforts of the past two decades. Although the frontiers were restored, pressure from the tribes on the frontiers continued to grow. This required a larger army to defend the frontiers, more taxes to support that army, more bureaucrats to collect those taxes, and even more taxes to support those bureaucrats.

A fifth problem was that, after Marcus Aurelius' death in 180 C.E., men unworthy of the throne

generally ruled Rome. For example, there was Marcus Aurelius' son, Commodus, who spent most of his time racing chariots and fighting gladiators in the arena instead of facing the important problems of ruling. Most of these emperors met violent ends, either through court intrigues or military mutinies. One common and unfortunate pattern these emperors followed in order to keep their thrones was to give ever increasing bonuses to the army to keep it happy, thus heaping another huge burden on the Roman economy. Despite all this, the illusion of eternal Rome persisted in people's minds.

The third century anarchy (235-284 C.E.). So many drains on the economy left the Roman government short of money. Therefore, it raised taxes and started debasing the coinage (i.e., decreasing its gold and silver content). This led to inflation, causing the soldiers to demand more pay to meet their expenses. The government thus faced more money shortages, leading to more taxes and coinage debasements, and so on. To make matters worse, this process triggered an even more serious cycle that left the empire in chaos for fifty years.

At the center of this new cycle were rebellious troops who would overthrow an emperor and put their own generals on the throne in order to get a raise in pay. While some criticism for the troops' actions is justified, we should keep in mind that coinage debasement and the resulting inflation were destroying the buying power of their salaries. They felt they had to do something to protect their incomes. However, the resulting civil wars stripped the frontiers of troops as they marched to Rome to put their general in power. This in turn invited invasions by the tribes to the north and Persians to the East. The resulting civil wars and invasions would further ruin the economy. This, of course, made it hard to pay the troops who therefore rebelled again, leading to more invasions, more economic problems, and so on. Complicating all this was a new epidemic (possibly measles) that hit the empire around 250 C.E. Meanwhile, all this would feed back into the ongoing cycle of coinage debasement discussed above, which then generated more revolts, civil wars, invasions, etc.

The fifty-year period starting with the reign of Maximinus the Thracian in 235 C.E. was one of the

most turbulent and chaotic periods in history, making it extremely difficult to discuss in any detail. At one point, eighteen different men were each claiming they were the emperors of Rome. At the low point of these troubles, the Emperor Gallienus controlled no more than Italy, Greece, Illyria (modern Yugoslavia), and North Africa.

Many of the invaders crashing across the frontiers were new tribes, such as the Goths, whom growing population pressures had forced to migrate toward the Roman Empire. Since these newcomers had little or no prior contact with Rome, they looted and plundered with incredible ferocity, murdering thousands of helpless people whose only crime was being in the path of conquest. Parts of the empire that had seen no wars for centuries were subjected to devastating raids while the army was largely busy making and unmaking emperors. To the East, a new and more aggressive neighbor, Sassanid Persia, had replaced the Parthians. The Persians probably would have overrun the whole eastern half of the Roman Empire, except that the independent oasis city of Palmyra stopped them and then basically ruled the East for itself.

Luckily, a series of remarkably tough and capable emperors emerged from Illyria to restore the Roman world's boundaries. The most important of these emperors, Aurelian (270-275), attacked and destroyed Palmyra and its famous queen, Zenobia. This restored the eastern frontier. Aurelian then reclaimed Gaul, Spain, and Britain to restore the Western frontiers as well and earn himself the title: "Restorer of the World". Despite the remarkable accomplishments of Aurelian and the other Illyrian emperors, they were all murdered by their own troops. Finally, in 284, an even more remarkable emperor, Diocletian, came to the throne and started to put the empire back on its feet. It was this emperor who put an end to the half-century of anarchy that had come close to destroying the Roman Empire.

A Wealth of New Problems

A major change in the warfare of the third century was the Sassanid Persians' use of heavy cavalry encased in armor from head to foot and known as *clibanarii* (literally "oven men" because they would bake in the hot sun). The Romans would soon adopt this type of soldier as a major part of their army as well. The Persians also revived the use of war elephants.

Why the Roman Empire fell is a problem that has fascinated historians for centuries. Typically, contemporary biases have influenced different historians' opinions. For example, Edward Gibbon, the eighteenth century author of the monumental *Decline and Fall of the Roman Empire* and a man very hostile to the Church, blamed the empire's fall on the rise of Christianity. Others have focused on the barbarian invasions or poor leadership. Today, we realize that it wasn't just one particular factor, but rather a combination of factors that brought down Rome. Below are listed some of the major problems that the Romans found themselves especially faced with starting in the mid second century.

Falling temperatures. There is evidence of a cooler climate in Northern Europe, which could have lowered harvests or available pastures and led to more intertribal fights for land. This could trigger a chain reaction, where losers would have to migrate, thus hitting other tribes, causing them to migrate, and so on until they hit the Roman Empire. Colder temperatures would have hurt crop yields inside the Empire as well, thus leading to malnutrition and greater susceptibility to disease.

Some of the evidence of falling temperatures comes from ice core samples taken in Greenland. Each year a new layer of ice would grow on top of the older ones. The colder the year, the more ice that would build up. Scientists will take a vertical sample core of ice that gives them a record of relative temperatures through the centuries. They can even get an idea of the level of production of lead pipes in the Roman Empire by measuring trace amounts of lead that got into the atmosphere from furnaces and later came back down with the snow much further north.

New diseases. Since microbes mutate so quickly, it's nearly impossible to positively identify a disease that struck 1800 years ago. We think smallpox and measles were the new diseases that struck in the second and third centuries because we have no previous records of diseases with these types of symptoms.

Over the generations, populations will develop some resistance to a new disease, since the lucky individuals with natural resistance will survive to pass that resistance on to the next generation. For example, smallpox (now declared an "extinct" disease except for some samples kept in labs), was still killing one in thirteen people in Europe until Jenner introduced a primitive form of vaccination in 1796. While that was bad enough, consider the horrific impact of smallpox on Native Americans when they were first exposed to it after 1492.

On the other hand, measles, which we think was probably one of the new diseases that hit the empire at this time, is not considered a "children's" disease that is generally harmless to children who then develop immunity to it. However, it can be much more serious if one doesn't get it until adulthood. It used to be that when a child developed measles, neighborhood mothers would send their children to visit that child and get the measles so that it wouldn't hit them really hard as adults. I wish my mother had done that with me, because I got measles as an adult, and that is the sickest I've ever been.

Other childhood diseases that are supposedly much worse if contracted as adults are mumps and chicken pox. However, even if one has had chicken pox as a child, it leaves the virus for shingles, which typically hits older adults and is very painful.

Inflation. Rising prices, caused by the drain of gold and silver for Eastern luxuries, was a major problem afflicting the Roman Empire starting during the Pax Romana. For example, inflation drove the price of wheat up 200 times between 150 and 300 C.E. Silver content in coins went from 90% silver in Nero's time, to 75% under Marcus Aurelius to virtually nothing more than a copper coin with a thin wash of silver that easily rubbed off by the height of the anarchy of the third century.

Growing strains on the frontiers. During the Pax Romana, Rome's legions were spread out along the frontier. Usually, any outside threats were small enough for local frontier troops to handle (1). If a major threat did appear, help could be brought in from other unthreatened frontiers (2). However, in the third century, threats arose simultaneously on multiple frontiers (3), forcing emperors to strip one frontier, thus inviting invasions elsewhere.

The greatest single threat to Rome's frontiers came from a revived Persia. In 224, The Persian dynasty of the Sassanids replaced their Parthian overlords with a revived Persian Empire (224-651). Harkening back to their first empire under the Achaemenid Dynasty (c.550-33-B.C.E.), they claimed the Roman provinces of Egypt, Palestine, Syria, and Asia Minor as part

of their ancient heritage. In 253 C.E., and again in 260, the Persians sacked Antioch, also capturing the Roman emperor, Valerian during that invasion. The replacement of a weak Parthian with a well organized and aggressive Persian Empire put much more pressure on Rome's eastern frontiers, adding to its budget problems and contributing to its decline.

The Beginning of the End (161-235 .C.E.)

Marcus Aurelius' son, Commodus (180-192), liked to pose as Heracles wearing a lion skin and carrying a club. He preferred taking part in chariot racing and gladiatorial matches to the serious business of government. Fittingly, after a reign of terror, he was murdered by a wrestler.

Following is a brief description of the emperors from Marcus Aurelius to the beginning of the third century anarchy

Marcus Aurelius (161-180) the last of the so-called Good Emperors, was a Stoic philosopher whose reign saw the first major signs of trouble for the empire: Germanic invasions from the north and a devastating epidemic. Despite his desire for a peaceful philosophical life, he stoically did what he thought was his duty and served as emperor. His book, *The Meditations*, is still in print today.

Commodus (180-192), Marcus Aurelius' son, was the first emperor in nearly a century to succeed his father rather than being groomed for the

throne (largely because the four previous emperors had no sons of their own). Instead of the serious business of government, he preferred taking part in chariot racing and gladiatorial matches. He imagined himself the reincarnation of Heracles and liked to pose wearing a lion skin and carrying a club. He would pretend he was slaying giants by clubbing unfortunate victims who had lost their feet and been tied together in the arena.

Commodus also liked to fight in the arena as a gladiator, amazingly never losing a match. He was reputedly an excellent archer and one day killed 100 lions. He also killed ostriches, elephants, and even a giraffe. In addition, he named Rome, the Senate, the Roman people, the legions, and even months of the calendar after himself. Supposedly, some senators hired an assassin who, as he drove his dagger home, said, "The Senate sends its greetings." Unfortunately, he missed his target, which initiated a reign of terror until Commodus was finally murdered by a wrestler.

Pertinax (12/31/192-3/28/193), Commodus' successor, seems to have been a capable emperor whose strict discipline and economizing measures quickly got him murdered by the Praetorian Guard only 87 days after ascending the throne.

Didius Julianus (3/28-6/1/193) was a Roman millionaire to whom the Praetorian Guard auctioned off the imperial throne. His authority barely extended outside of Italy, and even the Praetorian Guard that had put him on the throne murdered him. after a reign of 66 days in favor of a military revolt led by Septimius Severus.

Septimius Severus (193-211) was a capable emperor, but his annexation of the troubled lands in Mesopotamia and increasing militarization of the Empire through doubling

the troops' pay would help lead to the anarchy of the next century. Although he brought peace to the empire, his reputation suffered from the bloody methods he used to gain and maintain control of the throne. His dying words to his sons were supposedly "Enrich the troops. Nothing else matters."

Caracalla (211-217), son and successor of Septimius Severus, reportedly murdered his brother and co-emperor, Geta (211) in the arms of their mother. Caracalla's main claim to fame was the *Constitutio Antoniniana* in 212 C.E., giving Roman citizenship to all free men in the empire. This was probably done so everyone would have to pay the 5% inheritance tax that only citizens paid. He also increased the financial burdens on the Empire by raising the troops' pay by another 50%. The story is that someone sent Caracalla a letter revealing a plot against his life, but he was too busy watching the games and gave the letter to his trusted praetorian prefect, Macrinus, the ringleader of the plot that killed him.

Macrinus (217-218) was the first emperor not from a senatorial family. His lack of connections and lowering the pay of new recruits to maintain the raises Caracalla had given veteran troops got him overthrown and murdered by supporters of Elagabalus, the great-nephew of Septimius Severus' wife.

Marcus Aurelius Antoninus (218-222), was also known as Elagabalus after the Syrian sun god, Elagabal, of which he was a priest and devotee. He was only fourteen when he came to the throne and, as might be expected of a teenager, took full advantage of his position, such as having hills built from mountain snow in the summer.

Some of his crazier antics as an all powerful emperor who couldn't be refused reportedly

included giving dinner guests dead dogs or jars of flies, frogs, scorpions as gifts, or serving them desserts of wood, ivory, wax, marble, or clay. Sometimes hung-over guests would wake up next to old toothless lions or leopards. He might give a pile of valuable gifts to a mob and watch them fight over it. He also liked to hold races with chariots drawn by tigers, lions, camels, deer, dogs, or naked girls. His extravagant lifestyle supposedly included cushions stuffed exclusively with feathers from the underside of partridge wings, a golden potty chair, and beds made of rose petals (below).

How much of this is true is anyone's guess, but the fact that such stories were told suggests what the public impression of court life was. Elagabalus' reign does seem to have been repeatedly marked by one scandal after another, until, despite the protests of local florists, he was murdered by his cousin and adopted son, Alexander Severus.

Alexander Severus (222-235) also came to the throne at a young age and was dominated by his mother during his reign. Despite some apparently honest efforts at ruling well, he was overthrown and murdered by the army, thus marking the beginning of military rule and real problems for the empire in the next half-century.

Emperors of Anarchy (235-284 C.E.)

A famous relief sculpture shows Shapur using the captive Roman emperor Valerian as a footstool to mount his horse. Christians were also quick to point out how this enemy of their faith ended his days.

Following is a brief rundown on the emperors of the period to give a better sense of the futility of trying to rule the Roman Empire. Some of them, especially later on, were remarkable leaders who, against tremendous odds, managed to stitch the Empire back together.

Maximinus the Thracian (235-238) was the first of a half-century of "barrack" (i.e., military) emperors. He could reportedly rip a tree apart with his bare hands and knock out a horse by punching it between the eyes. Unfortunately, these remarkable skills didn't solve the empire's deeper problems, and Maximinus' humble birth and lack of connections eventually got him murdered and replaced by a senatorially supported candidate.

Pupienus and Balbinus (238 A.D.) were senatorially supported co-emperors set up to overthrow Maximinus. Unfortunately, they had a falling out, so the Praetorian Guard murdered them.

Gordian I and his son Gordian II were recognized as emperors by the Senate, but their revolt in North Africa against Maximinus was crushed in only three weeks. Luckily there was another Gordian.

Gordian III (238-244), grandson of Gordian I and nephew of Gordian II, was only 13 years old when he became emperor. He, or more properly, his praetorian prefect, Timestheus, seems to have run the empire well. Gordian spent most of his reign defending the empire's frontiers and died while campaigning against the resurgent Persian Empire under the Sassanid dynasty. His successor, Philip I is widely suspected in having a hand in the young emperor's death.

Philip I "the Arab" (244-249) presided over the 1000th anniversary of Rome's founding in 248 A.D. Besides that, he seems to have accomplished little of note and was defeated and killed by the rebellious general, Decius. Note the new type of radiate crown, projecting a more military and authoritarian image of the emperor.

Decius (249-251) who overthrew Philip the Arab, tried to unite the empire behind its pagan gods by instituting the first great persecution against Christianity. He had the dubious distinction of being the first emperor to die in battle against a foreign enemy, in this case, the Goths. His Christian enemies were quick to tie his fate to his persecutions.

Gallus (left) and Volusianus (251-253) saw an epidemic ravage the empire. They were soon murdered by their own troops, but that didn't seem to stop the epidemic.

Valerian (253-260), another persecutor of the Christians, had the dubious distinction of being the only Roman emperor to die in captivity, being taken prisoner by the Sassanid king, Shapur I. Sassanid kings liked to emphasize their skill as warriors, even claiming to decide battles by individual duels with opposing leaders.

While a cameo shows Valerian captured in a duel with Shapur, more likely he was captured treacherously during a parley with the Persian king.

Gallienus (260-268), Valerian's son, had the misfortune of ruling over the empire during the worst of the anarchy, with some fourteen other men claiming the throne at one time. Gallienus' effective control barely extended beyond Italy, the Balkans, and N. Africa. In the West, another general and self-proclaimed emperor, Postumus (260-9), controlled Gaul, Spain, and Britain. Even after Postumus was murdered, his realm lasted until his successor, Tetricus surrendered it back to Aurelian in 274.

In the East, Odenathus, ruler of the desert oasis city, Palmyra, drove back the Persians and then claimed the eastern half of the empire for himself. Meanwhile, the Goths invaded Asia Minor and the Balkans, sacking Athens, Delphi, and other Greek communities in 267. Supposedly they spared the library in Athens so the Athenians would spend all their time reading instead of training for war, making them an easy target the next time around.

As if things weren't bad enough, Gallienus' reign saw a new type of epidemic ravage the empire for the first time. It was said that 5,000 people were dying a day in Rome, while two-thirds of Alexandria Egypt's population was also afflicted.

Despite these problems, historians now view Gallienus as a good emperor fighting valiantly against overwhelming problems. His efforts and reforms, such as creating a more mobile army to respond more quickly to invasions, laid the foundations for the empire's later recovery, but that didn't stop his troops from murdering him.

Quintillus (270) reigned only 77 days before he was most likely murdered.

Claudius Gothicus (268-70). As the honorific title Gothicus indicates, he defeated the Germanic Goths, and at least temporarily secured the Danube frontier. He was probably the only emperor in the century between Septimius Severus and Diocletian to die a natural death, succumbing to an epidemic before his troops could get to him.

Aurelian (265-270), more than any other emperor, was responsible for reuniting the empire. Thanks to his nearly superhuman efforts, the breakaway provinces in the East under the Palmyrene queen, Zenobia, and Postumus' realm of Gaul, Spain, and Britain were brought back under Roman rule. For this feat, he was rewarded with the title "Restitutor Orbis" (Restorer of the [Roman] World) and later murdered by his own officers rather than face punishment for some minor infraction.

Zenobia, the Palmyrene queen, was the most renown of Aurelian's opponents. Having been brought back into the empire, Palmyra rebelled again, so Aurelian, this time destroyed the oasis. Zenobia was brought back to Rome for Aurelian's triumph, and lived out her days in Italy, married to a Roman senator, a fate supposedly worse than death.

Despite his Herculean efforts, Aurelian abandoned the province of Dacia to establish a more defensible position south of the Danube River. Thus the last province to be added to the empire was also the first one to be given up some 150 years later.

Tacitus (275-6) was senatorially elected and accepted by the army. After he and his half-brother, Florianus, defeated a tribe known as the Heruli, Tacitus died either from fever or assassination. Florianus succeeded him, but only

ruled 88 days, being quickly murdered by his troops when faced by the more experienced general, Probus.

Probus (276-82) was another one of the capable military emperors from Illyria (modern Yugoslavia) who helped restore order to the empire's frontiers. His troops celebrated his victories by murdering him.

Sol Invictus (Unconquerable Sun) was a god highly favored by the Illyrian emperors. Its radiate crown would be adopted in Christian iconography as the halo.

Carus (282-3), *Carinus (283-4)*, and *Numerian (282-3)* were all murdered by their troops.

Diocletian (284-305) finally put an end to the anarchy and propped the empire back up, allowing it to survive another 200 years.

THE GROWTH OF THE GERMANIC THREAT TO ROME BY c.160C.E.

Unfortunately, that was only the beginning of centuries of such conflict.

[Back to flowchart](#)

“To ravage, to slaughter, to usurp under false titles, they call empire; and where they make a desert, they call it peace.”— Calgacus, British chief, as quoted in Agricola, by the Roman historian, Tacitus

The invasions of the Roman Empire by Germanic tribes starting c.160C.E. seems in hindsight like a sudden eruption of a brand new threat. However, the growth of these tribes spanned two centuries before they were able to successfully challenge Rome. There were three main lines of development in this regard, two of them amounting to aggressive policies on the Romans' part. The most blatant of these was a policy of mounting continuous attacks on the Germanic tribes bordering the empire not just in order to keep them at bay, but also to keep the legions busy and to win glory for the emperors. Naturally, this provided incentive for various Germanic tribes to unite in bigger confederations. The first notable example of such a confederation was that of the Marcomanni who broke through the Danube frontier defenses in the 160s and occupied so much of Marcus Aurelius' reign. Another Roman policy was to subsidize some tribes and turn them against others to keep them all weak and divided. In the long run, this sometimes backfired, because it gave some Germanic leaders the wealth to attract followers and build up their own power. In additions to wars, there were other points of contact between the Germanic tribes and the richer Roman civilization. Trade was the most obvious, but there were men who crossed the frontier to fight in the Roman army, as well as others who were taken as slaves by the Romans and made their way back home. Through these contacts they learned Roman military and diplomatic techniques, which helped them unite in bigger confederations and fight more effectively against the legions.

Eventually, all these factors encouraged Germanic leaders to attack Rome for a variety of reasons. One was to keep their own warriors busy. Another was to win plunder with which they could reward their warriors and attract new ones to their standards. Finally, such raids into Roman territory would hopefully keep the Romans off balance and preempt Roman attacks on their territories. By the mid second century, we can see various Germanic tribes coalescing into several large confederations and peoples: the Marcomanni, Franks, Goths, and Alemanni. Pressure kept building up between and behind these peoples, unleashing the first of their invasions, that of the Marcomanni, in the 160s.

· DIOCLETIAN'S REFORMS AND THEIR IMPACT (284-395)

When Diocletian took the throne in 284, he found an empire in shambles from 50 years of civil wars, invasions, and plague. The population was decimated and demoralized. Many of the peasants had become serfs tied to the soil for local lords in return for protection. Large sections of the empire's agriculture and trade were wrecked. The coinage was debased to the point of being almost worthless. The frontiers were under constant pressure. And the army was in serious need of reforms. Everywhere he looked Diocletian saw serious problems, while the means to solve those problems were horribly damaged. Therefore, he concentrated on three issues: defense, creating a more efficient government, and protecting the emperor against revolts and assassination.

Turning to the army, Diocletian saw two needs that worked against each other: the need for efficient defense against the growing threats on his frontiers, and the need for insurance against revolts. The larger the army he created, the more potential there was for revolt. But too small an army meant invasions, which was even worse. Therefore, he increased the army to twice its size under Augustus. And since there were now simultaneous threats on several frontiers, Diocletian also split this army into two parts: stationary frontier militia who could stop small invasions and slow down big ones, and mobile legions, increasingly made of cavalry, that could rush to any trouble spots that the militia could not handle.

Unfortunately, the Roman populace, unused to military service after the Pax Romana and reduced in numbers by the recent anarchy, could not provide the number and quality of recruits that were needed. As a result, the government resorted more and more to recruiting Germanic tribesmen who were willing to fight for Rome for a price. While these recruits were warlike enough, they were generally unwilling to submit to the level of discipline and training that had made the Roman army so effective through the centuries. As a result, the Roman army, especially in the West where roughly half the recruits were Germanic, decayed to a pathetic shell of its former greatness.

However, this larger army further increased the danger of revolts by powerful generals. Diocletian did three things to protect himself against this. First, he broke the army into smaller commands for each general, while keeping part of the mobile legions under his personal command. Second, he split the control of each province between civil and military authorities. This made it harder for a rebellious general to command such resources as food and money needed for a successful revolt. However, it also meant that civil governors and generals might not cooperate against invasions. Finally, Diocletian isolated himself with elaborate court ritual similar to that of the Persians. Not only did this physically separate him from potential assassins, it also gave him a semi-divine status that made attacking the emperor seem like a sacrilege.

Finally, the empire needed a more efficient government than it had had in the calmer days of the Pax Romana. For one thing, the empire was much too large for one emperor to defend, especially now that several frontiers would come under attack at the same time. Therefore, Diocletian split the empire between the Latin speaking West and the Greek speaking East, with an emperor, known as an Augustus, and separate administration in each half. Technically, there was still one Roman Empire, but more and more it functioned as two independent and, at times, competing empires. Overall, splitting the empire aggravated the natural split between Greek East and Latin West and prevented cooperation when it was most needed.

Unfortunately, a larger army, bureaucracy, and elaborate court required heavy taxes. This merely stifled people's initiative to work hard. In order to ensure a stable tax base, people and their descendants were tied to their stations in life. Not only did a shoemaker, soldier, or farmer have to remain in his profession for life, but his sons had to follow in his footsteps, as did their sons after them and so on. This plus the high taxes reduced people's incentive to work hard and helped create a stagnant economy. The depressed economy meant a lower tax base to draw taxes from, which forced the government to further raise taxes, thus catching Roman society in a vicious feedback cycle similar

to the one that triggered the anarchy of the third century.

The Roman Empire under Diocletian presents a depressing picture, with its frontiers under constant pressure, oppressive taxes, and people stuck in their positions in society. However, it was more secure from invasion, which did allow trade and agriculture to revive some. One might doubt whether Roman security was worth the price paid for it. However, Diocletian did accomplish one thing of importance for later civilization. He propped the Roman Empire back up for two more centuries, allowing the new tribes along the northern frontiers to become more accustomed to Roman civilization through trade, raiding its borders, and serving as mercenaries in its army. When the western half of the empire finally fell by 500 C.E., these tribes were more willing to try to preserve Roman civilization and pass its heritage on to the Middle Ages and eventually to our own culture.

New Solutions to New Problems in a New World

The dragon standards Roman troops carried into battle and the Roman army's growing reliance on Germanic formations such as the shield wall reflected the growing barbarization of the army.

The threats and problems that Diocletian and his successors faced constituted a very different world than the one Augustus had faced three centuries earlier, forcing them to virtually reinvent the empire they ruled. Symbolic of this was the colossal scale statues of emperors in the later empire, which were meant to overawe the populace, indicating a shift from the *Principate*,

when the emperor was seen as first citizen, to the *Dominate*, when he was an absolute lord.

Rome's growing need to meet threats on multiple fronts meant a growing reliance on cavalry, in particular *cataphract* (above)s, which could function as both heavy cavalry charging with lances or as mobile horse archers. However, this also reduced reliance on infantry trained with the drill-and-march, the real key to the cohesion and success of Roman armies through the centuries.

Barbarian raids. In many or most cases, giving generals smaller commands may not have been that risky to the empire's safety, because, when the barbarians breached the frontier, they either started out as small raiding parties or, in the cases of larger groups, typically spread out into smaller bands to maximize each man's plunder and avoid the problems of supplying one big war band. Therefore, a larger number of smaller armies would probably be better suited to clearing out all the individual war bands scattered across a province.

The multiplication of threats and problems on multiple fronts also forced Diocletian to create a new administrative structure that looked something like this:

Hard Times in the Later Empire

A Roman *colonus* (serf) is forcibly returned to his master after trying to escape to freedom. The repressive measures of Diocletian and other later imperial rulers forced them to freeze everyone in their family occupations in order to guarantee a stable tax base.

Signs of a shifting economy. The fourth century saw a temporary improvement of the economy as evidenced by the restoration of the silver coinage and creation of a new gold coin, the *solidus* by Constantine. However, appearances can be deceiving. Restoration of the silver coinage was a temporary phenomenon that was gone by the fifth century. It was probably sparked by the favor Constantine showed Christianity, thus allowing him to plunder pagan temples for a lot of gold and silver.

The gold *solidus* remained the most stable coinage in Mediterranean for centuries. However, it was so valuable that it could only be used for large transactions, especially by the government. It remained out of reach for most people, so the predominant coinage used in daily transactions was bronze. The virtual disappearance of silver coinage after 400 indicates a large gap between rich and poor, especially in the Western Empire, with few people of moderate wealth in between, not the sign of a healthy economy.

Hard times even for tax collectors. According to the Theodosian Law Code, civic officials, known as *decurions*, were expected to make up any shortfalls in tax revenues from their cities out of their own pockets. If they were caught moving

to another city with lower taxes to assume the *decurionate* there, they were held personally responsible for the taxes from both cities. *Decurions* would even run off to join the army to avoid the burdens of their office and had to be dragged back to their cities. Apparently, the duties of the *decurionate* were so burdensome that men who chopped off fingers to avoid military service were sentenced to become *decurions*.

Infanticide, also indicative of hard times, was more common in the late Empire, judging from a law requiring local officials to restrain parents from killing their babies. The state also provided support for raising such children, another sign of concern over depopulation.

An extensive waterwheel system from the fourth century near present day Arles, France was capable of milling enough grain to feed 80,000 people. The waterwheel was a Hellenistic Greek invention that found little use while there were adequate labor supplies to do the work. Therefore, increased efforts such as this to exploit waterpower suggest depopulation from war and pestilence in the later empire.

Three Emperors of the Fourth Century

This giant head of Constantine is all that remains of a colossal statue of the 4th century emperor. Such large-scale statues in the later empire were meant to overawe the populace and indicate the shift from the Principate to the Dominate.

Three emperors of the fourth century, Constantine I, Constantius II, and Julian, while each having their quirks, were generally capable rulers who kept the Empire together through much of the fourth century.

Constantine I (324-37) reunited the empire after a period of civil wars following Diocletian's voluntary abdication in 304. Besides murdering most of his family, Constantine did two things of especial note for the Empire. First he moved the capital to Byzantium, rebuilding it as Constantinople, thus recognizing the shift in wealth and power to the East. Secondly, he converted to Christianity, which set in motion the conversion of the whole empire to that faith.

Constantius II (337-60) was one of Constantine I's three surviving sons. After exterminating his brothers and a couple of cousins to boot, he ruled as sole emperor. Although a capable ruler, he was unable to solve the religious controversy still raging in the Church as a result of the Arian Heresy.

Julian (360-63), one of the few relatives that Constantius II didn't kill, was made Caesar in the West to deal with Germanic invaders in Gaul. Although by nature a philosopher, Julian proved to be an excellent general who cleared Gaul of its invaders at the Battle of Strasbourg

(below). When Constantius called for some of Julian's units in Gaul to join him in the East for a war against Persia, the troops rebelled and declared Julian emperor. Luckily for Julian Constantius suddenly fell ill and named Julian as his successor before he died. Julian was the last pagan emperor of Rome. He died on campaign in Persia after a short reign of only three years, a fate Christian writers of the time tied to his hostility to the Church.

[Back to flowchart](#)

THE FINAL COLLAPSE OF THE ROMAN EMPIRE IN THE WEST (395-c.500)

Why the West? For the century since Diocletian, generally capable and energetic emperors had ruled the empire. However, the death of Theodosius the Great in 395 C.E. marked a turning point in Roman history as the Western half of the empire steadily slipped into oblivion. There were several reasons why the West fell and the East survived. First of all, the East, with its older civilizations and more established trade routes, was considerably richer than the West, so it could buy off the barbarians until it found the strength to fight them.

The second factor was the barbarization of the Roman army. Depopulation and centuries of peace made it hard to get enough qualified recruits for the army. As a result, the Romans had turned more and more to enlisting Germanic tribesmen in their ranks. In the East, there were still areas where good native recruits could be found to balance out the number of barbarians. The West, having few good native recruits, relied more heavily on Germanic recruits. By 400 C.E., they made up an estimated half of the Roman army in the West and ruined its effectiveness by refusing to submit to Roman discipline. Not only that, but the high military commands were also often held by men from these tribes who spent much of their time intriguing for political power rather than defending the empire.

A third factor was that the West had two large frontiers, the Rhine and Danube, to guard against the barbarians, while the East had only the Danube. Granted, the Eastern Empire also had to deal with Persia, but it was often preoccupied with threats on its own borders, in particular from the Huns. Finally, the East had fairly capable emperors after 450 C.E., while the West never had a good emperor after Theodosius I's death in 395.

How and why the barbarians took over. Popular imagination tends to see the final collapse of the empire in the West as a cataclysmic wave of Germanic tribes overrunning the Roman world. In fact, it was more a case of barbarians infiltrating a civilized society and destroying it from within. The century between the military disaster at Adrianople and the final collapse of the empire in the West did

not see a single major victory of barbarians over a Roman army. Instead, in some cases, the Romans freely let in individuals or even whole tribes, which was the case with the Visigoths in 376. In other cases, tribes just walked in when legions were pulled from a frontier to revolt or meet an invasion or revolt elsewhere. That is how such tribes as the Angles, Saxons, Jutes, Visigoths, and Alans got into the empire.

Once inside the empire, the tribes would loot and pillage, but they were also anxious to gain legal status and Roman titles. In the case of a few exceptions, such as the Saxons who had little previous contact with Roman civilization, the invading tribes wanted to become a legal part of the Roman Empire, not destroy it. Long after the Empire in the West was gone, the legal fiction of its existence persisted, both at the Eastern Empire's court in Constantinople, and among the peoples who settled in the West. In fact, the idea of the Roman Empire was so strong among these people that in 800 C.E., three centuries after its fall, the imperial title was revived in the West. The Holy Roman Empire, as this revival of Roman grandeur was called, lived on at least as an idea for 1000 years. Finally in 1806, Napoleon declared the Holy Roman Empire dead, largely to make room for his own imperial ambitions with Roman style titles and military standards. The idea of Rome did not die easily.

The end of the empire in the West started with the Visigoths. In 376, they had been let into the Eastern Empire to escape an even more ferocious people, the Huns. When the Roman authorities failed to adequately care for these refugees, they revolted and destroyed an entire Roman army and the emperor Valens at the battle of Adrianople in 378. Theodosius I managed to settle them down in the Balkans until 395 when he died and his weak sons, Arcadius and Honorius, took the thrones of the Eastern and Western empires respectively. The Visigoths' king, Alaric, who wanted Roman titles and lands for himself and his people, took the opportunity to cause trouble again. The Eastern Empire managed to divert the Visigoths into Italy, thus shoving the problem onto the Western Empire, which responded to this threat by pulling troops from the Rhine frontier.

This triggered a pattern of events much like the cycle of anarchy in the third century C.E., only this time, no Aurelian or Diocletian emerged to save the Empire. Once a tribe was in the empire, it would loot and pillage, wrecking the empire's economy and lowering its tax base. The increased military burden and decreased means to meet it would weaken the empire's ability to provide an adequate defense, causing more tribes to break in and repeat the pattern. Thus the Visigoths, Vandals, Saxons, Huns, and Franks in turn would benefit from this cycle and also perpetuate it, allowing the next people to come in, and so on.

The Visigoths who started this cycle managed to sack Rome in 410. Pulling troops from the Rhine frontier to meet this threat allowed the Vandals and other tribes to invade Gaul, Spain, and eventually North Africa. The loss of North Africa meant the peace and unity of the Mediterranean were disrupted, further stretching Rome's dwindling defenses and resources. In 455, the Vandals sailed to Italy and sacked Rome in much worse fashion than the Visigoths had. Meanwhile, all this turmoil plus an attempt by a rebellious general, Constantine, to seize the throne had stripped Britain of its legions, and the Angles, Saxons, and Jutes started crossing the Channel. At this point, Britain virtually dropped from the sight of recorded history.

By 450, the Western Empire's material resources were so depleted that there was little or nothing that could save it. When Attila the Hun demanded a huge tribute from the Western Empire, Rome did manage one final military victory in alliance with the Visigoths and other tribes against the much more dangerous Huns. Attila's death soon afterward led to the break-up of his empire, which unleashed his subject tribes against Rome. While Germanic generals in Italy intrigued against one another, setting up puppet emperors in rapid succession, the decrepit remains of the Western Empire came crashing down, and various tribes came pouring in to carve out new kingdoms on its ruins. The last and, as it would turn out, most important tribe, the Franks, now started to make its move to carve out its own kingdom in northern Gaul. As it turned out, the Franks would be the

tribe to contribute the most to the transition from the ancient world to Western Civilization.

The last legally recognized emperor of the West, Julius Nepos, died in exile in 480. Although the eastern emperors in Constantinople claimed that they now ruled over the whole empire, for all intents and purposes the Roman Empire in the West was gone. The "Dark Ages" would descend upon the West, while the Eastern Roman, or Byzantine, Empire managed to survive, revive, and attain new heights of its own in the centuries ahead. The heritage of antiquity would live on, but a new era in history was dawning: the Middle Ages.

The Huns Change the Rules of War

The Huns were a nomadic tribe that stormed out of Central Asia c.370 C.E. A previously popular theory, now discounted, identified them with the Xiongnu, a nomadic tribe that threatened China's northern borders 300 years earlier. The Romans imagined the Huns to be inhuman monsters who would even scar their baby boys' faces to make them look fiercer to enemies.

The symbiotic relationship between a Hun and his horse was such that they (like other nomads) might resort to opening a vein in the horse's neck to drink its blood for sustenance. In typical nomadic fashion, they taught their boys to ride almost as soon as they could walk. Roman sources claimed they were so bow-legged from being in the saddle that they could barely walk. All these tales added to the mystique and fear of a people who do seem to have been particularly savage to their enemies.

The Huns, like other nomads, were divided into tribes that were as likely to fight each other as attack their neighbors. The Romans regularly

used Hunnic mercenaries in the fifth and sixth centuries. The Huns also gave the Sassanid Persians a hard time, thus inadvertently helping maintain the balance of power in the Middle East.

While civilized empires and kingdoms had encountered mounted nomadic horse archers (e.g., the Parthians who nearly massacred an entire Roman army at Carrhae), they had never encountered a threat on the scale of Attila's Huns. And scale changed everything.

Whereas nomads in the steppes of Eurasia were typically divided into small clans and tribes preoccupied with their immediate neighbors, Attila's genius had united a large number of clans into one fighting force, thus creating a new sort of threat that Europe and China on the fringes of the steppe would face for the next 1000 years. What gave these armies such an advantage was speed, on both the tactical and strategic level.

We have already seen how the Parthians' hit and run tactics with the composite bow created such problems for slower armies, such as the Romans' heavy infantry. Strategically, Attila's army also had the advantage of traversing large distances at remarkable rates of up to fifty miles per day compared to fifteen miles per day for civilized armies.

Two factors made the Huns and other nomads much faster: traveling lightly compared to their civilized counterparts and bringing up to a dozen horses per man to disperse the burden of carrying him and what few supplies he had. Therefore, not only could they travel several times faster than civilized armies in one day, they could maintain that pace for several days in a row, while civilized armies had to give their horses, pack mules, and oxen every other day off to keep from wearing them out.

What this meant was that Attila's Huns were usually messengers of their own arrival, giving even fortified cities no time to prepare

adequately for an attack and forcing them to surrender to nomadic armies that didn't have siege engines. For example, from 441-447 Attila took all the major fortified cities along a 600-kilometer front in the Balkans.

Even after the Hunnic empire disintegrated after Attila's death, there was a seemingly endless series of new nomads to take their place throughout the Middle Ages: Avars, Bulgars, Magyars, Patzinaks, Pechenegs, Mongols and Turks. Stemming the tide of many of these successive waves of invasions would be the Eastern Roman (aka, Byzantine) Empire, which would survive through a combination of adroit diplomacy and adapting its warfare to meet the nomads largely on their own terms. Not until the invention and efficient application of gunpowder after 1500 would civilized empires regain the advantage over the nomads.

Sacking Rome

An older depiction of the sack of Rome by the Visigoths in 410 may inadvertently be somewhat accurate. While the artist at the time wanted to depict the shock value of the event, he also couldn't shock the sensibilities of the reading public of the time by being too graphic. The resulting compromise in a sense reflects historians' changed perceptions of what the sack in 410 was really like.

The sack of Rome in 410 was easily avoidable. Stilicho, the Germanic general commanding Germanic and Roman troops defending Italy, had successfully repulsed Alaric and his Visigoths on two separate occasions. However,

for some reason, he had let them escape, possibly since they were *foederati* (allies) with legal status in the Empire. Also, for some unknown reason, the Western emperor, Honorius ordered the massacre of the innocent families of 30,000 of the Germanic mercenaries defending Italy for him. Not surprisingly, those mercenaries deserted and joined the Goths, leaving Rome open to attack.

J. W. Waterhouse's painting, *Honorius' Favorites*, suggests how weak and ineffective the Western emperor was, being more interested in feeding his pigeons than defending the Western Empire. Even the sack of Rome was of little interest to him, since in the 400s Western emperors ruled from Ravenna, which was more defensible than the capital.

In 410, the Goths sacked Rome. While bad enough, this was hardly the barbaric atrocity of popular imagination. For one thing, the Goths were Christians with orders from Alaric to spare the churches. There is even the story of how a Goth entered a church and demanded any valuables its nuns had. When they brought out some Christian relics, the Goths decided to escort these treasures to a safer locale. Other people joined this procession and it became a full-scale parade of Goths and Romans singing hymns.

Very likely, most of the Goths sacking Rome weren't so kind or religious, but this story puts the Goths in a somewhat different light from that of popular imagination. Very likely, the worst acts of violence may have been carried out by slaves seeking vengeance against their masters. However mild the sack of Rome may have been, just the fact that Rome had been sacked sent shock waves through the empire.

By contrast, the sack of Rome by the Vandals (from which we get our word *vandalism*) in 455 was much worse than the one by the Visigoths in 410, as was the sack of Rome by Charles V's Christian troops in 1527.. This was largely due to the length of exposure the two different peoples had experienced with Roman civilization. The Visigoths had much longer contact, having lived within the Empire since they had been let in as refugees from the Huns in 376. Therefore, most of them had lived in contact with the Roman civilization all their lives. While this may not have made them love the Romans, it must have at least softened their attitudes toward them. The Vandals, however, were relative newcomers and probably much more hostile to their hosts' culture.

The fall of the West (c.450-476)

Odovacer, a Germanic leader with the title of Roman general, overthrows the last emperor of the West, Romulus Augustulus, in 476. The former emperor, a mere boy at the time, was given a pension and lived out his days on an Italian villa. Odovacer, would rule as king of Italy, although technically in the name of Rome, until the Ostrogothic king, Theoderic, sent by the Eastern emperor, overthrew him in 490. Half a century later, another Eastern emperor, Justinian, would send an army to reclaim Italy for the Empire in reality as well as in name.

Largely because of poorer record keeping and declining literacy, the final days of the Western Roman Empire are partly shrouded in uncertainty, leaving room for various legends to fill in the gaps.

Attila's invasion of the West. When Attila turned his attention against the Western Roman Empire after 450, his pretext was supposedly a ring sent to him by Honoria, sister of the weakling emperor, Valentinian III. After a failed attempt to assassinate her brother, she had been driven from the palace and forced to marry an old Roman senator. Being a fun-loving girl, she sent money and a ring to Attila asking for his help. Attila chose to interpret this as a marriage proposal and demanded half the Western Empire as Honoria's dowry. When Valentinian refused to agree, Attila invaded the West to claim his dowry.

In 452, Attila invaded Italy, but mysteriously withdrew when it seemed he had Rome within his grasp. According to legend, it was a plea by Pope Leo that persuaded the Hunnic leader to spare Rome. More likely, it was the outbreak of disease in his camp along with a Roman army from the East threatening his line of retreat that convinced him to exit Italy. The next year, he died on one of his many wedding nights, the victim, in one version, of another jealous wife.

Attila's invasion of Italy led to a number of refugees fleeing to a marshy area in the northeast and starting what would become the city of Venice.

King Arthur. Britain at this time was the most likely setting for the historical King Arthur, a Romano-Briton who led the defense of his land against invading Angles, Saxons, and Jutes. His efforts, or those of some other leaders, were temporarily successful in driving the invaders from Britain. However, just as in the Arthurian legend, Britain eventually succumbed to the rising pressures from its enemies. The Anglo-Saxon invasions seem to have been particularly destructive, as little evidence of Roman civilization survived them. At this point, Britain virtually dropped from the sight of recorded history.

A dreary list of "emperors." The last twenty years of the Western Empire saw a virtual revolving door of emperors being made and un-made by unscrupulous politicians and generals. Just for the record, here are their names and dates:

Maioresanus (457-61)
Liberius Severus (461-5)
Anthemius (467)-72
Olybrius (472)
Glycerius (473-4)
Julius Nepos (474-5; 480)
Romulus Augustulus (476)

Even their coins reflected imperial decay in the fifth century.

The last emperor in the West, according to popular belief, was Romulus Augustulus (above), a boy who was relieved of duty in 476 and sent to live on a country estate. The popular appeal and irony of Romulus Augustulus' name is that it combined the names of the founder of Rome and the founder of the empire (Augustulus meaning "Little Augustus"). Technically, the officially recognized emperor of the West was Julius Nepos who lived in exile until his death in 480.

THE RISE OF THE CHRISTIAN CHURCH (c.30-323 C.E.)

"Render unto Caesar that which is Caesar's and unto God that which is God's"—Mark 12:17

If one is to understand Western Civilization, one has to understand Christianity and the history of the Christian Church. No single faith or institution has had a more profound impact on Western Civilization than Christianity. However, many of its influences may not be so readily apparent because they are so deeply rooted in our past and therefore are harder to recognize. One example is the work ethic that traces its roots back to medieval Christian monasteries. Other examples abound, but suffice it to say that the Christian heritage is a significant part of our culture today, whether or not we belong to the Christian faith.

During the Middle Ages, the influence of Christianity was much more obvious. In fact, Christianity played such a dominant role in medieval life and culture that we still refer to this era as the Age of Faith. During that time, the art and architecture were primarily religious in nature. The calendar was the Church calendar whose holidays (holy days) were those of the Christian faith. The daily lives of the people, even their diets, were largely controlled by Christian dictates. And politics were tightly interwoven with religion and the Church. Christianity, which traces its beginnings all the way back to the time of the Roman Empire, is still thriving as one of the world's great religions. Therefore, it is a major bridge linking the ancient world and its civilization to the medieval world and ultimately our own.

In its basic form, Christianity is a simple religion centering around the brief life of a humble Jew, Jesus Christ. According to Christian dogma, Jesus was the Son of God, but miraculously born in human form to a virgin named Mary. For several years he performed various miracles as proof of his divinity and preached a simple but profound doctrine of love and forgiveness, faith in God, and penitence for our sins. At the age of 33, he was brutally executed on a cross because of his teachings. However, on the third day after his execution, he supposedly rose from the dead, seen as further proof of his divinity. Forty days later, after appearing to other disciples and followers, he ascended into Heaven. He said that sometime in the future he would return for a final judgment day

whereby the dead would be resurrected and go either to Heaven or Hell according to their faith.

Christianity is a monotheistic religion (i.e.-believing in just one god) that is derived from Judaism. The God of the Jews in the Old Testament is also the God of Christianity. However, there is one aspect of Christian theology that has confused people down through the ages and led to untold controversy and even bloodshed. That is the belief that the god of Christianity is a triune god or Trinity. In other words, there are three aspects to God, but all are parts of one united god. They are: God the Father and creator; Jesus Christ, his son who came to earth as a human in order to save us from our sins by giving up his life on the cross; and the Holy Spirit which inspires us with faith. Through the years, people have disagreed, at times violently, over the exact nature of each of these aspects and how they relate to one another. All the various points of view and the arguments to support them are too subtle, involved, and often confusing to relate here, although they would emerge from time to time with tremendous impact.

Early history (c.30-311 C.E.). Christ's ministry left two things of vital importance to the later success of Christianity. One was an appealing message of love, forgiveness, and eternal salvation for all people. The other was the mission for Christ's apostles and all Christians to spread this new faith. After Christ's departure, his followers started spreading his message in order to win new converts to the faith. At first, preaching this message was confined to Jews, and the ruling Romans saw it as merely a sect or offshoot of the Jewish religion. But a critical turning point in Christianity came with St. Paul of Tarsus, who saw Christianity as a religion for all peoples: Jews and Gentiles (non-Jews). Therefore, he started spreading the word of Christ throughout the Roman world.

Thanks to its message and this preaching, the Christian religion grew in popularity slowly but steadily during its first century and a half (c.30-180). Hollywood and popular imagination have romanticized and exaggerated the persecutions of the Christians during this period. The truth is that Christianity during this time was still a relatively minor religion that drew little attention from the Roman authorities. There were occasional persecutions in these early years, not so much for the Christians' religious beliefs as their refusal to worship the Roman emperor and state gods. Such worship was more like a pledge of allegiance than a religious act to most Romans, and refusal to do it

was seen as an act of treason. The Christians could have freely practiced their religion if they would only have paid the empire this worship.

However, unlike most other ancient religions where the religion was intimately tied up with the state and society as a whole, Christianity was a very personal religion that drew a sharp distinction between what one owed to the state on the one hand and to God on the other. Therefore, Christians refused to worship the state gods, which was where they got into trouble. During the Pax Romana, the persecutions were few and intermittent, and most Christians could practice their religion with little or no interference. Times were good and the authorities saw little harm coming from the odd habits of this minor sect. In the third century all that changed.

The great persecutions. The third century was a time of intense anarchy. Civil wars, barbarian invasions, and plague wracked the empire from end to end and threatened its very existence. This affected Christianity in two very different ways that both worked ultimately toward one end. First of all, the widespread troubles of the time led many people to question the truth of their old pagan religions whose gods did not seem to be protecting Rome anymore. Consequently, people started turning to new, more emotionally satisfying salvation religions to comfort them in such troubled times. Christianity was just one such religion that gained converts during this turmoil. Other cults worshipping the Persian Mithra, Asia Minor's earth goddess Cybele, and Egypt's Trinity of Isis, Horus, and Osiris also gained in popularity.

The second effect of the third century anarchy was more intense persecutions of Christians. As long as the Empire was peaceful and prosperous, the Christians' refusal to pay homage to the emperor and state gods was usually overlooked. However, when things started falling apart, many Romans blamed the Christians for abandoning the old gods who in turn abandoned Rome. The late third and early fourth centuries saw the most intense periods of persecutions, the worst coming under Diocletian and his successors from 303 to 311 C.E. Ironically, the persecutions helped the Christian Church, because they gave the Christians publicity that won them widespread sympathy and many new converts. Consequently, right on the heels of its darkest hours of persecution came the Church's greatest victory: legalization and acceptance as the virtual state religion of the Roman Empire.

Constantine and triumph of the Church. The man who gave Christianity its big break was the emperor Constantine. Legend has it that on the eve of a major battle against a rival for the throne, Constantine saw a vision of a cross in the sky with the words: "In this sign conquer". Taking this as a message from God, he placed a Christian emblem on his troops' shields and then won the battle. However true this legend may be, the fact is that in 311, Constantine declared toleration for Christianity in the Western half of the Roman Empire. When he took over the eastern half in 323, he also legalized it there. From this point on, the Christian Church quickly became the dominant religion in the Roman Empire, largely from the favor bestowed upon it by Constantine and his successors.

The question arises as to why Christianity triumphed over other competing salvation religions. Besides strong state support, there are five main reasons. First of all, it was exclusive. Unlike most ancient religions which tolerated other faiths, Christians said a person could belong to only one faith, Christianity, and be saved, which scared many people away from other competing faiths. Secondly, Christianity actively sought converts. Most other religions were there for other people to accept, but did not go out of their way to gain new members. In sharp contrast to this, Christianity did seek new members, which gave it a decisive edge. Third, Christianity was secretive and treasonous. As seen above, this led to persecution, which led to publicity and popularity. Fourth, from the reign of Constantine onward (with the brief exception of Julian's reign), the Church received strong state support that put increasing pressure on pagans to convert until Theodosius I shut down all pagan temples in 393. Finally, Christianity was well organized much along the lines of the Roman Empire. As the faith spread across the empire, it especially caught on in cities. Consequently, each city, which was already a center of Roman administration, became a Christian center as well under a bishop. Each province, besides having a governor to rule it, also had an archbishop to rule the affairs of its bishops in the different cities. Diocletian had divided the empire into four large districts called prefectures. The Church, similar to this, had five main centers where Church patriarchs resided. Four of these centers (Constantinople, Jerusalem, Antioch, and Alexandria) were in the East, reflecting where Christianity's main strength was then.

The fifth patriarchal center, Rome, would become the most influential for several reasons. First of all,

it was the capital of the empire, giving it a good deal of prestige. Second, Peter, Christ's most influential disciple, had started Rome's first Christian congregation, which also gave Rome prestige. Finally, after 600 C.E., Rome was free from the control of the Eastern Roman (Byzantine) emperors. This made life more dangerous for Rome's popes (patriarchs), but it also gave them more freedom to expand their influence when more peaceful times came after 1000 C.E.

The Life of Christ and the Christian Religion

Sandro Botticelli (1445-1510), *The Annunciation*, (1489-90)

No topic has aroused or continues to arouse more controversy than religion. For example, in America the concept of separation of church and state still sparks fierce differences of opinion on the role of religion in public schools. Consequently, textbooks often just shy away from the topic of the role of religion in history, thus leaving a huge gap in our understanding of the past, including our calendar, popular sayings, and dominant themes in Western art. With that in mind, following is a brief rundown on the basic Christian beliefs about the life of Christ and the Christian religion.

The life of Christ. The story of Christ begins with the annunciation by the archangel Gabriel to the Virgin Mary that she would give birth to the Messiah, the Jews' long awaited savior. Christians have long used the miraculous virgin birth as evidence of Christ's divinity. The Magi (AKA, Three Wise Men) were Zoroastrian priests from Persia whose journey to see the Christ child has been used by Christians to show their religion is for all people, not just the Jews.

For centuries, the Jews had awaited the coming of a messiah (savior) who would deliver them

from captivity, much as Moses had led them from Egypt in the Exodus. Therefore, many expected this deliverance by a messiah as a physical, even military, liberation from the Romans. Naturally, this made the Romans extremely nervous about anyone claiming to be the messiah. Therefore, even though Christ led a peaceful, non-violent movement, his association with the messiah made him an obvious target for the Roman authorities.

Christ's first miracle took place at the wedding at Cena where he turned water into wine. Christians have used this as evidence that drinking alcohol *in moderation* is not sinful. Although Muslims see Christ as the last of the five prophets preceding the greatest prophet, Mohammed, Islam forbids drinking alcohol.

Other miracles included restoring a blind man's eyesight, helping a lame child walk, walking on the waters of the stormy Sea of Galilee, and even raising a man named Lazarus from the dead.

Christ taught largely through parables, allegorical stories that carried a moral message. In one of his most famous parables, that of the Prodigal Son who, despite his previously sinful life, is welcomed back by his father, he illustrated God's unconditional love for us as being like parents' unconditional love for their children.

Rembrandt van Rijn (1606-69), *Prodigal's Return*.

In the story of the widow's mites, Jesus sees a widow offering two mites (small coins) at the synagogue, and uses this to teach a lesson in humility to the *pharisees* (the somewhat self-righteous priest class), saying that God views the

widow's humble sacrifice much more favorably than he does the large donations the rich make, since it sincerely comes from her heart.

The Good Samaritan was another of Christ's parables. A man is waylaid and badly beaten by brigands and left lying on the road. Several people just pass him by, until a Samaritan stops to help him. Since the Samaritans were looked down upon by most Jews, Jesus' point was that what is in one's heart, not bloodline, is what matters most to God.

Jewish law prescribed death by stoning for women caught in adultery. When such a woman is brought forth, the Pharisees challenge Jesus to cast the first stone to test his commitment to the law. Instead, he says let whoever is without any blame cast the first stone. Since no one wants to make such a claim for themselves, they drop their stones and leave, thus saving the woman. Once again, Christ's message of love and forgiveness is a central theme of Christianity.

Nicolas Poussin (1594-1665), *Christ and the Woman Taken in Adultery*

Mary Magdalene was a woman of ill repute who became one of Christ's most ardent followers. Despite her background, he is kind to her as an object lesson to his disciples about how God accepts all people for what is in their hearts rather than their social background or past.

The Last Supper. Judas Iscariot, one of Jesus' disciples arranges to have him betrayed to the authorities. At the Last Supper, Jesus shocks his disciples by revealing that he knows one of them will betray him. He then passes around bread and wine (representing his body and blood) as a way of remembering him. This ceremony, known as communion, becomes one of

the main sacraments (sacred actions) in the Christian service and religion in the coming years.

Christ's crucifixion and resurrection. Later that night, Judas betrays Jesus to the authorities, identifying him by a kiss on the cheek. When the apostle Peter defends Jesus and cuts off one of the soldiers' ears, Jesus tells him to stop and even heals the soldier's ear.

Judas' reward for betraying Jesus was 30 pieces of silver. Even now the term "30 pieces of silver" indicates one's price for betraying a friend or cause. Similarly, the term "the kiss of Judas" indicates an act of betrayal.

On what Christians refer to as Good Friday, Jesus was brought before Pontius Pilate, the procurator (governor) of Judea, for trial. Although he saw Jesus as having done no wrong, he allowed him to be whipped and mocked by the mob. When he offered the crowd the choice of freeing Jesus or a real criminal, Barabbas, the crowd freed Barabbas. Later, Pilate would wash his hands, as if this would clear him of any guilt in Jesus' execution. Similarly, we today talk of washing our hands of a crime.

As Jesus was marched to the hill known variously as Calvary or Golgotha, the mob put a crown of thorns on him to mock his descent from king David. On Calvary he was crucified, a slow and agonizing way to die that was generally reserved for the worst criminals.

The central event in the Christian faith, celebrated on Easter Sunday, is Christ's resurrection, the belief that he rose from the dead three days after his execution, thus proving his divinity.

When Christ appeared to some of his disciples after his resurrection, one of them, Thomas, wanting proof it was indeed Jesus, wanted to see the wounds from the crucifixion and even poked his finger into the wound where Christ had been pierced by a spear. Even today, we use the term a *doubting Thomas* to describe someone who is particularly skeptical.

Caravaggio (1573-1610), *The Doubting of St. Thomas*.

According to Christian doctrine, Christ only remained on earth for forty days after his resurrection before ascending into Heaven. At some future time he will return for a final judgment day, where those judged worthy will spend eternity in Heaven and those not judged worthy will be condemned to an eternity in Hell. Judgment Day and the fear of eternal damnation in Hell became two of the most pervasive themes of Christian thought and art in the Middle Ages.

The Pentecost, occurring 50 days after Christ's transfiguration, was another crucial event in the history of the Church. Supposedly, all the surviving apostles were gathered together when tongues of fire appeared on their heads without burning them. At the same time, inspired by the Holy Spirit, the third part of the Trinity and symbolized by the dove, they started speaking in various languages. This was a sign they should go out and preach the Gospel to all nations.

Possibly the most confusing aspect of Christianity is that of the Trinity, the idea that the one god has three different aspects: the Father who created the universe, the son (who is both divine and human) who died and was resurrected for our sins, and the Holy Spirit (commonly represented by the dove) which inspires us to faith. Christians are adamant that there is only one god, but having these three aspects. Muslims consider this heresy, especially the idea that Christ, a man, was also divine. To them, he was a great prophet, but only human.

Among the more controversial and frightening aspects is the last book of the Bible, "Revelations", which describes in highly symbolic language the final days before the second coming of Christ.

Christian symbolism

An early Christian epitaph of a Roman named Atimetus in the catacombs of St. Sebastian in Rome is flanked by two Christian symbols, an anchor and a fish.

Given the two facts that so many of their early followers were illiterate and that, for much of its first three centuries, their faith was an outlawed religion, Christians developed a number of symbols, in some cases to connect people to their religion, and in other cases as a secret code of identification.

Iota, eta, and sigma were the first three letters of the Greek spelling of Jesus.

Chi Rho: a monogram of the first two letters, Chi (X) and Rho (P), of the Greek word for Christ.

Alpha and Omega: The first and last letters of the Greek alphabet which signify that Jesus is the beginning and the end of all things. (Revelation, chapter 1, verse 8)

 The Fish: a secret sign used by the early persecuted Christians to designate themselves as believers in Jesus.

ΙΧΘΥC The initial letters for the Greek words for "Jesus Christ, God's Son, Savior", spell the Greek word for fish (I Ch Th U S)

 Similarly, all five of these letters can be found in this seemingly innocuous symbol.

Portability and Persecution

“The blood of the martyrs was the seed of the Church.” While many Christians did recant their faith under torture or threat of death, others faced death with incredible courage, inspiring many spectators to sympathize with the victims in the arena and, in many cases, join this new religion.

Portability: It works for iPods and it worked for Christianity. One thing that gave Christianity an edge over other religions and also sparked persecution was portability. In other words, while most pagan religions were identified with a particular place, the Christian god was portrayed as a universal god whose power and rules applied everywhere. Pagan peoples generally did not identify themselves in terms of their gods (e.g., *Zeusists*). Christians carried that identity wherever they went. Not that they were the first. The Jews were also identified with their god, which is what made them and the Christians seem so odd and difficult to deal with.

Saul of Tarsus (aka, St. Paul) was an ardent enemy and persecutor of Christians until he was temporarily blinded on his way to Damascus and experienced a dramatic conversion to the new faith. From then on, Paul, as he was now known, became the most important advocate for spreading Christianity to the gentiles (non-Jews).

Caravaggio (1573-1610),
*The Conversion of St. Paul
on the way to Damascus.*

The Diaspora. Rome’s suppression of Jewish revolts in the 1st and 2nd centuries led to the Diaspora (scattering) of the Jews away from Palestine for the next 1900 years. Since most of Christianity’s first converts were Jews, its earliest areas of concentration corresponded to areas of Jewish settlement during the Diaspora, typically cities, such as Rome, where they could carry on trade. While peoples of the Middle East in general were just as engaged in trade and banking, the Jews’ mercantile activities did stand out more in Western Europe, which had fewer cities and less trade. This, and the fact that lending money for interest was later frowned on by the medieval Church, led to the unfortunate myth of all Jews being money-grubbing bankers.

Early treatment of the Christians. While much has been made (especially by Hollywood in the 1950s) of early persecution of the Christians, we should keep in mind that in the first and second centuries, Christians made up a tiny fraction of the empire’s population and were barely noticed. However, around 100 CE the emperor Trajan received a letter from Pliny the Younger, his governor in Asia Minor, describing his treatment of the growing sect of Christians. After

describing how he only executed them after giving them numerous chances to renounce their faith and worship the emperor, he asks Trajan for further instructions on how he should deal with this problem.

“The method you have pursued my dear Pliny, in sifting the cases of those denounced to you as Christians is eminently proper...No search should be made for these people; when they are denounced and found guilty they must be punished; but where the accused party denies that he is a Christian, and gives proof...by adoring our gods, he shall be pardoned...Information without the accuser’s name subscribed must not be admitted in evidence against anyone.”

In the late second century dialogue, *Octavius*, Minucius Felix, an early apologist for Christianity, relates the typical charges pagans made against Christians.

“Is it not deplorable that a faction ... of abandoned, hopeless outlaws makes attacks against the gods? They gather together ignorant persons from the lowest dregs, and credulous women, easily deceived as their sex is, and organize a rabble of unholy conspirators, leagued together in nocturnal associations and by ritual fast and barbarous foods, not for the purpose of some sacred rite but for the sake of sacrilege-- a secret tribe that shuns the light, silent in public but talkative in secret places. They despise the temples as if they were tombs, they spit upon the gods, they ridicule our sacred rites. Pitiably themselves, they pity... our priests; half-naked themselves, they despise offices and official robes. What amazing folly! What incredible arrogance! They despise present tortures yet dread uncertain future ones; while they fear to die after death, they have no fear of it in the meantime; deceptive hope soothes away their terror with the solace of a life to come.

“Already... decay of morals spreads from day to day throughout the entire world, & the loathsome shrines of this impious conspiracy multiply. This plot must be completely rooted out & execrated. They recognize one another by secret signs &

tokens; they love one another almost before they are acquainted...I hear that in some absurd conviction or other they consecrate and worship the head of a ass, the most repulsive of beasts--a religion worthy of the morals that begat it...Whether this is false I know not, but suspicion naturally attaches to secret and nocturnal rites. To say that a man put to death for a crime and the lethal wooden cross are objects of their veneration is to assign altars suitable for abandoned and impious men the kind of worship they deserve.” (Omitted are descriptions of the Christians’ cannibalism and wild feasts.)

“Furthermore, they threaten the whole world & the universe itself with fire, & work for its destruction...Not content with this insane notion, they add to and weave old wives’ tales: they say that they are reborn after death from the cinders & ashes, and with unaccountable confidence believe in each other’s lies...”

“...But you [Christians]... abstain from wholesome pleasures; you do not attend the shows; you take no part in the processions; fight shy of public banquets; abhor the sacred games, meats from the sacrificial victims, drinks poured in libation on the altars.”

A crude graffito from the Palatine Hill in Rome is apparently making fun of a Christian, Alexamenos, who is praying to a crucifix with a donkey's head, presumably because Jesus rode into Jerusalem on a lowly donkey instead of a more dignified horse. This is one of the oldest representations of the crucifixion, dating between 200 and 250 C.E.

Shopping for demons. While the original message of Christianity was a positive and uplifting one, Christian apologists, in reaction to attacks on them, threatened their persecutors with eternal

punishment in Hell if they failed to convert. Not having a demonology of their own, Christians borrowed images from other cultures, notably the Etruscans and Babylonians, providing us with ideas about Satan and demons that continue today.

Below: Pazuzu, the Babylonian demon king of the winds

commemorating the feast held by Mithras and the sun god, Sol.

Another deity popular in the empire was Isis, an ancient Egyptian goddess who assumed more universal aspects during the Roman era, as seen in this passage from the second century novel *The Golden Ass* (i.e., donkey) by the author Apuleius:

“You see me here, Lucius, in answer to your prayer. I am nature, the universal Mother, mistress of all the elements, primordial child of time, sovereign of all things spiritual, queen of the dead, queen of the ocean, queen also of the immortals, the single manifestation of all gods and goddesses that are, my nod governs the shining heights of Heavens, the wholesome sea breezes. Though I am worshipped in many aspects, known by countless names ... the Egyptians who excel in ancient learning and worship call me by my true name...Queen Isis.”

Through a process of syncretism (combining the attributes of several deities), Isis became associated with other goddesses such as Ceres, Venus, and Artemis. After the triumph of Christianity as the state religion of the empire in the fourth century, competing cults soon died out, largely from state-backed pressure from the Church.

Constantine's Conversion

Constantine's vision of the cross

Constantine's conversion. There are two popular versions of Constantine's conversion, both taking place in 312 right before the decisive battle of the

Mithraism and other Salvation Cults

Mithra slaying the sacred bull

Christianity was by no means the only salvation religion promising an afterlife to its followers. A number of other cults challenged the traditional position of Rome's state gods by offering a deeper spiritual experience.

One cult especially popular with the soldiers, possibly derived from Persian Zoroastrianism, was Mithraism, which saw life as an ongoing struggle between good and evil. Mithra was a god of light and truth who, upon the orders of the sun god, reluctantly slew a sacred bull. As the bull died, the world came into being and time was born. From the bull came all life, the four elements, and the seasons, while Mithra's cloak became the heavens with all the stars and planets. Mithra's followers, as in most salvation cults, had to follow a strict code of conduct and a secret initiation to earn an afterlife. Most notable among their practices was a sacred banquet

Milvian Bridge against his rival in the West, Maxentius, and neither being written down until some 60 years later. In one he was told in a dream to paint the monogram of the first two letters of Christ's name, the Greek chi and rho on his soldiers' shields.

In the other version he saw a vision of a cross in the sky with the words, "In hoc signe, vince" ("By this sign, you will conquer.") Some have speculated that he saw a conjunction of Mars, Saturn, Jupiter and Venus, an astronomical event that would have disturbed most people then.

Whatever he saw, after his victory, Constantine issued an edict of toleration for Christianity in the Western Empire which he extended to the whole empire when he also won control of the East in 324. From that point on, with the exception of the reign of Julian (360-363), the Empire would favor Christianity.

Just how Christian was Constantine? This is still a matter of controversy among historians. Following are some signs that he was Christian, although in his mind he might not have been exclusively Christian.

- He gradually dropped pagan insignia from his coins & his duties as *pontifex maximus* & showed increasing favor to Christians
- Declared Sunday a holiday, although it was also sacred to the sun god.
- Although he dedicated Constantinople with pagan rites, he forbade pagan worship in his new capital,
- He passed laws favorable to the Christians such as restricting the grounds for divorce, prescribing harsher penalties for rape and adultery, and ending gladiatorial shows
- Forbade magic & pagan sacrifices in private homes (318), though public temples still made sacrifices. However, he did little to enforce this.
- He gave his sons a Christian education
- He was baptized on his deathbed, a common practice then to make sure all one's sins were washed away before dying.
- He confiscated temple treasures, thus

procuring supplies of gold and silver to restore the coinage and to pay for his new capital, Constantinople, and numerous Christian churches.

Christian holidays. Christians often adapted pagan holidays to Christian ones to draw in more converts. For example, Christmas coincided with the winter solstice festival, known as the Saturnalia, even though we think Jesus may have been born in the springtime. Easter (from *Ishtar*, the Babylonian goddess of love, fertility, and rebirth) originally coincided with celebrations of spring and fertility rites on March 25th. However, the Church changed it to the week after the Jewish Passover, occurring on the first Sunday after the first full moon after the spring equinox.

Church and State. A major event in the relations between Church and state occurred in 390 when St. Ambrose, bishop of Milan, forced the emperor, Theodosius the Great, to do penance for a massacre. Throughout the Middle ages in Western Europe, the struggle between Church and state would remain unresolved.

"On this rock (petra) I will build my church." Catholics believe Jesus especially favored Peter and gave him the keys to heaven. Since Peter founded his church and died in Rome, Catholics claim this is the center of the church. Peter supposedly insisted he be crucified upside down, since he was unworthy to die like Jesus had. St. Peter's Basilica in Rome is built on top of where Peter was supposedly buried.

Just how Christian was the Roman Empire in 312?

A map of the empire at the time of Constantine showing largely Christianized areas in orange

Just how Christian was the Roman Empire in 312? Given the wide diversity within something as huge as the Roman Empire, this is something that defies one simple answer and needs to be broken down according to social classes and regions of the empire.

The peasants, representing 90% of population at the time, were barely touched by this new religion, but this is to be expected. Our word *pagan* comes from the Latin word *pagus*, meaning rural, since peasants were the last ones to be exposed to and to adopt any new ideas, including Christianity. A century after Constantine John Chrysostom and Augustine were complaining about the large numbers of pagan peasants, and there were still mass conversions of peasants taking place as late as Justinian's reign (527-65). And even then, conversions were largely forced and superficial, with pagan rites continuing as late as the 1100's in some parts of the East.

So much for 90% of the population, but they didn't matter anyway, at least politically.

As far as other social classes were concerned, artisan and merchant classes were largely Christian and relatively mobile, which helped spread their faith. Scholars were mainly pagan, but state support of Christianity would gradually lead more and more of them to switch. The army was mainly pagan, with pockets of

Christians depending on their geographic origins, but since it moved around more than most people then, Christians in its ranks also helped spread this new religion. The emperor and court, being strongly Christian, spread its acceptance downward level by level.

Regionally, Greece and the Balkans didn't start converting until c.400 C.E. Northern and Western provinces were also still mainly pagan, although Mediterranean cities were likely to have strong Christian populations. Similarly, most cities in the West (except Rome) and frontier regions were pagan.

Eastern cities were a mixed story. Alexandria was split three ways between Christians, pagans, and Jews, leading to occasional religious riots that burned the temple of Serapis in 385 and part of its famous library in the 400's. Antioch was also divided, but not so turbulent as Alexandria. Asia Minor's cities were mostly Christian. However, neighboring cities might be radically different. For example, Gaza was pagan, but its port, Maiuma, was mostly Christian. Edessa was Christian, but nearby Carrhae was pagan.

Constantine who spent most of his time in the East, mainly saw Christians in Eastern cities, probably giving him a distorted view of Christian numbers and strength.

Double duty. Christian priests often held pagan priesthoods, which was seen as all right since these were considered civic offices.

[Back to flowchart](#)

**THE PROBLEMS OF SUCCESS:
RELIGIOUS HERESIES AND THE RISE OF
MONASTERIES (C.300-500 C.E.)**

"The city is full of mechanics and slaves, who are all of them profound theologians and preach in the shops and in the streets. If you desire a man to change a piece of silver, he informs you wherein the Son differs from the Father; if you ask the price of a loaf, you are told by way of reply that the Son is inferior to the Father; if you inquire whether the bath is ready, the answer is that the Son was made out of nothing."-- Gregory of Nyssa

The favor Constantine and his successors showed the Christian Church increasingly made it the state religion of the empire until 393, when the emperor Theodosius ordered public worship in the pagan temples to be ended throughout the empire. Christianity had triumphed, but success would also bring its problems.

The root of the Church's problems lay largely in the heavy persecutions of the third century that did two things. For one thing, they created a more decentralized Church by driving into hiding Christians who had lost contact with one another. On the other hand, the persecutions also helped lead to the triumph of Christianity as the virtual state religion by giving it publicity that attracted converts. In addition, as Christianity gained popularity, formerly pagan intellectuals joined the Church in greater numbers and started grafting pagan, especially Greek, philosophies onto Christianity. These factors would contribute to two very different lines of development in the history of the Church: the spread of religious disputes and heresies and the rise of monasteries.

Religious disputes and heresies. One of the more confusing aspects of Christianity was the nature of the Trinity of Father, Son, and Holy Spirit and the relation of the three parts to one another. During the persecutions, communities of Christians isolated from one another had developed different ideas on the Trinity. Christianity's legalization meant these different congregations that persecution had forced underground (literally in some cases) now could come out into the open, only to find they had very different ideas on this point. Added to this was the growing number of intellectuals joining the Church who, instead of just accepting Christianity as a simple religion, saw various subtle interpretations of the concept of a triune god. Confounding the

confusion was the vague wording of the Bible itself, which also led to different points of view.

The most serious of these disputes centered on the relationship of the divine and human natures of Christ. The first of these, the Arian dispute, flared up soon after Constantine had legalized Christianity. The issue was whether Christ, being the begotten son of God the Father, was co-eternal with the Father, and thus fully divine. An Egyptian priest, Arius, said he was not co-eternal with the Father, and the Arian view, as it was called, spread widely throughout the Roman world, causing heated arguments and even violence. Therefore, instead of creating a unifying factor for his empire by legalizing and favoring Christianity, Constantine had unleashed a wholly new type of controversy that threatened to tear the empire apart. Given the Church's close relationship now with the state, Constantine and later emperors felt they could not tolerate religious disputes and heresies.

These religious disputes typically followed an unfortunate pattern to that made a correct solution practically impossible to achieve. A new interpretation of Christianity would pop up and gain converts. This would lead to arguments and at times bloodshed. A church council, backed by the emperor, would denounce the new belief as a heresy (wrong belief) and either exile the heretics or persecute them within Rome's borders in order to preserve the public peace. Unfortunately, this tactic usually backfired much as imperial persecution of Christianity had backfired a century earlier.

Today, many people may wonder why people and governments got so emotionally involved in these disputes. The answer revolves largely around Christianity's exclusiveness. Since it was seen as the only true religion and path to salvation, people believed they had to have exactly the right belief in order to be saved, and even the slightest deviation from that belief could mean eternal agony in Hell. Similarly, the Roman government believed it must support the exact right belief to ensure God's favor and protection. Tolerating heresies could lead to God's disfavor, and any military defeats or natural disasters were often interpreted in that light. Also, since the Empire had tied its fortunes securely to the Christian Church, its religious and political policies were tightly interwoven, so that tolerating religious heresies was seen as the same as tolerating treason. Therefore, from the later Roman Empire to the early modern era (c.300-1700), religion and politics went hand in hand, and a decision in one realm generally had serious implications in the other realm as well.

The histories of the Arian and Monophysite heresies especially show this mentality and its results.

In the case of Arius, Constantine called a council of Christian bishops together at Nicaea in Asia Minor in 325. Arius was logically shown to be wrong, his beliefs were declared a heresy, and he himself was exiled. Arius then went to the northern tribes whom he converted to his brand of Christianity. A century later, when these tribes conquered the Western Roman Empire, they did it as Arian Christians, turning the tables and persecuting their predominantly Roman Catholic subjects.

Another heresy, the Monophysites, was suppressed in Egypt, Syria, and Palestine, which led to strong undercurrents of resentment and even rebelliousness against the Roman government. When the more tolerant Arab Muslims invaded these provinces in the 600's, instead of meeting stiff Christian resistance, they found the populace oftentimes welcoming them against Roman oppression.

Poverty, chastity, and obedience: the rise of monasteries. The success and favored status of Christianity also brought other problems. When Christianity was an outlawed religion, the motives and sincerity of its members were rarely in doubt since there was nothing to gain and plenty to lose by joining the Church. When Christianity became the favored religion of the Roman Empire, all that changed. There was an influx of new members joining for reasons of social, political, or material advancement. Also, the influx of intellectuals who grafted pagan philosophies upon the Christian faith was complicating the religion almost beyond recognition. The purity of the Church's membership was becoming seriously diluted.

This upset many of the more devout members of the Church, and they wanted to purge it of such worldliness. Since they could not drive the new members from the Church, they retreated into the desert to live pure Christian lives away from worldly temptations. In order to cleanse themselves of their sins, some of these men performed incredible feats of endurance nearly to the point of self-destruction. One such feat was to sit on the top of a pillar for years at a time. Another was abstinence from food almost to the point of starvation. As word of these "super-hermits" spread, other devout Christians moved out to the desert to be near them and share in their holiness. Soon the desert was so crowded with these people that they had to be organized into communities

called monasteries. In the East, St. Basil was the man who established the first monastic rule.

The Benedictines. In the West, it was St. Benedict who established a regularized monasticism. After a fairly sinful and dissolute youth, this man launched a career of violently trying to purge himself of his sins. At last, he arrived at a more moderate concept of Christianity and formed a monastic order known as the Benedictine Rule. The Benedictine Rule reflected its founder's more moderate views, though it was still strict by modern standards. A new monk took three vows: poverty (no material possessions), chastity (clean living), and obedience (to God and his superiors in the monastery). The day was divided into roughly equal parts of prayer, work, and rest. Incredible acts of self-torture or self-denial were not expected. Instead the monk worked around the monastery and in the fields, the belief being that idle hands are the devil's playground. Our own modern work ethic is directly descended from this idea.

The moderate expectations of the Benedictine Rule led to the spread of their monasteries all over Western Europe. As the orderliness of the Roman Empire gave way to the anarchy of barbarian rule, monasteries and monks would provide the one shining light of civilization in the West. These quiet and vigilant men bravely carried the word of their religion beyond the frontiers of the old Roman Empire, thus spreading civilization to new areas as well as preserving it in old ones. Monasteries were also the main centers for any kind of social and economic relief in the Dark Ages. The poor and destitute looked to them for food, shelter, and protection. The sick looked to them for hospital care. And travelers looked to them for safe havens on their journeys.

Another important and somewhat ironic aspect of monasteries was that many of the pagan intellectuals whom the hermits had originally tried to avoid were now showing up in the monasteries in an effort to flee the growing anarchy of the times. These men, who had received pagan classical training brought their love of that pagan culture with them and devoted much of their time to copying pagan works of literature. Thus ironically, monasteries, which started as a somewhat anti-intellectual movement, were the primary agents for preserving ancient pagan culture during the Middle Ages.

Throughout the Middle Ages, the contributions and monasteries and of the Church overall were

immensely important to our culture. The early Church was very much a part of Roman Civilization and absorbed a good deal of it into its own theology and ritual as shown by keeping the mass in Latin all the way to the 1960s. As the Roman Empire faded from history, the Christian Church survived to carry on the Roman heritage along with its own unique contributions to Western Civilization.

growing differences between Christians in the Latin West and Greek East, culminating with the final schism (split) between the Roman Catholic and Greek Orthodox Churches in 1054.

Heresies in the Later Roman Empire

St. Ulphilas, who brought the Arian version of Christianity to the Goths

The illegal status and underground nature of Christianity during the first three centuries of the Christian era led to a lot of isolated Christian communities that naturally developed many of their own ideas about their religion. Following is a brief summary of the most important of these heresies (outlawed beliefs).

Donatism stated that sacraments administered by priests who handed over Christian texts to Roman authorities during the persecutions were not valid. After Christianity was legalized and made the virtual state religion of the empire, the Church ruled that those sacraments were valid. Donatists, who were especially numerous in North Africa, disagreed vehemently, triggering the first major split in the Church.

Arianism held that Christ was begotten at a point in time, thus making him inferior to the Father who existed before the beginning of time. This was popular with Germanic tribes whose old gods and religion were typically patriarchal. When those tribes conquered the Western provinces of the empire, they often persecuted their mainstream Roman Catholic subjects who believed the Son was equal to the Father. This was one reason for the failure of many of the Germanic kingdoms founded on the ruins of the Western Empire. It would also contribute to

A copy of the Gothic translation of the Bible that Ulphilas used to convert the Goths to the Arian version of Christianity

Monophysitism: Christ's human and divine natures are indivisibly fused into one nature. This was particularly popular in Egypt, Syria, and Palestine, thus creating a lot of dissension against the Roman government in those provinces. When the Arab Muslims came in during the 600s, the largely Monophysite population in this region offered little resistance to the new regime, since it was more tolerant of their beliefs than was the Christian regime in Constantinople. Shortly before this, the emperor Heraclius had tried to bridge the gap in beliefs with what he called **Monothelism**, the idea that Christ had two separate natures, but they were fused into one will. It didn't catch on.

Nestorianism: Christ's human and divine natures are completely separate. Outlawed by the Council of Chalcedon in 451, many Nestorians fled eastward into Persian and points beyond. As a result, there were Nestorian Christian communities scattered across Asia, even as far as China. Reports/rumors of these fellow Christians and their legendary king, Prester John, would be one of the inspirations for the age of Exploration 1000 years later.

A wall painting from a Nestorian Church in China (7th-8th centuries)

Gnosticism is a term for a variety of beliefs based largely on books rejected by the Church Fathers as not worthy of being included in the New Testament, of which there wasn't even a definitive version agreed upon by most of the Church fathers until the third century. Probably the best known of these books was the Gospel of St. Thomas. Gnostics drew heavily from Plato's dualistic view of separate material and spiritual worlds. Thus some believed that creation of the material world was evil, and God who created it was an evil demi-urge from Wisdom. Following this logic, the Serpent was a savior and the fall of Adam and Eve was a liberation. Likewise, all the prophets who followed God (e.g., Abraham and Moses) were evil, while Cain, the first murderer, was good. Since matter is evil, Christ had no body and was not human, making his very existence an illusion.

Constantine as Religious Ruler: The Council of Nicaea

A medieval portrayal of the Council of Nicaea with Constantine presiding as both secular and religious ruler

Instead of creating a unifying factor for his empire by legalizing and favoring Christianity, Constantine had unleashed a wholly new type of controversy that threatened to tear the empire apart. Given the Church's close relationship now with the state, Constantine and later emperors felt they could not tolerate religious disputes and heresies. Constantine's attitude toward the Arian heresy and theology in general is revealed in this message to the disputants:

"...The cause seems to be quite trifling and unworthy of such fierce contests. You, Alexander

[Patriarch of Alexandria] wished to know what your priests were thinking on a point of law, even on a portion only of a question in itself entirely devoid of importance; and you Arius, if you had such thoughts should have kept silence...these are silly actions worthy of inexperienced children, and not of priests or reasonable men."

The Nicene Creed as Presented in the Traditional Tridentine (Latin) Mass:

"I believe in one God, the Father Almighty, Maker of heaven and earth, and of all things visible and invisible. And in one Lord, Jesus Christ, the only begotten Son of God. Born of the Father before all ages. God of God, Light of Light, true God of true God. Begotten, not made, of one substance to the Father. By Whom all things were made. Who for us men and for our salvation came down from heaven.

And He became flesh by the Holy Ghost of the Virgin Mary and was made man; He also was crucified for us, suffered under Pontius Pilate, and was buried. And the third day rose again according to the Scriptures. He ascended into heaven and sits at the right hand of the Father. He will come again in glory to judge the living and the dead. And of His Kingdom there shall be no end.

And I believe in the Holy Ghost, the Lord & Giver of life, who proceeds from the Father and the Son. Who together with the Father & the Son is adored and glorified; and Who spoke through the Prophets. And one holy, Catholic, and Apostolic Church. I confess one baptism for the remission of sins. And I await the resurrection of the dead. And the life of the world to come."

The most controversial part was in the last paragraph describing how the Holy Ghost "proceeds from the Father and the Son [*filioque*]", indicating Christ the son is equal to the Father. The Filioque Clause, as it was known, would be the source of centuries of religious disputes between the Western Roman Catholic and Eastern Orthodox Churches throughout the Middle Ages, culminating with the tragic sack of Constantinople by the Fourth Crusade in 1204.

Challenges to Secular Authority by the Church

Detail from Anthony van Dyck's painting of the emperor Theodosius I doing penance as ordered by St. Ambrose.

While emperors like Constantine took it for granted that they could rule the Church as a department of state, many Church leaders saw it the other way, that the kingdom of God should rule the temporal kingdom on earth.

The most notable challenge to imperial authority came from Ambrose (340-397) (aka, St. Ambrose), archbishop of Milan. While the emperor Valentinian I was Arian, Ambrose was staunchly Catholic and resisted government efforts to change. His most notable challenge to imperial authority came in 390 when he barred emperor Theodosius I from entering the cathedral of Milan until he had done penance for the massacre of 7,000 opponents. Surprisingly, Theodosius, the last powerful ruler of the entire empire, submitted, providing a powerful precedent for the Western Church in its struggle with the state throughout the Middle Ages over whose authority should prevail on earth. St. Ambrose would be revered as one of the Four Fathers of the Church, along with St. Augustine, Pope Gregory I, and St. Jerome, who would translate the Bible into its definitive Latin Vulgate version.

St. John Chrysostom ("Golden Mouth") (345?-407) was one of the most powerful and influential religious figures of his day. He backed down to no one in his pursuit of religious purity, even publicly rebuking the empress Eudoxia for her immodest behavior (below). Unlike Ambrose, Chrysostom paid for his defiant behavior, being replaced as patriarch of Constantinople and dying in exile. Reportedly,

on the day of his exile, an earthquake rocked Constantinople.

Several of Chrysostom's more famous quotations follow:

"A comprehended god is no god."

"Poor human reason, when it trusts in itself, substitutes the strangest absurdities for the highest divine concepts."

"Music withdraws our minds from earthly cogitations, lifts up our spirits into heaven, makes them light and celestial."

St. Augustine Lays Down the Law on War and Sex

Saint Augustine (354-430) probably had more influence on medieval Christian thought than any other man. In his autobiography, *The Confessions*, he describes how, after getting a strong classical education, he spent his early years in a wanton and sinful life. After searching for inner peace through different philosophies, he achieved sudden conversion to Christianity when he heard a child singing "Tolle lege" ("Take up and read"), causing him to open the New Testament to the thirteenth chapter of Romans.

Drawing upon St. Paul, Augustine saw humans as so thoroughly corrupted by the fall of Adam that only the grace of God can save them. Even our virtues are so tainted by desire for personal

gain that healing by God's grace is not complete and sin remains with us to the grave. Augustine's views on sex and marriage especially bear this out. Sex was all right as long as it was only for propagation of the species and within marriage. Outside of marriage it was a sin. If it was for pleasure within marriage, it was still a minor sin, thus leaving even the most decent couples plagued by some guilt. To Augustine and many after him, celibacy (staying unmarried) was the best way to avoid the taint of sin. Augustine's ideas on sex have had a profound influence to the present day.

Augustine's thoughts on history, the state, and war were also vital in Western thought. He saw all empires, including Rome, as being born from a lust for power, and therefore deserving destruction. This brought up the question of should Rome be defended from the barbarians? Augustine said yes, because Rome did embody a certain good by allowing the spread of Christianity, securing the peace, and administering law fairly.

This raised the question of whether a Christian can rightly take up arms. Here Augustine drew upon the Roman philosopher, Cicero, who said war can be legitimate under the guidance of the state if it is a just war, meaning one that restores or protects order and justice and is fought fairly by showing good faith to the enemy and respecting prisoners and hostages. Augustine added two more conditions. First, the motive for war must be love, which is possible since killing the body does not kill the soul. Second, for a war to be just, the other side must be wrong. This led to the concept of war guilt whereby one side might blame everyone on the other side for a war, which in turn could lead at times to justifying massacres and even genocide. Augustine had three codes of conduct in war: one for the ruler who determines the justice of the war and directs it, one for the subjects who fight under the command of their rulers (but never elsewhere), and one for priests and monks who abstain entirely from war.

By grafting Christian morals onto the state, Augustine effectively fused Church and State

closely together, since each contained both saints and sinners. The issue that emerged (and flared at times into full scale war) was which partner, Church or State, would be the dominant power. That conflict would rage on and off for over a millennium.

Some Other Notable Saints

St. Jerome, who translated the Bible into Latin

St. Jerome (c.347-420), who translated the Bible from Hebrew and Greek into Latin to make it more accessible to Christians in the West, became the patron saint of scholarship. In the Middle Ages, the Church would later declare Jerome's Latin Vulgate [common people's] Bible the only proper version of the Bible. Since by then the only ones who were literate and able to understand Latin were church clerics, this made Christianity virtually incomprehensible to the vast majority of people, just the opposite of what Jerome had intended.

Besides just copying words, some monks also turned their books into artistic objects by creating elaborately decorated letters at the beginning of a chapter. Irish monks especially excelled at this, applying elaborate Celtic designs to their work. The most famous of these was the Book of Kells.

St. Patrick (early 400's) is given credit for converting the first of the non-Roman lands, Celtic Ireland, to Christianity. The story of Patrick purging Ireland of its snakes reflects the fact that the mass conversions of pagans often followed a missionary performing a miracle (or perceived miracle) such as purging snakes, victory in war, or healing sickness. Patrick's work was important since Ireland suffered no barbarian invasions and thus preserved a purer Latin language and culture that it passed back to

Western Europe after the turmoil of the barbarian upheavals.

Pope Gregory the Great (590-610) became pope at a difficult time of plague and war. With virtually no support from the Eastern Roman Empire, he was forced to assume responsibility for defending Rome, feeding its people, and providing justice. The Church's extensive lands in such places as Sicily allowed Gregory to relieve his people's hunger. Under Gregory the Papacy started to become an independent power as it fought for its very life against the invading Lombards. Afterwards the papacy sought to extend its religious (and at times political) influence over the rest of Europe. However, it would be centuries before the religious leadership of the popes was recognized throughout Western Europe.

The Castel d'San Angelo (above) especially symbolized the transition from the City of the Caesars to the City of the Popes. During Gregory the Great's reign a vision of the Archangel Michael appeared on top of the tomb of the emperor Hadrian (117-138) during an epidemic. The epidemic subsided and Hadrian's Tomb became known ever after as the Castel d'San Angelo.

The "Superhermits"

St. Anthony (251-356), the first and most famous of the "super-hermits," lived in the desert near the Red Sea. He ate little and seldom washed, but still lived to 105. At the age of 90 he walked into Alexandria to debate Arius. His exploits in the desert, in particular his resistance to the temptations of the world have been a common theme for artists ever since. One contemporary described Anthony as follows:

"...He subjected himself to an even greater and more strenuous asceticism, for he was always fasting, and he had clothing with hair on the interior and skin on the exterior that he kept until he died. He neither bathed his body with water for cleanliness, nor did he wash his feet at all, and he would not even consent to putting them in water unless it was necessary. Neither did anyone ever see him undressed-- indeed, no one saw the body of Anthony naked, except when he died and was buried."

St Anthony's example inspired a growing number of other would-be hermits who seemed to compete to outdo one another with their feats. One of these, Macharius, couldn't stand to be outdone. If other hermits ate no cooked food for Lent, he did it for 7 yrs. If some maintained a 7-day sleepless vigil, He did it for 20 days. Once he remained standing all through Lent, eating only a few cabbage leaves a week.

Another time he slept in a marsh for 6 months with poison flies all around. Other hermits specialized in specific types of feats of endurance. One stayed in the bottom of an abyss with barely room to sleep. Others specialized in vows of silence, carrying heavy

weights wherever they went, chaining themselves to rocks, or binding their limbs with iron bracelets or chains. Others roamed the hills of Syria eating grass or avoided the sight of women's faces for years.

Most lived on very slim diets. Macharius, when ill, was given some grapes. He passed them on to another hermit and they made the rounds all the way back to him without being eaten.

Hermits considered cleanliness hostile to godliness and many never washed. One convent of 130 women finally gave in to the stench and washed. Old timers longed for good old days of pure dirt.

Many went mad when they gave in to temptation after years of austerity. One even jumped into a furnace to cool his desires!

Another famous hermit was Simeon Stylites (390-459) who maintained a continuous vigil for thirty-seven years on top of a 60-foot high pillar, the remains of which can still be seen. People would come from far and wide to hear him preach. Such was his influence that barbarians were converted to Christianity by his words and moneylenders were shamed into lowering their interest rates from 6 to 12%.

To keep from falling off the pillar, Simeon had a railing and rope tied around his waist. Over time the rope imbedded itself in his skin which putrefied. It is said that when a worm feeding on this skin fell off, Simeon put it back saying, "Eat what God has given you."

One day people noticed Simeon had been in the same prayerful position for an unusually long time. When someone went up to check on him, they found he had died in that position and stayed there until rigor mortis set in.

Stylites set a trend for sitting on pillars that lasted 1200 years. It was a common sight for visitors to Constantinople to see one or more of such hermits engaged in such prolonged vigils. In a somewhat similar vein, in the 1920s flagpole sitters became the rage again, although for

personal publicity rather than to save their souls or anyone else's. In the early 1980s H. David Werder claimed to have sat on a pole for 439 days, 11 hours, and 6 minutes as a protest against high gas prices.

Even after organizing into monasteries, monks typically would try to settle away from the dangers and corrupting influences of mainstream society. Mt. Athos in Greece covers the eastern-most peninsula of the Chalcidice in the Aegean. The entire area is devoted to monastic life, with twenty monasteries here still practicing the monastic discipline laid down centuries ago. Some monasteries could be so inaccessible that supplies and even visitors had to be hauled up in a basket.

St. Benedict and the Birth of Western Monasticism

St. Benedict "cooling off" in a bed of thorns

In the West, it was St. Benedict who established a regularized monasticism. After a fairly sinful and dissolute youth, this man launched a career of violently trying to purge himself of his sins. At last, he arrived at a more moderate concept of Christianity and formed a monastic order known as the Benedictine Rule. The Benedictine Rule reflected its founder's more moderate views, though it was still strict by modern standards. A new monk took three vows: poverty (no material possessions), chastity (clean living), and obedience (to God and his superiors in the monastery). The day was divided into roughly equal parts of prayer, work, and rest. Incredible acts of self-torture or self-denial were not expected. Instead the monk worked around the monastery and in the fields, the belief being that idle hands are the devil's playground. Our

own modern work ethic is directly descended from this idea.

Better than a cold shower. Following is an account of how Benedict cured himself of temptation:

“A greater temptation of the flesh than he had ever experienced overtook the holy man. For the evil spirit brought back before the mind’s eye a certain woman whom he had once seen. So intensely did the Tempter inflame his mind by the sight of that woman that he could hardly control his passion. He was overcome by sensuality, & almost considered leaving his solitary retreat. Then suddenly God graciously looked upon him & he returned to himself. Since he saw that thickets of nettles & thorn bushes were growing nearby, he stripped off his garments and flung himself naked upon those stinging thorns and burning nettles. He rolled about there for a long time, and came out with his whole body wounded by them. So through the wound of the skin he drew out from his body the wound of the mind by changing his lust to pain. Although he burned painfully on the outside, he had put out the forbidden flame within.”

The Benedictine Rule, while mild compared to what hermits like St. Anthony were doing, was still strict:

“Idleness is the enemy of the soul. Therefore, the brethren should be occupied at certain times in manual labor, and again at fixed hours in sacred reading...”

“And if the circumstances of the place or their poverty should require that they themselves do the work of gathering the harvest, let them not be discontented; for then are they truly monks when they live by the labor of their hands, as did our Fathers and the Apostles. Let all things be done with moderation, however, for the sake of the faint-hearted.”

“Therefore, since the spirit of silence is so important, permission to speak should rarely be granted even to perfect disciples, even though it be for good, holy, edifying conversation; for it is written, ‘In much speaking you will not escape sin,’ and in another place, ‘Death and life are in the power of the tongue.’

“But as for coarse jests and idle words or words that move to laughter, these we condemn everywhere with a perpetual ban, and for such conversation we do not permit a disciple to open his mouth.”

The typical daily schedule for monks went as follows:

- Rise at 2AM for Matins prayers and then sleep for 3 hours
- Other daily prayers were Prime (6 AM), Tierce (9AM), Sext (12PM), Nones (3PM), • Vespers (6PM) and Compline (7PM in winter; 8PM in summer).
- Interspersed with these prayers would be work and other religious devotions.
- After Compline, monks went straight to bed.

Noon. Originally, monks got only one meal per day at 3 PM, which by the Roman way of reckoning time was the ninth hour (nones) from the beginning of the day at what we call 6 AM. However, after six hours of hard work, they would be hungry, so the meal was moved to 12 PM, Aka Sext, the sixth hour. However, mealtime continued to be known by the old time, nones, and still is referred to as noon.

Sign language for the silent meals had 127 different signs. Here are a few:

- Would you like some wine: two fingers as if uncorking bottle
- Pass the butter: Stroke the inside of one’s hand with three fingers.
- Pass the pepper: Knock one index finger on the side of the other
- Pass the salt: Shake three fingers.

Monte Cassino in Italy, was the site of the first monastery in the West. Unfortunately, the allies bombed the original monastery into rubble during World War II.

THE TRANSITION TO THE MIDDLE AGES IN THE WESTERN MEDITERRANEAN (c.500- 700 C.E.)

Introduction: the “Dark Ages”. The disintegration of the Roman Empire in the West left a patchwork of Germanic kingdoms founded on its ruins. The Germanic general, Odovacer, ruled Italy. The Visigoths held Spain and southern Gaul. North Africa was the realm of the Vandals. Britain was divided between the Angles, Saxons, and Jutes, known to us simply as the Anglo Saxons. And the rest of Gaul was starting to fall under the sway of what would eventually become the most successful of these tribes, the Franks. In addition, there were various minor tribes scattered throughout the West trying to carry on an independent existence: Alemanni, Burgundians, Lombards, Heruls, Gepids, Alans, Sueves, and so on.

Traditionally historians have described the centuries immediately following Rome’s fall as a barbaric and chaotic period known as the Dark Ages. However, recent historical research shows a much more gradual transition to the Middle Ages, especially in the Western Mediterranean where Roman influence was more deeply rooted and contact continued with the Eastern Roman (AKA Byzantine) Empire.

Converging interests. To a large extent the fall of the Western Empire saw the interests of the Germanic rulers in the West and Byzantine emperors in Constantinople largely converging. This was largely because of the attitudes that the Germanic tribes and emperors in the Eastern Roman Empire had toward the situation and each other.

From many of the barbarians’ point of view, rather than coming to destroy the empire, they had been looking for new lands within the empire and Roman titles to go along with those lands. For example, the Visigoths originally entered the empire as allies of Rome. Throughout their wanderings, they continued to see themselves as such allies, and occasionally acted accordingly. They settled in Gaul and Spain as part of a deal with Rome where they would clear other tribes out of those provinces for the empire. Many of them also fought at Rome’s side against a much more deadly common enemy, the Huns. When dividing their new lands between themselves and their Roman subjects, they even tried to follow an old Roman custom known as *hospitalitas*, where the conquerors would take one-

third of any conquered lands and leave the other two-thirds for the natives.

Therefore, the Germanic kings wanted Roman titles for two basic reasons. For one thing, even if they had contempt for their unwarlike subjects, they still stood in awe of the Roman achievement with its vast empire, network of roads and incredible system of aqueducts and wanted to carry it on, although ultimately they failed. Secondly, holding Roman titles made the Germanic rulers look more like legitimate rulers to the Roman natives under them. This was doubly important since most of these tribes were Arian Christians facing the hostility of their Roman Catholic subjects.

At the same time, the emperors in Constantinople still wanted to keep their legal claim to the lands in the West until they were strong enough to take them back. Therefore, they granted Roman titles to the new Germanic rulers to maintain the legal fiction that the Empire was still alive in the West and owed allegiance to the one emperor in Constantinople. This way, they could bide their time until the Eastern Empire was strong enough to reclaim the West in reality as well. Until that time came they would have to follow other strategies.

One such strategy was to play different tribes off against one another. This was especially tempting in the case of the Ostrogoths (cousins of the Visigoths) who were troubling the Eastern Empire. The Byzantine (East Roman) emperors decided to kill two birds with one stone by diverting the Ostrogoths into Italy, giving them the legal right to settle there. This way, they would be rid of the Ostrogoths while weakening them and Odovacer in the fight for Italy, hopefully, opening the way for eventually reclaiming it for themselves. Therefore, in 487, the Ostrogothic king, Theoderic, led his people into Italy, which they soon conquered.

Theoderic's rule in Italy is a perfect example of how well some of the Germanic tribes had absorbed Roman culture during the last 200 years. While his army consisted solely of Ostrogothic warriors, Theoderic was smart enough to keep the Roman civil servants in charge of day-to-day government operations. And even though the Ostrogoths were Arian Christians, Theoderic showed tolerance for his Roman Catholic subjects who made up most of the population. He also had swamps drained, harbors dredged, and aqueducts repaired. As a result of this enlightened rule, Italy, which had been a parasite on the rest of the empire for centuries,

was self-sufficient for the first time in 500 years. However, trouble was looming on the horizon.

Justinian and the reconquest of Italy. In 527, Justinian I became emperor in Constantinople. He has been called the last of the Roman emperors, since he spoke Latin and was clean-shaven. After him, the emperors spoke Greek, wore beards, and are generally called Byzantines rather than Romans. Justinian also saw things from a Roman point of view and worked to restore the old boundaries of the empire. Therefore, he turned the Eastern Roman Empire's resources toward reconquering the West.

His first campaign against the Vandals in North Africa was a quick and resounding success. Easy living had sapped the Vandals' vitality, and the Catholic population resented persecution by their Arian rulers. From North Africa, the Byzantine forces moved north against the Ostrogoths. Sicily and Southern Italy fell almost without a fight, and it seemed Justinian's dream of a reunited Roman Empire might come true. Then trouble hit as the Ostrogoths regrouped and counterattacked. What ensued were twenty years of warfare raging up and down Italy. Rome was besieged three times and, for a while, became a virtual ghost town.

In the end, Justinian conquered Italy, but it was a costly victory for both the Eastern Empire and Italy. The cost of his wars in the West, tribute to keep the Persians to the east quiet, and a devastating epidemic (probably Bubonic Plague) left the Eastern Empire exhausted. This opened it up to 200 years of invasions from all directions, which nearly destroyed it.

As far as Italy was concerned, three years after Justinian's death in 565, a new tribe, the Lombards, invaded from the north and conquered about half of the peninsula. Pope Gregory I even had to lead Rome's defense since the Byzantines were unable to defend it any longer. Rome had passed from the city of the Caesars to the city of the Popes, while Italy would remain fragmented into a number of warring states for 1300 years until its final reunification in 1871.

A gradual transition. As stated above, historians have revised their traditional view of a sudden collapse of civilization in Western Europe during the early Middle Ages, seeing instead a gradual transition to medieval civilization. This was especially true for the areas surrounding the Mediterranean that were reclaimed by the

Byzantines or were ruled by tribes strongly influenced by extended contact with Rome before taking over. However, this period was a mixed bag, showing signs of continuity with the Roman Empire in some ways, but decline or change in others.

There were several areas of continuity and even revival. For one thing, both the Byzantines and Germanic rulers maintained Roman law codes for their Roman subjects. Justinian's codification of Roman law reinforced this trend in areas of Byzantine rule (N. Africa, Italy, and S. Spain). The Church, which maintained its own courts, also used Roman law, spreading its influence among the Frankish, Lombard, Visigothic, and Celtic realms.

The social structure of the old Roman lands largely continued as before. Although the old Roman nobility had been expelled by the Vandals and Lombards in North Africa and parts of Italy, they remained influential in Spain, Southern Gaul, and Central Italy, having fled to their country estates to avoid religious persecution and tax collectors in the cities. Over time, many of these nobles would intermarry with the ruling Germanic nobles, blending into a new ruling class that by 700 had even replaced their tripartite Roman names (e.g., Gaius Julius Caesar) with Germanic forms. By the same token, the late imperial trend continued where peasants sought protection from nobles in return for their freedom.

After the turmoil of the invasions subsided, agriculture revived somewhat as peasants abandoned marginally productive lands in favor of more fertile ones. This involved dispersal of the population from the safety of the estates to more rural areas where some peasants could maintain or reclaim their freedom from nobles. An abundance of coin hoards indicate trade also continued to thrive across the Mediterranean as Byzantine silks, Egyptian papyrus and natron (for making glass), and Chinese and Indian spices were traded for Western products such as grain, pitch, pottery, and slaves. Likewise, Germanic kings and a large number of local mints issued gold, but not silver or bronze, coins according to Byzantine standards. However, the huge purchasing power of gold made trade on a small scale difficult, leading to a gradual deterioration of the gold coinage to conform to real trade conditions. It remains a mystery why the Germanic rulers failed to issue silver and bronze coins.

However, areas of decline and change existed alongside those of continuity and revival. One

unfortunate policy of continuity was the oppressive tax system of the late empire and the self-perpetuating bureaucracy needed to run it. However, as rulers tried to squeeze as much as they could from the economy, their subjects often revolted or fled the tax collectors, letting themselves become nobles' serfs in return for protection from the government. As a result, tax revenues diminished, causing a gradual break down of the old Roman administration.

Cities overall in the Western Mediterranean went into decline, ceasing to function as centers of either production and consumption or centralized administration as Roman central government broke down. Wars seriously damaged some cities, such as Milan, Trier, and Arles. Rome especially suffered, with its population declining from an estimated 800,000 in the 300s to 25,000 after the turmoil of the Byzantine re-conquest. However, other cities, such as Pavia and Ravenna in Italy, Toulouse and Paris in France, and Toledo and Barcelona in Spain, revived as centers of local government, trade, or church administration. Such cities were always walled and, if the seats of royal government, mimicked Roman imperial cities with palaces, palace staff, and royal retinues. More often they were centers of trade and local administration with a count (from the late imperial *comes*) and/or a bishop over-seeing local administration, justice, and commerce. Bishops were an especially new factor, since they ran their own courts, hospitals, and hostels for travelers. As agriculture (and church revenues from its lands) revived, bishops became the primary patrons of new buildings. Thus the landscape of early medieval cities saw Roman secular monuments give way to more religious buildings such as churches and bell towers.

The armies of these new states differed greatly from the professional Roman armies of old. For one thing, Germanic rulers usually used only their own people for military service, excluding the Roman population. Also, as government funds declined, soldiers were typically paid with land instead of money. In partial compensation, kings, nobles, and even bishops typically kept their own private armies of retainers, known then as *bucellarii* (Latin for "biscuit eaters"). Thus we see the beginnings of the more private feudal armies of a later age.

Trying to Do as the Romans Did

Theoderic's mausoleum, showing how he consciously copied the Romans, most likely using Roman artisans.

One of the common myths about the Germanic peoples who took over the Western Roman Empire was that they came in to destroy it. Granted, their first contact with Roman civilization (e.g., the Goths in the third century) was generally hostile. But as time went on and they became more familiar with Rome's cities and culture through trade, serving as mercenaries, or even as slaves or hostages, they came to appreciate the Roman achievement, especially its material comforts. In that particular sense, Diocletian had done his job well, buying the empire two centuries to get its northern neighbors to get used to and absorb at least some of its culture.

Not that it worked perfectly. There was something of a sliding scale based on length of exposure that largely determined how well the new rulers in the West absorbed the older civilization they now were in charge of. Italy, having the oldest and most deeply rooted cities along with maintaining more contact with the Byzantines in the East, fared the best and was the first to revive. Gaul and Spain also did fairly well in maintaining the old culture, as seen even today by their languages, which we still refer to as Romance languages because of their Latin roots. This can largely be attributed to the fact that their new rulers, the Franks and Visigoths respectively, had experienced prolonged contact with Rome before finally taking over.

At the other end of the spectrum was Britain, the last province to be conquered and civilized by Rome and the first to be abandoned in the West.

The new owners, the Angles, Saxons, and Jutes, having little previous contact with Rome, had little appreciation for its accomplishments and were much more destructive than their cousins across the Channel. Thus English is a Germanic language (with a strong Latin influence thanks to the later invasion by the Norman-French in 1066), and no Roman monuments survive comparable to the aqueducts and theaters one finds in France and Spain.

Still, the Germanic rulers' success in keeping Roman civilization running was limited by their incomplete understanding and appreciation of how it worked, in particular bureaucracies for collecting taxes to finance the building and maintenance of such things as roads and aqueducts. The physical magnificence and value of public monuments was much more obvious and appealing than was the need to sit in schools learning to read, write, add, and subtract. However impressed the Franks and Goths may have been by the sheer size of Roman aqueducts and theaters, they probably had more contempt for the sedentary people they found in charge of them. Not that it was a one-way street. The Romans looked down their noses at the barbarians and their culture as well, even passing a law forbidding their citizens to wear Germanic trousers. Thus the blending of these cultures into something new and dynamic would take centuries.

Right: a Visigothic coin from a century later, showing how the ability and willingness to maintain Roman standards gradually declined

Justinian's Italian Wars (535-55)

The Byzantine general, Belisarius, commanded mostly a mixture of mercenaries, including Huns whose hit-and-run tactics were very effective against the less mobile Ostrogoths.

In 526, the Ostrogothic king of Italy, Theoderic, died and was succeeded by an able and intelligent offspring, Amalasutha, who unfortunately was a woman. Facing opposition from the Ostrogothic (and Arian) nobles, she sought support from the Roman Catholic populace, which made the nobles even madder. Looking for some security, she married her first cousin, who murdered her in 534, giving Justinian the excuse to reclaim Italy, as well as protecting the Roman Catholic population.

Justinian's general, Belisarius, who had just conquered Vandal North Africa, sailed to Sicily, which he took without any serious resistance. From there he crossed to South Italy and marched virtually unopposed until he reached Rome. That was when his problems began.

The First Siege of Rome (December 537-December 538). Initially, the Goths abandoned Rome upon Belisarius' approach, supposedly evacuating through one gate as Belisarius entered through another. However, they soon returned to retake the city, leading to the first of three sieges of the old imperial capital.

Since Rome was too big to surround with their forces, the Goths built seven fortified camps to command the exits, still forcing Belisarius to defend the entire wall with a force of only about 5000 men. Gone were the days when the Romans could field forces of 60,000 men or more.

The siege was a classic game of move and counter-move. For example, when the Goths cut water to Rome's aqueducts, Belisarius blocked them off to keep the besiegers from sneaking in to the city. Since the aqueducts had also provided power for milling the city's grain, Belisarius compensated for their loss by putting boats fitted with mills in the Tiber River. When the Goths threw logs and dead bodies into the river to break up the mills, Belisarius countered by putting a chain across the Tiber to stop any floating debris.

In one assault on the city, Hadrian's mausoleum (Aka Castel d'San Angelo) was defended by pushing statues ringing it down on the Goths. For another assault, the Goths supposedly used siege towers drawn by oxen, which Belisarius just laughed at and shot, stranding the towers and dead oxen in the middle of a field.

This raises the question of whether the Goths were indeed as "dumb as oxen" and so clueless about siege warfare, or whether the pro-Byzantine source, Procopius, wanted to portray them as ignorant barbarians to enhance the reputation of his hero, Belisarius. The Goths certainly had been in contact long enough with the Romans to see siege towers in action and that hauling them with oxen was a dead end solution to attacking a fortified city.

During the siege much of Rome's population left the city due to diminishing supplies and the fact that the Goths couldn't guard all the city's exits. The Goths had effectively cut off Rome's grain supplies from the sea by taking its harbor, Portus. By June hunger was hurting both the population inside and the Goths outside Rome.

Eventually, Roman ships broke through to the Tiber and resupplied Rome, forcing the Goths to retreat. Although Rome had been saved, the destruction to its aqueducts during the siege ruined its water supply for 1300 years.

Stalemate (538-545). After this, the Goths were driven to Northern Italy and besieged in their capital, Ravenna. Meanwhile, Justinian, needing peace in the West due to war with Persia, signed a treaty with the Goths dividing Italy between them in the North and the Byzantines in the South. Despite this treaty, Belisarius, seeing how close the Goths were to surrendering persevered with the siege of Ravenna until it surrendered. This, and the story that the Goths would only surrender to Belisarius aroused the suspicions of the emperor, who recalled his general and divided his part of Italy between several generals who also mistreated and alienated the population. Therefore, in just a few months, the Goths regained ground they had lost over the previous five years.

This led to a second siege of Rome (545-546), which was defended by a garrison of only 3000 men led by a corrupt general, Bessus, who profited by selling grain at exorbitant prices to his hungry subjects. Starvation and death raged till Bessus allowed people to leave Rome. Unfortunately, many who left, were captured and killed by Gothic patrols.

Several attempts were made to break through the Goths' blockade of the Tiber. Even the pope, staying in Syracuse sent grain ships that fell into an ambush because, when the garrison at Portus waved and signaled to *warn* them off, the crews thought they were *welcoming* them and sailed into the trap.

At this point, Belisarius, sent to retrieve the situation, tried to relieve Rome up the Tiber. The Goths had a wooden boom across the river with a tower at each end and an iron chain reinforcing it further down stream. To attack this, Belisarius bound together two broad boats, each with a tower on top of which he put boats loaded with pitch, sulphur, resin, and other

combustibles. As the boats approached the blockade, they lit and dropped the boats, burning the towers and 200 Goths. However, a rumor that Portus and his wife had been captured caused Belisarius to return, allowing the Goths to reblock the river.

independently of the Byzantines, he made peace with the Lombards, marking the growth of an increasingly independent Papacy.

[Back to flowchart](#)

In the end, Isaurian mercenaries, mad over being unpaid, betrayed Rome to the Goths. By this time, the city, which once had a population of one million, had only 500 people left, and the Goths killed 60 of them. Instead of trying to hold Rome, the Gothic king, Totila, destroyed parts of the wall and gates and abandoned the city, which Belisarius reoccupied and tried to repopulate by re-establishing the grain markets and encouraging surrounding people to move into deserted homes.

A desultory war of sieges followed with nothing much accomplished. Belisarius, who never had adequate forces or support from Constantinople, was again recalled. Rome even endured a third siege (549-550), which it endured by planting crops in its deserted areas. However, the city was once again betrayed by Isaurian mercenaries bitter over no pay. By this time, only a few strongholds remained in Byzantine hands, the Goths even being able to ravage Sicily.

At this point, the war took another unlikely turn. In 551, Justinian sent a new general, Narses, who was 70 years old, and had little or no military experience. He also turned out to be surprisingly talented. By 555, Narses had defeated the Goths in a series of battles, retaken Rome (again), and had regained all but a few strongholds. After twenty years of grueling warfare, Italy was once again part of the Roman Empire, but at a heavy cost.

And its troubles weren't over yet. In 568, only three years after Justinian died, a new people, the Lombards (Longobards), invaded Italy and took large parts of it.

Rome only escaped Lombard (and Arian Christian) rule, thanks to Pope Gregory I (590-604) who organized its defense and provided relief services food for the poor. Finally, and

THE RISE OF THE FRANKS (c.500-814 C.E.)

Much of Europe's destiny would be tied in with a new Germanic power, the Franks. This tribe had played a minor role in the breakup of the Roman Empire. In fact they had occasionally served as loyal allies, defending Rome's Rhine frontier against the invasions of the Vandals in 406 and the Huns in 451. However, after 451 when the Western Empire was coming totally unraveled, the Franks made their move and started taking northern Gaul. It was at this time that the first of their great kings, Clovis, emerged.

Clovis was only fifteen when he came to the throne in 481. Despite his youth, he was an ambitious and capable ruler, who made a shrewd and far-reaching move of converting to Catholic Christianity. The story goes that in a desperate move to influence the course of a battle against another tribe, the Alemanni, he prayed to the god of the Christians to give him victory in return for his conversion. For whatever reason, the Franks prevailed, and Clovis kept his promise and became a *Catholic* Christian like his Roman subjects. While most other Germanic tribes were Arian Christians, often persecuting and alienating their Roman Catholic subjects, the Franks could count on more loyal support from their Catholic subjects, allowing the Franks under Clovis and his immediate successors to expand rapidly at the expense of the Arian Christian kingdoms around them. By 600 C.E., this factor of Frankish rulers and Roman subjects united by the Catholic faith made the Frankish kingdom the largest and most powerful of the Germanic states to succeed the Roman Empire in the West.

Unfortunately, the Frankish kings shared the other Germanic tribes' concept of the state as the king's property and, as a result, split the kingdom between their sons when they died. Not surprisingly, civil wars and turmoil followed, plaguing the Frankish realm from the death of Clovis in 511 to the early 700's, leaving the Franks split into three kingdoms: Austrasia, Neustria, and Burgundy. All were ruled by weak "do nothing kings" that let their kingdoms degenerate into further turmoil.

Luckily, new officials, called mayors of the palace, emerged to rebuild the Frankish state. One of them, Pepin of Heristal, reunited the Frankish kingdom and laid the foundations for one of the greatest dynasties of the Middle Ages, the Carolingians. Several factors helped in the resurgence of the Franks under the Carolingians. One was the decline of the neighboring Germanic kingdoms because of the anarchy and decay generated by their poor understanding of the Roman state they had inherited.

Another factor was the Frankish adoption of the stirrup for warfare. While the Frankish kingdom had been wrecking itself in civil wars and palace intrigues, a dynamic new power had been rising in the East: the Muslim Arabs. United and inspired by their new religion, Islam, the Arabs had swept both to the east and west with incredible speed. A century after the death of the prophet, Mohammed, Muslim armies had conquered North Africa and Spain and were raiding into southern Gaul. In 733, the Frankish mayor of the palace, Charles Martel, turned back an invading Muslim force at the Battle of Tours.

Historians have argued whether this was the defeat of a major invasion or just a large raid. Either way, it apparently saw the dramatic introduction of the use of the stirrup in battle and the rise of mounted knights as shock cavalry that would rule the battlefields of Western Europe for centuries. Since the Franks were the first to adapt the stirrup for this purpose, they gained a decisive military edge over their enemies and a reputation as the fiercest fighters in Western Europe. Writers of the period would typically refer to any warriors from that region as Franks because of that reputation.

The third factor helping the Franks was the natural alliance of rulers with the Church who often needed each other's help. This especially held true for the Franks and the pope. Charles Martel and his son, Pepin the Short, continued to rebuild the Frankish state to its previous status as a great power. However, they did this as mayors of the palace, while the "do nothing" Merovingian kings they served did nothing useful except ride around in a cart from estate to estate. Pepin wanted the crown as well as the power and authority, and in 752 he

got it thanks largely to the Lombards who were hard pressing the popes. Pepin helped the pope against these enemies in return for his blessing to take the Frankish crown for himself. Soon afterwards, Pepin shaved the king's long hair (the symbol of royalty), packed him off to a monastery, and had himself declared the new king, thus officially establishing the Carolingian dynasty as the ruling family of the Franks.

Archaeological evidence points to a fourth factor helping the Franks at this time: money. Although the Germanic kingdoms were not producing much silver coinage at the time, the Arab Muslim caliphs to the east were. Much of this money was making its way through Russia and the Baltic Sea to the Franks in return for such things as furs and slaves. This increased silver supply gave the Franks the means to expand and consolidate their power and helped pave the way for the greatest ruler of early medieval Europe: Charlemagne.

Charlemagne (768-814). Possibly the most legendary figure in the medieval period was Pepin the Short's son, Charles, known to us as Charles the Great or Charlemagne. As is true of any legend, there was some factual basis for certain stories surrounding this remarkable man, but there was also a good deal of fantasy. Physically he was a big man, which in the simple world of the eighth century helped him assert his authority among those around him. He was also a strong willed man, which was necessary for holding together an empire under such primitive conditions as existed then. There were three aspects of Charlemagne's reign that were especially important: his conquests, his attempts to revive Roman culture in what is known as the Carolingian Renaissance, and the revival of the Roman imperial title.

Charlemagne was an extremely energetic king who spent a large part of his reign campaigning on his empire's ever widening frontiers: in Italy against the Lombards, in Spain against the Muslims, in the east against the Avars, and in Germany against the Saxons whom he forcibly converted to Christianity at the point of the sword. By the end of his reign, Charlemagne's empire contained most of Western Europe: France, Germany, Austria, half of Italy, the

Low Countries, and Denmark. The size of his empire was the primary basis for his later legend.

Charlemagne did his best to rule his empire efficiently, but there were too few trained officials with which to rule and too many lands for them to administer effectively. As a result, he also had to delegate a good deal of power to local nobles who ruled in his name. Although the king's officials did travel around to periodically check up on the nobles and Charles himself was a strong enough king to inspire most men to keep in line, he failed to set up a lasting government that could function under less exceptional kings. As a result, when Charles was gone, his empire fell apart.

People have argued over whether Charles was a barbarizing or civilizing influence on Europe. On the one hand, he did spend a lot of his reign fighting, and occasionally used some brutal methods, especially in converting the Saxons to Christianity. On the other hand, he patronized culture and the arts in what came to be called the Carolingian Renaissance. This was a self-conscious revival of Roman culture, which people then looked back upon as a golden age. There was very little that was original in this revival, but it did manage to copy a large number of Roman books. As a result, 90% of the oldest versions of Roman texts we have come from the Carolingian Renaissance.

The most celebrated event of Charles' reign was his being crowned Roman emperor by the pope on Christmas day, 800 AD. There has been endless debate about the motives of Charles and the pope and just exactly what this revived title meant three centuries after the end of the Roman Empire in the West. The revival of such a title does show how much of a grip the memory of the golden age of Rome had on the medieval imagination. The real importance of this revived title would fade somewhat after Charlemagne's death and not regain its luster until 961 when the ruler of Germany, Otto I, was crowned emperor by the pope. For some 850 years, Germany would be known as the Empire, or the Holy Roman Empire. Despite the glory it invoked, this title would ultimately be a source of tremendous problems for Germany. In later years, it was said that it was neither holy, nor Roman, nor

empire, but we can see that it represented a powerful idea.

Succeeding generations would look upon Charlemagne's reign as a golden age. Indeed, his realm did encompass most of Western Europe in a larger and relatively peaceful empire. It also tried to revive the grandeur of Rome's empire and culture. And a powerful energetic king did rule over it. Therefore, even though his empire collapsed soon after his death, Charles' reign did have lasting and profound effects. Frankish political institutions, in particular feudalism, and military tactics (the mounted knight) would dominate Western Europe for centuries. In fact, the predominance of Frankish culture and customs was so overwhelming in Western Europe that the Byzantines and Muslims typically referred to anyone from Western Europe as a Frank.

Possibly the most significant sign that Charlemagne's reign was a turning point in history was the fact that for the first time scholars referred to a unified culture and realm known as Europe. After Charlemagne, Western European culture would no longer be a cheap imitation of Roman culture. Rather, from now on, it would define its own institutions and culture in its own terms. Western Civilization was being born.

The disintegration of the Carolingian order (814-c.1000). Charlemagne's death seemed to be the signal for every thing to go wrong at once. Indeed, a number of factors did combine to send Western Europe into some of its darkest centuries ever. For one thing, the money coming from the Arab Muslims that helped make possible the palace and cathedral that Charles had built in his capital at Aachen dried up as the caliphs in Baghdad lavishly spent themselves into bankruptcy. This led to a decline of trade that caused a reversion to a land-based economy and a weaker government. This in turn hurt the Vikings in the north and Arabs in the south who had relied on Arab silver and trade. As a result, they turned to raiding and piracy, which further weakened the Frankish economy and state, causing more raids, and so on.

Along these same lines, the growing dependence on mounted knights for defense also meant a growing

dependence on nobles to provide those knights. Since there was no money to pay these nobles, the king had to give them land, which regenerated wealth in the form of crops, making the nobles independent of the king's authority and therefore more rebellious. Rebellions also invited invasions, which encouraged more revolts, etc.

Finally, there were problems within the ruling family. Charlemagne's successor, Louis the Pious, was a weak king who let matters get out of control. He also followed the old Germanic custom of dividing the state among his three sons as if it were personal property rather than a responsibility. This division led to civil wars that ended with splitting the Frankish realm into three states: West Frankland (roughly corresponding to modern France), East Frankland (roughly modern Germany), and Lotharingia, (modern Lorraine) in the middle. Because of its position between France and Germany, Lorraine would remain a source of conflict between its neighbors into the twentieth century. Civil wars also forced the kings to give away more and more royal lands for military support. Soon those lands were parts of virtually independent states. And, as with the independent nobles and weakened economy, turmoil at court also invited invasions.

These invasions came from three directions. From the south came the Muslims who devastated parts of Italy and southern France with their raids. From the east came the Magyars, nomadic horsemen related to the Huns. Eventually they would be defeated and would settle down to found the kingdom of Hungary. Worst of all, from the north came the Vikings whose raids and invasions tore a good part of the Frankish state to pieces and nearly overwhelmed England. In 911 C.E., the Viking chief Rollo gained recognition from the French king to rule what came to be called Normandy in return for military service to the crown. Of course, the Vikings, or Normans, were their own men and lived under the king's rule in name only. By 1000 C.E., France was a hopeless patchwork of some 55 virtually independent principalities. The king was the nominal ruler of all this, but in reality just the head of one of these many states. As a result, a new political order would emerge: Feudalism.

Clovis and the Rise of the Franks

Medieval tomahawks and mohawks. The Franks supposedly got their name from the distinctive type of throwing ax, the *francisca*, which they used in battle. They also wore distinctively striped clothes and hair that was shaved around the sides and backs of their heads, leaving only a tuft of hair on top.

Clovis' conversion to Catholic Christianity was probably the most far-reaching act of his reign c.(466-511). But it wasn't easy. Clovis' wife was a Burgundian princess, Clotilda, who was also a Catholic Christian. In deference to his wife, Clovis allowed their first son to be baptized, but he soon died, a common enough occurrence until very recently. However, it was only after much persuading that Clotilda got her husband to agree to have their second son baptized. As luck would have it, he also fell sick, and only recovered after intense praying by his mother, which made his recovery seem like a miracle. It was soon after this that Clovis' famous conversion in the midst of a battle with the Alamanni in 496 occurred.

Clovis' baptism

Such conversions often took place in the wake of perceived miracles, in particular military

victories, thus creating the perception of Christ as a god of war. This would particularly appeal to warlike tribes such as the Franks. In addition, some 400 of Clovis' closest followers also converted, which would have the likely "trickle down" effect of other Franks of lower status also converting.

The conquest of Visigothic Gaul (507). At the time, the Visigoths were a much larger and more prestigious people than the Franks. But being Arian, they had to worry about the loyalty of the 80-90% of their population who were Roman Catholic. This plus a decisive defeat at the hands of the Franks in 507 drove them out of Southern Gaul, thus confining their power to Spain. After a series of mostly weak kings and years of instability, the Visigoths finally converted to Catholic Christianity in 586, too late to save their holdings in Southern Gaul.

Paris first became the capital of the Franks under Clovis, and would continue to be on and off under the Merovingian Dynasty. A permanent capital was seen as a sign of the transition from barbarism to civilization. However, the transition was only partial for some time, since it was so hard to transport supplies across country to support a large court at a central location. It was more common for kings to travel from one estate to another, making it easier for the country to support them, as long as they kept moving. In the absence of any mass media, it was also useful for people to get a first hand look at their king to reassure them that he did indeed exist.

Just family politics. Clovis was king of the Salian Franks, but not the Riparian Franks. In 509, the son of the Riparian king, convinced by Clovis that he would support him, murdered his father to seize the throne. But Clovis immediately denounced the son as a murderer, "avenged" his father's death, and took control of the Riparian Franks for himself.

The tradition of vicious family politics continued after Clovis' death. And it wasn't confined to the men. In particular, a blood feud between Queen Brunhilde and a servant girl, Fredegunde, led

to the latter having both the queen and her sister murdered, leading to a round of civil wars that tore the realm apart.

The old empty chest of relics trick. Even the Church got dragged into this nastiness.

According to one story, Martin, a friend of Pepin of Heristal, was trapped in a church. His enemies lured him out by swearing over a chest of holy relics they would not harm Martin. However, when he came out, he found the chest had been empty, so his enemies could kill him without feeling guilty.

Wamba the Visigoth. The Franks weren't the only people involved in family intrigue. Take, for example, Wamba, the Visigothic king (672-680) who was deposed in a most peculiar way. According to one version, Erwig, a rival for the throne administered a sleeping potion so that the king lay apparently dying. As was common right before death, his servants dutifully shaved his head and dressed him as a monk to make him more holy. When he woke up, he was now a monk and, according to Visigothic law, could no longer be king, leaving the way for Erwig to take the crown. Wamba, being especially devout, supposedly was happy to give up the throne, which he never wanted, and ended his days in religious contemplation.

After Wamba, the Visigothic kingdom went into decline and fell to the Arab Muslims in 711.

Frankish Revival and the Birth of the Papal States (687-768)

The Frankish army at Tours consisted almost entirely of infantry. The core of it was seasoned veterans of Charles Martel's wars since 717. They were the ones who withstood the Moors cavalry charges. The

rest of the army was made up of untrained peasant militia who would have been virtually worthless in the battle, since they generally would panic at the first charge of enemy cavalry.

By 650, the Merovingian monarchy had degenerated into meaningless figureheads known as "Do Nothing Kings", wandering around in carts from estate to estate showing off their long hair that symbolized their privileged position. Meanwhile, officials, known as mayors of Palace (Sp. *Major Domo*), who originally just ran the palace while kings were away at war, took over running the whole government.

In 687 Pepin II of Heristal, Mayor of the Palace for Austrasia, succeeded in reuniting the Frankish realm. When Pepin died in 714 and his legitimate son was assassinated, his illegitimate son, Karl (Charles) Martel took power. The name Karl (English churl) originally denoted the lowest class of peasants, but soon came to have regal associations. His nickname, Martel, meant hammer, possibly referring back to the late biblical figure, Judas Maccabee, and Charles' own showdown with a Moorish invasion of the Frankish homeland.

The Battle of Tours (732). Arab forces from Spain had been raiding Southern France for several years before 732, having established a base at the city of Narbonne on the Rhone River. In 721, Count Odo of Aquitaine had surprised and defeated an invading force besieging Toulouse, which served as a temporary setback for the Moors, who soon renewed their incursions into the Frankish lands. After crushing Odo's army near present day Bordeaux, they continued north and were surprised to find Charles Martel waiting with a sizable force in north-central France near Tours.

The core of his army was a force of infantry seasoned by years of campaigning with him and drawn up in a rectangular shield wall at the top of a hill. While the Moorish forces largely consisted of cavalry, the Franks had little or none. However, as long as they held formation, they were able to repulse the repeated enemy attacks. (Horses don't like charging into tightly

packed masses of angry men armed with spears.) This was one of the few battles in medieval Europe where infantry defeated cavalry. Being late in the season, the Moors retreated to Southern France.

The significance of the Battle of Tours is still being debated. While it's now clear that heavy shock cavalry using the stirrup was not part of the Franks' success, it does seem that contact with Moorish cavalry using the stirrup was an inspiration for the revolution in shock cavalry that soon swept Western Europe.

More immediately, Charles Martel followed up his victory by gradually reconquering Southern France from the Moors. His son and successor, Pepin the Short would complete the process by taking the Moors' main base, Narbonne, in 759. Whether Tours was a decisive battle or just showed the extreme limit of how far Muslim forces could advance into Europe, it marked a turning point in history.

A special place in Hell. Relations between the Frankish rulers and Church weren't always so smooth. For one thing, in 732, Charles Martel confiscated large tracts of Church lands to pay for the army that repulsed the Arab Muslims (aka, Moors) at the battle of Tours. In the eyes of the Church, this, and his failure to help the popes against the Lombards, earned him a special place in Hell. More likely, Martel's army helped save Europe and the Church from continued Muslim invasions and maybe even conquest. However, the jury is still out among historians on the significance of the Battle of Tours.

It was Martel's son, Pepin the Short (741-68), who would make the Carolingian family the legal as well de facto rulers of the Franks. The key to this was the Pope, who was under constant attack by the Lombards. In return for agreeing to help the Pope, Pepin sent an innocent-sounding letter in 751 asking the hypothetical question of whether a person without authority should be king, or should it be the one with the authority. The Pope answered that the one with the authority should be king, leading to Pepin

shaving king's long hair and packing him off to a monastery. After that, Pepin was crowned by a French bishop with the words "by the grace of God."

However, when the Pope asked for further help against the Lombards, Pepin made him come to Frankland and redo the coronation. This led to an ongoing dispute throughout the Middle Ages of who had more authority: the popes who spiritually ruled Christianity or kings and emperors who defended it.

The birth of the Papal States. About this time, Pepin donated to Pope Steven III (768-772), the provinces of the Byzantine Exarchate and lands recently taken from Astolfo, King of the Longobards (749-756). Thus was born the Papal States, the defense of which would constantly keep the popes distracted from their spiritual duties for centuries.

Pepin the Short's legate Fulrado, Abbot of Saint-Denis, donates Italian lands taken from the Byzantines and Lombards to the Papacy, thus establishing the Papal States.

The Donation of Constantine. To further boost its power, the papacy came up with a document whereby Constantine I had donated the entire western half of the Roman Empire along with Judea, Greece, Asia, Thrace and Africa to Pope Sylvester I for instructing him in Christianity and curing him of leprosy. Throughout the Middle Ages Popes would use this document to support the claims of the Church against those of secular authorities, especially those of the German rulers of the Holy Roman Empire.

One problem: the document was a forgery from the eighth or ninth century. Although suspected as such, it was finally proven in 1440 by the Italian humanist, Lorenzo Valla, who showed that it was written in Medieval Latin, not the classical Latin of Constantine's day.

A Portrait of Charlemagne

Physical description and character. Based on his skeleton, which was exhumed in 1861, Charles was 6' 3.5", a huge size for back then, which he most likely got from his mother, Bertha of the Big Feet, not his father, Pepin the Short. Supposedly, the length of Charles' foot set the standard for the measurement, the "foot". He was the product of *friedelehe*, a looser form of Germanic marriage the Church considered polygamy. While the Church considered Charles illegitimate, in Frankish eyes he, along with his grandfather, Charles Martel, and son Pepin, all products of *friedelehe*, were legitimate.

According to his biographer, Einhard, Charles was a big eater but light drinker, unusual for back then, and hated drunks. He was easy going and so sociable he even liked people to hang around during his baths. He would invite anyone to dinner and was accessible to all. He had a bell at his capital, Aachen, with which anyone could summon him. He was also a doting father for his daughters whom he encouraged to have affairs at court rather than to marry and move away. However, he had his sons raised away from court to encourage independent action.

Charles was also vain and egotistical, which is typical of great men, and especially loved flattery about his religious and philosophical wisdom. He was religious in the superstitious manner of his day, going to church several times a day and having a large collection of religious relics. He studied astronomy/astrology (back then the same thing) to divine the future in the stars, plot his course of actions and calculate the time of movable feast days. At his death he left only one twelfth of his treasury to his heirs and the rest to the Church for it to pray for the salvation of his soul.

Charlemagne's Wars

A Carolingian manuscript showing the Frankish army at the time of Charlemagne, much of which no consisted of cavalry equipped with stirrups, a radical change from the army of his grandfather, Charles Martel, at Tours

Charlemagne spent much of his reign in the saddle and on campaign. In addition to his conquests, Charlemagne also quelled a rebellion in Aquitaine (769) and two more in Brittany (786-88 and 799), returned to fight in Spain (793 and 795), and fought the Byzantines in Italy (802-12) until they recognized his imperial title.

In 772, Charles invaded Saxony to convert it by the sword after the murder of several missionaries there. Saxons resistance melted away into the woods, allowing the Franks to destroy their sacred tree, Irminsul, and set up several churches and monasteries. After Charles went home, the Saxons retaliated by attacking the monasteries and churches.

Thus began the Saxon campaign, which followed a dreary pattern of Frankish invasions and Saxon revolts over the next thirty years (774-78, 782-85, 799, & 804). In the process, Charlemagne practically depopulated Saxony with a policy of massacres and forced expulsion of the Saxon people, leaving a blight on his reputation. However, Saxony became the most Frankish of Charlemagne's conquests since its population mainly consisted of Franks who moved into this virtually empty land.

Charlemagne also waged several wars against the nomadic Avars (791 & 796) and various Slavic tribes to the east (803). Already weakened

by a new group of nomadic warriors, the Bulgars, the Avars, were so thoroughly defeated that there is still a Russian expression, “to vanish like an Avar,” indicating something has suddenly and completely vanished.

Charlemagne’s eastward expansion against the Slavs would be continued for centuries by his East Frankish successors (AKA Germans) in a movement known as the *Drang nach Osten* (drive to the east). When Hitler invaded Russia in 1941, the codename for the invasion was *Barbarossa*, the name of a medieval German ruler especially remembered for his eastward expansion against the Slavs.

In 773, Charlemagne entered Italy to protect the pope against the Lombards. After a nine-month siege, the Lombard capital, Pavia, fell and Charles assumed the Lombard crown. The region of Italy the Lombards ruled is still known as Lombardy.

In 778, Charlemagne went into Spain to help rebels against the Muslim ruler there and supposedly to avenge Muslim raids into Frankland. However, while besieging Saragossa, news came of a major Saxon revolt that forced him to leave Spain. Despite two more campaigns in Spain, all he accomplished there was to set up a military frontier, the Spanish March, to guard against further Muslim incursions.

The Song of Roland. One of the most legendary incidents in Charlemagne’s reign was the ambush and massacre of his rear guard by Basque tribesmen (below) during his army’s return from Spain in 778. Because the massacre took place on the well-traveled pilgrimage route to Santiago de Compostela, the story was constantly retold. It eventually grew into the medieval epic, *The Song of Roland*, in which Muslims replaced the Basques as the villains and Charlemagne played a prominent role in the fighting even though in the poem he was 200 years

In *The Song of Roland* the hero, Roland, sounds his horn, Oliphant, to alert Charlemagne of the treacherous attack on his rear guard. Although, for heroic reasons, Roland waited until it was too late to save his troops and himself, it allowed Charlemagne to play the proper role of a lord who avenges the wrongful death of his feudal vassal.

Charlemagne’s elephant. The expansion of Charlemagne’s power into Italy and Spain involved him in the complicated diplomacy of the Mediterranean. Since the Abbasid Caliph in Baghdad, Harun al-Rashid, was also at war with the Byzantines and the Umayyads in Spain, he saw the Franks as natural allies, despite their religious differences. To help seal their friendship, the Muslim caliph sent a number of gifts to Charlemagne, including an elephant. Although this may sound quaint to us, the sight of their ruler traveling with such a huge creature must have filled Charles’ subjects with an even greater sense of awe. Keep in mind that people then believed Egypt had ants the size of dogs and red hens that would spontaneously burst into flames.

The Church and Christianity under Charlemagne

Aerial view of Aachen cathedral, Charlemagne's most prominent architectural monument. Built between 796 and 804 it was modeled after the circular Byzantine church of San Vitale at Ravenna.

Since the Church owned so much land and clergy could not have legitimate heirs, most bishops, abbots, and higher clergy in the Middle Ages came from the noble class. To keep from splitting their lands, a noble would leave his oldest son the estate and try to find a lucrative church office (or, barring that, a place in a monastery) for his younger sons. However, since the business of nobles was fighting and politics, these newly appointed bishops and abbots were still very much a part of the military establishment for the realm.

Charles himself had a secular view of the Church as a virtual department of state, appointing higher clergy at will and taking the pope's approval for granted. He even left offices vacant for years. (e.g., the archbishopric of Metz for 27 years), in the meantime collecting its revenues. Or he might appoint particularly trustworthy subjects to multiple bishops' *sees* (from the Latin word *sedes*, meaning seat or throne). Likewise, he treated higher clergy as royal vassals who had to attend court and couldn't leave without permission.

The lower clergy. This raises the questions of how well supervised and educated were the lower clergy (i.e., parish priests and monks). In a

word: poorly. The lower clergy of the 700s were still sacrificing animals to pagan gods and spirits (typically identified with Christian saints), living with women, and taking part in drinking bouts. Most nobles appointed serfs as their own proprietary priests, whose duties included tending the lord's hunting hounds and serving his table. They were often beaten for disobedience or incompetence, being dismissed and replaced by another serf who would hopefully do a better job.

In the monasteries, monks, many of whom were unruly sons of nobles, commonly resisted Church discipline by running away on "pilgrimage," becoming vagabonds or brigands, and sometimes even founding their own "monasteries". Making matters worse, in the absence of an organized prison system, criminals were often made monks rather than being imprisoned.

Even for those who might want to be good priests, abbots, and bishops, the unsophisticated cultural level of Western Europe at this time led to a general inability to read the Bible or relate to written literature on Christian behavior. Such widespread illiteracy led to a need for concrete examples of the religion at work, which led in turn to the popularity of saints (or living figures often seen as saints) and holy relics: physical remains of body parts (bones, skulls, hair, vials of blood) and objects (clothes, shoes, or instruments of torture, such as pieces of the true cross) associated with Christ and the saints and popularly believed to have magical (especially healing) powers. People still sacrificed to the spirits of trees, rocks, and springs, and baptized bells against demons, though those practices were gradually waning.

A crystal reliquary in the form of jewelry talisman reputedly holding some of the Virgin's hair and a piece of the True Cross

The popularity of relics triggered a lively trade in what were purportedly the bones or other remains of saints. Monasteries would even steal saints' remains from other monasteries, in one case, planting a mole who worked his way up in a monastery's hierarchy until he had access to its saints' remains and could steal them.

Supposedly, Thomas Aquinas, who all agreed would be canonized as a saint after he died, had to escape a murder plot by monks who wanted to boil his body to get the bones as relics.

Naturally, there were also plenty of scams. It was said there weren't enough cows in all Lombardy to produce what were being touted as vials of the Virgin Mary's milk, or enough trees to match what were being sold as pieces of the true cross on which Christ was crucified. In one case in Scotland, a purveyor of vials of the blood of Christ and the saints was caught beheading chickens and pouring their blood into vials.

This preoccupation with saints wasn't seen as polytheism, but rather as a reflection of the earthly hierarchy from kings down through nobles to peasants. Just as peasants were too lowly to directly petition a king, we are too lowly to directly petition God, thus leading to saints and the Virgin Mary to intercede to God on our behalf.

Over the centuries, a virtual multitude of saints were canonized, so that there is a patron saint for nearly every profession, activity, ailment, and danger. Here is a select list of saints and what they patronize:

- St. Adrian the patron of soldiers
- St. Agatha the patron of bell founders and breast diseases
- St. Agnes and Saint Dymphna- patrons of rape victims
- St. Anne patron of grandmothers, mothers, women in labor & horse riders
- St. Anthony, patron of lost items, the poor,

- amputees & cemetery workers
- St. Appollonia the patron of dentists
- St. Augustine, Bishop of Hippo the patron of theologians
- St. Barbara patron of ammunition workers, architects, builders, miners, storms and sudden death
- St. Bernadine the patron of advertising
- St. Bernadino the patron of impulsive and uncontrolled gambling
- St. Bernard the patron of the alps, mountain climbers, skiers and jewelers
- St. Catherine the patron of philosophers, secretaries, spinsters
- St. Denis the patron of France and headaches
- St. Christopher the patron of bachelors, drivers, travel and travelers
- St. Clare of Assisi the patron of television
- St. Francis of Assisi patron of animals, birds, fire, merchants & solitary death
- St. Francis Xavier patron of the Orient, missionaries, navigators & sailors
- St. George the patron of England, chivalry and soldiers
- St. Gerard the patron of pregnant women and those falsely accused
- St. Germaine the patron of child abuse
- St. John the Baptist the patron of baptism, conversion and tailors
- St. John the Evangelist the patron of book sellers, art dealers and printers
- St. John the patron of heart ailments and orators
- St. John Vianney the patron of pawnbrokers and priests
- St. Joseph the patron of Belgium, carpenters, married couples & pioneers
- St. Joseph/Saint Anne the patron of Canada
- St. Jude the Patron of desperation and hopeless causes
- St. Julian Hospitaller, patron of hospitality, innkeepers, travelers, & boatmen
- St. Lawrence the patron of fire and banks
- St. Leonard the patron of prisoners, captives, and slaves
- St. Lidwina the patron of skaters
- St. Louis the patron of child death
- St. Louise the patron of orphans and widows
- St. Lucy, patron of the poor, cutters, eyes,

- peddlers, saddlers & salespeople
- St. Lucy/Saint Lawrence the patrons of blindness
 - St. Luke, patron of artists, doctors, jewelers, sculptors & surgeons
 - St. Margaret Mary the patron of polio
 - St. Margaret of Antioch patron of women in childbirth
 - St. Margaret the patron of homelessness
 - St. Mark the patron of Venice, glaziers and stained glass workers
 - St. Martha the patron of housewives, domestic workers and servants
 - St. Martin the patron of vintners and alcoholics
 - St. Martin de Porres the patron of Negroes
 - St. Mary Magdalene the patron of frail and penitent women
 - St. Maurice the patron of infantrymen, cramps and swordsmiths
 - St. Maximilian Kolbe the patron of drug addiction
 - St Michael: battles, Germany, grocers, police officers, radiologists, seafarers
 - St. Monica: alcoholism, bakers, brewers, children, coopers, Greece and peace
 - St. Swithin - weather

Largely because of a near obsession with keeping a balanced symmetry between Heaven, Earth, and Hell, the medieval imagination also supplied Satan with his own hierarchy of demons. In fact it was believed Satan was an ever-present force and the very air itself was full of demons doing his dirty work, such as throwing mud on travelers' clothes and interrupting conversations. There was even a legend of a demon taking a break after a busy day of mischief who was accidentally eaten when a nun ate the cabbage on which he was resting.

“Organizing” one’s salvation. For those not fluent in the tenets of their faith, actions, not motives, seemed more essential to salvation. As a result, many believed their sins could be quantified into specific penances. For example, the sin of usury could be worked off by here years on bread and water.

Along those lines, many believed they could ensure their salvation by having as many people

as possible pray for them so that they could force their way into Heaven by the sheer force of numbers of prayers said for them. Therefore, priests had to pray for their lords (whether nobles or upper clergy), and sometimes for their lords’ overlords as well. One archbishop had 300 monks and 100 clerics organized in continuous prayer shifts for Charles, two-thirds of them praying all the time. In addition Charles left three-fourths of his treasury specifically to support such prayers.

Those not rich or powerful enough to command such services would organize themselves into special prayer confraternities in which, upon one member's death, survivors owed up to 100 masses or psalters apiece for his soul. Such fraternities dotted the map of France and spread to Spain and England as well.

Originality: a real career killer. In the medieval view, the world was near its end; the Greeks and Romans represented the peak of civilization, everything else was inferior, and the world was hurtling toward imminent destruction. Therefore, there was little or no room for original ideas not based on classical culture. For example, Alcuin, one of the great scholars of his day, was famous for his knowledge and compilation of the ideas of his predecessors. By contrast, there was a churchman at a synod who was cornered into admitting his views weren't based on the Bible or Church fathers, but just his own ideas. Verdict: end of his career.

The carmina figurata was a unique popular literary and artistic device during this time. On a manuscript page there would be a painting or several pictures. Superimposed on the pictures would be text arranged in a square grid. In addition to the overall text on the page, the letters over certain images would spell out another message. For example, in the manuscript portrait of Louis the Pious below, The letters in the halo spell “*You Christ crown Louis*” while The letters in the cross spell “*The true victory and salvation of the King are all rightly in your cross, Christ.*”

The Cathedral houses many relics, including the four "Great Relics," namely, the cloak of the Blessed Virgin, the swaddling-clothes of the Infant Jesus, the loin-cloth worn by Our Lord on the Cross, and the cloth on which lay the head of St. John the Baptist after his beheading. They are still displayed every seven years and venerated by thousands of pilgrims.

However, by the end of Charles' reign, a new spirit was starting to take over which looked beyond empty deeds as the key to salvation. In 813 Charles decreed that sins of thought should be confessed as sins, marking the turn to an age of more internalized religion and moral reform in the Church. Christian art from this point on reflected this more emotional (and terrifying) approach to Christianity, as seen in the depictions of the Judgment Day placed over the entrances to churches.

Charles' later years (800-814)

Aachen cathedral. The one major architectural monument created under Charlemagne, Aachen cathedral, was based on older Roman and Byzantine lines. As with many medieval churches, Aachen cathedral when finished was a conglomeration of parts built over a broad stretch of time spanning the 700s, the 1100s (the enormous corona of lamps over the spot where Charlemagne is buried), the 1300s (the upper choir), the 1400s (the fourteen statues of the Mother of God, the Twelve Apostles, and Charlemagne), and the 1800s (the gothic high altar and gold mosaic on the interior of the dome). The main feature of the eighth century church was its octagonal dome (below) that has a sixteen-sided circumference of 120 feet, and a height of 124 feet.

Although the disintegration of the Frankish empire can be seen as partly due to lack of strong rulers, it was starting to become apparent in Charles' later years. Famine, pestilence, and a cattle epidemic disrupted the empire, while Charles' own youthful vitality left him and the tide of conquest started turning. There was growing social disorder in reaction against the burdens of Charles' wars as nobles and bishops forced peasants to serve in the king's army on the one hand and enserfed them on the other. At the same time, there was increasing pressure on the frontiers, in the north from the Vikings, the sight of whom supposedly moved Charles to tears over what they would do to his realm.

Making the future look even more grim, Charles' two most capable sons, Pepin and Charles, died, leaving only Louis the Pious who had already proven incompetence in war. Even Charles' elephant, which he took with him wherever he went, died. As living conditions declined, growing numbers turned to brigandage (which they often called "pilgrimages"), while many more were forced turn to local nobles and abbots, trading their freedom for protection. The court poet, Theodulf of Orleans, captured the growing spirit of malaise in Charles' later years when he wrote:

"The walls which in our youth stood fast, artistically painted, are full of cracks, the sign of coming dissolution. Just as it irks an old man to sing & make merry, so all sweetness has left the aging world & nothing remains of its former strength."

Charles even attempted to avert disaster by ordering a three-day empire-wide fast, a practice he himself had frowned upon before. Finally, on January 28, 814, Charles, who himself was fasting to stop attacks from fever, died. His empire didn't long survive him. His legacy would.

In 881, a Viking raid damaged Charles' cathedral at Aachen, and within decades no one could remember where he was buried. However, the legend lived on and continued to grow. The Song of Roland would grow into one of the great medieval epics, with Charles portrayed as 200 years old, but still capable of engaging in hand-to-hand combat, and winning. In 1165, the German emperor, Frederick I Barbarossa, oversaw Charles' canonization as a saint. A century later, German rulers were referring to their realm by a new name: the Holy Roman Empire.

Disintegration (814-c.1000)

Coin of Louis I the Pious under whom the Frankish realm started coming apart

Louis the Pious (814-840) was the only surviving legitimate son of Charlemagne, his older and apparently more capable brothers dying before their father. Except for a passion for hunting which he shared with his father, Louis was different from the old king in nearly every other way. While his father was gregarious and fun loving, Louis supposedly "never showed his white teeth in a smile" according to one

contemporary. While Charles enjoyed the presence of women at court, even if that meant putting up with his daughters' open love affairs, Louis had most of the women banished from court. Louis did continue Charles' patronage of letters and reforming of the Church, but with an apparently deeper inner piety than his father's. His nickname "the pious" was well deserved since, even though his father had him crowned co-emperor with him in 813, Louis voluntarily had the pope redo the ceremony after Charles' death, despite the fact the pope was desperately in need of his help at the time.

It was Louis' family life that especially created problems for Charlemagne's empire in the centuries to come. Louis had three sons: Lothair, Pepin, and Louis. In accordance with older Frankish custom, which saw the kingdom as the king's personal property, he planned to split his inheritance three ways. Louis would get East Frankland (roughly corresponding to Germany), Pepin would get West Frankland (roughly corresponding to France), and Lothair, the eldest would get the imperial title and land in middle. So far, so good.

Unfortunately, in 818 Queen Irmingard died, and Louis remarried a Bavarian princess, Judith who gave birth to a fourth son, Charles, in 823. Naturally, Judith wanted a kingdom for her son, so in 829 Louis agreed to carve out another kingdom for Charles, leading his elder three sons to revolt, capture the king, Judith, and little Chuckie, and pack them off to different convents, which doubled as prisons.

However, this little family drama was hardly over, as Louis escaped and restored his position. In 833 he disinherited Pepin and gave his lands to Charles, triggering a second revolt by his sons. Unfortunately for the king, Lothair controlled Italy, and with it the pope, whom he "persuaded" to join his cause. When the two armies met, the king's men refused to fight the pope and deserted Louis, who was forced to admit to horrible crimes and abdicate.

This left Lothair in charge, whose domineering behavior alienated his younger brothers, driving

them to rejoin their father and have a group of bishops reinstate him once again as king. “Luckily” Pepin died in 838, leading to an agreement to give West Frankland to Charles and finally restoring some degree of order and family harmony. Two years later Louis died after a long and ignominious reign and then the real “fun” began.

Almost immediately, civil war broke out between Lothair and his two brothers. In 841 the opposing forces met in a bloody battle at Fontenoy. The level of carnage from this battle was shocking even to contemporaries who were hardened to the sight of bloodshed. As one survivor described it:

*“Wars call. On all sides, a terrible battle is born.
Brother kills brother, the uncle his nephew;
The son now shows his father no respect.*

...

*On Charles’ side, On Louis’ side as well,
The ground grows white with shrouds to cloak
the dead,
Just as in autumn, when fields grow white with
birds*

*The battle owns no praise; it is not fit for song.
May east, and south, and west, and north
Lament the men who died in so much pain*

*Cursed be that day. Let it be numbered not
In any calendar, but expunged from all
remembrance
Unlit by the sun, unlit by creeping dawn.*

*That night—that dire night—and the day after—
That night, tears and sorrow mixed,
And some men died and others groaned, forlorn.*

*O Mourning, lamenting: Naked are the dead
The vulture, crow, and wolf consume their flesh
Their corpses, vacant, stiffen; they have no
tombs.”*

The Treaty of Verdun in 843 giving Louis the nucleus of Germany, Charles the nucleus of France, and Lothair the untenable strip in between, was sworn by Charles’ troops in old French and Louis’ troops in old German,

indicating the growing development of those two nations.

Italy in turmoil. The interrupted flow of money from Baghdad also had drastic consequences in the Mediterranean. As trade dried up (FC4.4A), Arab sailors turned to raiding and piracy, a situation made worse by the weakened state of the Byzantine navy due to the turmoil generated by the Iconoclastic controversy (FC6.1).

A civil war at the western end of the Mediterranean in Spain also played a role, as 15,000 Muslim refugees seized Alexandria, Egypt, only leaving after a huge bribe, and went on to Crete, which they seized in 826 and used as a base for piracy for 150 years.

Meanwhile, in Sicily a Byzantine governor aspiring to the throne called in Muslim mercenaries who seized power for themselves in 827 and began the gradual conquest of the island. Although the Byzantines held on to part of the island till 965, the Muslims stayed in power 250 years until being overthrown by Norman invaders.

From Sicily, Arab raiders continued to Italy, sacking Naples in 837, capturing the ports of Bari and Taranto three years later, and establishing bases at the mouth of the Rhone River from which they could raid into France. Muslims even threatened Rome in 846, part of which Leo IV fortified, that district still being known as the Leonine City. In 871, the Franks drove the Arabs out of Bari and Italy, although it was the Byzantines who benefited, getting Bari for the Franks’ efforts. Incidents such as this would be at the center of growing tensions between the Byzantine East and Latin West.

Pope Joan, the only woman pope? The turbulence in Italy is reflected in the story of Pope Joan, the only woman pope. According to the story, Joan was an Englishwoman whose love of a monk and books led her to follow him to France, Italy, and finally Athens where her boyfriend died. She then returned to Rome where she established a reputation for learning and was elected as Pope John VIII, no one suspecting her sex... at least

until she was overcome in the middle of mass by labor pains which killed her (either that or being stoned by an outraged crowd).

As unlikely as this story may be, there is possibly some credence to it because, since then, new popes were ordained in a chair with a hole in the seat, presumably to check his (or her) gender. Also, for whatever reason, the route of papal procession was changed at this time.

Viking raids. Because of the Vikings' mobility and ability to strike suddenly from the sea, their raids over-stretched the ability of Charlemagne's successors, especially in West Frankland (AKA France), to defend their realm. As a result, the responsibility to combat these raids fell to local authorities, such as the Frankish noble depicted below. However, such nobles also used this as an opportunity to claim more independence from the king. By 1000 CE, France had fragmented into 55 virtually autonomous principalities, many of them stronger than the king himself.

Muslim Trade Links and the Rise and Fall of the Carolingian Empire (c.800-1000)

The Pirenne Thesis. In the 1920s, a Belgian historian, Henri Pirenne, challenged the commonly accepted notion that the end of the Western Roman Empire around 500C.E. signaled a catastrophic collapse of Roman civilization itself. His theory, known as the Pirenne Thesis, claimed that Roman civilization continued until the Muslim Arabs broke up the unity of the Mediterranean in the seventh century. Elements of the Pirenne thesis have come under attack since then, although historians have learned to take a more balanced look at the fall of Rome and the start of the Middle Ages thanks to Pirenne.

Archaeological evidence has provided an interesting twist to the link between the Arab Muslims and the Frankish dynasty of the Carolingians, but in the eight and ninth centuries rather than the seventh. It starts at the height of the Arabs' power when they were carrying on trade as far away as India, Central Asia, North Africa, Spain, and also present day Russia, where they would exchange silver for furs and amber. Viking merchants from Russia would then sail by way of the Baltic Sea to the Franks' realm and trade Muslim silver for Frankish goods. Archaeologists have found evidence of a good deal of this silver in the Frankish realm, which would go a long way toward explaining the sudden resurgence of the Franks in the 700s, and early 800s, and in particular their cultural activities: trying to revive learning, copying ancient Roman manuscripts, and building projects such as Charlemagne's cathedral at Aachen.

Unfortunately, just as Muslim silver from Baghdad helped make Frankish power and prosperity possible, the lack of it helped bring down Charlemagne's successors. The reason was apparently overspending by the caliphs on building projects. When, for whatever reasons, their money ran out, so did trade through Russia, thus cutting off the Franks' source of silver and much of their power. Then everything started going wrong.

When Arab traders in the Mediterranean and Vikings in the Baltic and North Seas saw their trade drying up, they turned to raiding to supplement their

incomes. This, of course, was destructive to the overall economy, thus weakening the Franks' ability to trade and marshal the resources necessary, thus allowing more Arab and Viking raids, and so on. By 900, the Frankish empire had disintegrated into various pieces, leaving the way for new powers and institutions to take over.

[Back to flowchart](#)

Economic Collapse After The Fall Of Rome (C.500-700 C.E.)

Introduction: the “Dark Ages”. The disintegration of the Roman Empire in the West left in its wake a patchwork of Germanic kingdoms founded on its ruins. The Germanic general, Odovacer, ruled as king of Italy over a hodgepodge of tribes. The Visigoths held Spain and southern Gaul. North Africa was the realm of the Vandals. Britain was in the process of being divided between the Angles, Saxons, and Jutes, known to us simply as the Anglo Saxons. And the rest of Gaul was starting to fall under the sway of what would eventually become the most successful of these tribes, the Franks. In addition, there were various minor tribes scattered throughout the West: Burgundians, Lombards, Heruls, Gepids, Huns, and so on.

Traditionally historians have described the centuries following Rome’s fall as a barbaric and chaotic period known as the Dark Ages. However, recent historical research has rekindled the debate on this issue. While it is clear that most of the Germanic tribes wanted to enjoy Roman civilization rather than destroy it, archaeological evidence seems to indicate they failed. As the historian Bryan Ward-Perkins put it, they may not have murdered Roman civilization, but they could still be charged with manslaughter for inadvertently killing it.

The physical evidence. While most types of evidence from this period have disappeared by now, there are a few that have survived, most notably pottery, coins, and roof tiles. Evidence from the Pax Romana shows a large quantity and wide variety of high quality pottery made on pottery wheels. Just as significant is the wide geographic distribution of different regions’ pottery, suggesting a highly sophisticated and specialized system of production, transportation and distribution. Apparently, people from one province could get and afford specialized goods from the far-flung provinces of the empire. Similarly, coinage was plentiful in gold, silver, and bronze. The large numbers of bronze coins suggests money was widely used even by the poor. Especially telling is the fact that a significant number of these coins were found lying around in a casual manner, the sign of prosperous times, as opposed to all of them

being hidden in hoards, which was typical of hard times and economic decline. The plentiful remains of ceramic roof tiles produced elsewhere, even in the ruins of peasant houses, is another sign of the high standard of living and sophisticated economy of the Pax Romana.

This changed radically starting in the fifth century. Pottery remains and coins, especially bronze ones used by the poor become scarce. There are virtually no surviving ceramic roof tiles from this period, suggesting the use of thatch, which can leak and harbor insects. The question is: how did this happen?

Conditions of prosperity. First, we need to understand the sorts of conditions that made the highly specialized and interdependent economy of the Pax Romana possible. Overall, it relied on a combination of five factors:

- 1) A skilled specialized labor force able to mass-produce excellent but cheap goods;
- 2) A sophisticated network of transportation and trade to move and distribute goods;
- 3) An imperial government that minted enough coins and maintained the roads to sustain the economy;
- 4) An influx of money from the central government to pay the thousands of soldiers and bureaucrats in the less developed frontier provinces, thus tying them into the larger empire-wide economy; and
- 5) A large and widespread consumer market.

Process of decay. Rome’s highly interdependent economy and trade was similar to today’s global economy, although on a much smaller scale. Despite that difference, its decay and collapse hold a cautionary lesson for us today. In each case, the high degree of inter-dependence of all the regional economies of the empire on the other regional economies carried the danger that, if one regional economy collapsed, that weakened the whole economy and its individual parts needing that area’s goods and markets. That, in turn, would lead to the collapse of one or more other regional economies, weakening the rest of the economy, and so on. Therefore, rather than collapsing all at once, the Mediterranean and Northwestern European economy went in stages, the northern frontier

provinces going first by 500, the western Mediterranean economy next in the 500s, and finally the Aegean area after 600.

The first region to go was the northern frontier, especially Britain, in the 400s. This part of the empire was the most recently civilized region of the empire, with less deeply rooted cities than other regions around the Mediterranean. Two major factors wrecked its economy. First of all, being on the frontier, it bore the brunt of the violence and destruction wrought by the Germanic invasions. Secondly, its economy was especially dependent on the imperial government for money to pay the legions. Therefore, as the empire declined, the government was increasingly unable to pay its soldiers, thus undercutting the whole regional economy as well its ability to defend the empire, further wrecking the economy, and so on.

After the final demise of the Western Empire (c.500 C.E.) the Western Mediterranean went into a steady decline. Three main factors brought this about. For one thing, there was no longer an imperial government to maintain roads and protect trade. Also, the markets and resources the Mediterranean economy had depended on were gone. So were any imperial revenues that helped fuel the economy. As personal accounts from the time indicate, trade continued during this time, but became increasingly difficult. Most pottery found from this period was primitive compared to the wheel-thrown pots of the Pax Romana. The small number of high quality pots suggests they were made exclusively for the rich. Similarly, bronze and silver coinage, the mark of a broadly based consumer economy, disappeared, while the gold coinage was crudely made compared to its predecessors. Clearly, money-based trade had taken a nosedive.

Starting in the late 500s, invasions by Slavs and Avars in the Balkans, Persians, and then the Arab Muslims in the Eastern provinces, and the first outbreaks of bubonic plague combined to send the economy of the Aegean into precipitous decline. Aggravating this were two other factors: the loss of trade and markets in the Western Mediterranean as its economy collapsed, and the loss of taxes and revenue from Syria, Palestine, and Egypt when they fell to the Arabs. Cities in the Balkans and Asia

Minor either disappeared or shrank dramatically in size, not being able to recover for 200 years or more.

Aftermath of the collapse. The economic collapse of most of the Roman Empire had several results. For the Eastern Roman, or Byzantine, Empire difficulties continued as it bore the brunt of successive waves of nomadic invaders in the north and constant pressure from the Arabs to the south. However, by 750, the Byzantines had weathered the worst of these troubles and would begin a prolonged period of recovery and expansion.

By contrast, the economies of Syria, Palestine, Egypt, Mesopotamia, and Persia prospered, since those areas fell rapidly to the Arabs with minimal material damage and disruption, seem to have suffered less from the Plague than the rest of the Mediterranean, and were able to plug into the new “global” economy being created by the Arab Empire that stretched from India to Spain. Therefore, this area entered upon an economic and cultural golden age that also expanded across North Africa and into Spain.

Italy and the frontier regions of the Roman Empire (Britain, Gaul, and Germany) would experience a brief revival under the Carolingian Franks, thanks largely to an influx of silver and trade from the Muslims via Russia and the Baltic. However, overspending by the Caliphs in Baghdad would bring an end to this prosperity soon after 800, triggering new rounds of raids and invasions by the Arabs in the Mediterranean and Vikings in the North. Political order in Western Europe would then collapse, to be replaced by feudal anarchy for two centuries.

Rome’s “Modern” Economy

The rise and fall of the Roman cow. Comparing cattle remains at 137 different sites, archaeologists have determined that in the Iron Age before the rise of Rome, the average height of a cow was 115.5 centimeters. During the

Roman era that figure increased to 120 centimeters, but in the early Middle Ages it fell to 112 centimeters.

The remains of Monte Testaccio Rome's trash heap for broken amphorae

Monte Testaccio. Trade and manufacture were at such high volumes during the Pax Romana that it was considered cheaper to bust up amphora (a type of large pottery holding 70 liters) after olive oil deliveries than carry them back to Spain and North Africa for refills. The result was a virtual mountain of broken pottery in Rome that was over 35 meters high and a kilometer in circumference, holding the remains of an estimated 59,000,000 amphorae. Rather than being just a haphazard waste dump, it was supervised by state officials who had it terraced using intact amphorae. Amphorae were brought by Donkeys from the nearby harbor, broken up, the pieces (*testiae*) being laid out in an orderly manner to conserve space and the stability of the terraced mound. Lime was probably sprinkled over the shards to keep down the odor of rancid olive oil.

Excavation of the mounds tells us a lot about the high level of organization involved in the oil trade, since many of the amphorae were painted (*tituli picti*) or stamped with the weight and origin of the oil, along with the names of the owners and those who weighed and documented it. The mound fell out of use when harbor facilities were moved sometime after 260. For whatever reason, there are no corresponding mounds of amphorae for grain or wine.

Roman quality control. The Romans also had strict quality controls for their pottery. At one site in Southern France, Gruafesenque, archaeologists have found a refuse pit 3 meters deep and 2.3 meters in diameter full of discarded pottery that presumably was rejected as substandard.

Political Anarchy, Economic Decline, and the Failure of the Germanic Kingdoms in the Early Middle Ages (c.500-1000 C.E.)

As we have seen, most of the Germanic tribes that took over the lands of the Western Roman Empire had absorbed at least some respect for Roman civilization and a desire to maintain it. However, in the end, most of those Germanic kingdoms failed to establish strong long lasting states despite their efforts to carry on Roman traditions. The root of this failure lay in the fact that, despite their best intentions, the Germanic tribes still had a poor understanding of the Roman heritage they had taken over. This created problems in two ways.

First of all, no matter how much they may have admired Roman government and technology, the Germanic rulers had, at best, an imperfect understanding of how such things worked. Occasionally a ruler, such as Theoderic in Italy, would be lucky enough to still have Roman technicians and bureaucrats and smart enough to use them to run his state along Roman lines with some success. But that was the exception to the rule. More often, the barbarian kingdoms were loosely knit states with local nobles ruling their lands and sometimes following their kings in war. As the economy declined, the few trained Roman bureaucrats that were left became scarcer with each generation. Bit by bit, orderly Roman rule gave way to a more casual kind of order, veering more and more toward anarchy. Taxes went uncollected; roads, bridges, and aqueducts remained in disrepair; and public order broke down, sending towns and trade into decline.

The second problem, which tied in with the first, was the Germanic concept of the state, or lack of it. The Romans saw the state as an abstract concept that encompassed all the people. The Germanic concept of the state was that the crown and the loyalty of the subjects were the personal property of the king. A warrior had no loyalty to a state, only to his chieftain or king, and that was a very personal matter. This went back to a time when leaders of warrior bands gained followers by promising and giving them plunder, which then was in the form of movable wealth, not land. Since the kingdom was

the personal property of the king, he divided it between his sons after he died much as we today will split our estates among our various children. These sons were naturally jealous of their brothers' shares, and civil wars often resulted.

Together, these civil wars and the breakdown of the old Roman economic and political order bred even more economic decline and the passing of money from circulation. This had two serious results. First of all, schools closed down without money to run them, and the trained Roman bureaucracy gradually died off without anyone to replace them. Second, with money disappearing from circulation, land was becoming the main source of wealth. These two factors forced the kings to rely more and more on local nobles to administer their kingdoms. And since money had virtually disappeared from circulation, kings had to pay their noble supporters with land. This was where their troubles really started to mount.

The problem with land as the main source of wealth was that it regenerated wealth in the form of crops. Giving nobles land that kept producing crops meant the nobles no longer needed the king. Therefore, they became more independent and started defying royal authority. For the king to bring these rebels under control, he would need an army. Unfortunately, he needed to pay his armies, and the only thing he had to pay them with was land, which started the whole vicious cycle over again. In such a way, kings in early medieval Europe saw their power continually disintegrating.

Two other factors led into this feedback process. One was the cycle of Church corruption and reform where people would donate land to the Church in hopes of saving their souls. This would make the Church rich and corrupt, which would trigger a new round of reforms by devout church members. The reformed Church would thus attract more donations of land, and the cycle would start over.

As a result, the Church had large amounts of land, making it a major source of wealth and power in the early medieval state. This created the problem of local nobles fighting and scheming to control Church lands. Typically, they would give their younger sons the offices of bishop or abbot (head of

a monastery) while passing the family lands on to the older sons. However, putting a bishop's robes on a young noble did not usually change his wild and warlike ways, and we find bishops and abbots engaged in drinking bouts and fighting in the front ranks of battle along with the most unruly of the other nobles. The problem of these ambitious nobles trying to gain control of Church lands also fed into the vicious cycle of land regenerating wealth, making nobles more independent, and so on.

Naturally, this situation did little for the piety of the Church. Also, as a result, the lower clergy were largely unsupervised, illiterate, and ignorant of the religion they were supposedly in charge of, while carrying on fairly lax lifestyles themselves. This is not to say there were not any good pious Christians at the time. One of the remarkable things about the history of the medieval Church is the fact that pious individuals did exist and occasionally prevailed against the corruption that constantly plagued the Church. Still, the view we get of the early medieval Church is not a very pretty one.

The Church naturally wanted to maintain its independence and often looked to kings for protection from the nobles. The kings in turn looked to the Church for land (or at least support from the land), spiritual support to make them popular, and monks to provide what few educated officials there were. One striking example of this mutual support was when the German monarch, Otto I, went into Italy in 961, roughly 75% of his troops were supplied from Church lands. This made it critical for early medieval monarchs to control the elections of bishops and abbots, which would give them control of the Church's extensive lands and wealth. If they could do this, they were in a good position for ruling their states. In later centuries, when both kings and popes became powerful independently of one another, there would be trouble between church and state. However, in the chaos of the early medieval world, church and state often relied heavily upon one another out of necessity.

The other factor contributing to the decline of the early medieval state was the spread of a simple invention that would revolutionize medieval

warfare and, to a large extent, medieval society: the stirrup (see **FC41.2A**). The main function of the stirrup was to hold the rider more securely in the saddle. This allowed him to use the impetus of his charging horse to drive a lance through an opponent without himself being thrown from the saddle. The success of this new *shock cavalry* forced defeated enemies to adopt the stirrup if they were to survive. This led to the further spread of shock cavalry until it had become the dominant form of warfare in Western Europe.

Such shock tactics, as they are called, required a large warhorse, lance, heavier armor, and professional troops trained in riding a horse and using a lance. However, such an army was expensive, especially given the economic and political decay of the time. The Frankish leader Charles Martel's confiscation of large amounts of church lands in 732, the year before the battle of Tours, suggests he was building up an army of this new type of cavalry, paying them land in order to support them while they trained and fought. Unfortunately, weaker rulers after Charlemagne couldn't confiscate land in such a way. Rather, they had to give their own lands to nobles in return for military service. However, those lands were virtually worthless unless someone worked the fields for their owners, and, since there were few peasants willing to give a noble two or three days a week of free work to that noble, the peasants had to be tied to the land as serfs to serve their overlord. Out of this came a social order divided into three classes: those who pray (i.e., clergy, those who fight (nobles) and those who work, (the other 95% of the people who had to work the land in order to keep the other 5% of the population alive).

The cycle of Western Europe disintegrating into anarchy as local nobles rebelled against their kings and fought each other in their own private wars didn't stop there. It also encouraged raids and invasions by such peoples as Vikings from the north, Arabs from the south, and nomadic Magyars from the east. Such raids and invasions would only encourage more turmoil, which would bring in more invasions and so on. To aggravate matters even further, this cycle of anarchy and invasions would also feed back into the original cycle involving land as a source of wealth. And so it would go, as these

mutually reinforcing cycles of decline, anarchy, and invasions would continue to feed into one another, dragging Western Europe down into further chaos. Not until money came back into circulation could the nobles' stranglehold be broken. This was because money did not regenerate itself, thus keeping nobles and officials constantly dependent on the king.

Feudalism. Out of this chaos there emerged a new political order, known as *feudalism*. This was a decentralized political order where a king or lord would give his nobles land worked by serfs (peasants bound to the soil) in return for military and other forms of service. Each of those dukes and counts wanted his own army. Therefore, they *subinfeudated* (subdivided) their lands, giving them to lower nobles in return for service from them. Those nobles in turn might subinfeudate to get their own armies from loyal followers. And so it would go until the whole kingdom was split up into dozens of little states. A petty noble who owed service to his overlord, and probably was owed service by vassals beneath him ran each of these. Theoretically, every noble owed allegiance to the king, but in reality he dealt mainly with his immediate overlords and vassals. What resulted were innumerable little wars that usually amounted to little more than border raids that burned some crops, inflicted few if any casualties, and added greatly to the confusion already plaguing Western Europe.

Manorialism was the economic counterpart to feudalism. As the name implies, Western Europe's economy centered on isolated agricultural manors worked by the local lords' serfs. Because of its isolation, the manor had to be virtually self-sufficient. It had agricultural land divided into two or three fields (one always fallow), wasteland which was the lord's private preserve for hunting, a peasant village, a church, a mill, and the lord's manor house or castle (generally made of wood until the 1100's).

The feudal order was an extremely localized and decentralized arrangement. States were so small and poor, and terms of service were so short (in France, usually only 40 days a year) that no one was able to build up much power. However, in the

absence of a strong central government, feudalism did provide some degree of defense against the constant raids and invasions then besetting Europe. By 1000 C.E., things would settle down and a certain amount of stability had been established as the Viking, Muslim, and Magyar raids died down. This stability set the stage for a revival of civilization in Western Europe known as the High Middle Ages. Out of that civilization would evolve our own modern Western Civilization.

Battling Bishops

Nobles who held higher Church positions continued to live and act like nobles. Charles' biographer, Alcuin, described bishops at court with splendid garments, golden baldrics (belts) from which hung daggers inlaid w/precious stones, and their spurs clanking at their heels. Bishops and abbots had banquets with lots of wine, largely a carryover of old German sacral drinking bouts and adapted to occur on saints' days. Some nobles owned monasteries outright, while most parish churches were controlled by local nobles, who would appoint and dismiss priests at will.

And they didn't give up fighting either. Bishops loved jousts and hunting and even carried on blood feuds (which Charles at least momentarily curtailed). Most importantly, bishops and abbots made up an essential part of the royal army. This makes sense when one considers the Church owned so much land, and land was crucial to supporting the new shock cavalry being developed. Supposedly, one abbot loved his war chargers so much that he converted a church into a stable to house them.

Not only did bishops and abbots hunt and play at war, they also fought in the front ranks. In *The Song of Roland*, Archbishop Turpin leads one of the charges and kills his first opponent. This sparks the comment: “Our good bishop defends us well with his crook,” the shepherd’s crook being a double entendre referring both to the bishop role as spiritual leader of his flock and its defender against external enemies. For most people then, there was no inherent contradiction between the two roles.

Time after time, bishops would lead the defense against incursions of Vikings from the north and Magyar nomads from the east. In one account, a bishop lost an ear and was left for dead on the battlefield after a fight against the Magyars. As he recovered, he was confronted by a personal enemy whom he had to kill before making it home to a triumphal parade held by the grateful town. At the battle of Hastings in 1066 (top), William the Conqueror’s half-brother, Odo, bishop of Bayeux, was in the front ranks bashing in Saxon skulls with his war club, the belief being that if a bishop or abbot killed an enemy with a concussion without actually drawing blood, it wasn’t a sin.

Feudal Warfare

Just as feudalism existed on a small local scale, so did feudal warfare with invading forces probably having less than 100 men. Wars mainly consisted of surprise hit-and-run raids to destroy the enemies’ crops and villages while the peasants ran for cover. Pitched battles were probably rare, since the defenders often had no warning or time to prepare for an attack. Following is a contemporary account of feudal warfare and its cost to society.

“They start to march. The scouts and the incendiaries lead; after them come the foragers who are to gather the spoils and carry them in the great baggage train. The tumult begins. The peasants, having just come out to the fields, turn back, uttering loud cries; the shepherds gather their flocks and drive them toward the neighboring woods in the hope of saving them. The incendiaries set the villages on fire, and the foragers visit and sack them. The distracted inhabitants are burnt or led apart with their hands tied to be held for ransom. Everywhere alarm bells ring, fear spreads from side to side and becomes general. On all sides one sees helmets shining, pennons floating, and horsemen covering the plain. Here hands are laid on money; there cattle, donkeys and flocks are seized. The smoke spreads, the flames rise, the peasants and the shepherds in consternation flee in all directions... In the cities, in the towns, and on the small farms, windmills no longer turn, chimneys no longer smoke, the roosters have ceased their crowing and the dogs their barking. Grass grows in the houses and between the flag-stones of the churches, for the priests have abandoned the services of God, and the crucifixes lie broken on the ground. The pilgrim might go six days without finding anyone to give him a loaf of bread or a drop of wine. Freemen have no more business with their neighbors; briars and thorns grow where villages stood of old.”

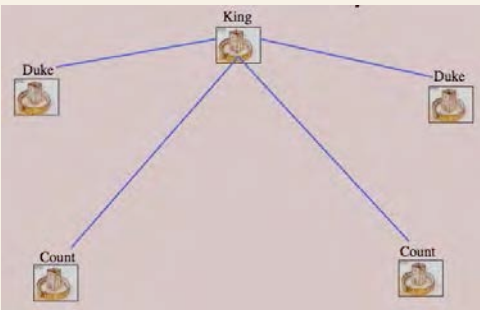

Evolution of a Feudal Hierarchy

This is a highly idealized account of how a feudal hierarchy could evolve. Over time, these hierarchies got increasingly messier, as lands were conquered in war or traded in marriage alliances, reverted back to the lords when vassals died without heirs, etc. Further complicating matters would be such things as vassals owing allegiance to different (often competing) lords for different manors acquired at different times. Keeping that in mind, the following should provide some idea of how the feudal order developed.

1. The king needs armies to defend his kingdom, but has no money with which to pay them. Therefore, he divides the kingdom into five parts, keeping one for himself and giving the other four as *fiefs* to *vassals*, who defend their fiefs and owe him five knights each for 40 days a year.

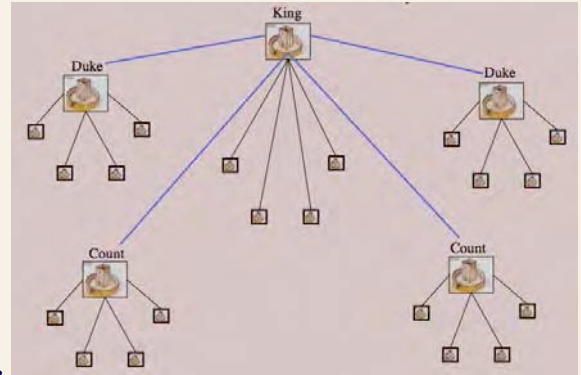

1.

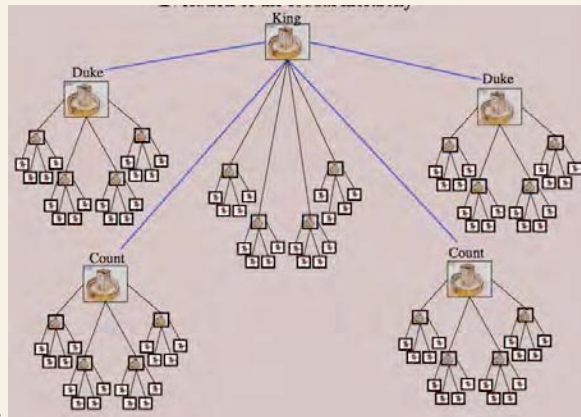

=Fief with one or more manors-> Can support at least 1 castle & enough men-at-arms to defend it

2. However, each vassal duke and count needs knights to give to the king and for his own army. Therefore, they each *subinfeudate* (subdivide) their respective lands into 5 parts, keeping one to live on and giving the other 4 as fiefs to rear *vassals* who owe their lords 3 knights each for 40 days a year for his wars.

2.

3. To meet his obligations and needs, each rear vassal *subinfeudates* (subdivides) his fief into five fiefs, each with one small manor able to support one knight. He keeps one for himself and gives the other four to vassals who personally owe him 40 days of service a year for his wars.

3.

= Fief & 1 small manor -> can support only 1 knight

Feudal Rights and Obligations

Key to security against surprise attacks by Vikings or hostile neighboring nobles in the early Middle Ages was the wooden motte (hill) and bailey castle. Such castles were easy to build and defend. In 1066 the Normans even brought a pre-fab castle with them when they invaded England. By 1100 they had built 500 such castles there to hold down the Saxon population. After 1100 stone castles, modeled on fortifications Crusaders had seen in the East, started to replace wooden ones.

Feudalism was a highly personal political system. The ceremony central to the relationship between a vassal and his lord, *homage*, from *homme*, the French word for man, shows the highly personal nature of this system. The vassal would kneel before his lord, place his hands between those of his lord, and promise to be his man. In return, the Lord would give his vassal a clump of land to signify the fief he received for his services. Despite wide variations between individual feudal contracts, most, if not all, contained certain types of rights and obligations.

Military aid was the most important type of obligation. First of all vassal and lord owed each other mutual defense whenever attacked. In addition, each vassal owed his lord a certain number of knights for a certain number of days of campaigning each year. In France, this was typically 40 days a year, but the terms could vary greatly from contract to contract. After that, the vassal could go home or stay if his lord paid him. All this made for very unstable armies, so that

any noble with a castle and several household troops could defy his lord, wage his own wars, and build his power base like any other independent ruler.

For example, the Count of Champagne, whose vassals owed him 2039 knights, owed the king only ten. No wonder that French kings during this time could hardly make their authority felt beyond the immediate vicinity of Paris. Not until the revival of towns and a money economy in the 1100s could kings and upper nobles replace vassals with mercenaries who would fight full-time. Along these lines, vassals would typically elect to pay their lord *scutage* (literally: shield money) in lieu of their own personal services. This would accelerate the process where the king could establish more stable nation states.

Court Service. Vassals were expected to attend their lord's court either at set times of the year or whenever they were summoned. Vassals attending a lord's court performed several duties. They would settle any disputes between two other vassals or between a lord and one of his vassals. Before the lord could attack one of his vassals for some alleged wrong, the vassal must first be tried by his peers. This could be somewhat risky, since it might involve a trial by combat between the accused and one of the vassals who rendered judgment against him. The belief was that god would give victory to the righteous party. *The Song of Roland* describes such a trial by combat between the main villain, Ganelon, and a champion chosen to represent Charlemagne. The king's champion, although not a great warrior, defeats the more imposing Ganelon, thus reinforcing this idea of divine intervention to ensure justice.

A lord's vassals would also give advice on matters of concern to all, such as whether to go to war, which marriage would bring him the best dowry, etc. In addition to these duties, vassals would attend court for special occasions to enhance lord's prestige. Foremost among these would be the knighting of his son and the marriage of his daughter.

Economic obligations were another common duty imposed on vassals. The most important of these, called *relief*, was a payment to renew the feudal contract upon the death of the former lord or vassal. This usually equaled one year's income from the vassal's fief and at first was paid in kind. However, when towns and trade revived, payment increasingly took the form of money. Relief paid for an ecclesiastical fief, such as an abbey or a bishop's see, was referred to as an *annate*. Other financial burdens facing a vassal were paying ransom money if the lord was captured in war, a payment known as *aid* when the lord's son was knighted or the his daughter was married, and optional contributions to the lord for special occasions such as going on crusade or pilgrimage.

Miscellaneous feudal obligations & privileges.

Typically, a vassal had to get his lord's permission for his daughter to marry since her dowry came from the lord's lands. If a vassal died with only a daughter or wife to succeed him, the lord could select a husband or regent for her. If a vassal failed to perform his feudal obligations or wronged his lord somehow, the lord could seize his land. The death of a vassal without an heir led to his fief going back to the lord by *escheat*. The highly personal nature of feudal contracts might occasionally contain some peculiar obligations. In one case, a Kentishman had to hold the king's head when crossing a river in a boat. Another vassal, for each Christmas, had to perform for his lord "a leap, a whistle, and an audible gaseous expulsion (*bumbulum*)."

Obligations of Serfs to their Lords

Part of a medieval calendar showing different seasonal activities peasants typically worked on

Most of the peasants working the fields in the centuries after Charlemagne were serfs bound to the soil and owing a number of obligations to their lord. Most importantly, they would work the lord's fields 2 or 3 days a week. In addition to owing him part of the produce from their fields. Every year they had to spend several weeks working on the lord's walls, moat, roads and bridges, an obligation known as the *corvee*. Other obligations commonly owed to the lord were carting his wine casks or sacks of grain, feeding and chasing after his hunting hounds, and fighting in the lord's army.

Serfs owed their lord a share of fish from the village fishpond, and had to use the lord's mill and oven, paying his miller one out of twenty bags that were milled. They also had to endure various indignities such as the *captaineries* allowing the lord to hunt through serfs' fields and the *ius primae noctis* ("right of the 1st night") with a serf's bride. Serfs could not hunt in the lord's woods, but did have the right to pick up dead wood from the ground and let their pigs forage there. They could also graze their sheep in the common pasture. Upon a serf's death his heir must pay a death tax (*main morte*) giving the lord his best beast and his second best animal to the priest. If he couldn't pay this, he must give his best clothes, brass cauldron, or bed.

A contract between a villein and his lord, 1307.

While most of the tenants on a manor were serfs bound to the manor for life, others, called *villeins*, were legally free but subject to the lord's authority. Each *villein* had a contract with his lord spelling out his rights and duties. Eventually lords wrote these contracts down in account books so that everyone would know what the duties were. Following is one such contract. Keep in mind that, as with feudal contracts between lords and vassals, there were no standard contracts laying out the obligations of serfs to their lords.

John of Cayworth [villein] holds from his lord one house and thirty acres of land. For his right to this land, he must pay the lord two shillings a

year at Easter and Michaelmas. At Christmas he must give the lord one rooster and two hens worth four shillings.

He must harrow [cultivate] the lord's land for two days during Lent at sowing time with his own horse and harrow. He receives from the lord each day that he harrows three meals.

He must carry the manure of the lord's animals for two days using his own two oxen. He receives from the lord three meals each day that he carries the manure.

He must carry wood from the lord's forest to the manor house for two days in summer. He receives from the lord three meals each day that he carries wood.

John of Cayworth may not allow his daughters to marry without the consent of the lord or the lord's bailiff. Neither may he permit his sons to enter the clergy without the lord's consent. He may not cut the timber growing on his land without the consent of his lord or the bailiff, and then only for the purpose of building.

After his death, his survivors will pay to the lord the best animal that he had, unless he has no living beast, and then the lord will receive no payment.

And if his sons or daughters wish to continue holding his house and thirty acres after his death, they must make a payment to the lord equal to the entire rent for one year, and continue paying the rent as set down in this contract.

Stirrup Fun Facts

While cavalry couldn't train in the tightly coordinated infantry maneuvers of the drill and march that had given Roman armies such an edge, they could practice charging together in closely packed lines. Since infantry by this time had also lost the Roman drill and march, they were easier to panic with just the sight of massive cavalry bearing down on them. Not until the 1400s, probably starting with the Swiss pikemen, would infantry revive the drill and march and be able to withstand the charge of shock cavalry.

The stirrup apparently has its origins in India in the first century C.E. At that point it was just a toe stirrup, which was fine in the region's hot climate. The stirrup's most revolutionary effect occurred when it moved north to Central Asia where nomadic herders expanded it to fit the whole foot, which freed the hands from having to control the horse. That, in turn, allowed the nomads more effective use of the composite bow, making them an even more potent force and threat to civilized armies in both Asia and Europe.

It was in Western Europe that riders relied more on bracing themselves against the horse to use the full impetus of its charge to drive home a lance without being thrown from the saddle by the shock of the collision, leading to the term "shock cavalry."

At first, all freeborn Frankish men were liable for military service as infantry. However, by the end of Charlemagne's reign, growing reliance on expensive cavalry was increasing the gap between the *miles* (soldier of the cavalry class) who fought on horseback and the peasants who just supported him. By the high

middle ages, this gap would solidify into the classic medieval social order of nobles who fought as mounted knights ruling over impoverished serfs. One aspect of this professionalization of the military was holding contests between rival leaders' cavalry where they would practice maneuvers and display their prowess. The average peasant couldn't afford the equipment or time off for such activities.

Another example of a widening gap in the social order is the housing that the peasant and the *miles* had. While peasants homes typically had thatched roofs and only one room for the whole family, a *miles* would have a house with a wooden roof, but not yet a majestic castle as in later centuries.

Interestingly, for centuries European knights would fail to take full advantage of the stirrup's potential by couching the lance under their arms to use the force of the horse's momentum to run through or unseat an opponent. The Bayeux Tapestry depicting the Battle of Hastings in 1066 shows Norman knights more often striking with an overhand thrust.

However, when they did perfect these shock tactics, the charge of a line of such cavalry would prove virtually irresistible and rule the battlefields of medieval Europe for centuries. Another innovation along these lines would be the high-backed saddle to further stabilize the rider at the moment of impact.

Before the stirrup, one way of mounting a horse was by vaulting over its rear end.

The Vikings and Their Impact (c.800-1000)

"Deliver us O Lord from the wrath of the Northmen."—Medieval prayer

For nearly two centuries there was hardly a church in northern Europe that did not echo with the above prayer. While other peoples, notably the Arabs from the south and the nomadic Magyars (Hungarians) from the east, also raided and plundered Europe, it was the Vikings who wreaked the most havoc in the short run, but may have had the most positive long term effects on Europe.

Various forces launched the Vikings in their raids and voyages of exploration. Two of these factors we have already seen: the decline of the Frankish Empire after Charlemagne's death, which invited raids, and the overspending by the Arab caliphs, which wrecked trade in the Baltic Sea and forced the Vikings to seek their fortunes through more violent means. Another factor was a growing population of landless younger sons looking for fortune and adventure caused by a good climate (allowing more children to survive), and the Viking customs of polygamy (having more than one wife) and primogeniture (leaving the entire inheritance to the oldest son).

Two other remarkable factors were the Vikings' ships and their navigation techniques. There were various classes of Viking ships ranging from the typical longship and the larger dragonships (*drakkar*) to the stouter oceangoing *hafskips* (half ships). However, they shared certain common characteristics that made them quite versatile. They could hold up to 200 men in some cases, yet be sailed by as few as 15 sailors. They were strong enough to handle rough seas, but were also light enough to sail up inland rivers and even be carried around river defenses. Likewise, Viking navigation techniques, which were basically the product of a centuries' long oral tradition of sailors' lore, got them safely across open waters that other peoples of the time would never dream of sailing. In our eyes, the Vikings were remarkable and fearless sailors. In the eyes of many of their contemporaries, they were downright mad for making the voyages they did, which only added to their mystique.

Starting around 800 C.E., wave after wave of Vikings set out from Scandinavia either to raid their neighbors or explore new and more distant lands for the purpose of trading and settling there. Viking raids created a feedback cycle by weakening their

victims while also winning plunder and status, which encouraged more and larger raids, and so on. As raiding parties increased in size, the Vikings would grow bolder and strike further inland by sailing up inland rivers or even seizing local horses to carry them and their plunder. As repeated successes further increased the size of the raiding parties, the Vikings would establish winter bases rather than return home to Scandinavia for the winter. Eventually these winter bases might become permanent settlements and the basis for the eventual conquest of the region.

Viking raids and conquests were accompanied by a good number of atrocities that reflected the Vikings' rough character, but were also designed to intimidate their victims. The Vikings showed no special respect for Christian churches and monasteries. In fact, those were generally their first targets, since the Church owned so much of the wealth in Western Europe at the time. However, the Vikings were also great traders, not seeing trade and plunder as mutually exclusive, and combining these activities according to what the situation dictated or allowed. As a result, they opened up trade routes, which helped start a revival of Europe's economy.

Ironically, considering all the chaos and destruction the Vikings brought with them, they founded some of the best-organized and most dynamic states in Western Europe. In 911 C.E. they founded Normandy as a virtually independent state in western France. Having established a well-run government there, they spread out to conquer England in 1066, laying the foundations for that modern nation. They also gradually conquered Southern Italy and Sicily in the eleventh and twelfth centuries and set up strong state there just as they had in Normandy and England. Some of these Normans later joined the First Crusade and conquered Antioch in Syria, holding it for nearly two centuries.

Other Vikings (known as the Rus) struck eastward and founded the first Russian state centered around Kiev. From there, they raided the Byzantine Empire. Later, Byzantine missionaries followed them back to Russia, bringing with them Christianity, Byzantine architecture and the Cyrillic alphabet, all of which became vital elements of Russian culture.

The Vikings were also fearless explorers. To the west, they founded a state in Iceland, continued across the Atlantic and discovered Greenland and

North America. However, Greenland's climate proved to be too harsh to support even the Vikings, while attacks by Native Americans called "*Skraelings*" (screechers) made settlements there also short-lived. However, the rest of Europe was not ready to absorb these new discoveries, and they were forgotten for nearly 500 years.

Viking Ships and Navigation

Viking ships were a breakthrough in nautical technology for their day as seen by several specimens unearthed in graves. They laid planks down in the overlapping clinker style, fastened them with iron rivets, and then sealed the ship by forcing woolen string coated with tar into the spaces between the planks. While the clinker built style limited the ships to a length of one plank, Scandinavia's tall trees allowed for ships over fifty meters in length.

Norse shipwrights favored oak because its branching structure gave its planks a natural curve suited to framing the hull. They could bend up to one inch in rough seas and draw less than three feet in shallow waters. They were light enough that they could be dragged around fortifications or other obstructions in the water. When confronted with a giant chain blocking Constantinople's harbor, Vikings used rollers to haul their ships overland and drop them in the unprotected harbor behind it. (Five hundred years later, the Ottoman Turks would use the same tactic to help them take the city.)

Sails were woven from the wool of Norse sheep, which had straighter and larger outer hairs than their modern counterparts, making it both much stronger and lighter, while its natural coating of lanolin made the sail water resistant. The ship's rotating sail and steering oar made quick raids and getaways much easier, despite the wind's direction. The steering oar (*styr*), mounted on the right side, is the source for the word "starboard". The rigging was made from horsehair or, if available, walrus hide. Modern reconstructions of Viking ships have attained speeds of 17 knots (~13 MPH). Their fabled prow ornaments of animal images were supposed to ward off evil spirits.

Although lacking navigational tools such as the compass and sextant, Vikings were excellent sailors, relying on the North Star at night and the sun at sunrise and sunset, measuring the length of shadows each day to figure out how far north or south they had gone. Navigation in the day by the sun was more difficult than by the more constant North Star at night. However, they had three ingenious devices to help with that:

- *The sunboard* was a board with a bearing dial in the center and compass points radiating out. By taking a reading every sunrise or sunset and making sure the shadow was always on the same compass point, Vikings knew they were on a steady course.

- *The sunstone* was a calcite crystal called cordierite with the remarkable property of turning from yellow to dark blue when held at a right angle to the sun. What made it so valuable was it worked on cloudy and foggy days, so that even then one could set a bearing on the sun at noon and maintain a fairly steady course
- *The sun shadow board* was a wooden disc marked with concentric circles roughly

equivalent to lines of latitude. In the center was a vertical shaft that could be moved up or down depending on the time of year. (e.g., when the staff was set for the sun's declination in mid August, its shadow at noon would fall on a particular circle and should fall on that circle day after day. It was kept level by floating it in a dish of water

Scandinavia was a good starting point for sailing because its length meant different points were due east of various destinations: Iceland, Shetlands, Greenland. The Vikings measured speed by dropping a wood chip in the water and counting how long it took their ship to pass it.

Vikings also used a wide body of sailor's lore compiled and transmitted orally through the generations: what sorts of clouds, wind changes, currents, waves, color of water, birds, fish, and vegetation they would encounter at certain places.

- They knew they were approaching the Faroe Islands by the swell over the Banks surrounding them.
- They knew Greenland by the abrupt change in water temperature upon entering the Polar Current and the change of the water from blue to green due to the reflection of the ice in the sky.
- They knew how to use the Norwegian Current to get to Iceland and from there the Irminger Current to get to Greenland and eventually North America.

Viking Raids and Invasions

Although Charlemagne's empire was progressively disintegrating after his death in 814, local authorities did emerge that could occasionally counter Viking raids such as the one being surprised here by the forces of a local Frankish noble.

Most Viking raids involved two or three boats, each with 40 to 50 men armed with spears, swords, axes, and daggers and protected by helmets, round shields, and, if they were rich, chain mail. Shields were made of wood and covered with cowhide.

Most expeditions involved quick hit-and-run raids to get plunder and leave before local forces could gather against them. Only later, when they launched full-scale invasions, were they interested in battles against local authorities. Despite popular perceptions and their fearsome reputation for fierceness and cruelty (which they promoted), they lost a good number of such head-to-head fights.

Testing a Viking shield wall

Much like the Greek phalanx, Vikings in battle formed a shield wall although with less emphasis on thrusting spears as the primary weapon. Such tactics also reflected a similar social order of equal or nearly equal warriors as opposed to a noble hierarchy led by mounted knights then emerging in much of the rest of Europe.

Horned and winged helmets. Contrary to common belief, the Vikings did not wear horns and wings on their helmets, although some leaders had elaborate helmets. Many Vikings also had colorful and descriptive nicknames:

- Harold Bluetooth
- Eric Bloodaxe
- Halfdan the Generous-with-Money-but-Stingy-with-Food
- Ragnar Hairy Breeches
- Ivar the Boneless,
- Einar Jingle Scale (an Icelandic musician)
- Eyvind the Plagiarist (a Norwegian poet)

Starting around 800 C.E., wave after wave of Vikings set out from Scandinavia either to raid their neighbors or explore new and more distant lands for the purpose of trading and settling there. Viking raids created a feedback cycle by weakening their victims while also winning plunder and status, which encouraged more and larger raids, and so on. As raiding parties increased in size, the Vikings would grow bolder and strike further inland by sailing up inland rivers or even seizing local horses to carry them and their plunder. As repeated successes further increased the size of the raiding parties, the Vikings would establish winter bases rather than return home to Scandinavia for the winter. Eventually these winter bases might become permanent settlements and the basis for the eventual conquest of the region.

Sometimes places were sacked more than once. The port of Dorestad was destroyed and depopulated six times. Vikings sacked Tours six times between 853 and 903. The Irish monastery at Armagh was plundered five times, three times in one month alone. Paris (below) was one town that especially suffered from Viking raids, being besieged four times, sacked three times, and burned twice. In 886 it was besieged by “40,000 Vikings in 700 ships,” but after a heroic defense of almost a year, the invaders were bought off.

Becoming “civilized”. Eventually, many Viking invaders settled down and married local women, who naturally raised their children in the old civilized ways and language. Supposedly, only one generation after settling down, the duke of Normandy couldn’t find a tutor who knew the old Norse language until he went to Bayeux, 100 miles away, where the most recent Viking immigrants were.

Most Vikings converted to Christianity, but their level of commitment was suspect. One Viking chief was baptized twenty times, since for each baptism he received a white linen robe to symbolize being cleansed of his sins. After a while, word got around and so many Vikings were converting that the Church ran out of robes and had to give lower quality robes or just patches of cloth. As a result, many Vikings said forget it and went back to their old gods.

Hrolf the Walker (Aka Rollo), the first duke of Normandy converted to Christianity. But, to play it safe, on his deathbed, he ordered large sums of gold given to the Church along with a human sacrifice to the Norse god, Thor.

In 872 the would-be king of Norway, Harald Harfargi, defeated a coalition of landowners in the Battle of Hafrsfjord (above). Although fought at sea, it resembled a land battle where both sides tried to board the enemy ships. Harald won the battle, establishing himself as king of Norway. The losers, rather than live under Harald’s rule, left Norway and settled in a new home, Iceland.

Duck Feathers & Unicorn Horns: Viking Trade

The fool on the left is doomed if he thinks he can tame a unicorn that way. It's well known that only young virgins can tame these crafty beasts.

The Vikings tied together a trade network with a number of forts and towns, many of which they had sacked several times before: Dublin, Limerick, Cork, York, Rouen, Kiev, Norvgorod, and Birka (in Sweden).

Birka had a population of 1000 transients and inhabitants at the height of the trade season. It consisted of wattle and daub houses and timber buildings caulked with clay and moss. It had timber boardwalks to protect feet from the mud. It was typically a wild and noisy scene of Greek's, Arabs, Spaniards, Slavs, Irish, Anglo-Saxons, Franks, and Frisians jostling each other in the streets, haggling over prices and quality, and sometimes just enjoying a good drunken brawl.

Foreign visitors to Birka enjoyed equal protection under the law, in return for which the local ruler had the right to buy any choice quality imports three days ahead of anyone else. There was little trade in bulk goods, especially since Viking ships could carry little.

A Rus (Viking) settlement on Lake Ladoga in northern Russia. An Arab traveler, Ibn Fadlan, left an account of the Rus in the 10th century, remarking especially on their heavy drinking and how filthy they were.

Local trade items included bars of smelted iron, salt, amber (fossilized resin that was valued like diamonds and was magnetic when rubbed), furs, horsehides, goatskins, sword hilts, duck feathers, walrus ivory for holy objects, walnuts, hazelnuts, acorns, reindeer horns for combs and sword mounts, which were traded for Byzantine brocades, Frisian woolens, Anglo-Saxon embroideries, Chinese silk, Arab harnesses, leather belts from Persia, two-handled ceramic jars with wine from the German Rhineland, tinted Frankish glass, slaves, and anything gold or silver.

One particularly prized commodity was unicorn horns (actually narwhale horns) traded to unsuspecting customers who ground them up for love potions and as an antidote for epilepsy, poison, and even diarrhea.

Catching a unicorn, according to medieval folklore, involved either of two methods:

- 1) Stand in front of a tree and taunt it (i.e., the unicorn, not the tree) until it charges and, at the last second, step aside so the unicorn crashes into the tree and gets its horn imbedded into the tree. Before it can extricate itself, chop off his head.
- 2) Put a beautiful virgin (unicorns love virgins) in its path. When it prances up and lays its head in her lap, jump out from behind the tree and hack off its head.

Supposedly, to escape you, a unicorn will even jump off a cliff and land on its horn, which absorbs the shock. How the unicorn pulls itself out of the hole it's imbedded into is unknown. Probably magic.

The Far Ranging Normans

Norman forces led by Roger de Hauteville land in Sicily in 1071

Having adapted at least a smattering of civilization, especially shock cavalry tactics, the Vikings proved to be dynamic state builders. One group, the Normans (from *Northmen*) conquered Northwestern France (aka, Normandy), and, branching out from there, extended their power to Britain and across the Mediterranean to Sicily and even Syria.

Normandy was founded in 911 by the Viking leader, Hrolf the Walker, called that because presumably no horse was big enough to carry him and he always had to walk. The treaty recognized him as the legitimate ruler of the area in exchange for defending it against further Viking raids. He also had that rough sort of Viking sense of humor. As he knelt before Charles the Simple's throne, he grabbed its front legs and tipped it over.

Hrolf, or Rollo, could be brutal in typical Viking fashion. When some peasants petitioned him for the right to hunt and fish in his woods, he had a hand and foot of each petitioner cut off, apparently his way of saying no.

He was also shrewd as seen in his conversion to Christianity and rebuilding churches and monasteries, winning him the support of the Church and the only educated men in Normandy. Because of his policies and those of his successors, Normandy was one of the best-run feudal states in Western Europe. In 1066, Hrolf's descendant, William the Bastard (later known as the Conqueror) crossed the Channel and conquered England, the last successful invasion of that island.

The primary type of armor worn by the Normans and other knights through a good part of the Middle Ages was chainmail. Wire would be wrapped tightly around a stick and then cut off into individual rings. Each ring would be linked with four other rings and then riveted shut. Such armor was flexible and mainly effective against slashing cuts, not so much against a stabbing point, and even less so against blunt force trauma. The invention of the crossbow (which the Church tried to outlaw as inhumane) made knights more vulnerable, so chainmail was gradually replaced by stronger plate mail. Then came gunpowder.

The Normans in the South: the Kingdom of the Two Sicilies. In 1016 several Norman pilgrims returning from Palestine through Southern Italy were approached by Melo, a Lombard noble who enticed them with stories of the vast wealth to be made as mercenaries in Southern Italy.

Like their Viking ancestors, the Normans had many landless younger sons, growing numbers of whom drifted south, willing to fight for anyone and even against each other. One of these was William de Hauteville, the eldest of twelve sons, most of whom would eventually follow him to Italy. Fighting first for the Byzantines in Sicily, he won fame for his prowess by killing the Arab ruler of Syracuse, earning him the title, "Iron arm." He then went on to earn the title count of Apulia, which lured his younger brothers Robert and Roger to join him from Normandy. Robert ravaged Byzantine Apulia so thoroughly and escaped his enemies so cleverly, that he was called "Guiscard" (cunning).

William Iron Arm's death led to such destructive civil wars that Pope Leo IX allied with the Byzantines against the Normans, who promptly united and thoroughly crushed papal forces at Civitate in 1053. The people of Beneventum, terrified of Norman reprisals, rather than giving

the pope refuge, turned him over to Normans. Surprisingly, the Normans, being “devout” Christians, fell to their knees and kissed the sandals of their captive. However, they still refused to let him go and kept him captive for nine months until he recognized their rule in South Italy. Later, as the Pope Gregory VII’s allies, they would drive the German emperor’s forces from Rome and then celebrate by thoroughly sacking the city. The Normans continued the conquest of Southern Italy, taking the last Byzantine stronghold, Bari, in 1071.

In the same year, Robert Guiscard’s brother, Roger, took Syracuse, thus beginning the conquest of Sicily, which he would control by 1100. Pope Nicholas II offered the Normans recognition of their control of Sicily in return for an oath of loyalty to Rome, so that the Catholic Church replaced Greek Orthodoxy as the dominant Christian faith in Sicily.

After conquering Sicily, Roger left Muslim governors in office and let them administer Muslim law, making him popular with the local population. Norman rulers would wisely continue to follow this policy. In 1130, Roger II was crowned king of the Two Sicilies (Sicily and Southern Italy), which would be one of Europe’s best-administered states and continue variously as one unified and two separate states (Sicily and Naples) until Italy’s unification in 1861.

From Sicily, Normans wandered farther east, first serving as mercenaries for the Byzantines and later conquering the Syrian city, Antioch, in 1098 during the First Crusade. Antioch would remain in their hands until the early 1200s.

[Back to flowchart](#)

ANGLO-SAXON ENGLAND (c.500-1066)

England followed a somewhat different course of development from the countries on the continent. Being separated from the rest of Europe by the English Channel certainly made it harder to keep in touch with the continent, especially during the Dark Ages. By the same token, the Channel generally has also made it harder to invade England, although that did not seem to be the case against Viking raids and invasions.

After the departure of the Roman legions in the early 400's, the Romano-British population probably carried out resistance against the invading Angles, Saxons, and Jutes (known collectively as the Anglo-Saxons). This resistance is very likely reflected in the legend of King Arthur. However, the Anglo Saxons eventually conquered Britain by 600 and split it into 7 competing kingdoms known as the Heptarchy. For a brief time, one kingdom or the other might have the upper hand in trying to unite Britain, but the other kingdoms would gang up on that kingdom and restore the balance of power. By 700, the Anglo-Saxons had been converted to Catholic Christianity, and English scholars, led by such men as the Venerable Bede, were in the forefront of European scholarship. However, the advent of Viking raids in the ninth century would radically alter all that.

England especially suffered from the Vikings. Being divided into seven independent kingdoms made it an irresistible target, and Viking raids on England were merciless. Six of the seven Anglo-Saxon kingdoms were overrun, with only Wessex in the south, led by Alfred the Great (871-99), holding on grimly against the Northmen. Alfred did three things to defend his realm against the Vikings. First of all, he kept a standing army, with half of its soldiers on guard at any given time while the other half could tend their crops. Second, he built a navy to head off Viking invasions and raids before they could even reach English shores. Finally, Alfred established fortified centers, known as *burhs*, to protect his people and their property from the Vikings.

These measures saved Wessex from Viking conquest, and Alfred and his successors were gradually able to take the offensive and reclaim a good part of England. Ironically, the Viking raids were good for Anglo-Saxon England in two ways. For one thing, they forced the Anglo-Saxons to build a strong state in self-defense. For another

thing, the Vikings eliminated the six Anglo-Saxon Kingdoms Wessex had been competing with before. As a result, as Wessex retook one part of Britain after another, a single strong united kingdom replaced seven separate ones. Also, it could more easily impose its own laws and customs on other Saxons, since the Vikings had eliminated the other Saxon kingdoms' laws and customs. Probably reinforcing that trend was the Saxons' fear of the Vikings returning, thus making them more likely to submit to the rule of a strong king. Therefore, the Saxon kings of Wessex could establish a much stronger state than would previously have been possible.

Besides their defensive measures, Alfred and his successors did three other things to build a strong English state. First of all, they set up royal officials, known as *thegns* and *reeves*, to administer the king's justice throughout his realm. The second thing was to extract a loyalty oath from all Saxon freedmen under their rule. In an age when oaths were taken especially seriously, this was important, since it made loyalty to the king more important than loyalty to any other lord or official. Finally, the Saxon kings collected a permanent tax known as Danegeld. This was originally tribute paid to the Vikings to keep them from raiding. Later, it was used as a defense tax to support the army and navy, thus keeping England safe from attack.

In 973 C.E., a century after Alfred came to the throne, the Church anointed his descendant, Edgar, with oil as God's chosen king of all England. Although the Vikings still controlled much of England under what was known as the Danelaw, this act showed the progress Wessex had made and the ambitions it had toward uniting all of England. Also, by anointing the king as God's chosen, it marked the king as someone special in society and laid the foundations for the later doctrine of Divine Right of Kings.

These measures kept the Saxon state strong until Ethelred "the Unready" (literally "No plan") came to the throne at the age of ten. This triggered renewed Viking raids until the Danish king, Knut, conquered all of England. As luck would have it, when Knut died, his sons fought for the throne, which allowed the Saxons to regain their independence and give the crown to another Saxon king, Edward the Confessor.

However, England was never far from some sort of Viking intervention. In this case, it was the Norman duke, William, who, as a cousin of the childless

Edward the Confessor, claimed the English throne when the Saxon king died. When the Saxons chose another Saxon, Harold of Wessex, to succeed Edward, William gathered an army, crossed the channel, and crushed Harold's forces at the Battle of Hastings in 1066 in what would prove to be the last successful invasion of Britain. Despite this, the Anglo-Saxon heritage would continue as the Normans would adopt many of the policies and institutions the Saxons had used to build their state in times of crisis.

The Real King Arthur and Anglo-Saxon Britain to c.900

The end of Roman Britain. In the early 400s, Roman forces left Britain to support their general, Constantine (not the famous one), in a bid for the throne. The rebellion failed, but Roman forces never returned to defend Britain, leaving the Romano-Britons to defend themselves against mounting Anglo-Saxon incursions.

If there really was a King Arthur, he probably lived in the 5th or 6th centuries, organizing the Romano-Briton population against the Saxon invasions. Over the ensuing centuries, the story grew into the legend we have today.

It does seem that the Romano-Britons did hold back the Anglo-Saxons for a time. However, in the 600s, their defensive efforts finally collapsed under continued pressure from the invaders. The Anglo-Saxons, being less familiar with Roman culture, were especially destructive to the civilization they took over in Britain, leaving hardly any standing monuments compared to what survived in Italy, France, and Spain. Britain was then fragmented into seven kingdoms known as the Heptarchy. *The seven kingdoms of the Heptarchy* and the tribes who

formed them were Kent (Jutes), Northumbria (Angles), Mercia (Angles), E. Anglia (Angles), Essex (Saxons), Sussex (Saxons), and Wessex (Saxons).

Offa's Dyke, built in the 9th century along the border between Mercia and Wales. While it is unlikely it could stop enemy raids and invasions, it would make it much harder for raiders to escape with livestock.

England's conversion to Christianity involved competition between the Irish and Roman Churches. The Irish, who had never suffered barbarian conquest, contended their Christianity was purer than that in other parts of Europe where it had been corrupted by the various Germanic tribes. The two churches especially disagreed over when to celebrate Easter and how the tonsure (monks' haircut) should look. The Roman Church thought monks should shave the tops of their heads to symbolize the crown of thorns Christ wore on the cross. The Irish thought it should be the reverse.

The conflict came to a head when Irish monks and missionaries working their way from the North met Roman monks preaching their version from the South. To settle the matter, king Oswy held the Synod of Whitby in 664. The deciding factor was when the Romans told Oswy that Christ had entrusted the keys of Heaven to St. Peter, something the Irish had to admit. Feeling he couldn't afford to offend the gatekeeper of Heaven, whose representative lived in Rome, Oswy went with the Roman Catholics.

Clearing the air. In 597, King Ethelbert of Kent met missionaries in the open air so the wind would blow away any spells they might try to cast on him.

England, along with Ireland, remained a center of learning and culture, which heavily influenced the Carolingian renaissance.

Above: Gospel Book of Lindisfarne, England, late 7th Century: St. Matthew.

Norse influence on the English language is seen in the following words: thrive, die, ill, bread, eggs, take, call, window, husband, sky, anger, low, scant, loose, ugly, wrong, happy

By the same token, the closeness of Old English and Norse can be seen in the following sentences:

Old English: Haefst thu hors to sellenne?

Norse: Hefir thu hross at selja?

OE: Ich haebbe tu hors ac (but) an is eald

Norse: Ek hefi tvau hors enn einn er aldr

Place name endings also say a lot about England's history:

Anglo-Saxon place endings: *ham* (Durham), *stead* (Hampstead), *stowe* (Felixstowe), *ing* (Reading), *ton* (Kingston)

Norse place name endings: *thorpe* (Scunthorpe), *toft* (Lowestoft), *scale* Windscale

Danegeld. Payments in silver could take the form of coins, but ingots and so-called *hacksilver* (silver objects such as plate or jewelry cut up for reuse), were also common. Many of the weights for measuring the tribute had coins, or small pieces of jewelry inserted into the top.

Lead weight used to weigh out silver, both for trade and probably also for the division of plunder. While payments in silver could take the form of coins, ingots and *hacksilver* (silver objects such as plate or jewelry cut up for reuse), were also common. Many of the weights had coins, or small pieces of jewelry inserted into the top. This one, of Ethelred I, king of Wessex (reigned AD 865-71), was made of silver of a poor quality, and the pin holding the coin to the weight is actually made of finer silver than the coin.

Alfred the Great and Anglo-Saxon Revival (871-c.1000)

Coin of Alfred the Great (871-899)

Alfred the Great is the only English monarch known as the Great. However, his reign started off ominously. After a surprise attack by the Vikings Alfred went into hiding in the local fens and marshes. According to one story, he was hiding in a cave from enemies and was saved by a spider quickly spinning a web over the entrance to make it look like no one was there.

Alfred managed to gather a new army with which he defeated the Viking leader, Guthrum (below), and established a stable frontier

between the Saxon kingdom of Wessex in the south and the Danelaw in the north. The defeated Viking leader, Gunthrum, also agreed to convert to Christianity.

Alfred also built a navy of flat-bottomed ships that rode higher than Viking ships and could avoid rocks in coastal waters. Although it did destroy 20 Viking ships and their crews in 896, the English navy seems to have had little long-term effect against Viking sea raids. The navy was also expensive, taking 300 peasant holdings, known as hides, to support one ship.

In addition to spending much of his reign just defending his realm, Alfred also supported Church reforms and promoted learning and the arts. Among other things, this made him a close ally of the Church, which supported and sanctified the rule of the Wessex kings as being ordained by God.

The Anglo-Saxon army consisted of three elements: the royal guard (*huscarls*), nobles (*thegns*), and peasants (*fyrð*). Since the stirrup and shock cavalry tactics didn't catch on in Saxon England, the army fought as infantry in a shield wall, much like the Vikings did. Since they could afford protective armor, the thegns and huscarls fought in the front ranks, with the huscarls gathered in the center around the king. Their primary weapon was a long two-handed

battle-axe. By the Norman invasion in 1066, many nobles had adopted the chainmail hauberks (knee-length shirts) and kite-shaped shields then in use on the continent.

The peasant fyrð behind them mostly fought with spears, many or most of them having round wooden shields. A few might have bows or javelins, but there seems to have been no concentrated missile fire developed by the Saxons. After the Norman conquest, the predominance of shock cavalry and the Saxon peasants' hatred for their overlords would drastically reduce the role of the peasant fyrð.

Saxon Burhs. Reconstruction of a typical Saxon Burh, many of which had evolved into towns with markets, churches, and bridges by the 11th century. In this case, the original wooden fortifications are in the process of being replaced by more durable and defensible stone. Note also the multiple defensive ditches to slow down attackers. In some cases, the Saxons revived older Roman towns with their fortifications and rectangular grids of streets. They also established a network of beacon fires to quickly warn of invading armies.

Royal coinage was another feature of the Saxon monarchy. There were around 70 royal mints, many of them run by local jewelers or goldsmiths subcontracted by the state. Mintmarks allowed the coins to be traced to a specific mint to ensure weight and quality. Issuing light or impure coins led to chopping off the minter's hand and hanging it in the mint as a warning to his successors. Saxon coins were recalled every two or three years to be melted down for reminting. The state gave only eight or nine new coins in exchange for every ten old ones.

Saxon accounting. In an age of limited literacy and record keeping, the Saxons kept accounts on what were known as *tally sticks*. A notch was made on a stick for each sum of money being counted in a transaction. Then the stick was split down the middle, giving each party half with identical notches and a record of the transaction.

The Last Anglo-Saxon Kings (968-1066)

Alfred's measures kept the Saxon state strong until Ethelred (968-1016) "the Unready" (literally "No plan") came to the throne at the age of ten. This triggered renewed Viking raids that would last until the Danish king, Knut, conquered all of England by 1016.

Unlike Alfred, Ethelred tried to buy off the Vikings, which only led to more raids and heavier demands, climbing from 10,000 pounds of silver to 16,000 pounds to 24,000 pounds to 36,000 pounds. Supposedly when told of a pending Viking attack, Ethelred had his men take off their armor and shoes and march around a church. It didn't work.

Viking atrocities included tying the captured archbishop of Canterbury to a pole and pelting him to death with stones and severed cow parts.

The nursery rhyme, "London Bridge is Falling Down" supposedly comes from a Viking raid in

1011 when they tore down London's bridge with grappling hooks.

Knut, who reportedly killed someone over a chess game, is remembered for his legendary arrogance by placing his throne on the seashore and commanding the sea to recede, which it apparently did not do. Despite these stories, Knut's rule seems to have been fairly temperate.

Edward the Confessor was supposedly so pious he refused to sleep with his wife, which made it hard to produce children. (His widow may have perpetrated this story to defend her failure to produce an heir to the throne.) There is controversy over how ineffective Edward was as a king, some historians saying he was quite active and effective in the early part of his reign. However, his reputation did get him canonized as a saint in 1161 by Pope Alexander III, his saint's day being October 13. He was regarded as the national saint of England until being replaced by St. George around 1350.

ROME IN THE EAST: THE BYZANTINE EMPIRE (c.500-1025 C.E.)

Introduction: the "Second Rome". When we study the Middle Ages, we tend to focus on Western Europe, since it became the center of Western Civilization during the Italian Renaissance around 1400. However, this gives us a distorted view of medieval history, for Western Europe was little more than a backwoods frontier compared to the real centers of civilization further east. It is here that we are concerned with one of those eastern cultures, Byzantium, and its contributions to civilization. Cities provide the central focus of civilization, and no civilization seemed to center on a city more than Byzantine civilization did on Byzantium, or Constantinople as it was known after its refounding by Constantine in 330 C.E.

Constantinople's location at the narrow juncture between the Aegean and Black Seas was ideal for controlling trade between those two bodies of water as well as the trade routes that converged there to link Asia and Europe. The city itself was blessed by nature, with water bordering two of its three sides, providing it with both an easy defense and an excellent harbor known as the Golden Horn. The natural advantages of the city were further enhanced by human ingenuity. The harbor was protected from invasion by a massive chain stretched across its entrance. The landward side had a huge triple set of walls to protect it. Down through the centuries, when all else failed, that chain and set of walls kept Constantinople safe from invasions. Many times all that seemed to remain of the empire was Constantinople itself. But as long as the city survived, the empire also survived to bounce back and recover its old territories.

Inside its walls, Constantinople contained some of the most marvelous sights in the civilized world. Many of these reflected the Roman heritage that the Byzantines were carrying on: aqueducts, sewers, public baths, and street planning. Other sights, in particular some 100 churches, reminded one that Constantinople was a very Christian city. Still other sights reflected oriental influences: the bustling markets offering goods from all over the civilized world, the palace complex of the Boucoleon with its

reception halls, mechanically levitating thrones, imperial gardens, and silk factories. Much of the Byzantines' success in dealing with their less sophisticated neighbors was due to their ability to dazzle visitors with such wonders.

Turmoil, crisis, and the transition from Roman to Byzantine Empire (527-717 C.E.). While we refer to the Byzantine Empire, people in the Middle Ages still called them "Romans," never losing sight of the fact that this was the eastern half of the Roman Empire that had survived the barbarian invasions of the fifth century C.E. Both the terms *Byzantine* and *Roman* have some truth to them. They were the direct heirs of the Roman Empire and did carry on the remains of that empire for some 1000 years after the fall of the western half of the Empire. However, for all intents and purposes, it became a predominantly Greek empire and culture as the Middle Ages progressed. Its subjects spoke Greek, worshipped in what came to be the Greek Orthodox Church, and wore beards in the Greek fashion. They even argued and fought over religion in much the same way the ancient Greeks had argued and fought over politics.

The turning point in this transition from Roman to Byzantine civilization came in the reign of Justinian I (527-565). We have seen how this "last of the Roman emperors" tried to reclaim the Western empire. In the process, he virtually wrecked the eastern empire with the high cost in money and manpower for his wars and tribute to keep the Persians quiet in the east. Two other factors merely added to the damage: persecution of Monophysite heretics in Syria, Palestine and Egypt which alienated much of the population against the central government and bad luck as the Bubonic plague made its first appearance and devastated the empire's population. When Justinian died, the empire may have looked strong on the map, but in reality it was exhausted and in desperate need of a rest. Unfortunately, rest was the last thing the empire would get.

The next two centuries would see the Byzantines constantly beset by waves of invaders coming from the north, the east, and the west. The very fact that the Empire survived at all seems a miracle considering the troubles it endured. In the West, the

first wave of invaders, the Lombards poured into Italy in 568, only three years after Justinian's death, and set off centuries of fighting between themselves, Byzantines, Franks, and even Arabs. The Byzantines did manage to hold onto Ravenna and Venice in the north and southern Italy and Sicily to the south, gradually losing them by 1100. However, except for those outposts, the Roman Empire in the West was gone.

A more serious threat to the empire's existence came from the east. Around 600 C.E., the chronic hostility between Byzantines and Persians erupted into a titanic life and death struggle that would last a quarter of a century. The Persians overran Syria, Palestine, and Egypt while the nomadic Avars in the north rampaged through Greece and the rest of the Balkan Peninsula. At the low point of the war, Constantinople was virtually all that remained of the empire in the east, and even it had to withstand a siege by the combined Persian and Avar armies. Fortunately, the stout walls of Constantinople held fast against the enemy assaults, and a new hero, the emperor Heraclius, emerged to save the empire. Leaving Constantinople to defend itself, he struck deep into Persia to draw its armies away from his capital. In a series of resounding victories, the Persians were crushed and the Byzantine Empire saved. However, in the process, both empires had been thoroughly exhausted.

Unfortunately, right on the tail of this war a much more serious threat suddenly appeared. The Arabs, newly united and inspired by Islam, swept in like a desert storm, toppling Persian and Byzantine resistance like a house of cards. The Persian Empire was subjugated in its entirety while the Byzantines watched as Syria, Palestine, Egypt, and North Africa all fell to the Arabs. Not content with these conquests, the Arabs pressed on through Asia Minor toward the coveted prize of Constantinople itself. Once again, the city's fortifications held out, and after a four-year siege, the invaders were driven back. One reason for this victory was the use of a new secret weapon, Greek Fire, which sent the Arab ships into wild uncontrollable flames. This chemical would be a mainstay of the Byzantine defense and a highly guarded state secret for centuries to come. We still do not know exactly

what was in it, although it was probably some sort of petroleum compound.

In 717 C.E., a new emperor, Leo III, from Isauria in southern Asia Minor, came to the throne. The empire's situation at the time was not very hopeful, for another huge Arab army was descending on Constantinople. As in times past, Byzantine fortifications and Greek Fire took their toll, and by the following spring, the Arabs were in full retreat. This was the last time the Arabs would besiege Constantinople, and the end of this siege symbolized the beginning of a period of stabilization for the empire's frontiers and internal development. Fighting would continue with the Arabs, but mainly in the form of sporadic border raids rather than massive invasions.

The Byzantines also faced serious threats in the north from Asiatic nomads and their Slavic subjects whom they drove in front of them. Two of these nomadic tribes, first the Avars, and later the Bulgars, waged relentless warfare on the Byzantines, mercilessly devastating the Balkan Peninsula in their raids. The Balkans virtually dropped out of Byzantine control and the light of history for nearly two centuries as they were inundated with Slavic invaders. To the north, a powerful Bulgar kingdom proved to be nearly as serious a threat as the Arabs for the next 350 years. Eventually, they would settle down, adopt Christianity, and even briefly be conquered by the Byzantines. But for now, they were one more major problem to be overcome.

By 750 C.E., thanks to some astute diplomacy that turned their enemies against one another, perseverance in the face of disaster, and the fortifications of Constantinople, the Byzantines had survived, often against incredible odds, both foreign invasions and internal religious strife. However, they had been stripped of all their lands except for Asia Minor, part of Thrace around Constantinople, Sicily, and parts of Italy. And they were still surrounded by very aggressive neighbors. No longer was it a Roman Empire in anything but name and a few Italian holdings. From this point on, it was truly a Byzantine Empire.

Unfortunately, just as outside pressures from the Arabs were starting to ease, a cloud of religious controversy descended upon the empire. The new issue, *Iconoclasm*, concerned the icons (religious images) the Church used to depict Christ and the saints. The iconoclasts thought that the use and veneration of these images was idolatry. The iconodules said icons were needed to instruct the illiterate masses in the teachings of Christianity. Leo III and several of his successors were iconoclasts and moved to abolish this form of idolatry by seizing the icons and destroying them.

As one might expect in an era when religion was such a vital issue to both the individual and the state, Iconoclasm touched off some violent reactions from people attached to the icons. Riots swept through the cities of the empire. Relations were strained with the Church in Western Europe, which also defended the icons. Palace intrigues and murders centered largely on the icon issue. When an iconodule empress, Irene came to the throne (blinding her own son in order to seize power), she disbanded several of the best regiments of the army since their troops were mainly iconoclasts. This, of course, damaged the empire's ability to defend itself and invited raids from its neighbors. After over a century of this turmoil (726-843), the images were restored and the empire could pursue a more stable course undisturbed by major religious controversies.

The imperial centuries (c.750-1025). The disturbances of the seventh and eighth centuries left a very different empire from the one that Justinian had ruled. The most noticeable difference was that the empire was much smaller, having been stripped of Syria, Palestine, Egypt, and North Africa. While this deprived the Byzantine government of valuable revenues, it also made the empire much more compact and easier to defend since it was now confined mainly to Asia Minor and the Balkan Peninsula.

The recent turmoil also made the Byzantine Empire a more ethnically, culturally, and religiously united realm. The largely Aramaic speaking peoples and Monophysite "heretics" of Syria, Palestine, and Egypt were now under Muslim control. This left a predominantly Greek speaking populace more or less united by the same religious views once the

Iconoclasm struggle had settled down. The empire may have been smaller, but it was also more cohesive.

The upheavals caused by two centuries of foreign invasions forced the Byzantines to adapt their society, government, and defenses to what seemed to be a continuous state of crisis. There were five main factors that helped the empire revive. First of all, after 750 C.E., the pressure from invasions let up somewhat, although it was still an ever-present menace. Second, the Byzantines pursued an active policy of repopulating Asia Minor that had been devastated by the wars of the previous centuries. The main policy they followed to this end was to take hundreds of thousands of the Slavic people who had overrun the Balkans and resettle them on the empty lands in Asia Minor. These people were hard working industrious folk who became loyal subjects and excellent soldiers for the Byzantine state. No single policy probably did more to revive the fortunes of the Byzantine Empire than this resettlement policy.

A third factor aiding Byzantine revival had to do with the administration and defense of the empire, which needed serious overhauling. Back in the third century, Diocletian had created separate civil and military officials in his provinces to cut down on the possibility of revolt. However, the constant threat of invasions faced by the Byzantines forced them to abandon Diocletian's system and create military provinces called *themes* run by military governors (*strategoi*). The emperors did cut down on the possibility of revolt somewhat by having the tax collectors answer directly to them. This still left the governors enough power and freedom to defend their provinces. The governors needed professional help in running the provinces, which was provided by an excellent civil service, possibly the best of any medieval state.

Given the high priority that claimed, it should come as no surprise that the Byzantine army also carried on the ancient Roman tradition of excellence. However, the nature of the warfare the Byzantines faced, (usually quick hit and run border raids), differed considerably from the Roman style of warfare. As a result, the army's core consisted of highly mobile and versatile regiments of cavalry

known as *cataphracts*. The cataphract was heavily armed and could rely on shock tactics similar to those of western knights to drive back the enemy. But he was also armed with a bow and could function as a horse archer when necessary. The Byzantines also fielded light cavalry plus heavy and light infantry who were useful in different types of terrain, especially hills and mountains. Recruitment was done according to village, each village being responsible for supplying a quota of peasants armed and ready for service. This system was superior to that of Western Europe where the more troublesome and ambitious nobles were responsible for and in control of defense.

Another important aspect of Byzantine defense was the navy, since the empire contained so much coastline. At its height, the Byzantine navy consisted of some 200 ships of the line called *dromons*. These were galleys armed with rams as well as catapults or siphons for launching the deadly Greek Fire. Unfortunately, the high expense of maintaining a fleet and the rebellious nature of the sailors caused the Byzantine government to neglect the navy from time to time. Such periods of a weak navy allowed the resurgence of piracy and enemy navies, in particular those of the Arabs.

The fourth factor helping the Byzantines was their diplomacy and the fact that they were the only people of the Middle Ages who made a systematic study of their enemies' military tactics. They produced several military manuals detailing precisely what formations, maneuvers, and tactics to use against the heavy knights of Western Europe as opposed to the mobile light cavalry used by their enemies to the north and east. The Byzantines had to be more scientific in these matters because they were usually outnumbered by their enemies and had to rely on every trick or stratagem possible.

The first goal they generally pursued was to avoid a war if at all possible. As a result, the Byzantines were very skillful in diplomacy, especially against the less sophisticated cultures to the west and north. The first principle of Byzantine diplomacy was to turn two neighbors against each other and let them fight for Byzantine interests even though they might not realize they were doing just that. Naturally the neighbors who were duped into this kind of

behavior would be somewhat bitter about it. Byzantium's neighbors, especially those in Western Europe, denounced the Byzantines as cowards for their strategies. Even today the word "byzantine" is used to denote vicious intrigue. However, looking at the Byzantines' situation, we can understand why their behavior and concepts of war and heroism differed so much from those of Western Europe. When they had to fight, they did so very well. But they were masters of conserving their meager human resources and relying on other methods to attain their goals.

Finally, such a well-run empire with a highly trained civil service, army, and navy, required a healthy economy to support it. The invasions of the seventh and eighth centuries severely damaged the Byzantine economy. Most of its cities were reduced to little more than fortified strongholds to protect the surrounding peasants. In spite of this, Byzantine wealth was legendary, especially to the relatively simple peoples surrounding the empire. Such contemporary writers as Liutprand of Cremona tell of being thoroughly dazzled by the wealth and splendor of Constantinople. The capital city was the crossroads of much of the trade of the civilized world at that time.

A ten per cent toll on all imported goods from this trade raised sizable revenues. The government also kept monopolies on such goods as silk, grain, and weapons. Furthermore, it kept tight control on all the craft guilds, strictly regulating their quality of workmanship, wages, prices, and competition. As stifling to their economy as these measures may seem, they did protect the somewhat fragile industries and trade in the unstable period of the early Middle Ages. As a result of this protection, Byzantine industries flourished and its goods were among the most highly prized and sought after in the Mediterranean. Later, when trade and industry revived elsewhere, strict Byzantine controls would work against its people in more competitive markets.

The firm foundations of administration, defense, and economy laid by the Isaurian and Amorian dynasties (717-867) bore fruit under the Macedonian dynasty, which took the Byzantine Empire to the height of its power. The century and a half from

867 to 1025 saw a succession of generally excellent emperors who maintained the stability of the empire internally while expanding its borders. In 863, a major Arab invasion was annihilated at Poson, which set the stage for the steady advance of Byzantine armies against the Muslims. Antioch, one of the five original patriarchates of the Church lost to the Muslims in the 600's, was recovered. The Byzantines even had their eyes set on retaking the Holy Land and Jerusalem. In the north, the emperor Basil II waged relentless warfare against the Bulgarians, eliminating their kingdom entirely, and earning the title "Bulgar slayer". By Basil's death in 1025, the Byzantine Empire's borders extended all the way to the Danube River in the north and the borders of Palestine in the south. The Byzantines were definitely the super power of the Near East, but after Basil II's death everything started going wrong.

Our debt to the Byzantines. Byzantine civilization created little that was new or unique, being largely absorbed in religious matters or copying the literary forms of ancient Greece. However, in such an age of violence and confusion, the Byzantines did make invaluable contributions to civilization. First of all, Byzantine missionaries spread Greek Orthodox Christianity and civilization northward. Eastern Europe, especially Russia, was heavily influenced by Byzantine architecture, religion, and the Cyrillic alphabet. For example, the "onion domes" atop many Russian Churches testify to Byzantine influence. Orthodox Christianity has also had a profound and lasting impact on the Russian people down through the centuries to the present day, even surviving and outlasting official discouragement from the communist regime that held sway for nearly 75 years.

Second, the Byzantines passed Greek civilization, in particular its math and science, on to the Muslim Arabs. They in turn took the Greek heritage, added their own ingenious touches (such as the invention of algebra), and passed it on to Western Europe by way of Muslim Spain. This helped lay the foundations of our own scientific tradition.

Finally, the Byzantines directly passed much of ancient Greek culture to Western Europe during the Renaissance. Also, just by holding back so many

nomadic invaders from the East through the centuries, they allowed Western Europe's culture survive and develop in relative peace. Many writers from the West, hostile to the Byzantines for historical reasons discussed above, have downplayed and criticized the role the Byzantines have played in the history of our civilization. This is unfortunate, since, during the Early Middle Ages in particular, the Byzantines did more than their share in the preservation and advance of civilization.

Constantinople: The New Rome

A second foundation myth. Much as the creation of the original city, Byzantium, was said to be the result of divine guidance when the Oracle of Delphi told its founders to build their city across from "the blind men," so its second founding was allegedly the product of supernatural inspiration, this time in the form of a dream. Constantine's original plan was to build his new capital on the site of ancient Troy, having personally laid out its boundaries and seen its gates hung. But then God came to him in a dream and led him to the new location.

Constantinople's location at the narrow juncture between the Aegean and Black Seas was ideal for controlling trade between those two bodies of water as well as the trade routes that converged there to link Asia and Europe. The city itself was blessed by nature, with water bordering two of its three sides, providing it with both an easy defense and an excellent harbor known as the Golden Horn. The natural advantages of the city were further enhanced by human ingenuity. The harbor was protected from invasion by a massive chain stretched across its entrance. The landward side had a huge triple set of walls to protect it. Down through the centuries, when all else failed, that chain and set of walls kept Constantinople safe from invasions. Many times

all that seemed to remain of the empire was Constantinople itself. But as long as the city survived, the empire also survived to bounce back and recover its old territories.

The Golden Horn. The sixth century historian, Procopius described the Constantinople's harbor, the Golden Horn this way: "*The whole bay is about 5 miles long & all of it is a harbor, so that when a ship anchors there the stern rides on the sea while the prow rests on land, as if the 2 elements rivalled each other in their desire to be of greatest service to the city.*"--

Constantinople's walls were legendary to its neighbors. Supposedly, Mohammed had promised paradise to the first Muslim to breach them and take the city. A 60' wide and 20' deep moat could be flooded or drained at will. Behind that, a low wall shielded archers trying to block passage over the moat. The 2nd & 3rd walls were the main lines of defense with 192 towers staggered for maximum covering fire. The third wall's towers were 70' high with 25' thick walls.

The two levels of the towers were entirely separate, with the lower room entered from the city and the upper part from the battlements. This made it harder for anyone breaching one section of the walls to spread out beyond it.

Inside its walls, Constantinople contained some of the most marvelous sights in the civilized world. Many of these reflected the Roman heritage that the Byzantines were carrying on:

aqueducts, sewers, public baths, and street planning. Its array of some 100 churches, in particular the spectacular dome of the church of the Hagia Sophia, reminded one that Constantinople was a very Christian city. Still other sights reflected oriental influences: the bustling markets offering goods from all over the civilized world, the palace complex of the Boucoleon with its reception halls, mechanically levitating thrones, imperial gardens, and silk factories. Much of the Byzantines' success in dealing with their less sophisticated neighbors was due to their ability to dazzle visitors with such wonders.

Hydraulic engineering. The emperor Valens' aqueduct, completed in 368, was one of 8 aqueducts supplying the city with water. As with other Roman water systems, it led to reservoirs, which in turn supplied corner fountains. Likewise, there was an intricate sewage system of drains under the streets leading out to the sea. There were also 8 public and 153 private baths open to men and women at different times. Beneath the city lay enormous cisterns supported by hundreds of columns for storing water against times of drought or siege (below).

Besides water, church and state combined to supply food to the needy, supposedly feeding 80,000 people a day, while state medical officers tried, with limited success, to keep the city clean and free of disease. Along those lines, although the city had been laid out in a rectangular grid in Roman style, earthquakes and fires had realigned the streets in a less orderly manner. There were also great public gardens kept up at municipal expense to provide some green space

Among the treasures looted to adorn Constantine's new capital, in particular the Hippodrome, where the chariot races were held, were an Egyptian obelisk, and the tripod dedicated to Apollo in thanks for the Greeks' victory over the Persian Wars.

The Hippodrome (literally "where the horses run") was the major sports complex in Constantinople for the chariot races. The influence of Christianity had gotten blood sports of the Coliseum (gladiators, animal fights, animal hunts, etc.) outlawed, leaving chariot racing as the only remaining major public spectacle sport. By the 500s, the red and white teams were also gone, reducing the number of chariot teams/factions to the Greens and Blues, whose rivalry resembled modern sports rivalries, except that the fans brought knives to the stadium. In one disturbance, a gang of Blues sewed a Green into a leather bag and tossed him into the sea.

Adding to the intensity of the competition was the fact that Greens and Blues largely represented socio/political/religious factions as well, the Greens largely being from the poorer classes and Monophysite in faith, the Blues being richer and against the Monophysite heresy. Blues and Greens were also networked across the Empire, so a disturbance between them in one city could trigger trouble in others. This call and response cheer by the Blues shows how religious factionalism entered sports by emphasizing Jesus' divinity over his humanity.

"Who was crucified for us?"

"Holy God, Holy and mighty, holy and immortal"

Circus day was an all-day event for which businesses shut down and fans waited all night before to get good seats. The highlight of opening ceremonies was the entrance of the emperor, who had a special causeway from the palace to his box, which itself was elevated on pillars to protect the imperial family from angry sports fans. Similarly, railings and a moat surrounding the track protected the drivers. In the interest of public order, the emperor would

choose the race days, the drivers, and the leaders of the factions.

Races were 10, 15, or 20 laps usually lasting around 15 minutes, often with bloody pile-ups at the ends of the tracks with their hairpin turns. In the stands there was both heavy betting and praying. This Byzantine sports fan's prayer reflects the fans' intense loyalty, especially in the absence of a real political voice: *"O God, protect the emperor, protect the magistrates, protect our masters, protect our empress and her children, protect Anatellon! (driver?) Give them victory. Grant victory to the Veneti! Mother of God, let them be victorious that the empire may be filled with joy, that we may dance the dance of triumph! Jesus is our protector! Victory for the Blues! We win, and the emperor and his armies will gain victories, there will be abundance in the towns of the Romans. May the divinity eternally grant triumph and glory to the Blues! Victory to the Autocrator, to the empire, to the Veneti!"*

Another fan was so devoted to the races that, when he refused to sell certain property to the emperor, he was thrown in jail within earshot of the Hippodrome so he could hear the crowd, but not attend. The torture worked and he sold out at a ridiculously low price.

After the fourth race, marking the end of the morning's competition, there were various entertainments to keep the fans pacified: clowns, dwarves, spectators racing chariots pulled by other spectators, dogs that could pick out the most greedy or vicious people, men leading around gilded crocodiles, and gymnasts performing dangerous feats, one troupe of gymnasts losing half its members on one tour.

Too much testosterone? A recent theory about fan violence at soccer games may help explain the volatile nature of Byzantine chariot fans as well. At least in some places, male soccer fans pack the stadium so there is standing room only. They also tend to drink a lot of alcohol...which means they have to go to the bathroom...but they don't want to give up their spots by leaving...so they urinate on the floor where they are standing...which releases testosterone...which can help trigger violence.

It's a theory, but it could explain a lot. After all, the chariot races were all-day affairs where fans brought their own food so they wouldn't have to give up their spots. They also brought wine. Most theories agree that people throughout history have had to go to the bathroom.

That may also help explain the fans' impatience to get the afternoon races started, which didn't begin until the emperor returned to his box. To hurry the emperor along: fans would chant songs of increasing disrespect, such as: "Arise oh Imperial Sun. Arise and come forth", which was their way of saying: "Come on, you've had too many bottles already. You're already seeing double."

Apparently the fans weren't the only ones with short tempers. After one such round of chants, the emperor Phocas, already known for his mean disposition, unleashed his guards on the crowd, cutting off heads, noses, and ears with great slaughter.

The Nike ("Victory") riots (532) were probably the worst sports disturbance in history, although, as mentioned before, sports were tied up with politics and religion. What united the two factions was anger by everyone (including the poor, who supported the Greens) at government corruption and Justinian's raising taxes on the rich (who generally supported the Blues, like he did).

Therefore, after one riot at the Hippodrome, he ordered seven ringleaders, from both factions executed. However, two of them, one Green and one Blue, escaped after two botched attempts

(due to broken ropes and the collapse of the scaffold) and took refuge in a church, which imperial troops put under siege.

The emperor announced new games several days later to defuse the situation. This was where the cry of *Nika* came in. Normally each faction would yell *Nika* (victory to) and the name of their favored driver. This time however, the Greens and Blues joined forces in the thunderous victory chant against the watching emperor. He retreated to the palace and the crowd poured out into the streets to start a huge riot that nearly toppled the throne.

Putting down such riots was particularly difficult, because the narrow streets made it possible for rebels to barricade them and resist imperial troops while other rioters, including women, could hurl roof tiles, bricks, and even flower pots on the enemy from above. The object of one such uprising in later centuries was killed by such a flowerpot, while Pyrrhus of Epirus in the third century B.C.E died from a roof tile thrown down by an old woman joining the uprising.

A mosaic of Theodora and her court. This and the accompanying mosaic of Justinian are the most famous mosaics in Byzantine history.

Meanwhile, rioters set fires that spread throughout the city, even burning a hospital with all its inhabitants. By this time, Justinian was ready to go into exile when the empress, Theodora, entered to bolster his nerves. Determined not to go back to the life of poverty she was raised in, she told the emperor, "As for me, purple makes the best burial shroud."

Taking courage, Justinian sent his top general, Belisarius, who caught and slaughtered some 30,000 rioters trapped in the Hippodrome. In the aftermath, nineteen senators were executed, their palaces torn down, and their bodies dumped into the sea. Surviving nobles paid with their purses to the emperor's vengeful tax collectors.

Reconstructed view of the Hagia Sophia as it appeared during the period of the Byzantine Empire.

The Hagia Sophia. However, the riot's widespread destruction also gave Justinian the opportunity to pursue an ambitious building program. The most famous of these monuments still stands today: the church of Hagia Sophia. It was the most spectacular Church in the Christian world for centuries. Its dome, which was 100 feet across and 180 feet high, was the largest of any Church until the completion of Santa Maria del Fiore in Florence, Italy in 1436. As the historian Procopius put it: "*It seems not to rest upon solid masonry but to cover the space beneath as though suspended from Heaven.*" Its surrounding windows bathed it in what seemed an unearthly light by day, while thousands of candles would make it a shining beacon by night. Amazingly, it was completed in only five years. Because of earthquakes, the dome had to be rebuilt or restored in 558, 989, and the 1860's.

The Palace of the Boucoleon, a mile-long complex of buildings overlooking the emperor's private harbor, was the virtual nerve center of the empire. Some 20,000 people worked here: soldiers, sailors, bureaucrats, courtiers, priests, and entertainers. The palace's factories manufactured high-grade weapons and dyes. It was also the site of the state silk factories, one of the empire's most profitable monopolies.

The secrets of silk weaving supposedly reaching the Byzantines by way of two monks who smuggled silk worms and mulberry leaves out of China in hollowed out bamboo canes. For centuries people from Europe, the Muslim world, and Russia clamored for Byzantine silks since they were the only source of this precious commodity outside of China. In 1147, the Normans captured Thebes and Corinth with their silk factories, and silk manufacture spread to Italy and the rest of Europe.

The Gynaecium (women's quarters) was where the empress held sway. After the empress Theodora died of cancer in 548, Justinian went through her quarters and found a Monophysite priest she had hidden from him for twelve years.

One peculiar Byzantine custom was an empire-wide beauty contest to choose the emperor's bride. Given the stakes, families competed fiercely to get their candidate chosen as the new empress, even trying to sabotage rival candidates with knockout potions and poisons.

Byzantine wealth was legendary, especially to people in the less sophisticated West and North. One bedroom in the palace was floored with marble strips radiating out from a central medallion that framed a mosaic peacock. At the foot of each wall was a mosaic eagle with outstretched wings. The walls above these were covered with multicolored glass that shimmered like a field of flowers. Above those mosaic portraits of imperial family members raised their hands toward a brilliant green cross on the ceiling. The Imperial gardens of the palace had shaded walks and fountains, one expelling wine through a golden pineapple into a silver basin full of almonds and pistachios. Wandering among the shrubs & flowers were exotic birds such as ibis and peacocks.

The Blachernae Palace on the Golden Horn, built by the emperor Theophilus (829-42), became the main palace as the empire declined, since the Boucoleon was too big and expensive to run.

The Kingdom of Christ on Earth

The Kingdom of Christ on Earth. The biggest distinction between the old and new Rome was that New Rome was very much a Christian city and its empire the realm of Christ on earth. Byzantines saw themselves as subjects of Christ *Pantokrator*, ruler of all, and the emperor who was his representative on earth. Coins bore the image of Christ Pantokrator wearing the imperial diadem on the obverse and the emperor holding a cross on the reverse.

Psalms to “Christ the Conqueror” were sung in military parades. Next to the emperor’s throne was a second throne with a copy of the Gospels as a reminder of who the real ruler was.

The emperor was largely an actor in a spectacular passion play, with himself representing Christ. His daily life was strictly defined by ritual acts, each carrying religious significance. He was even dressed more as an icon than a human with his crown bearing a cross. His garments, supposedly divine gifts from the angels to Constantine, were kept in a Church. Meals were allusions to the Last Supper with twelve tables facing the emperor’s, each with twelve couches. Similarly, the palace was more like a church hung with relics. Imperial receptions resembled divine revelations more than just audiences. Officials announced the emperor as "Equal of the Apostles" while those

in attendance shielded their faces from his divine brilliance.

Visitors to the throne room were greeted by mechanical birds twittering in trees and bronze lions that roared and beat their tails. After falling to their faces in *prokynesis*, they would look up to see the throne elevated forty feet above them. Of course, all this was to overawe the empire’s subjects and, even more, its neighbors who found themselves faced with the imperial grandeur of Rome and the very power of god itself.

The monastic tradition was another important part of Byzantine civilization, so important that at times it may have drained the empire of some of much needed manpower. However, just as monasteries in the West preserved Roman literature through the chaos of the Middle Ages, Byzantine monasteries did the same for Greek literature.

Many monasteries, such as those at Meteora and Mt. Athos (below left), were nearly inaccessible, protecting the monks from both invaders and the corrupting influences of secular society. Visitors and supplies had to be hauled to the top by means of a rope attached to a basket. Other Christian ascetics took refuge in Cappadocia in present day Turkey (below center and right) where they carved churches out of its soft volcanic tufa. The desert was another popular refuge for escaping the evils of the world. Mt Sinai Monastery, in the desert where Moses supposedly saw the burning bush, was a particularly important center for art.

Justinian I: "last of the Roman Emperors"

The famous mosaic at Ravenna, Italy of Justinian and his court

While we refer to the Byzantine Empire, people in the Middle Ages still called them "Romans," never losing sight of the fact that this was the eastern half of the Roman Empire that had survived the barbarian invasions of the fifth century C.E. Both the terms *Byzantine* and *Roman* have some truth to them. They were the direct heirs of the Roman Empire and did carry on the remains of that empire for some 1000 years after the fall of the western half of the Empire. However, for all intents and purposes, it became a predominantly Greek empire and culture as the Middle Ages progressed. Its subjects spoke Greek, worshipped in what came to be the Greek Orthodox Church, and wore beards in the Greek fashion. They even argued and fought over religion in much the same way the ancient Greeks had argued and fought over politics.

If any emperor marked the dividing line between the Roman and Byzantine eras, it was Justinian I (527-565). He was clean-shaven in the Roman manner, the last emperor to speak Latin instead of Greek, and was responsible for having Roman law codified. His law code would become the basis for most Western European law codes today.

Law Codes. While states have systematic ways of passing laws, those laws are not generally made in any systematic order, but rather as needed to meet certain situations as they come up. In addition, there are often the courts and judges that have to interpret those laws: where and how they are applied. So in addition to the laws

themselves, there are often legal opinions from specific court cases that are used as precedents in deciding new court cases. However, many of those cases don't exactly match previous cases, so new opinions based on older opinions but also adapted to the new cases are made. The result is a growing mountain of laws and legal decisions based on those laws that judges must consult as the basis for their current cases. After several centuries, this can be an overwhelming mass of material to absorb and use, much of it either contradictory and/or redundant as it cites older decisions. Therefore, periodically some one needs to sort through this mountain of material and distill it down to a law code that is manageable enough in size for judges to use efficiently and effectively.

For this task, Justinian chose Tribonian, a brilliant lawyer and virtual walking encyclopedia of Roman law. The latter quality was especially important since, without printed books, there was no one central collection of written decisions, the best option being one brilliant mind, probably with a photographic memory. Tribonian completed this monumental task in a mere fourteen months.

Justinian's law code has served as the basis for most European law codes, but not those of England and the United States, which were based on English Common Law. This is largely because, thanks to the Vikings who eliminated six of the seven Anglo-Saxon kingdoms, Wessex was able to establish one unified legal system over all England. Meanwhile, continental Europe, was fragmented into hundreds of separate political and legal jurisdictions (700 in the Low Countries alone), so that when nation states pulled together in the High Middle Ages, they drew upon the one European-wide institution (the Church) and its law codes based on Roman law to create a unified legal system for the whole country.

One problem with Justinian's Code in the Byzantine Empire was that it was in Latin, the use of which virtually died out to be replaced as Greek as both the daily and literary language among Byzantines. Therefore, some three

centuries later, the emperor Leo VI (886-912) presided over a new codification of the laws, this time into Greek, being condensed into only six volumes. It was for this accomplishment that Leo was called “the Wise”.

Justinian was also very Roman in his desire to reclaim the Western Roman Empire. In 535, he sent his best general, Belisarius to take North Africa from the Vandals and Italy from the Ostrogoths.

Belisarius, commanded a mixture of mercenaries, including Huns whose hit-and-run tactics were very effective against less mobile enemies. At first the conquest of Vandal North Africa and Ostrogothic Sicily and Southern Italy went smoothly. However, when the Ostrogothic king, Totila, rallied his forces, a prolonged struggle over Italy ensued.

Unfortunately, Justinian distrusted Belisarius and gave him inadequate forces for finishing the conquest of Italy. Consequently, the Byzantines often had to remain on the defensive, even enduring three sieges of Rome by the Ostrogoths.

Finally Justinian replaced Belisarius with a 70-year old eunuch named Narses who had little or no prior military experience. Surprisingly, Narses proved to be a brilliant commander who completed the conquest of Italy. However, after 20 years of warfare, Italy was a wreck and Rome a mere shell of its former self, with only 500 inhabitants left.

The Byzantine Empire at Justinian’s death had recovered much of the West, but at huge cost and leaving it with long borders that over-stretched its defenses.

Eunuchs, men who had been castrated as they young boys so they could serve as court officials,

were an institution of several Eastern courts, including that of the Byzantines. Since they could not produce any children to succeed them and were seen as unfit for the throne themselves, they were not a threat to the ruling family. Therefore, they typically served as very loyal civil servants and, on rare occasions, such as that of Narses who completed Justinian’s conquest of Italy, as generals. In times of turmoil at court, they were often heavily involved with intrigues as power brokers behind the scenes, making and unmaking emperors. Aristocrats often had their younger sons castrated as eunuchs in order to promote them to lucrative palace careers. As relations between the Greek East and Latin West deteriorated over the centuries, this institution would be the source of much Western propaganda against the Byzantines as effeminate and decadent.

While Justinian’s efforts to reclaim the Western empire exhausted the eastern empire with the high cost in money and manpower for his wars and also tribute to keep the Persians quiet in the East, two other factors added to the damage. One was persecution of Monophysite heretics in Syria, Palestine and Egypt, which alienated much of the population against the central government.

Day of the rats. The other problem was Bubonic plague, which made its first appearance in history at this time. While the most famous outbreak of Bubonic Plague (Aka, Black Death) occurred in the mid 1300s, its initial, and equally damaging appearance came in the 540s in the middle of Justinian’s reign with its expensive wars and building projects.

Since the pneumonic variety of the disease kills its victims so quickly, it needs a large population to sustain it and spread it quickly. The Asian black rat was the ideal agent on both accounts, since it exists in large burrowing populations and also thrives on ships, which travel quickly, up to 100 miles per day. Therefore, before the Plague could kill off all the rats on one ship, it could spread to rats at the next seaport. Some of those rats could replace the ones who had died on

board the ships and make it to the next port, and so on.

Meanwhile, as the rats died, the fleas carrying the plague would have to find new hosts, those being sailors and people in the seaports. Some sailors would die along the way, but could be replaced by new recruits in seaports before they were infected. Or some sailors and merchants would have immunity and survive the entire voyage. Even if *most* crews died at sea before reaching port, it only took one ship to complete the voyage from India up the Red Sea or the Persian Gulf to spread the disease.

Therefore, the areas most affected would be those reached by water: the Byzantine Empire clustered around the Mediterranean, and the Persian Empire, especially Mesopotamia. The decline of the irrigation systems in Mesopotamia starting before the Arab invasions in the 640s indicates the Bubonic plague had hit there as well, setting the Persians up for their rapid collapse much like that of the Byzantines. Conversely, the Arabs being an inland people, were not affected by Plague in the 540s, while the Persian and Byzantine worlds were still recovering a century later.

Plague also devastated the Byzantine empire's population, supposedly killing 10,000 people a day in Constantinople and leaving so many dead that the bodies were piled into a castle, until they overflowed its walls. When Justinian died, the empire may have looked strong on the map, but in reality it was exhausted and in desperate need of a rest. Unfortunately, rest was the last thing the empire would get.

The word "plague". Since translators of the King James Bible in the early 1600s knew the Black Death as the only serious epidemic disease, they naturally interpreted any Biblical epidemic as "plague", even though it didn't burst upon human scene until much later. Thus our own somewhat generic use of the term for any epidemic, even though technically it refers just to one specific disease.

The Empire's Trial by Fire (565-c.800 C.E.)

A depiction of the Byzantines' secret weapon: Greek fire

The two and a half centuries after Justinian's reign would see the Byzantines constantly beset by waves of invaders coming from the north, the east, and the west. The very fact that the Empire even survived seems a miracle considering the troubles it endured.

In the West, the Lombards poured into Italy in 568, only three years after Justinian's death. According to one version, this invasion was the result of an insult to the eunuch, Narses, who had brilliantly finished the Byzantine conquest of Italy for Justinian. Like Belisarius, he was tactlessly recalled from Italy. The wife of Justin II, Justinian's successor, in order to mock the old man's status as a eunuch, sent him a golden distaff with the message, "Since you are not a man, go spin wool with the women." In revenge, he invited the Lombards into Italy in 568, thus undoing Justinian's work only three years after his death.

Whatever the cause of the invasion, it triggered centuries of fighting in Italy against the Lombards, Franks, and even Arabs, with the Byzantines managing to hold onto Ravenna and Venice in the north and southern Italy and Sicily to the south. After the Arabs overran North Africa in the 600s, these were the only remnants left of Justinian's conquests in the West.

A more serious threat to the empire's existence came from the east. Around 600 C.E., the

chronic hostility between Byzantines and Persians erupted in a titanic life and death struggle that would last a quarter of a century. The Persians overran Syria, Palestine, and Egypt while the nomadic Avars and their Slavic subjects rampaged through Greece and the Balkans. At its low point, Constantinople was almost all that remained of the empire in the east, and even it had to withstand a siege by the combined Persian and Avar armies.

Fortunately, the stout walls of Constantinople held fast against the enemy assaults, and a new hero, the emperor Heraclius, emerged to save the empire. His first task was to remove the unpopular emperor, Phocas (602-10), who was one of the worst emperors Byzantium produced. Having a beetle brow that met in the middle of his forehead and lit up bright red when he was angry, he seems to have been a lot less pleasant than he looked. Being constantly preoccupied with keeping his throne, his reign was a reign of terror that supposedly initiated the Byzantine practice of torture and mutilation of political prisoners. Blinding someone or chopping off his ears and nose made him unfit to rule in the eyes of the Byzantines, although Justinian II “the slit nose” (685-95; and 705-11) did regain his throne despite such mutilation.

Heraclius’ main foe, Chosroes II of Persia (590-628), who blinded his own father after overthrowing him, was also known to be less than pleasant when he didn’t get his way. He had the Arab ruler, Nu’aman III, crushed by elephants for failing to cooperate with him. His general, Shahin, to avoid this kind of treatment, committed suicide after being defeated in battle rather than face the wrath of his king. Nevertheless, Chosroes had the body packed in salt (to preserve it) and brought to the Persian court where he scourged it beyond recognition. Another defeated general apparently got off lightly, just being sent a dress to commemorate his defeat.

Jerusalem also suffered the wrath of Chosroes. At first, its patriarch, Zacharias, had arranged for the city’s peaceful surrender. However, rioting broke out in the city between Jews (whom

Phocas had forcibly converted) and Christians, leading to the expulsion of the Persian garrison and Jews. The Persians, joined by Jewish refugees, came back with a vengeance, undermined and collapsed the walls, and proceeded to massacre the city’s Christian population. The Persians also carried off the city’s holy relics, including the pieces of the true cross on which Christ supposedly was crucified.

Because of this, the war between Persia and the Byzantines assumed the status of a crusade with Heraclius being remembered by some as the first crusader. Supposedly at the height of the climactic battle in the war, Heraclius defeated the opposing Persian general in single combat (below). This idea of holy war would be revived nearly 500 years later in what we know as the Crusades.

The cost of the prolonged war with Persia was horrific, especially to Syria and Palestine. Hundreds of churches had been destroyed and thousands of Christians massacred by their Jewish neighbors and the Persians. Because of that and the rapid conquest by the Arab Muslims a few years later, Christianity in this region never recovered.

Unfortunately, right on the tail of this war a much more serious threat appeared. The Arabs, united and inspired by their religion, Islam, swept in like a desert storm, toppling Persian and Byzantine resistance like houses of cards. The Persian Empire collapsed, while the Byzantines saw Syria, Palestine, Egypt, and North Africa fall to the Arabs.

The Arabs then pressed on through Asia Minor toward the coveted prize of Constantinople itself. Twice (674-678; 717-18) the city's fortifications repulsed epic sieges by the Arabs. One factor aiding the Byzantines was a new secret weapon, Greek Fire, which, when fired from Byzantine ships sent the Arab fleet into wild uncontrollable flames. Greek fire even burned on water and supposedly could only be extinguished by sand, vinegar, or urine. However, because of its volatility, it could only be safely transported by water without exploding.

Greek Fire became a mainstay of Byzantine defenses for centuries to come. It was kept a highly guarded state secret by cutting out the tongues of the chemists who put it together. Therefore, we still do not know exactly what was in it, although it was probably some sort of petroleum compound similar to napalm.

Even after the introduction of Greek Fire, the first Arab siege of Constantinople lasted three more years before the Arabs finally retreated. Not only was their fleet destroyed, but their retreating army of 30,000 men was caught and massacred by the Byzantines. Despite the scale of this defeat, the Arabs were only temporarily checked in their advance against Byzantium.

"The Years of the Locusts" (685-717). Even during this reprieve, the Byzantines continued to see things go from bad to worse with a string of awful and/or incompetent emperors during a period they referred to as "The Years of the Locusts." The most notorious of these emperors was Justinian II (685-95), whose reign started off well enough, but was ruthless enough to lead to his overthrow and mutilation, earning him the nickname "Slit-nose."

But that wasn't the end of old "Slit-nose", who managed to slip into the capital and regain power for six more years (705-11). He may have left as a tyrant, but he returned as a homicidal maniac, killing all his enemies and their followers. When the men charged with the execution of the entire population of the city of Cherson overlooked the children, Justinian sent another expedition to finish the job. When word

came back of that expedition's shipwreck, he reportedly roared with laughter and sent another one. Not surprisingly, he was assassinated, only to be followed by a succession of weak emperors for the next six years.

In 717 C.E., a new emperor, Leo III, from Isauria in southern Asia Minor, came to the throne. This was just as another huge Arab army was descending on Constantinople. The second Arab siege of Constantinople (717-8) followed much the same pattern as the first, with Greek fire devastating the Arabs' fleet while hunger during the winter decimated their army and disease from all the rotting corpses did the same after the spring thaw. Less than half the Arab army and only five ships survived the siege and retreat from Constantinople.

According to one apocryphal story, Leo III sent a message to the Arab leader that he wanted to betray the city, and that the Arabs should pile all their grain and burn it as a sign that they were determined their next meal would be inside Constantinople after this coming assault. The logic supposedly was that by burning their own grain, the Arabs would scare the city into surrendering. It didn't work. Constantinople held on while the Arabs went hungry... if they really did fall for such a trick, which is unlikely.

This was the last time the Arabs would besiege Constantinople, marking the beginning of a period of stabilization for the empire's frontiers and internal development. Fighting with the Arabs would continue, but mainly in the form of sporadic border raids rather than massive invasions.

The Byzantines also faced serious threats in the north from Asiatic nomads and Slavic tribes. Two of these nomadic tribes, first the Avars, and later the Bulgars, mercilessly devastated the Balkans in their relentless warfare on the Byzantines. This area virtually dropped out of Byzantine control and the light of history for nearly 200 years as it was inundated by Slavic invaders.

After the Bulgarian khan, Krum, defeated and slew the Byzantine emperor, Nicephorus in 811, he had the emperor's skull lined with silver and made into a drinking cup, from which he forced visiting Byzantines diplomats to drink.

Even after converting to Greek Orthodox Christianity, the Bulgars remained a major problem for the Byzantines. After one particularly devastating raid, people rushed to the tomb of Constantine V, the one emperor who had successfully fought the Bulgars, begging him to come back to life, despite the fact that he was a hated iconoclast nicknamed "Copronymous", meaning "called from dung."

The Bulgars would be a major threat to the empire until their destruction by the Byzantine emperor, Basil II in 1018. Eventually, they would settle down, adopt Christianity, and even briefly be conquered by the Byzantines. But for now, they were one more major problem to be overcome.

By 800 C.E., thanks to perseverance in the face of disaster, Constantinople's walls, and some astute diplomacy that turned their enemies against one another, the Byzantines had survived, often against incredible odds. However, the empire had been stripped of all its lands except for Asia Minor, part of Thrace around Constantinople, Sicily, and parts of Italy. And it was still surrounded by very aggressive neighbors.

No longer was it a Roman Empire except in name and a few Italian holdings. From this point on, it was truly a Byzantine Empire.

The Iconoclastic Dispute (727-843 C.E.)

Mosaic icon of St. Agnes, typical of those the Iconoclastic emperors wanted to destroy

Unfortunately, just as outside pressures from the Arabs were starting to ease, a cloud of religious controversy descended upon the empire. The new issue, *Iconoclasm*, concerned the icons (religious images) the Church used to depict Christ and the saints. *Iconoclasts* said the use and veneration of these images was idolatry. *Iconodules* said icons were needed to instruct the illiterate masses in the teachings of Christianity. Leo III and several of his successors were iconoclasts and moved to abolish this form of idolatry by seizing the icons and destroying them.

Leo III the Isaurian and Constantine V (joint reign 720-741) who started the iconoclastic dispute

As one might expect in an era when religion was such a vital issue to both the individual and the state, Iconoclasm touched off some violent reactions from people attached to the icons. Riots swept through the cities of the empire, while relations were strained with the Church in Western Europe, which defended the icons.

Palace intrigues and murders centered largely on the icon issue. When an iconodule empress, Irene came to the throne (blinding her own son

in the process), she disbanded several of the army's best regiments since they were mainly iconoclast. Similarly, Iconoclast emperors disbanded parts of the navy, since most sailors were iconodules. The resulting damage to the empire's defenses invited raids and invasions that people saw as divine displeasure with whatever side was in power.

Iconoclastic & Iconodule Arguments

Iconoclasts, citing the Commandment that prohibited pictures of God, claimed icons were idolatrous and sinful.

Iconodules refuted this with several arguments:

- 1) Since that Commandment was given before Christ was incarnate as man, it was no longer valid.
- 2) They also used a Neo-Platonist line of reasoning: saying that since we live in an imperfect sensory world, icons are essential, but transitory, stepping stones toward knowing the absolute truth of God.
- 3) Since Christ's incarnation as man was the first indispensable step in raising men's souls toward God, denying the value of an icon to the soul was like denying the value of Christ's humanity.

Iconoclasts replied that if Christ was of two natures, human and divine, coalesced into a single, if unconfounded, union, how can we depict this?

- 1) If you are trying to depict his whole nature in one image, you are claiming to describe the indescribable, which makes you Monophysite heretics.
- 2) However, if you are claiming to depict only his human side, you are splitting Christ's indivisible nature, which makes you Nestorian heretics.

Iconodules refuted this by saying the icon was not consubstantial with Christ, but merely a Platonic imitation of him, not having any

importance in itself except it partook of the divine form to help elevate the soul up to that divine form.

Just as Christ's likeness was describable, such as the Holy towel of Edessa made by his own divine emanation, so icons did much the same.

Therefore, taking on the flesh did not degrade Christ, it sanctified the material icon and made it holy.

After over a century of this turmoil (726-843), the images were restored and the empire could pursue a more stable course undisturbed by major religious controversies. However, by then many works of religious art had been destroyed.

The Imperial Centuries (c.800-1025 C.E.)

Basil II (976-1025) who brought the Byzantine Empire to the height of its power

The disturbances of the seventh and eighth centuries left a very different empire from the one that Justinian had ruled. The most noticeable difference was that the empire was much smaller, having been stripped of Syria, Palestine, Egypt, North Africa, and most of Italy. While this deprived the Empire of valuable revenues, it also made it more compact and easier to defend since it was now confined mainly to Asia Minor and the Balkan Peninsula.

All this also made the Empire more ethnically, culturally, and religiously united. The largely Aramaic speaking peoples and Monophysite "heretics" of Syria, Palestine, and Egypt were now under Muslim control. This left a predominantly Greek speaking populace more or less united by the same religious views once the Iconoclasm struggle had settled down. The

empire may have been smaller, but it was also more cohesive.

Two centuries of upheaval had forced the Byzantines to adapt their society, government, and defenses to what seemed to be a continuous state of crisis. There were five main factors that helped the empire revive. First of all, after 750 C.E., the pressure from invasions eased somewhat, although not completely.

Second, the Byzantines repopulated Asia Minor, devastated by the wars of the previous centuries, by taking hundreds of thousands of the Slavs who had overrun the Balkans and resettling them on empty lands in Asia Minor.

The Slavs were hard working industrious people who became loyal subjects and excellent soldiers for the Byzantine state. No single policy probably did more to revive the Byzantine fortunes than this resettlement policy.

Part of the Byzantine resettlement of the Slavs was converting them to Christianity.

Third, the Byzantines overhauled the empire's administration and defenses. In the third century, Diocletian had separated civil and military offices to reduce the chances of revolt. However, constant threat of invasions forced the Byzantines to abandon this system and create military provinces called *themes* run by military governors (*strategoï*).

Having the tax collectors answer directly the emperor did reduce the likelihood of revolt while still leaving governors enough power to defend their provinces. An excellent civil service, possibly the best of any medieval state also helped in running the provinces.

Given their defensive needs, the Byzantines continued the Roman tradition of military excellence. However, their enemies' quick hit and run tactics and border raids forced them to rely more on highly mobile and versatile cavalry known as *cataphracts*. These were heavily armed to use shock tactics similar to those of western knights, but they were also armed with a bow and could function as horse archers when necessary. The Byzantines also fielded light cavalry plus heavy and light infantry who were useful in different types of terrain.

The backbone of this army consisted of peasants who served as cavalry in return for land to support them. Recruitment was done according to village, each supplying a quota of peasants armed and ready for service. This reduced the nobles' ability to challenge their ruler, in sharp contrast to situation in Western Europe. Every theme had several *drungi*, each able to supply about 1000 cavalry.

Although peasant soldiers usually presented no direct threat to the emperor, local nobles did frequently use them to rebel. To counter this threat, the emperor Constantine V (741-45) created the imperial *tagmata* (regiments). These were also peasant-farmers, but settled close to Constantinople and given more pay and equipment by the government, thus keeping them more tightly under the emperor's control. This gave the emperors both more security against revolts and a very effective field army for defending the empire.

Left: Thematic (provincial) cavalry
Right: Tagmatic (imperial) cavalry

The Byzantines were the one people who made a systematic study of their enemies' tactics thus giving their generals professional advice on how to avoid head-on charges by the heavy cavalry of Western Europe and escape ambushes and hit-and-run tactics of the Arabs and nomadic tribes from the north and east.

In addition to the cataphract, the Byzantines also developed super heavy cavalry called *klibanophoroi* (literally “oven men” since they virtually baked under the hot sun in their heavy armor), whose shock tactics could be used to match those of West European knights as well as being effective against more lightly armed enemies if caught in the open.

The Byzantines also employed mercenaries. Possibly the most renowned regiment in the Middle Ages was the Varangian Guard originally made up of Norsemen who had first come down from Russia to raid the Byzantines. The Varangians (meaning “men of the pledge”) were also renowned for their loyalty to the emperor. Making service in the Varangian Guard especially lucrative and popular was the custom of letting them each take as much gold as he could carry from the treasury upon the death of an emperor. Later, they also drew recruits from Anglo-Saxons who were dispossessed by the Norman conquest of England and also adept in the use of the battle-ax.

With so much coastline to defend, the navy was also important, consisting of some 200 galleys called *dromons* (below) armed with rams as well as catapults or siphons for launching the deadly Greek Fire. However, the high cost of maintaining a navy plus the sailors' rebellious nature caused the Byzantines to neglect the navy from time to time, allowing resurgence of piracy and enemy navies, in particular those of the Arabs.

Byzantine Diplomacy. The Byzantines also excelled at diplomacy, especially against their less sophisticated neighbors to the west and north, whom they would dazzle with the wealth of the imperial treasury, the magical powers of the imperial collection of holy relics, and the otherworldly splendor of the imperial court. In 949, the Westerner, Liudprand of Cremona, went on an embassy to Constantinople and gave this account of the court:

“Before the emperor’s throne stood a tree, made of gilded bronze, its branches filled with birds also gold, uttering different cries, depending on their species. The throne was so marvelously fashioned that at one moment it seemed a low structure, and at another it rose high into the air. It was immense and guarded by lions made of bronze or of wood covered over with gold who beat the ground with their tails and gave a dreadful roar with open mouths and quivering tongues ... I three times made obeisance to the emperor with my face upon the ground.”

However, the first principle of Byzantine diplomacy was to turn two neighbors against each other so they would unwittingly fight for Byzantine interests. For example, in 871, they used the Franks to besiege Bari in S. Italy while convincing the Arabs to surrender to them.

Naturally, anyone duped by these tactics would be somewhat bitter about it, and Byzantium's neighbors, especially those in Western Europe, denounced them as cowards for such tricks. Even today the word "byzantine" is used to denote vicious intrigue. However, given the Byzantines' situation, we can understand why their behavior and concept of heroism differed so much from that of Western Europe. When they had to fight, they did so very well. But they were masters of conserving their meager human

resources and relying on other methods to attain their goals.

The Byzantine economy. A highly trained civil service, army, and navy, required a healthy economy to support it. The invasions of the seventh and eighth centuries had severely damaged the Byzantine economy, reducing most of its cities to little more than fortified strongholds. In spite of this, Byzantium, being at the crossroads of much of the trade of the civilized world, was legendary for its wealth, especially to its less sophisticated Northern neighbors.

Byzantine payday. The Western chronicler, Liutprand of Cremona, gives an eyewitness account of the annual payday at the Byzantine court, telling how various governors, generals, and other officials would be loaded down with bags of gold so heavy it took several slaves to drag them out. No doubt this method of payment was done as a spectacle to impress visiting dignitaries.

Byzantine coins, in particular its gold *nomismas*, were literally the gold standard throughout much of the Middle Ages, being the primary medium of exchange throughout much of the Mediterranean, setting the standard for stability for centuries. Such coins also constantly reminded people of the enduring power of Rome.

A ten per cent toll on all goods passing through Constantinople raised sizable revenues. The government also kept monopolies on such goods as silk, grain, and weapons. Byzantine customs agents would board trade ships armed with long needles with which they would impale what were supposedly bags of grain. This way they could detect anything solid or tear any precious fabrics merchants might be trying to smuggle into the city. Foreign merchants could only stay for three months. Any unsold goods were confiscated by the city prefect and sold for them, the money, the

money from those sales given to them when they returned next year.

Byzantine guilds. Each industry in Constantinople had its own state-run guild. Everyone engaged in that industry had to belong to that guild and one could belong to two guilds. The guild as a whole bought all raw materials and distributed them to its members who sold the finished products in a designated public market at a price fixed by the city prefect. Bakers and butchers, being vital to the public welfare, were especially restricted by forcibly low prices, even during times of famine.

No middlemen were allowed into the process and there were severe restrictions against buying up and cornering a market. Offenses against guild regulations led to expulsion from the guild and sometimes even mutilation. Guilds were often responsible for unpaid public services. In addition, the belief that idleness bred crime led to mandatory work for the unemployed in public utilities or charities.

As stifling as these measures may seem, they did protect the somewhat fragile industries and trade through some unstable times. They also made Byzantine goods among the most highly prized in the Mediterranean.

Later, however, when trade and industry revived elsewhere, strict Byzantine controls would work against its people in more competitive markets. But for now they helped protect their trade.

The firm foundations of administration, defense, and economy laid by the Isaurian and Amorian dynasties (717-867) bore fruit under the Macedonian dynasty, which took the Byzantine Empire to the height of its power. The century and a half from 867 to 1025 saw a succession of generally excellent emperors who maintained the stability of the empire internally while expanding its borders. In 863, a major Arab invasion was annihilated at Poson, which set the stage for the steady advance of Byzantine armies against the Muslims. Antioch, one of the five original patriarchates of the Church lost to the Muslims

in the 600's, was recovered. The Byzantines even had their eyes set on retaking the Holy Land and Jerusalem.

In the north, the emperor Basil II waged relentless warfare against the Bulgarians, eliminating their kingdom entirely, and earning the title "Bulgar slayer". By Basil's death in 1025, the Byzantine Empire's borders extended all the way to the Danube River in the north and the borders of Palestine in the south. The Byzantines were definitely the super power of the Near East, but after Basil II's death everything started going wrong.

Bulgaroctonus. In 969, Basil II, possibly Byzantium's greatest warrior emperor, came to the throne at the age of five. After a stormy childhood and regency, he assumed power in his own right. However, unlike his predecessors, who had concentrated on campaigning in the South and East against the Arabs, Basil turned his attention to the Bulgars in the north.

Basil waged relentless warfare against the Bulgars, destroying their kingdom entirely by 1018. At the climax of this campaign he took 1500 Bulgarian prisoners, blinded 99 of every 100, leaving the remaining prisoner one eye with which to lead the other 99 home. Supposedly, the Bulgarian king, Simon, died of a broken heart upon seeing his sightless army returning home. From then on, Basil was known as *Bulgaroctonus* (Bulgar slayer).

A Scenario of Defending Against a Typical Arab Raid or Invasion.

Waves of Byzantine horse archers burst forth to harass their enemies with volleys of arrows, and then withdraw behind the protection of the more heavily armed

cataphracts, either to regroup and attack again or support their comrades in the melee to follow. In such a way the Byzantines combined the mobility and firepower of their nomadic enemies with shock tactics of the West, thus being able to adjust to different situations as needed.

Most Byzantine warfare consisted of defending the frontiers against various scales of border raids whose main goal was plunder and slaves. Such raids were at times annual events and required a finely tuned rapid response system. This is an idealized version of how the Byzantine thematic system should work in response to Arab raids along the Anatolian (modern Turkey) border.

As raiders entered Byzantine territory, guards in isolated watchtowers placed on high ground along the borders would spot them and alert the local *strategos* (governor) by triggering a series of watch fires to tell him where the incursion was and maybe some idea of its strength. He would send out light cavalry to hang on the outskirts of the enemy, keeping him updated on the situation and harassing foragers to deny them food and water. Meanwhile, thematic infantry would be mobilized and sent to block passes in the path of the invaders as well as their retreat.

Eventually a thematic army of sufficient strength (all eight Anatolian themes together being able to provide 25-30,000 cavalry, if needed) would converge on the invaders. When everything went right in springing the trap, they might catch the enemy exhausted, hungry, thirsty, and loaded with plunder and win a decisive victory that would stop such raids for several years. Such was the case when an Arab army was trapped and annihilated nearly to a man at Poson in 863.

Digenes Akritas, a Byzantine Epic Hero

Digenes Akritas (“Two-blood Border Lord”) was a popular Byzantine epic about a Byzantine warrior, named Basil, defending the Anatolian frontier. The *akritai* were a class of warriors charged with defending the borders. There were several shorter poems about other *akritai*. The term *Digenes* (“Two Blood”) refers to his origins as the son of a Muslim emir who kidnaps and marries the daughter of a Byzantine general, and then converts to Christianity. Their son, Basil, performs all sorts of superhuman feats in hunting (such as killing two bears with his bare hands) and battle against invaders and brigands. After an illustrious career of such heroics, Basil builds a palace by the Euphrates and lives happily ever after. Following is an excerpt describing him in battle:

*They mounted at once and they came to the battlefield.
They hissed like serpents, they roared like lions,
They soared like eagles, and the two clashed.
And then you could see a fight between fine brave youths.
In the heat of the battle they struck continuously,
and from the great clashing and the cut and thrust
trees were uprooted and the sun was darkened
Blood flowed down over their horse-trappings
and their sweat ran out over their breastplates
Constantine’s black horse was speedier,
and its rider was a marvelous young man
He charged at the emir and struck him a blow
with his stick
and then the emir began to tremble and flee*

*A Saracen addressed the emir in his own tongue
"Seize the youngster, my lord, and grab a quick victory
so that he doesn’t take your head off with his sudden turn
He has made a fine attack on you and now he might finish you off
I don’t think, my lord, you are going to do him much harm
but don’t let him boast that he routed an army
When the emir heard this, he withdrew some way from the youth
he threw away his spear and showed him his finger,
and with this gesture said these words
"May you live and rejoice, young man, for victory is yours."
--from Escorial manuscript, lines 32-54, by E.M. Jeffreys (pp. 241–2)*

THE DECLINE AND FALL OF THE BYZANTINE EMPIRE (c.1025-1453)

The Byzantine Empire, much like the Roman Empire, faced a formidable array of external enemies. However, it was largely internal decay that destroyed both empires. By 1000, the empire's political and economic stability created two lines of development that combined to trigger a pair of interlocking feedback cycles that, in turn, eventually wrecked the empire. First, there were the free peasants upon whom the government depended for taxes and recruits. When the empire had been under constant attack, land had been a poor investment. But once stability started to return in the eighth century, many nobles looked greedily upon the farmlands controlled by the free peasantry. There was a constant battle as the nobles tried to get these lands and enserf the peasants. The government, seeing the free peasantry as the backbone of its economy and defense, did what it could to defend them. Basil II in particular fought long and hard to defend the peasants, but even he was unable to break the power of the nobles.

Secondly, and unfortunately for the peasants, not all emperors were strong or concerned enough to defend the peasants. This was especially true after Basil II's death in 1025 when the empire was at its height and a strong military seemed less necessary. Therefore, a series of weak rulers with little military experience succeeded Basil. During hard times, such as famine, nobles would take the chance to dispossess the peasants. This would lead to the decline of the free peasantry and army, which in turn forced the state to rely more and more on expensive foreign mercenaries. This further increased the tax burden on the peasants, which caused more of them to lose their lands, leading to more reliance on mercenaries and so on.

This vicious cycle weakened the economy and tax base to the point where the Byzantines could not even afford to maintain their navy. Therefore, they asked such rising Italian city-states as Venice and Genoa to fight their naval battles for them. The price they paid was to lower and eventually eliminate the 10% import tolls the Venetians and Genoese would normally pay. This allowed them to undersell Byzantine goods, which lowered government revenues from trade as well as ruining the tightly run guilds of Byzantine artisans and craftsmen. The even lower revenues forced the Byzantines to rely even more on the Italians, who

then got an even tighter stranglehold on the Byzantine economy, thus repeating the cycle.

This also fed back into the first feedback cycle as the loss of money from lower tolls forced the government to raise taxes further and create an even greater burden for the peasants. The combined effects of these cycles led to growing internal decay within the empire and growing tensions with the Italian city-states who were taking over more of the empire's trade.

Along with these processes, events elsewhere were closing in on the Byzantines in the tenth and eleventh centuries. By 1070, a new and more aggressive enemy, the Seljuk Turks, had replaced the Arabs as the main Muslim threat to the Byzantines. In 1071, at the battle of Manzikert, the Byzantines found out that, besides being expensive, mercenaries can also be unreliable. The result was a disastrous defeat when their Norman and Turkish mercenaries abandoned them without even fighting, leading to the loss of part of the Balkans and most of Asia Minor, the very heart of the empire. This, along with the declining economy described above, generated steady internal decay for the empire.

Desperate for help, the new emperor, Alexius I, made a plea to Western Europe for mercenaries. What he got instead was the First Crusade, a religious war with the goal of taking Palestine and Jerusalem from the Seljuk Turks. Alexius skillfully handled this wave of half civilized Westerners as they passed through his empire on the way to Palestine. He even managed to use them to recover part of Asia Minor. Alexius and his successors, John I and Manuel I did manage to stabilize the empire's frontiers and recover some ground. Unfortunately, in 1176, Manuel and his army were ambushed and severely defeated by the Turks at the battle of Myriocephalum. The lands regained over the last century were lost once again, showing how hollow the Byzantine recovery actually was.

All the while, contact with the West kept growing, and with it friction between the two cultures. As the Italian city-states' stranglehold on the Byzantine Empire's trade grew, so did hostility against Italian merchants, who numbered some 60,000 in Constantinople alone. Cultural differences, such as how the two cultures carried on war and diplomacy, and a religious schism that split the Roman Catholic and Greek Orthodox Churches permanently in 1054, just added to the mutual animosity. In the late 1100's riots broke out in various Byzantine cities, with thousands of Italian merchants being massacred.

A major backlash came from Western Europe in 1204 when Venice directed the soldiers of the Fourth Crusade to Constantinople, which they stormed and brutally sacked. A short-lived Crusader state was set up, but the Byzantines recaptured Constantinople in 1261. However, irreparable damage had been done. The Venetians still held strategic Aegean islands, and the Crusaders still controlled parts of Greece. Furthermore, much of the wealth and splendor of Constantinople had been hauled off to Venice and Western Europe.

The energy and resources the Byzantines used in recovering from this blow would have been better spent in meeting a potent new threat from the East: the Ottoman Turks. From 1300 onwards, the Ottomans steadily encroached on Byzantine lands in Asia Minor. In 1345 they crossed into Europe never to leave. The Byzantine state crumbled piece by piece into a pathetic remnant of itself. Finally in 1453, Constantinople, the last remnant of the old Roman Empire, fell to the Turks after a desperate and heroic siege. With that siege went the last remnants of the Roman Empire.

Final Schism Between East and West (1054)

The Schism of 1054 largely centered on one Latin word, *filioque*, meaning “and the son.” The context was the Nicene Creed of 325 that spoke of the Holy Spirit emanating only from the Father, with no mention of it also emanating from the Son (Jesus). And so it remained until the late 500s when the Roman Catholic Church in Visigothic Spain added *filioque* to the creed, indicating the Holy Spirit emanated from the Father *and the Son*. The purpose was to emphasize Christ’s divinity to the Arian Visigoths.

Even though the Eastern Church, which also opposed the Arians, may have agreed with the idea behind *filioque*, it saw it as heresy because no Church council had officially endorsed it. And the Western Church remained silent on the topic, with Pope John VIII posting the Nicene Creed with the original wording (i.e., without *filioque*) as late as 880. However, at some point, the Popes started including “*filioque*” and the patriarchs in Constantinople would brand them heretics during times of tension between the two branches of the Church.

In 1054, in response from the Byzantine emperor Constantine IX for an alliance against the Turks, the pope sent the worst possible choice for a diplomat, Cardinal Humbert, who hated the Byzantines and wasn’t afraid to let them know it. The Greek patriarch, Cerularius, wasn’t much better behaved, refusing Humbert an audience while keeping him virtually under house arrest. He denied Humbert permission to leave when the pope died, making the Cardinal’s mission pointless. Finally, on July 16, 1054 Humbert solemnly left a bull of excommunication in the Hagia Sophia for the Patriarch, something he had no authority to do, since his sponsor, the pope was dead. But that didn’t stop Cerularius from returning the favor by excommunicating the Western Church.

And so began the Schism which has split the two branches of the Church ever since. There had been schisms before, and they had always been healed. So everyone figured this would be healed as well, but it never was. So as the Byzantines faced dark days ahead, they would have to do it with the hostility rather than the support of the West.

Disaster at Manzikert (1071)

The cost of letting the nobles oppress the peasants finally became apparent nearly a half century after Basil II’s reign at the Battle of

Manzikert against the newest nomadic threat to the empire: the Seljuk Turks. The Seljuks, like so many other nomadic tribes, started out small and were deemed by the Byzantines as a minor threat but a major irritant because of all their plundering raids. The Byzantine emperor, Romanos IV, tried to catch them several times and finally forced them into battle in 1071 at Manzikert in what is now eastern Turkey. The Seljuk leader, Alp Arslan, was heavily outnumbered and tried to negotiate a peace, but Romanos was determined to have it out then and there.

Unfortunately, forty-five years of neglect by the government and oppression by the nobles had taken their toll on the quality of the Byzantine army. Infantry reportedly showed up without regular weapons and cavalry showed up without horses. Therefore, in addition to the poorly equipped peasant militia, Romanos had to rely on what turned out to be very unreliable Turkish and Norman mercenaries along with a personal enemy, Andronikos Doukas, who commanded his rear guard. In fact, the Turkish mercenaries seem to have deserted before the battle even began.

Accounts vary about what happened in the battle itself, but apparently the fighting lasted most of the day and was inconclusive as the Seljuk horse archers harried the Byzantines while staying clear of a head-to-head melee that would play to their disadvantage. Toward the end of the day, Romanos ordered part of his army to return to camp. Unfortunately, the rest of the army mistook this for the emperor being killed, which prompted a general retreat. Andronikos Doukas could have saved the day with the rear guard, but used this as an excuse to desert, so the retreat turned into a rout that the Seljuks took full advantage of, massacring most of the Byzantine army.

Romanos kept fighting until his horse was killed from under him and he finally surrendered. Alp Arslan treated Romanos much better than his own court did, and released him after the promise of a ransom. Unfortunately, Andronikos Doukas and his allies had pulled off a coup and

blocked Romanos' return. (Apparently, Romanos' efforts to cut expenses and discipline the army had made him many enemies at court.) The emperor finally surrendered to Doukas after a promise of a safe passage to a monastery. However, Doukas reneged on the deal and had Romanos blinded. The wounds became infected and he died soon afterward.

The results of Manzikert were equally bad for the empire. With the army largely destroyed, the Seljuks swept through Anatolia and controlled all but the west coast by 1081 when a new emperor, Alexius Comnenus, came to the throne and bolstered what was left of the empire. Alexius and his successors did regain part of Anatolia, using the First Crusade at one point to help in their efforts, but the overall verdict of Manzikert proved to be permanent, as more and more Turkish tribesmen moved in, turning the region into what we now know as Turkey.

The Tragedy of the Fourth Crusade (1204)

The tragedy of the Fourth Crusade began when leaders of the crusade contracted Venice to build a fleet to take them to Egypt, rather than the Holy Land, the theory being they could trade Egypt for Jerusalem. As the Sixth Crusade would show later, it wasn't such a bad idea, but when the rank and file crusaders heard of this plan, many of them stayed home or found other ways to the Holy Land. As a result, instead of the planned for 30,000 crusaders, only 10,000 showed up, and they couldn't pay the Venetians, who had invested an entire year of their economy preparing for the crusade. At first they used the crusade to take the city of Zara on the Dalmatian coast (modern Croatia) as payment. Then they directed the crusade to Constantinople to restore a deposed emperor to his throne in return for money and support for the crusade.

The Siege and Fall of Constantinople (1453)

During the ensuing siege, Venetian galleys rammed through the chain blocking the harbor, exposing the weaker sea walls along the Golden Horn to attack and stretching the Byzantines' defenses. This convinced the emperor in Constantinople to abandon his throne and flee for safety.

However, when the restored emperor couldn't come up with the money he had promised Venice and the crusaders, they resumed the siege. Soon afterwards they stormed the exposed sea wall and proceeded to sack the city.

The sack of the city was much more brutal than that by the Ottoman Turks in 1453, as the drunken Crusaders indiscriminately slaughtered men, women and children, raped nuns, and plundered and defiled churches supposedly of their own faith.

The crusaders never continued on to Palestine.

The Byzantines never recovered from this blow.

Venice and the Crusaders split Byzantium's European and island possessions. While Venice would maintain a strong presence in the Aegean for centuries, the Crusaders' Latin Empire never coalesced into a strong state.

In 1261, the Nicaean ruler, Michael VIII, Paleologus recovered Constantinople and established the last dynasty to rule the Byzantine Empire, the Paleologi.

However, it never became more than a local power, facing ongoing threats of new Crusades from the West and the growing power of the Ottoman Turks in the East.

By 1328, the Ottoman Turks had nearly pushed the Byzantines out of Asia Minor.

In 1345, they would cross into Europe to intervene in a Byzantine dynastic dispute.

They never left.

By 1384, Ottoman advances had reduced the Byzantine Empire to little more than Constantinople and a few scattered outposts in Greece. Only a devastating defeat in 1402 at the hands of the last of the great nomadic conquerors, Timur the Lame, delayed the fall of Constantinople for another 50 years. But the empire was clearly living on borrowed time.

In 1422, during a Turkish siege of Constantinople, people saw an apparition of the Virgin Mary, whom the Byzantines had always thought especially protected their city. Indeed the city did survive this attack.

During the final siege in 1453, an icon of the Virgin fell over during a religious procession, seeming to portend the fall of the city. Unfortunately, once again the Byzantines would be right.

In 1453 the Turkish Sultan, Mohammed II, closed in for the final kill. What ensued was one of history's epic sieges. Central to the sultan's plans to demolish Constantinople's walls was a new technology, artillery. In particular he pinned his hopes on a huge cannon with a bronze barrel that was 26' 8" long, 8" thick & 2' wide. It could fire a 600 pound cannonball a full mile, imbedding it 6' underground. This monster could only be loaded and fired seven times a day, but each shot had devastating effects on Constantinople's walls.

Another Hungarian crafted siege gun, which was over 16 feet long, had an internal caliber of 42 inches, and fired cannonballs weighing 1200 lbs.

However, despite the odds and the lack of help from the West, the Byzantines put up a spirited defense. Time and again, they thwarted the sultan's attempts to get over, under, or through their walls. Several night assaults were all driven back with heavy casualties.

Mohammed then filled a section of the moat and brought a massive siege tower, bristling with guns, up against the city walls. At the end of the day it brought down a tower, leaving the city wide open to assault. However, with Mohammed absent, no one dared move without his orders. By dawn, the Byzantines had burned the siege tower, cleared their moat, and restored their walls to a defensible level.

When the Turks tried to undermine the walls, the Byzantines located each mine and destroyed it.

When four lone Christian ships appeared, a rag-tag Turkish force of ships swarmed out to meet them. Time and again Turkish crews were unable to storm the larger Christian ships, which cut through the Sultan's fleet to the safety of the Golden Horn and the cheers of the jubilant city.

Unfortunately, that was all the help the West would send.

Mohammed II, furious over this humiliation, had 70 ships hauled overland around Galata and dropped into the Golden Horn, thus threatening the city on all three sides, just as had happened during the Fourth Crusade.

Other things started going wrong for the Byzantines. As the continuous bombardment kept taking its toll, both physically and psychologically, news came that there was no more help coming from the West and bad omens were started appearing. One morning, the Byzantines awoke to find the city enshrouded in a mysterious and unseasonal fog. Even the icon of the Virgin Mary fell over to everyone's horror during a religious procession.

Soon after midnight on May 29, 1453 the Ottomans launched their final assault on Constantinople. At one point, Urban's cannon scored a direct hit on a section of restored fortifications, causing it to come crashing down. As Mohammed's troops closed in, the emperor and the general Giustinianni led a counterattack that threw back the enemy.

After several desperate hours of fighting, the Turks' elite troops, the Janissaries, finally

stormed the crumbling walls, soon followed by thousands of their comrades. Constantine XI died fighting on the walls fulfilling a prophecy that the Byzantine Empire, which began with Constantine I, would end with the death of another Constantine on the walls where it had all begun. His body was hacked to pieces by the triumphant Janissaries, only being identified by its crimson imperial slippers.

On the morning of May 29, 1453, Muhammed II rode triumphantly into the city and the Roman Empire was gone at last.

MOHAMMED, ISLAM AND THE RISE OF ISLAM

“O Mankind! We [God] created you from a single pair of a male and a female, and made you into Nations and tribes, that you may know each other. Verily the most honored of you in the sight of God is [he who is] the most righteous of you”-- Koran (XLIX, 13)

Arabia. If the middle Ages were an age of faith for Europe, they also were an age of faith for the lands to the south and east. Just as Christianity largely defined European culture, so the Near East came to be identified with another new religion: Islam (meaning submission to god's will). This dynamic new faith would soon stretch from the Atlantic shores of Spain and Africa eastward into India and to the very frontiers of China. It remains to this day one of the major religions in the world. However, since its followers have often competed with Christians in Europe for converts and power, it has been subject to a number of misinterpretations that still contribute to misunderstandings and hostility between the Arab world and the West.

As with most other religions, Islam's beginnings were quite humble, originating in the hot deserts and caravan towns of Arabia. Since the days of the earliest Near Eastern empires in the third millennium B.C.E., the Arabs had inhabited the fringes of civilization, absorbing their cultures as allies, enemies, mercenaries, and traders. Their caravans formed a vital link in the region's overland trade, while their ships sailed the Indian Ocean and beyond in search of spices and other luxury goods that the civilizations of the Near East and Mediterranean always hungered for.

Politically, Arabia was a buffer zone between the warring empires of the north, in particular Rome (later Byzantium) and Persia. Neither empire considered the Arabian Desert worth the effort of outright conquest. However, maintaining some influence there through allies, client kings, and Arab mercenaries was a cost effective way of securing their southern flanks against each other's attacks.

Before the seventh century C.E., Arabia had never been unified under one power. Instead, it was a patchwork of various tribes led by sheiks, some of who ruled tens of thousands of square miles of desert. These tribes jealously guarded their territories and independence, thus preventing unification and allowing manipulation by outside powers such as Rome and Persia. Even today, that tribal organization survives with the Saudi tribe ruling Saudi Arabia and the Hashemite tribe ruling Jordan.

Most Arabs were nomads, herding their sheep, goats, and camels from one grazing spot or oasis to the next. Being close to nature, they worshipped numerous tribal gods and natural forces and objects. The major center of worship was and still is the Kaaba in Mecca, a square building with a black meteorite that pilgrims visited and kissed because Abraham had started the building with that stone. Roman and Persian influences were especially strong in Mecca, with many Arabs being converts to Judaism, Christianity, and Persian Zoroastrianism. It was in this atmosphere of mingling cultures and religions that the new religion, Islam, would be born and inspire the Arabs to greatness.

The Prophet. The founder of Islam was Mohammed (c.570-632 C.E.). A wealth of details about Mohammed's life are preserved, including such things as names, ages and nicknames of his friends and cousins, where his house stood, who his neighbors were, personal problems he had with his uncle and aunt, and even the jokes he told. He was a member of a minor branch of the ruling clan of Mecca, the Quraysh. As a young boy he was orphaned and raised by his uncle. At the age of 25, he married a rich widow, Kadija, and became a merchant, traveling the trade routes of the Near East and coming into contact with its various cultures.

The turning point in Mohammed's life came in 610 C.E. While meditating in a cave outside Mecca, he had a vision of the archangel Gabriel who declared him the final prophet of God. It was three years till his next visions came, laying down the basic precepts of Islam and telling Mohammed to go out and preach the word of God.

In 613 C.E., Mohammed began preaching that there was one God, Allah, that all men are equal before God, and that the rich must share with the poor. Such doctrines did not set well with the ruling class of Mecca, seeing it as a threat to their social position, wealth, and the lucrative tourist trade from all the pilgrims coming to worship local idols and visit the meteorite in the Kaaba. As a result, they persecuted Mohammed, who fled Mecca and found a new home in Medina. This event, the *Hejira* (flight), is one of the critical events in Islamic history, and the Muslim calendar starts at this date (622 C.E.).

Mohammed was accepted at Medina and soon became its head of state. Over the years, new visions revealed the *Quran*, Islam's holy book. In addition to laying down the basic religious beliefs of Islam, it also dealt with conduct and all major aspects of living. Islam was more than a religion. It was a total way of life and continues to be today. Such a society ruled by religious principles is known as a *theocracy*.

Raids on Mecca's caravans led eventually to a war that ended with Mohammed's triumphant return to Mecca. A general amnesty and his lenient policies re-established peace there. By Mohammed's death in 632, the influence of Islam had spread across Arabia and was ready to burst upon the civilizations to the north.

The religion. Islam is a simple religion and therein lies much of its appeal. Its major tenets can be summed up in what are known as the Five Pillars of Islam.

Faith. A Muslim must believe in what are referred to as the Six Pillars of Faith. First of all, there is one God, Allah, the all-powerful creator of the Universe. He has no beginning or end and is indefinable (i.e., has no specific form, such as that of a human). As big and powerful as he is, Allah is described as closer to us than our jugular veins, a description that makes the faithful take heed of his power. The second belief is that Mohammed is the last in the line of the major prophets, following Adam, Noah, Abraham, Moses, and Jesus. They each brought us God's word, but each time people strayed from it. Since they see the Bible as a Holy

book, Muslims respect Christians and Jews as peoples of the Book, although their faith has been somewhat corrupted. Mohammed provides a true path to God by an example of living for all to follow. The third belief is in the final judgment day when we each will face God alone and be judged based on our deeds. Everyone shall be punished for every bad deed and be rewarded ten times over for every good deed, although God may forgive one's sins if he so chooses. The other pillars of faith are that Muslims should believe in angels, the *Quran* as the revealed word of God, and that anything that happens is the will of Allah and in his plan.

Prayer is the second Pillar of Islam. There are five specified times a day when the faithful pray toward Mecca. Prayers follow a specific format and take about two to three minutes to complete. Prayer reminds the faithful of their submission to God and humility in his eyes.

Pilgrimage to Mecca. This should be done at least once in a Muslim's lifetime, if possible. It is done at a particular time of year according to a certain ritual, and reinforces the idea of the unity of God and the Muslim community.

Alms to the poor. This amounts to 2.5% of the excess of one's income not used in the previous year. It reinforces the Islamic principle that we are all equal in the eyes of God.

Fasting. This involves taking in no food or drink from dawn to sunset during the lunar month of Ramadan, although one may eat and drink after dark. Islam, being a reasonable religion, makes exception for such people as the aged, very young, pregnant women, nursing mothers, travelers, and the ill. The basic idea behind fasting is one of sacrifice for the community and submitting to God's will.

The appeal of Islam. Several factors gave Islam wide appeal and contributed to its success. First of all, it is a simple religion that lays out in a very clear and straightforward manner what the faith is and what is expected of the faithful. Becoming a Muslim involves nothing more than declaring: "There is no God but Allah and Mohammed is his prophet." There is no hierarchy of priests, for all

are seen as equal in the eyes of God. Community worship on Fridays is optional and may or may not involve a sermon by the *imam* (prayer leader).

Equality of all before God and the idea of social justice also gave Islam wide appeal. Women especially gained higher status thanks to Mohammed's preaching, being better treated and had more rights than before Islam. Slaves and the poor also gained in status thanks to Islam.

One aspect of Islam and a common source of misunderstanding is the *jihad*. Meaning "striving", but typically mistranslated as "holy war", *jihad* more properly refers to the struggle against any corrupt system that keeps people from the free choice of religious beliefs. The *Quran* specifically says there should be no forcible conversion to Islam and that Muslims should deal kindly and justly with those who are kind and just with them. Only when faced with those who fight them for their faith and try to drive them from their homes, does the Koran sanction fighting. Unfortunately, those sorts of situations would lead to centuries of hostility between Muslims and Christians.

The sweep of Empire (632-750 C.E.). The death of Mohammed shocked many Arabs who had attributed divine qualities to the prophet. In order to ease their doubts, one of Mohammed's chief followers, Abu Bakr, addressed the crowd gathered in Mecca: "Whichever of you worships Mohammed, know that Mohammed is dead. But whichever of you worships God, know that God is alive and does not die." Then he quoted a passage from the *Quran*: "Mohammed is a prophet only; there have been prophets before him. If he dies or is slain, will you turn back?" Their nerves soothed and their reassured, the Arabs struck out on a path of conquest almost unparalleled in its scope and speed.

The civilizing influences filtering into Arabia from Rome and Persia had two effects combining to give the Arabs the dynamic energy for conquering an empire. For one thing, those influences made Arabia fertile ground in which Islam could take root. Second, they helped the Arabs to unify and expand outward, especially when inspired by Islam, whose warriors believed that death in a holy war for

the faith led to being transported instantly to Paradise. Add to this very capable leaders armed with the lightning fast tactics of the desert, and Islam's armies became the most potent forces of their day.

Two other outside factors also made the Arabs' rapid expansion possible. First, there was the degree of support, or at least non-resistance from the many Aramaic speaking peoples under Roman and Persian rule, since they felt much closer kinship to the Arabs than to their rulers. Also the Muslims were tolerant of Christians and Jews, charging only a special tax instead of forcing them to convert. This contrasted sharply with the harsher Byzantine policies against the Monophysite Christians in Egypt, Syria, and Palestine. The second factor was timing. Both the Byzantine and Persian Empires were worn out from years of prolonged warfare against each other. Likewise, Visigoth Spain was suffering internal decay and was thus ready for a fall.

The Arabs' first victims were the Byzantines and Persians. At the Yarmuk River in Palestine they were facing a large enemy force when a sandstorm blew up in the Byzantines' faces. Taking this as a sign from God, the Arabs charged and destroyed the Byzantine army. Syria and Palestine, along with Jerusalem, a city Muslims also revere, fell into the Arabs' hands. The Patriarch of Jerusalem, resplendent in his finest robes, had to meet this rag tag army of desert nomads and personally lead their leader's horse into the city. Nothing could better symbolize the contrast between the wealthy civilized subjects and their new masters fresh out of the desert.

The Arab advance continued northward into Asia Minor toward Constantinople, a particularly prized goal for Muslims. Despite their desert origins, they rapidly built a navy (with the help of their newly conquered Syrian and Palestinian subjects) with which they twice besieged Constantinople (674 and 717). In each case, the Byzantines' dreadful new weapon, Greek fire, helped save the city and empire. The Byzantines held fast, and a fairly stable frontier between Christianity and Islam gradually took shape in Asia Minor.

Sweeping westward the Arabs took Egypt with an army of only 4,000 men, following quickly with the conquest of North Africa. In 711 C.E., a small Muslim force crossed into Spain, where the Visigoth kingdom also crumbled before its onslaught. Storming into southern Gaul (France), the Arabs were finally stopped by the Franks at the Battle of Tours (733). Eventually a stable frontier formed in northern Spain between the Muslim and Christian worlds.

The Arabs also advanced eastward into Persia, which, also exhausted by prolonged war with the Byzantines, collapsed like a house of cards in 651. However, Persian culture would re-emerge as a major influence on Islamic civilization as it developed. In 711 C.E. (the same year Muslim forces entered Spain), the Arabs entered northwestern India and started to establish their power there. They also extended their rule into Central Asia and beat a Chinese army in a battle near the Talas River, which helped establish Islam as the dominant religion in Central Asia and brought the Arabs a new type of product, paper. Thus, by 750 AD, after little more than a century, the Islamic Empire stretched from Spain in the west to north India and the frontiers of China in the east, the most far-flung empire of its day.

Adapting to empire. In the year 640, a messenger brought news to the Caliph Omar in Medina that his forces had taken Alexandria with its 4000 villas, 4000 baths, and 400 places of entertainment. To celebrate this victory, Omar had the messenger share a meal of bread and dates with him, the simple fare of desert nomads. However, as ill suited to ruling such an empire the Arabs may have seemed, contact with their civilized Persian and Byzantine subjects allowed them to adapt quite quickly. They had three things to do: decide who was to rule, set up a system of government to rule the empire, and absorb and adapt the older cultures they ruled to Islam.

The ruler. The first problem was who should be *caliph*, the secular successor to Mohammed. The first four caliphs were elected by a tribal council of elders and are referred to as the Orthodox Caliphs, ruling from 632 to 661 C.E. However, as the empire grew, this form of government became

increasingly inadequate. In addition, tribal and clan jealousies continued. Of the four Orthodox Caliphs, only one, Abu Bakr (632-634) died a natural death. Finally, the Umayyad clan took over and established the Umayyad Dynasty (661-750). From now on, the dynastic principle of one family choosing the caliph would dominate.

However, not everyone saw the Umayyads as rightful rulers. Some known as *Shiites* felt that only descendants of Ali, the last Orthodox Caliph and a member of Mohammed's family, should be caliph. Those who felt any Arab could be caliph were known as *Sunnites*. The Sunnite-Shiite split is still one of the major factors dividing the Muslim world today.

In 750 C.E., a revolt led by Abbas, a governor of Persia, overthrew the Umayyads and established the Abbasid Dynasty (750-1258). Abbas was a ruthless man who worked to exterminate the Umayyad clan to a man. He even invited eighty Umayyads to a banquet and had them murdered at the table, then covering the bodies so he could finish his meal in peace. One member of the clan did survive, Abd-al-Rahman, who barely escaped Abbasid agents to make his way across the Mediterranean through the use of disguises and trickery. He arrived in Spain and founded an independent Umayyad dynasty. This was the first crack in the unity of the Islamic state. It would never be unified again.

Ruling the empire. From the start, the Umayyads saw that they must adapt Byzantine and Persian techniques for ruling their empire. Therefore, they instituted some major changes. They moved the capital from Medina to a much more central location, Damascus in Syria. They created the first Muslim coinage. They also adapted Byzantine and Persian bureaucratic methods as well as the Persian system of relay riders for faster communication of news from the further parts of the empire.

The Abbasids continued Umayyad centralizing policies. Consequently, more and more Persians, Greeks, Jews, and other non-Arabs gained positions of responsibility, since they had the training and experience necessary for running the government. This signified more equality and less distinction

between the Arab conquerors and their subjects, especially for those non-Arabs who converted to Islam. Even the Abbasid caliphs had less and less Arab blood in them, since few of them married Arab wives.

Nothing better shows these changes in Muslim government than the position and status of the caliph himself, which was modeled after the Persian concept of kingship. Although he still tried to advertise his religious functions by wearing the tattered robe of Mohammed upon occasion and styling himself as the "Shadow of God on earth", he was no longer a simple man of the people. Just getting an audience with him involved dealing with a multitude of officials. Upon approaching the throne, one prostrated himself, while the caliph remained out of sight, speaking to people through an elaborate screen that hid him from view. An executioner with drawn sword reminded one of the need to behave according to the strictest rules. This contrasted sharply with the Caliph Omar sharing his bread and dates with a messenger.

Exalting the caliph and keeping him hidden from view also isolated him from his people and the problems of his empire. As a result, the *vizier*, or prime minister, assumed more power and became the power behind the throne for the generally weak or disinterested caliphs. Later, *mamelukes*, slave bodyguards, also gained increasing power, virtually holding the caliph as a prisoner in his own palace.

Symbolic of the great changes going on in Muslim government and culture was the new capital the Abbasids built: Baghdad. Just as Constantinople was the crown jewel of the Christian world, so Baghdad became the same sort of gem for Islam. Its site in Mesopotamia was flanked by the Tigris River and various canals, thus making it easy to defend. Its central location also put the government in closer communication with the empire's far-flung provinces.

The form of the city shows the growing influence of Persian culture at court. Its layout was round in the Persian style, and had three sets of surrounding walls. The middle wall was the tallest, supposedly being 112 feet tall, 164 feet thick at the base, and 46 feet thick on top! Two highways split the city into

four quadrants, each with a central market. A great mosque and the caliph's palace, which was made of marble with a golden gate and a massive green dome 120 feet in diameter, dominated the central part of the city. On top of the dome was a statue of a lancer. According to legend, this statue would point toward parts of the empire where there was trouble. Baghdad was supposed to be inhabited mainly by the caliph, his court, and government officials, but such a capital drew a large population from all over the empire, its population reaching, according to some estimates, as high as one and a half million.

At first, all these expenditures stimulated trade with Western Europe, which helped both the Arab and Frankish empires. Unfortunately, continued heavy spending by the caliphs on expensive palaces, court ritual, adorning such cities such as Baghdad, and patronizing culture and the arts drained the treasury, which in turn wrecked trade with Europe. With trade so disrupted, Vikings in Russia and the Baltic Sea and Arabs in the Mediterranean turned increasingly to raiding and piracy in the ninth and tenth centuries. This brought the Dark Ages to their lowest point in Western Europe.

The development of Islamic Civilization. The period of roughly 750-1000 C.E. is known as a cultural golden age for Islam. During this period, the vigorous desert tribesman from Arabia assimilated the older cultures of the Near East and Mediterranean and infused new life into them.

The basis for such a golden age was the orderliness and resulting prosperity that Arab rule brought the empire from India to the Atlantic. The Arabs flourished as middlemen in a trade that involved silks and porcelains from China, gems and spices from India, slaves and gold from Africa, and slaves and furs from Europe. The stability and range of this trade are seen by a custom of writing letters of credit that would be honored in other cities of the empire. The Arab word for this, *sakk*, is the origin for our word "check". The Italian city-states would adopt these practices to become the premier centers of business in Europe in later centuries.

There were three main cultures the Arabs assimilated and fused into what we call Muslim

civilization: Indian, Persian, and Greek. From India, the Arabs picked up two concepts essential to the evolution of mathematics: the place value digit and zero. Both of these were vital to being able to do much more complex calculations than the old system of using letters represent numbers.

From the Persians, the Arabs inherited the full scope of Near Eastern cultures that extended back to the early days of Sumer. Much of Muslim art and literature was heavily influenced by Persia. The classic *One Thousand and One Arabian Nights*, with such tales as Sinbad the Sailor and Ali Baba and the Forty Thieves, dates from this period. Poetry also flourished, although it should be noted that the Arabs already had a strong poetic tradition before the conquests. Even such games as Backgammon, Chess, and Polo came to Islamic civilization by way of Persia.

The Greeks also contributed substantially to Muslim culture in the fields of philosophy, math, science, and architecture. Mohammed had said nothing wastes the money of the faithful more than building. However, the Muslims were great builders who owed much of their architectural skill and style to the Greeks. It takes little imagination to see the relationship between the dome of a Moslem mosque and the dome of a Byzantine church such as the Hagia Sophia.

Arab rule and civilization had important results in the way of providing economic stability and the spread of civilization. In time, it would pass many of its ideas to India, modern Islamic culture, and even Western Europe where they would be instrumental in the flowering of culture known as the Italian Renaissance.

The Setting for Mohammed: Arabia, Camel, Date Palms, and Mecca

Artist's conception of how Mecca, with the Kaaba in the middle, may have looked in Mohammed's time.

***Mohammad's homeland* consists of over one million square miles of sand wastes, gravel flats, and lava fields. An L-shaped rim of mountains on the south and west coasts produce moderate rainfall and agriculture there. However, there can be years between rains in the Nafud Desert in the North or Rub al-Khali (Empty Quarter) in the South. There is not a single permanent river in Arabia, just dry riverbeds punctuated by flash floods.**

***Date palms* (above) are known as "the mother and aunt of the Arabs", being used for food & fermented beer. Their crushed pits serve as camel feed, while baskets and building materials are made from palm fronds.**

***The camel* can carry 400 pounds, cover 60 miles a day in the desert and go three days without water. Its milk and flesh serve as food for Bedouins, while its hair is woven into tents and ropes, its hides are tanned into leather, and its dung is used for fuel. Camels are used as a unit of exchange for dowries or payment to end blood feuds.**

Mecca was where Abraham supposedly built the Kaaba with his son, Ishmael, who was also considered the common ancestor of all Arabs. Therefore, Arabs, like the Jews, trace their lineage back to Abraham. It was also the site of the Zamzam well that sprang from where Ishmael's heel hit the ground while his mother, Hagar, was frantically searching for water. By Mohammed's time, the Kaaba (below) was a major religious/tourist attraction housing a sacred meteor and where Hubal and 360 other gods were worshipped.

Life of the Prophet

Note: As explained to me by Muslim friends, it is permissible to portray the Prophet as long as his face is not shown. Using paintings from Muslim tradition, this is the guideline I have used out of complete respect for Islam. If I have erred in my assumption, please let me know. My intention here, as with any culture, is to give as positive view of that culture in the promotion of better peace and understanding in the world.

Birth of the prophet. As with Christ's nativity, a rich array of stories surrounds the birth of

Mohamed. Before he was born in 570 C.E., the year of the Elephant, a host of angels visited Mohammed's mother and told her she would bear the Prophet and she should name him Mohammed ("highly praised"). Just before his birth an Abyssinian army on elephants tried to destroy the Kaaba but the elephants refused to attack the shrine. Next came a cavalry attack, but a flock of birds stopped them by dropping stones from above. For his birth, angels (top) brought a mattress and coverlet for his mother's comfort. When Mohammed was an infant, they came with a pitcher, basin and towel for the ritual ablutions that Muslims still perform before prayer.

Mohammed's first visions. At age 40 (610 C.E.) he had his 1st vision while sleeping in a cave where the archangel Gabriel appeared to him. Mohammed thought he was possessed by demons and was about to jump from a cliff when Gabriel appeared again (below). Wherever he tried to turn he saw Gabriel's face. At last the angel told him: "O Mohammed! Thou art the apostle of God and I am Gabriel." After a long time Gabriel appeared in a second vision telling Mohammed to arise and call men to God. In subsequent visions he instructed Mohammed in the Muslim faith.

Night journey to Paradise. One night, angels appeared to take Mohammed on a tour of Paradise. First Gabriel took him to the Dome of the Rock in Jerusalem (making Jerusalem the third holiest city in Islam), where he slit Mohammed's body down to the waist, removed his heart to wash and purify it, and filled his body with faith and wisdom. To get there,

Mohammed rode the Buraq (below), a fantastic creature with a woman's face, mule's body, peacock's tail and fantastic leaping abilities. Supposedly the Buraq had taken other prophets to paradise.

Mohammed passed through the seven heavens and even experienced the joys of God's unveiled face. In Paradise he led the angels and Old Testament patriarchs in prayer. He described Moses as "a ruddy faced man", Jesus as "freckled and of medium height." Of Abraham he said: "Never have I seen a man more like myself."

Even when Mohammed demonstrated God's power by bringing forth a spring, his enemies denounced it as the Devil's work. Eventually he had to flee Mecca to Medina. At one point, to elude his pursuers, he hid in a cave where God had a spider spin a web to make it look like no one had been there recently. He found shelter one night with Bedouins who had a dry ewe until Mohammed miraculously made it give milk. When he arrived in Medina there were many offers of a place to stay. Mohammed let his camel decide and it stopped at house of a poor man.

In Medina many Arabs converted to Islam and gave up their tribal feuds in favor of a wider religious unity. Mohammed made an effort to win over the powerful Jewish faction by adopting some of their customs such as fasting on the Day of Atonement and praying toward Jerusalem. But the Jews saw him as a threat and opposed him. Therefore, he changed fasting to the whole month of Ramadan and prayer toward

Mecca. Even kissing the black stone in the Kaaba was authorized.

There was also the story that Mohammed was going to call the faithful to prayer with a Christian bell or Jewish horn, but Gabriel appeared and told him to use the human voice.

The Muslim calendar originally started in 610 C.E., the date of Mohammed's first vision, but was changed by the Caliph Umar to 622 C.E.

Mohammed's death. Supposedly Gabriel appeared to Mohammed and offered him the choice of eternal life on earth or in Paradise. He chose Paradise and died in 632 C.E.

Mothers of the Faithful: Mohammed's Wives

Mohammed and his wife Aisha free the daughter of a tribal chief

Much has been made of the fact that Mohammed had nine wives, even though Islam restricts a man to four as long as treats them properly and equally. In fairness to the prophet, most of them were widows, marriage to whom was largely an act of mercy. Several of them, either through learnedness or remarkable memories, would be major sources for sayings and details of the Prophet's life. Their lives and relationships to Mohammed teach us a lot about his and Islam's attitude toward women.

Khadijah, Mohammed's first wife, though older than him, was probably dearest to him, since she was his first convert and stuck with him through the hard period of persecution before the Hegira. He would marry all his other wives after Khadijah's death and his flight to Medina. After an intense period of mourning, Mohammed agreed to marry two women Sawdah and Aisha.

Aisha was only six when betrothed and ten when married to Mohammed, who at the time was fifty-four. While today, this is seen as inappropriate, even child molesting, it was common then when marriages were also for the purpose of sealing marriage alliances, and contemporary Muslims make no issue of the age of the Prophet's wives. That being said, Mohammed allowed her to enjoy her childhood, including her toy ponies, and was said to even join in some of her games.

After Khadijah, who had died before the Prophet took any other wives, Aisha seems to have been Mohammed's favorite wife. Despite their age difference, she was intensely jealous of several of his other wives, especially the young and pretty ones. Her jealousy would be a major source of the fracture lines that would lead to the Sunni-Shia split in later years after the Prophet's death.

Despite his favoring Aisha, Mohammed was careful to treat his wives equally. Each had her own hut surrounding a central court, and he visited each one's hut in a strict order night by night. Only when he was dying of fever, did he asked for permission from his other wives to break the schedule and spend his final days in Aisha's hut.

Sawdah was a middle-aged widow who was chosen by Khadijah for her ability to run a household, watch over Mohammed's daughters, and in a sense serve as a stepmother to the younger Aisha. She was also skilled at weaving fine dyed leather strips into mattress straps, fancy harnesses, and wind curtains.

Such leather goods were the primary source of income in Mohammed's household at Medina before tribute came pouring in. Even then, Mohammed gave away almost his entire share of the tribute, one-fifth of the total, to the poor, widows, and orphans. At one point, his wives even complained they would like to enjoy some of that wealth. Mohammed's reply was any of them could have her share now and leave or wait for it in paradise. They got the point and chose to wait.

Hafsah, Mohammed's next wife, was the daughter of Umar and widow of a soldier fighting for the faith. She had little in the way of charm and a temper to boot. Both Uthmann and Abu Bakr rejected Umar's offers of marriage. To defuse any difficulties this may involve, Mohammed offered to marry her.

Hafsah was both extremely devout and literate, and has served as a role model for Muslim women ever since. She also had an inquisitive mind that engaged Mohammed on serious religious and moral topics. She was a prime source for recalling many of the sayings of the Prophet and, according to some traditions, had the very first written copy of the Koran, even before the definitive version compiled by Uthman.

Zaynab bint Khuzayah was another war widow whom Mohammed married about a year after Hafsah. She was pious and renowned for her charity to the poor, but sadly died only a year after her marriage.

Umm Salamah joined Mohammed's household in 626. She was also a widow of a warrior fighting for Islam by whom she had children and was also quite beautiful, which created some tension within the household, especially with Aisha. Like Aisha, she also had a remarkable memory, making the two of them important authorities on the Prophet and his sayings after his death.

However Umm Salamah's experiences as a widow and responsibilities as a mother made her more serious minded than Aisha and she formed a special friendship with Mohammed's daughter, Fatima, also renown for her piety. Their friendship and that of Aisha and Hafsa created two rival axes around which Mohammed's wives would gather as part of the fault line that would later split Islam.

Raihanah and Safiyah were Jewish war captives whose husbands and families had been executed. Raihanah, who had a meek demeanor, chose to remain a concubine instead of a free Muslim wife and existed quietly in the Prophet's household until her death five years after her arrival. Safiyah was only seventeen, thus arousing Aisha's jealousy. However, her age and personality meshed well with Aisha's and she became part of her faction of wives. Although she converted to Islam and was quite devout, she still kept the Jewish Sabbath and donated liberally to her impoverished relatives.

Umm Habiba and Maymunah were both essentially married to Mohammed to seal political alliances.

Women and early Islam

Mohammed giving his daughter, Fatima, in marriage to Ali, the fourth and last Orthodox caliph. Since no other children of Mohammed survived childhood, all descendants of the Prophet came from her line as well. Fatima has been revered as model of upright behavior for Muslim women, as indicated by how the artist has enshrouded her head in a veil and divine fire (albeit smaller than Mohammed's)

Women and early Islam. The baseline attitude rooted in traditional Arabic culture can be summarized by what in the West is called chivalry. Stories about behavior toward women by Mohammed and his contemporaries repeatedly show extreme discretion and politeness toward women. For example, when escorting women they weren't married to, men were careful to walk in front of them so as not to be distracted and tempted by their sight. The current custom of women being in the back of the mosque is based on this same principle.

Similarly, the head coverings and veils worn by women in public are to protect their virtue and reputation. Until recently, women in the West also protected their modesty by keeping their hair covered or pinned up. Only when letting loose, presumably in privacy, would they "let their hair down." Granted, this "protection" of women also reflects their lower status in traditional cultures, both East and West, as virtual property. Modern issues of gender equality are just that, modern issues, and one must be extremely careful in using contemporary values to judge traditional societies.

Muslim Prayer

Muslim prayer involves a set ritual as follows:

- 1) The one praying ensure that his (or her) body & place of prayer are clean, performing ablutions (washing) if necessary. And then making the intention to perform the obligatory prayer. If water is not available for the ablutions, one can even use dust to symbolize spiritual cleansing.

Pilgrims' Progress during the Hajj

- 2) Standing, he raises hands up and says "*Allahu Akbar*" (God is Most Great).
- 3) Standing and with hands folded over chest, he recites the first chapter of the *Qur'an* in Arabic & any other verses he would like.
- 4) The worshipper raises up his hands up, saying "*Allahu Akbar*," then bows, reciting three times, "*Subhana rabbiyal*" (Glory be to my Lord Almighty).
- 5) He next rises to standing while reciting "*Sam'i Allahu liman hamidah, Rabbana wa lakal hamd*" (God hears those who call upon Him; Our Lord, praise be to You).
- 6) Again he raises his hands, saying "*Allahu Akbar*." Then, prostrate on the ground, he recites three times, "*Subhana Rabbiyal A'ala*" (Glory be to my Lord, the Most High).
- 7) Rises to a sitting position, saying "*Allahu Akbar*," then prostrates himself again in the same manner.
- 8) Rising to a standing position, he recites "*Allahu Akbar*."
- 9) This concludes one *rak'a* (prayer cycle) and he begins again from Step 3 for the second *rak'a*.
- 10) After two *rak'as*, one remains sitting after the prostrations and recites the first part of the Tashahhud in Arabic.
- 11) If the prayer is to be longer than these two *rak'as*, he now stands up and begins again to complete the prayer, sitting again after all *rak'as* have been completed.
- 12) Recite the second part of the Tashahhud in Arabic.
- 13) Finally, he turns to the right and then the left, each time saying "*Assalamu alaikum wa rahmatullah*" (Peace be upon you & God's blessings).

This concludes the formal prayer. Of course, in addition to the five obligatory prayers a day, one can make more informal prayers as the need or desire arises.

Muslim pilgrims pray on the Mountain of Mercy outside of Mecca during the Hajj.

The Hajj is a four-day process during which the pilgrim progresses through several rituals. Upon arrival in Mecca, one performs a ritual washing of the body and hair and dons two seamless white sheets. During the pilgrimage, one must not cut one's hair or nails. The pilgrim then runs seven times around the Kaaba and then seven times between two hills symbolizing Hagar's frantic search for water for her son Ishmael, through whom Arabs claim descent from Abraham.

The pilgrims then walk to Arafa, the scene of Mohammed's last sermon, along the way throwing rocks at a pillar that represents Satan. Upon return to Mecca, the pilgrim buys a goat for a blood sacrifice, which can be performed by a third party. The meat is distributed to the poor as a reminder of how all are equal before God.

Upon completion of the pilgrimage, one earns the title *Hajj* (pilgrim), which is a great honor among Muslims. Some people save up all their lives to take the pilgrimage to Mecca. If, because of poverty, they still cannot make the trip but have tried to save up for it, they are considered to have fulfilled their obligation.

Muezzins, Mosques, and Friday Worship

The Blue Mosque in Istanbul

Muezzins, who call the faithful to prayer, were the first salaried religious officials in Islam. As the empire and the number of Muslims grew, so did the number of muezzins needed to call them, with up to three of them on a balcony or tower (minaret) calling in all directions. The Great Mosque in Damascus employed seventy muezzins. The muezzin first called in the direction of Mecca, then to his right and then his left. Since their high vantage point allowed them to spy into courtyards and forbidden quarters, some mosques either blindfolded them, swore them to secrecy, or employed blind or people with impaired vision. Today, loudspeakers mounted at the top of minarets are typically used.

The mosque is the common place of worship for Muslims, analogous to the Christian church or Jewish synagogue. Its basic form is modeled after Mohammed's house in Medina: a main building, a portico around a courtyard where the huts of Mohammed's wives were placed, a fountain for the ablutions, and a tower (minaret) from which to call the faithful to prayer. Just as Mohammed's house served as a community center for Muslims to gather for meetings and prayers, so the modern mosque serves a lot of the same functions. Mohammed said there was no greater waste of the believers' money than building, but, not surprisingly, mosques became the supreme architectural expression of Islam.

Friday is the customary day for community prayers, but, unlike the Jewish Sabbath or Christian Sundays, it is not obligatory to go. After community prayer, the *imam* (prayer leader) will typically give a talk to the faithful.

Armies of the Arab Conquests (632-c.750)

A late Sassanid cavalryman (left), such as those who joined the Arabs after the conquest of Egypt, and a Bedouin warrior, more typical of the early armies of conquest right after Mohammed's death.

Arab armies of 600s fought mainly in tribal units. Their minimal command structure allowed them to keep fighting despite loss of generals. They traveled on horseback or camels, but generally went to battle on foot. Without the fully developed stirrup, it was still awkward and dangerous to fight from horseback except in flanking maneuvers and pursuit. And camels were too valuable for transport to risk in battle. Therefore, contrary to popular perception, Arabs fought mainly as infantry, although horses and camels did give their armies great mobility.

That being said, they fought using hit and run tactics to gradually wear down an enemy, darting in to pick off a few opposing soldiers, retreat hoping to lure the enemy out of formation and wear them down in pursuit, regroup, and attack again. As one Arab put it: "*Fight the enemy in the desert. There you will be victorious, or, even if defeated, you will have the friendly and familiar desert at your backs.*" The ebb and flow of these battles explains how long they lasted, such as Qadisiya in 637 against the Persians, which went on for four days.

Up till now, the Arabs had no skill in sieges, choosing instead to sidestep cities to destroy enemy armies while raiding the cities' trade and

supporting countryside. Merchants, being more concerned about business than politics, would typically surrender when there was no sign of deliverance, hoping to save their trade. As one Egyptian sage put it, “*the art of towns [surviving] is not to take sides*”

However, having conquered an empire, they quickly adopted more standard ways to fight and to besiege cities.

Early Arab Conquests (634-c.750)

The Arabs celebrate their conquest of Alexandria, Egypt in 639

One of the most celebrated feats in the Arab wars of conquest was the Arab general Khalid’s legendary 200-mile march across the Syrian Desert in 634 to join his comrades fighting in Syria. Supposedly, Khalid took three times the normal number of camels and engorged them with water before the march, killing them one by one along the way to water their horses from their stomachs. A more apocryphal version had Khalid constructing a pipeline of goatskins to pump water across the desert.

Sandstorms combine oppressive heat, high humidity, and high winds spitting fine red dust that gets everywhere, making it hard to eat without swallowing mouthfuls of grit and nearly impossible cook, draw water, or light fires. The sandstorm at Yarmuk, which lasted three days, also cut off the Byzantine chain of command and communications, making it even harder to react

in a concerted manner to the Arabs’ hit-and-run tactics.

The fall of Egypt was largely the work of the Christian patriarch/Byzantine governor, Cyrus. First he surrendered Central Egypt in return for letting his garrison and himself escape. Having somehow survived a trial for treason, he returned as governor of Alexandria, which he agreed to surrender in a year if the Arabs would let him leave in peace. Even without these betrayals, Cyrus helped the Arab cause by persecuting the Coptic Christians in Egypt, many of whom then welcomed the Arabs as liberators.

In 641 a Byzantine seaborne expedition briefly recovered Alexandria to the accolades of the Greek speaking population. When the Arabs retook it they sacked the city for betraying them. The last part of the famous library of Alexandria was destroyed now (part having been burned in 47 B.C.E. when Julius Caesar had been defending Cleopatra against rivals, and another part burning as the result of a religious riot in the 300s). The role of the Arabs is not clear. One apocryphal story has the Arab general burning it, saying any books with no mention of Islam should burn and others mentioning it weren’t needed. Most likely it burned in the confusion of the sack.

The Pharos Lighthouse of Alexandria, one of the Seven Wonders of the Ancient World, did no better. A series of earthquakes wrecked its lantern around 700, its octagonal tower in 1100, and everything else down to the foundations in the 1300s.

The Colossus of Rhodes, toppled by an earthquake nearly 900 years earlier, had lain in ruins in Rhodes’ harbor ever since the Arabs took the island in 672. Finally, an enterprising Arab merchant smelted down the bronze and sold it for a fortune. It was said that it took 900 camels to cart it off.

Fighting the Persians. As at the Battle of the Yarmuk against the Byzantines, a sandstorm blew up at the Battle of Qadisiya in 637 against the Persians. After three days, in what would be known as the “night of fury”, the Arabs launched a series of reckless night attacks on the Persian camp. Despite suffering heavy losses, they finally broke the Persians, leaving Iraq at their mercy.

Conquering Persia was a bit harder and longer, taking the Arabs twenty years to complete. In one battle, when confronted by a Persian war elephant, the Arab commander led a squadron of cavalry to bring it down with a javelin in its eye. In another battle against elephants, the Arab general, Abu Ubayd, led the attack, telling his men to go for the vulnerable trunks. Unfortunately for him, he was plucked from the saddle, thrown to ground, and trampled to death.

Yezdigird III, the last ruler of the Sassanid Persian dynasty fled eastward, begging in vain for help from the Byzantines and Chinese. He met an ignominious end as a refugee at the hands of a servant who killed him for his jewelry.

The Orthodox Caliphs (632-661)

The investiture of Ali as the fourth of the Orthodox Caliphs in 656.

Abu Bakr (632-4). In the confusion after Mohammed’s death in 632, one of his followers, Umar, threatened to cut off the hands and feet of

people who were in hysterics at the Prophet’s passing. More significantly, Abu Bakr calmed the crowd with a speech on how Mohammed was only a prophet and that God was still alive. A subsequent meeting of the Islamic community’s leaders chose Abu Bakr as Caliph, from the Arabic *Khalifat Rasul Allah*, meaning successor to the Messenger of God.

Abu Bakr was modest, pious and conscious of carrying on as Mohammed had. As a young man, he had been rich, but as a Muslim had given away nearly all his wealth to the poor. As Caliph, he would still patrol alleys in the evening to make sure there were no homeless or hungry widows or untended orphans. Similarly, he lived as the first among equals, only wearing an old cotton tunic and woolen cloak, unlike later Caliphs who would live in luxury and claim to be the “shadows of God on earth”.

Most of his short reign was spent suppressing a revolt in Arabia known as the Ridda and reestablishing Muslim control over the peninsula. In a particularly bloody battle called the “Day of the Garden of Death”, thirty-nine of Mohammed’s companions from the old days in Medina were killed. After that, Mohammed’s Companions were kept back for praying in order to save the collective memory of the early days. As he was dying, Abu Bakr had the Companions agree on Umar as the next Caliph and arranged to have himself buried next to Mohammed in the hut of Aisha, his daughter.

Umar (634-44) was a remarkable, but extremely severe leader, making him impossible not to respect, but also nearly impossible to love. Under Umar, Arab armies conquered Syria, Egypt, Palestine, and Iraq. When the Patriarch Sophronius would only surrender to Umar, he came up from Medina.

Umar was a puritanical man who allowed himself two garments a year and berated anyone he found wearing fancy clothes. When traveling, he didn’t use a bed, mattress or tent, but slept on

the ground covered by his well-patched cloak. He was just as hard on others, coming harshly punishing any public drunkenness, gambling, or improper dress. He even had his own son given the prescribed 80 lashes for drunkenness, killing him in the process. In the spirit of purity, Umar kept Muslim garrisons in separate towns away from the corrupting influence of native customs.

While Mohammed confessed an obvious love of women, Umar severely restricted their behavior, even trying to stop them from taking part in the Hajj and worshipping in mosques. It is to Umar that we can trace the more restrictive attitude toward Muslim women up to today.

However, Umar respected Christian holy places, since they were “people of the Book.” In that spirit, for centuries there was a custom at Easter when everyone in Jerusalem would douse their fires and then the Muslim governor would accompany the patriarch into the Holy Sepulchre, emerging with a new flame from which all the flames of the city would be rekindled. Umar also strictly banned forced conversions and insisted on offering enemies the chance to convert or submit to negotiated terms before attacking them.

Umar was murdered by Abu Lulu, a Persian slave he had refused to free. Before he died he was relieved to learn that his murderer was not a Muslim. A committee of six Companions appointed by Umar overlooked what seemed to be the obvious choice, Mohammed’s son-in-law and cousin, Ali, and chose instead the quiet, but also less strict Uthman who was seventy years old at the time.

Uthman (644-56), although from one of the richest Meccan clans, donated liberally to the poor like his predecessors had. However, he loosened Umar’s sumptuary restrictions, which attracted many richer Arabs to the faith, and even built himself a palace. (His wealth apparently didn’t help protect his eldest son who

was pecked to death by a rooster at the age of two.)

Uthman is still mainly remembered for his piety. Along with this charity, like Umar before him, he kept improving and expanding the facilities in Mecca to accommodate the rapidly growing number of Muslim pilgrims. He created a new level of administrators to handle the growing empire, established the rate of mandatory alms (zakat) at 2.5% of one’s excess income, made muezzins the first paid Muslim officials, and introduced a second call to prayer at noon on Friday to emphasize that as the time for the communal gathering of Muslims.

But Uthman’s greatest contribution to the faith was creating the definitive written version of the Quran in 650. Mohammed had dictated his revelations to his companions (known as *Sahabas*) who had written them down. Abu Bakr, the first caliph, had these verses compiled into one book, which was entrusted to Hafsa (Mohammed’s wife and Umar’s daughter). Uthman borrowed that text, had several thousand copies made, and invalidated any other versions.

Uthman’s version is the one standard version of the Quran, and it is commonly agreed that is the same as the original compiled by Abu Bakr. The fact that it was done within living memory of Mohammed has eliminated controversy over what should be in the Quran. Therefore, there is no difference between the Sunni Quran and Shiite Quran. Compare that to the final version of the New Testament, which wasn’t compiled for a couple centuries after Christ and is still the subject of controversy among some Christians, especially in reference to the so-called Gnostic Gospels that were not included. However, this has not stopped endless disagreement on interpretations of the Quran.

The finished product consisted of 77,000 words and 6211 verses arranged into 114 chapters known as *suras* (rows). They are classified either

as Meccan and Medinan suras, depending on where and when they were revealed to Mohammed, who kept receiving revelations until his death in 632.

Devout Muslims follow a strict protocol when handling the Quran. It should be stacked higher than all other books, wrapped in cloth when traveling, held above the waist, and opened only by those in a state of ritual cleanliness.

Uthmann was murdered in a dispute with the powerful Ummayyad clan, his cherished copy of the Quran being drenched in his own blood. According to a prophecy by Mohammed: *“Verily the Lord has a sword sheathed in a scabbard as long as Uthman lives, and when Uthman is slain that sword shall be drawn and it will not be sheathed until the day of resurrection.”*

The realm of Islam (Dar al-Islam) has been divided and often at war with itself ever since.

Ali (656-661) the last Orthodox Caliph, was married to Mohammed’s daughter, Fatimah and was the father of the prophet’s only male successors. He was Mohammed’s first cousin, adopted son, first male follower, closest disciple, a hero warrior of Islam, and the principal expert on law and understanding of the *Quran*.

Some believed Mohammed had imparted to Ali and Fatimah prayers, practices and concepts deemed too demanding for others. For these reasons, Shi’ites have believed that only Ali and his descendants were worthy of being Caliph. Unfortunately, Ali’s reign was plagued from the start with turmoil and challenges to his authority.

Despite the fact that Ali had tried to arbitrate a dispute with mutineers on Uthman’s behalf and posted his sons to guard his house, propaganda by Mohammed’s wife, Aisha, made him out as one of Uthman’s murderers. In 656 at the Battle of the Camel, after Aisha’s champions died one by one protecting her in a camel litter covered

with armored panels, she surrendered and Ali pardoned her followers. He then moved to replace Muawiya, the Umayyad governor.

Helping Muawiya’s position in the ensuing civil war was the fact that Ali had appointed one of Uthman’s murderers, Amr, as governor of Egypt. However, as Ali was winning a major battle, Muawiya had his men tear out pages of the Quran and stick them onto the tips of their spears, stopping Ali’s men in their tracks and forcing Ali to agree to a truce that got Muawiya off the hook.

In 661, three men, disgusted with the civil strife between Muslims, plotted to kill Amr, Muawiya, and Ali on same day during Friday prayers, when all three leaders would be most vulnerable while leading prayers. However, Amr didn’t attend prayers and Muawiya was saved by a quick-witted guard, but Ali was struck down, allowing Muawiya to seize the office of caliph and establish Islam’s first dynasty: the Umayyads.

Mohammed, Abu Bakr, Umar, and Ali all died at age 63.

THE SUNNI-SHI'ITE SPLIT IN ISLAM AND ITS IMPACT

“Verily the Lord has a sword sheathed in a scabbard as long as Uthman lives, and when Uthman is slain that sword shall be drawn and it will not be sheathed until the day of resurrection.”—Words attributed to Mohammed

Beginning of the rift. Soon after Mohammed's death in 632 C.E., the Islamic world suffered a religious/political schism that still constitutes the major divide among Muslims today: the Sunni-Shi'ite split. What made this so serious is the theocratic nature of Islam that combines religion and politics, where religious law, especially the *Quran*, rules state and society. This affected the Muslim world in three ways.

Two of them had to do with the Muslim Arabs' mission to spread Islam, resulting in the rapid conquest of a vast empire stretching from India to Spain. This, in turn, had two effects. One was the sudden accumulation of great power and riches by Arab leaders, who in many cases became corrupt and oppressed poorer Arabs and non-Arab converts to Islam. These conquests also brought the Arabs into increasing contact with and influence from Christianity, Zoroastrianism, and Judaism, all religions with belief in a future savior.

Meanwhile, a split had arisen between followers of Abu Bakr, one of Mohammed's first converts, and Ali, the prophet's very pious cousin and son-in-law over who should succeed as Kalifa (AKA caliph, literally *deputy*). Abu Bakr (632-634) was chosen over Ali, followed by the puritanical and severe Umar (634-44). When a Christian slave murdered Umar, Ali was again passed up in favor of Uthman from the powerful Umayyad clan. As was accepted custom, Uthman appointed many of his relatives to high posts in the rapidly expanding empire. When complaints about one of those relatives' corruption came to him, a dispute broke out which ended in Uthman's murder by an angry mob. In the aftermath, Ali was chosen caliph. However, Muawiya, the governor of Syria, led Uthman's Umayyad relatives in revolt. In 661 Ali, last of what were known as the four Orthodox Caliphs, was murdered, and Muawiya founded the Umayyad dynasty (661-750) in his place.

However, the dispute was far from over, because many Muslims believed Mohammed had designated

that only his son-in-law, Ali, and his descendants should rule as *imam* (he who walks in front or guides). This, combined with growing discontent over Umayyad corruption and oppression, became the basis of the Sunni-Shi'ite split. Shi'a is the shortened form for *Shi'atu Ali*, meaning followers of Ali, while Sunni comes from *Ahl as-Sunnah wa'l-Jam ā 'ah* meaning "people of the example (of Muhammad) and the community".

Two events in the decades after Ali's death intensified the dispute. In 680 C.E., a revolt by Ali's son, Husayn, was put down when he and seventy other members of his family were massacred in the present-day Iraqi city, Karbala, making this the Shi'ites' holiest city after Mecca and Medina. Only one son of Husayn, Ali, survived this massacre. Five years later, Ali's oldest son, Hasan, failed in an attempted revolt against the Umayyads. Twelvers, the dominant branch of Shi'a Islam, believe that Ali, his two sons, Hasan and Husayn, and a succession of nine of Husayn's descendants are the Twelve Imams. Many Shi'ites believe the twelfth and last of these imams, Muhammed ibn al-Hassan, is still alive and hidden by God until his chosen time, when he will return as the *mahdi* (rightfully guided one) with Jesus to restore just rule to the earth. Shi'ites believe the imams possess supernatural knowledge directly from God and thus are infallible. Sunnis reject this claim.

The deaths of Husayn and Hasan have also given Shi'a Islam a theme of suffering and expiation. This has justified in many Shi'ites' minds a long pattern of revolutions centered on the *da'l*, preachers of the imams' message who lead their followers to victory or martyrdom. These have given rise to more radical groups, some with beliefs far removed from mainstream Islamic beliefs. At least one group incorporated local beliefs, such as reincarnation, into their own. Others have gone so far as to deify the imams, attributing to them miraculous powers. Some Shi'ites, by rejecting all, especially Sunni, law have justified such things as murder and assassination, which has been the cornerstone of beliefs for a number of terrorist groups. One of these groups, known as the Assassins, targeted Sunni Muslims and crusaders in the twelfth and thirteenth centuries, murdering anyone who refused to pay them tribute. Our word, *assassin*, comes from *hashish*, which this group's followers would supposedly smoke before carrying out their political murders.

This is also the basis for present day resistance groups who, rightly or wrongly, are labeled terrorists. For example, Hezbollah (“Party of God”) in Lebanon, which started out as a resistance group without a solid base, has over the years come to provide many of the social services, such as schools and hospitals for many Lebanese Shi’ites. Ironically, the main terrorist group and nemesis of the West since the 1990s, Al Qaeda, is Sunni. Today, Sunnis make up about two-thirds of the Muslim world, but Shi’ites predominate in Iran, Iraq, and Lebanon. Most Shi’ites are known as Twelvers, believing in the twelve imams, but there are various splinter groups, such as the Ismailis and Zaydi (Fivers) who believe in a different line of succession for the imams. Both Shi’ites and Sunnis revere the Quran as the revealed word of God.

MOORISH SPAIN (711-1492)

The coming of the Moors. In the seventy years after the death of Mohammed in 632, the Arab Muslims had conquered an empire that stretched from the borders of India in the East to the Atlantic coast of North Africa in the West. In 711, an Arab general, Tariq, was sent into Spain with a force of unruly North African Berbers (from the Roman word for barbarians). Tariq, after whom the Rock of Gibraltar was named (from *Jebel al-Tariq*, the Rock of Tariq), decisively defeated the Visigoth king Roderic in 712, after which the Moors, as the Arab-led Berbers were called, overran most of the peninsula by 720.

Several factors aided the rapid Muslim conquest of Spain. First, despite Spain's hilly and fragmented geography, the Romans had succeeded in creating a tightly knit and Romanized province (both politically and culturally). Rome's Visigothic successors carried on these traditions, thus giving the Moors a fairly unified state whose government largely fell into their hands after one decisive battle, much as England fell to the Normans after the Battle of Hastings in 1066. A very different, but complementary factor was the de-centralized nature of Roman (and Visigothic) rule, where local nobles who copied Roman culture and showed loyalty to the empire, were allowed to run their cities or regions for Rome. By confirming these local officials in their positions in return for their loyalty the Moors avoided prolonged sieges. Therefore, it is likely that few people even noticed a change of management at the top.

By the same token, the Moorish conquest and its aftermath to c.800 seem to have been a fairly destructive and chaotic period in Spanish history for several reasons. First, there was some resistance by Visigothic leaders who lost their lands to Tariq's followers. Secondly, the Berbers who made up the bulk of the conquering army, were still unruly tribesmen and, for the most part, only superficially Muslim. Thus they often plundered and destroyed at will. Finally, while all Muslims were supposedly equal, the Arab

rulers and officers treated the Berbers as second-class citizens, taking the lions' share of land and plunder for themselves. This triggered a Berber revolt and period of turmoil (c.740-90).

This anarchy allowed the survival of the Christian states in the north, the most prominent of which would evolve into Portugal and Leon in the west, Castile in the middle, and Aragon in the east. Likewise, the Franks, who had turned back the Moors at Tours in 733, entered northern Spain in 778 under Charlemagne, supposedly to help the city of Saragossa. Although this expedition failed, Charlemagne's son, Louis I established a more permanent Frankish presence and military frontier, the Spanish March, in the northeast. This helped knit strong cultural ties with Catalonia, centered on Barcelona, which has maintained its own Catalan culture and language (a mixture of French and Spanish) and still harbors designs for political independence, much like the Basques do in the northwest.

The Umayyad Caliphate of Cordoba (c.800-1008). During this time, Abd al-Rahman, the lone survivor of the Umayyad Dynasty in the East after the Abbasid Dynasty's bloody coup, had escaped to Spain and gradually extended his control there (756-88). The Umayyads always had trouble maintaining firm control of their frontier regions, which were remote, turbulent, less wealthy and sparsely populated. This forced them to give more freedom and power to their military governors so they could defend the frontiers against the constant raiding that created a virtual no-man's-land between the Christian and Moorish realms.

However, under Abd al-Rahman III (912-61), al-Hakem II (961-76) and the viziers al-Mansur and his son Abd al-Malik ruling for the weak Hisham II (976-1009), the Umayyads established some degree of control over the frontiers and presided over the height of Muslim power in Spain. In 929, they even took the title of Caliph, spiritual and secular ruler of the Islamic world, most likely in reaction to the Shiite Fatimids in North Africa, claiming that title by right of descent from Mohammad's daughter, Fatima. The Umayyads also moved their capital from the old

Visigothic center, Toledo, to Cordoba, where they built one of the Islamic world's most splendid mosques and a magnificent palace complex. This palace had 140 Roman columns sent from Constantinople, a menagerie, extensive fishponds, and a room with a large shallow bowl of mercury that, upon shaking, reflected light wildly around the room like lightning in order to impress and terrify visitors. The court was also a flourishing center of culture, especially after the renowned Arab musician, Ziryab was attracted there from the East, bringing with him the latest in fashionable foods, clothing, and personal hygiene, most notably toothpaste. Cordoba was famous for its extensive library with 400,000 books and may have had a population of 100,000, making it one of the most splendid cities in the world at the time.

At this time, increasing numbers of Christians started coming from Northern Europe to absorb the growing body of knowledge stored in Cordoba, taking back such things as the abacus, astrolabe, Arab math and medicine, and translations of Aristotle. This transmission of Arab learning from Spain would be the basis for the revival of learning in Western Europe in the following centuries.

By 950, the population of Moorish Spain was largely Muslim, since as many as one million Berbers may have migrated to Spain and many Spanish Christians converted to Islam, either out of conviction, the influence of friends and family, or the improved opportunities such conversion might bring. Evidence for these conversions comes from the large number of Arab genealogies, which often show a point where Christian names are replaced by Arabic ones, indicating their conversion to Islam. Another source of converts was slaves, largely Slavs brought from Eastern Europe by Viking traders. These were often converted to Islam and trained as slave bureaucrats or bodyguards (although slaves with much higher status than the average subject). The caliphs in Cordoba had as many as 60,000 such recruits in their army, which largely freed them from dependence on unreliable Berber recruits.

Maintaining such a splendid court, capital, and army required a vibrant economy, which seems to have recovered in general across the Mediterranean after 750 and particularly in Spain after the turmoil of the 700s. Spain's agriculture especially flourished, from such new crops as rice, hard wheat for pasta (which required less water and stored better as a result), sorghum, sugar cane, cotton, oranges, lemons, limes, bananas, pomegranates, figs, watermelon, spinach, and artichokes. Figs, which were a Byzantine monopoly, supposedly reached Spain by smuggling seeds wrapped in a book past the customs agents. Making this "green revolution" possible were extensive irrigation and waterwheel systems copied from Syrian models, the largest being around Valencia, with reportedly 5000 waterwheels along the Guadalquivir River alone by 1200.

Better agriculture produced a healthier and more numerous population, which allowed the government to lower tax rates, which in turn promoted more innovation, thus creating even better agriculture, and so on. This, of course, allowed and encouraged urban growth and more industries, such as metals, ceramics, glass, silk, ivory carving, paper and book making, woolens, and dyeing with dyes imported from as far away as India. One indication of Moorish Spain's prosperity at this time was government revenue, which reached 6,500,000 gold dinars a year.

Fall of the Caliphate of Cordoba and rise of the Taifa, or "Party kings" (1008-c.1080).

After the death of the powerful vizier, Abd al-Malik, a period of civil wars and strife known as the *Fitnah* broke out (1008-31). Various claimants to the throne had to rely on Berber mercenaries, who claimed lands and provinces for their services. As a result, a string of weak caliphs rapidly followed one another, one supposedly reigning for only forty-seven days. In 1013 Cordoba was sacked and its library destroyed by Berber troops who, resenting their inferior status under the Arabs, saw no reason to preserve their culture. While the government disintegrated at the center, Christian princes in the north raided and conquered Muslim lands or extorted tribute from local rulers.

This chaos led to a fragmentation of power into some three-dozen city-states known as the *Taifa* (literally party or factional rulers, although our other meaning for party might also apply). Gradually, the smaller taifas were gobbled up by the larger ones, leaving six main ones: Seville and Granada in the south, Badajoz, Toledo, and Valencia in the middle, and Zaragoza in the northeast. Once affairs settled down and stabilized, there was a rapid revival of the economy and culture. However, rather than being concentrated at one central court, culture was dispersed and localized in a number of taifa states. Taifa rulers' status, much like that of princes in Renaissance Italy, rested as much on which scholars and artists they could attract to their courts as it did on warfare and conquest.

The richest of the taifa states was Seville in the lower valley of the Guadalquivir River, specializing in its olive oil, crimson dye made from a beetle, sugarcane, and musical instruments. Its rulers, al-Mu'tadid (1042-69) and his grandson, al-Mu'tamid, took Seville to the height of its cultural prestige and political power (even recapturing Cordoba from the Christians in 1069), and were themselves accomplished poets.

Meanwhile, the Christian states of Aragon-Catalonia in the east, Castile-Leon in the middle, and Portugal in the west were attacking and extorting tribute from various taifa states. Such tribute was a major, if not the main, source of revenue for these princes who, in turn, passed it on to their soldiers, nobles, churchmen, and merchants, making it a vital part of their economies. Joining in this were Muslim and Christian mercenaries who would fight for either side, depending on the pay and circumstances. The most famous of these was Rodrigo Diaz, known as El Cid (from the Arabic word for boss). During his very active career, Diaz served Castile (until he was exiled from there), the Muslim ruler of Saragossa (fighting both Christians and Muslims), and Castile again until another falling out with its ruler. Having built up his own fortune, reputation and following, he fought, plundered, and extorted tribute from both

Christians and Muslims until he took Valencia in 1094, where he ruled until his death in 1099.

Islamic resurgence from North Africa: the Amoravids and Almohads (1080-1250). Just as the Moors had originally come from North Africa and constantly drawn upon its Berber tribesmen for settlers and soldiers, so they drew renewed strength from two more North African groups to stem the tide of Christian conquest. The first of these, the Almoravids, were led by ibn Yasin, who had founded a *ribat*, a frontier religious community with a strong military character since it must be able to defend itself, and spread Islam through preaching and charity. As ibn Yasin's movement grew, it came to be called the Almoravids (from *al-Murabitun*, meaning people of the ribat). They founded Marrakech as a base in 1060 and took over Morocco by 1083.

They then moved on the taifas in Spain, which they saw paying tribute to non-Muslims, not recognizing the authority of the caliph in Baghdad, and failing to abide by the Muslim ban on drinking wine. In 1085 when the ruler of Castile took over Toledo, several alarmed taifas called the Almoravids into Spain for help. In 1086, the Almoravids crushed Castile's forces and embarked on a series of campaigns (c.1100-1125) to recover lands recently lost to the Christians. If the Almoravids were intolerant of any breaches of Islamic law by fellow Muslims, they were even less tolerant of Jews and Christians. From this point on we see growing hostility between Christians and Muslims who used to tolerate each other. Add to this aggressive Christian princes desperate to recover the lost revenue from tributes cut off by the Almoravids and a Church reform movement that wanted to channel the military energies of Europe's nobility into campaigns, such as the wars in Spain and the Crusades, to serve its own interests, and one can see a growing strain of intolerance that would plague Spain for centuries.

Arrogance toward other Muslims, growing indulgence in the very luxuries they had originally condemned, and the re-emergence of Berber tribal loyalties led to Almoravid decline after 1125. However, a new group of North

African reformers emerged to take their place, the Almohads (from al-Muwahhidun, upholders of divine unity). Founded by Muhammad ibn Tumart, their career seemed to parallel that of the Almoravids, starting with a ribat and winning over the local tribes with their own brand of religious fervor. One major difference between the two movements was that the Almohads believed in a more mystical unity of God in which all of us are immersed. In 1121, ibn Tumart was declared the *Mahdi* (rightly guided one) by his followers to restore righteousness in the final days before the Last Judgment. At this time, the Christian princes were taking advantage of a new period of turmoil (sometimes referred to as The Second Fitnah) by conquering more lands. In 1146, Alfonso VII of Castile briefly took Cordoba before losing it again. The following year, Alfonso I of Portugal took Lisbon with the help of an English navy, marking the start of a long friendship between those two countries. Consequently, a Sufi leader, ibn Qasi, called in the Almohads who took over the Almoravids and attacked the Christian states, inflicting a crushing defeat on them at Alcaros in 1195. This served as a wakeup call to the Christian states, which united against the Almohads and stopped them decisively at Las Navas de Tolosa in 1212.

In the next forty years (1212-52) nearly all the Iberian Peninsula came under the three Christian states of Portugal, Aragon, and Castile. Fernando III of Castile took Cordoba in 1236 and Seville in 1248 after a grueling siege. In the latter case, he ejected the surviving population and replaced it with Christians. A later elegy on the fall of Seville by the poet ar-Rundi seemed to bemoan the fate of Muslim Spain in general:

*Ask Valencia what became of Murcia,
And where is Jativa, or where is Jaen?
Where is Cordoba, the seat of great
learning,
And how many scholars of high repute
remain there?
And where is Seville, the home of mirthful
gatherings
On its great river, cooling and brimful with
water?
These cities were the pillars of the country:*

*Can a building remain when the pillars are
missing?
The white wells of ablution are weeping with
sorrow,
As a lover does when torn from his beloved:
They weep over the remains of dwellings
devoid of Muslims,
Despoiled of Islam, now peopled by infidels!
Those mosques have now been changed into
churches,
Where the bells are ringing and crosses are
standing.
Even the mihrabs weep, though made of cold
stone,
Even the minbars sing dirges, though made
of wood!
Oh heedless one, this is fate's warning to
you:
If you slumber, Fate always stays awake.*

Nasrid Granada and the end of Moorish power in Spain (c.1250-1492). By the mid thirteenth century, Moorish power in Spain was confined to a thin mountainous strip of land in the south that was never more than sixty miles wide. In the 1230s and 1240s, Muhammad ibn Yusuf ibn Nasr established a state centered on the city of Granada, thus giving his name to its ruling dynasty (Nasrid). Granada's strength was undercut by two main factors. First of all, it suffered from a good deal of internal disunity caused by tribal divisions, the ever-troublesome Berber mercenaries from North Africa, and an influx of Muslim refugees from the north. Second, it had a weak economy caused by its poor soil, forcing it to import much of its food, while Genoese merchants largely controlled its trade. Also, heavy tribute to the Christian states in the north forced the emirs (rulers) of Granada to charge high taxes, which made them unpopular.

Granada's survival depended on several factors: an excellent army consisting largely of Berber light cavalry, an extensive system of castles every five or six miles along its frontier and as many as 14,000 watchtowers scattered across the countryside, strong support from the Merinid dynasty in North Africa, generally capable rulers until the early 1400s, and some luck, such as the

intervention of the Black Death (1349), Castilian involvement in the Hundred Years War in the 1300s, and turmoil both within and between the various Christian states.

Despite its problems, culture flourished in Nasrid Granada, especially in the fields of poetry, architecture, and art. The most remarkable example of this is the Alhambra, probably the best surviving example of a medieval Muslim palace. Much of its beauty lies in its elegant gardens, fountains, and courtyards that provided a serene setting for meditation, reading, or romance. The rooms of the palace itself show Islamic decorative art at its peak, with intricate geometric designs gracing the walls, doorways, and ceilings. According to the poet, Ibn Zamrak:

*"...The Sabika hill sits like a garland on
Granada's brow,
In which the stars would be entwined,
And the Alhambra (God preserve it)
Is the ruby set above that garland.
Granada is a bride whose headdress is the
Sabika, and whose adornments are its
flowers."*

In the 1400s, Granada's luck ran out in several ways. Genoese control of its trade tightened, which further aggravated resentment caused by the high tax rates (three times that paid by the people in Castile) to pay tribute to the Christians. The Merinids in North Africa went into decline and could no longer provide Granada their support. Tribal strife within Granada increased while the Christian states of Portugal, Castile, and Aragon resolved their own internal problems. In 1469, Ferdinand of Aragon and Isabella of Castile married, thus uniting Spain into one powerful state when they ascended their respective thrones in 1474. The only missing piece of the puzzle, in their minds, was Granada, which they attacked in 1482. The war boiled down to a series of sieges, as one city after another fell to the Christian artillery. In 1492, after an eight-month siege, Granada fell to Ferdinand and Isabella, who accepted the surrender dressed in Moorish clothes. After nearly 800 years, Spain was again united under Christian rule.

For Spain's Jewish and Moorish subjects, Christian rule was anything but pleasant. Almost immediately, the Jews were expelled from Spain, thus depriving it of some of its most productive population. Despite Ferdinand and Isabella's promise to tolerate Islam, Muslims were forced to convert to Christianity or leave Spain in 1502. Since emigration was so costly, most converted in name while secretly maintaining their own beliefs and practices. In 1568, Philip II, increasingly concerned about his image as a strict Catholic monarch and the support Moriscoes (Moors supposedly converted to Christianity) might give to the Ottoman Turks and his other Muslim enemies, tried to stamp out their Muslim customs, which triggered a revolt. After brutally suppressing this uprising Philip dispersed the Moriscoes across Spain. However, since they still refused to assimilate into Christian society, Philip III took the final step of expelling some 300,000 Moriscoes from Spain in 1609. Aside from the suffering this caused, it also substantially hurt Spain by ridding it of much of its most productive population just when its power and wealth in other quarters were going into decline. This only accelerated Spain's decline into the rank of a second rate power by the mid 1600s.

Moorish Spain's legacy. As discussed previously, many Christian scholars during the Middle Ages came to Spain to absorb its learning, helping trigger a revival of learning in Europe. This was probably the single most important legacy of Moorish Spain to Europe. One of its most significant contributions came from the philosopher, ibn Rushd (known in Europe as Averroes), who devoted his life to reconciling faith and reason (in particular that of Aristotle). The Christian philosopher, Thomas Aquinas, whose *Summa Theologica* similarly reconciled faith and reason, quoted ibn Rushd no less than 503 times in his works. It was Aquinas' work that laid the foundations for the Renaissance and the birth of Western science in the centuries to come, but in a very real sense, it was the work of an Arab scholar, ibn Rushd, that was the real foundation.

[Back to flowchart](#)

ARAB MATH AND SCIENCE

The flow of history sometimes takes some devious twists and turns in its course of events. Such is the case with our own modern science, which received its legacy of Greek science and math not directly from the Greeks, but by way of Islam. Indeed, one of Islam's greatest cultural legacies was the preservation of Greek philosophy, math, and science, coming from Islam and the rise of the Arab empire in two ways. First of all, rather than rejecting ancient Greek learning, Muslim culture remained quite open to it. The story goes that the caliph al-Ma'mun had a dream where the Greek philosopher Aristotle assured him that there was no conflict between reason and faith. This revelation led al-Ma'mun to start gathering the works of the Greek philosophers. Second, the rise of their empire directly exposed the Arabs to Byzantine and Persian cultures that still carried on ancient scholarship. Therefore, the Arabs were both willing and able to absorb Greek math and science.

There were three things the Arabs needed to do: get copies of the Greek texts, translate them, and provide funding for these endeavors. As far as getting the books was concerned, many of them had fallen into Arab hands through conquest. However, there were still many texts that they needed. Sometimes they would negotiate with the Byzantines for copies of these books. At other times, raids into Byzantine territory would actually be aimed at seizing such works along with more material plunder.

Once these works had been gathered, the Arabs needed to translate them into Arabic. Luckily, Islam attracted a large number of converts, among them many scholars educated in Greek. However, since the *Koran* at that time was written only in Arabic, new converts had to learn that tongue in order to read Islam's holy book. As a result, Islam's appeal created a number of brilliant translators.

Funding largely came from the caliphs themselves. Caliph Ma'mun founded a palace learning center known as the House of Wisdom where many of the most brilliant minds of the age were gathered to translate Greek works and then add to this knowledge. The budget for the House of Wisdom

was 500 gold dinars a month, with fifty-seven translators working there at one point. The translator, Hunayn, was supposedly paid the weight of his translated books in gold.

All this led to a level of scholarship unsurpassed in its day. Since books were hand written, and thus prone to a growing number of mistakes as each generation of books was copied, the translators would gather as many copies of a particular book as they could and then compare them to see which was probably closest version to the original text. Just compiling such critical texts alone was one of Islam's greatest legacies to us.

Starting with this excellent base of Greek knowledge, the Arabs made their own advances in the fields of Mathematics, medicine, and physics. Since Islam also encompassed part of India, its math was assimilated into the larger body of mathematical knowledge and passed on to us. The Indians came up with two very valuable concepts that simplify math for us immensely: place value digits and zero. As brilliant as Greek math was, it did not have these two tools, thus severely limiting what it could accomplish, since any math using Roman numerals is extremely cumbersome. Because of such limits, Greek math excelled in geometry, which could function better than other branches of math without place value digits and zero. Even proofs in non-geometric math were done with the brilliant use of geometric figures to illustrate problems. The Muslims embraced Greek geometry wholeheartedly. One need only look at Islamic art and architecture to see their fascination with various geometric shapes and the ingenious things they could do with them. The religious ban on portraying the human figure certainly spurred Muslim art to excel in this direction.

However, the Muslims did not just slavishly copy the Greeks. Rather, they made their own original contributions in the fields of mathematics, medicine, and physics. Equipped with the Indian place value digits and zero, they developed trigonometry and first clearly defined sine, cosine, and cotangent functions. They further developed algebra (from the Arabic, *al-jabr*, which means "the missing"). The mathematician al-Khwarizmi wrote the first textbook on algebra and was probably the

first to solve quadratic equations with two variables. In future centuries his textbook would be the basis for European algebra. It has been said that science is always pushing against the frontiers of math. If that is true, then the Muslim mathematicians certainly allowed those frontiers to be expanded considerably.

As advanced as Islamic math and science were for their day, we should keep in mind that scientists then were not specialized in the way scientists today are. For example, the translator Qusta ibn Luqa wrote on such topics as politics, medicine, insomnia, paralysis, fans, causes of the wind, logic, dyes, nutrition, geometry, astronomy, etc.

The Arabs also excelled in medicine. The great physician al-Rhazi, or, as he was known in Europe, Rhazes (865-923), correctly differentiated between the symptoms of small pox and measles and showed that diagnosis on the basis of examining a patient's urine was not very useful. He also used animal gut for suturing wounds and developed mercurial ointments for treating skin and eye diseases. Keep in mind that the accomplishments of Muslim science were done without the microscope. Not until that was invented in the 1600's would scientists be able to see microbes and understand the real causes of most diseases. This makes Muslim medicine seem all the more remarkable.

Al-Rhazi also knew how to use psychological treatment. It is said that he was once commissioned to cure a caliph stricken with paralysis. He took the caliph to a cave and threatened him with a knife. The enraged caliph got up and chased al-Rhazi out of the cave and into exile. Al-Rhazi later sent a letter explaining that was the treatment, and the caliph subsequently rewarded him.

Muslim scientists also made advances in physics and optics, anticipating later European theories on specific gravity and developing formulae for figuring specific and absolute weights of objects. They calculated the size of the earth to an unprecedented degree of accuracy, though they still followed Aristotle in their belief in the geocentric (earth centered) universe. Muslim scientists disproved the Greek theory that light emanates from the eye to the object perceived. Ibn al-Hathan

showed this theory was wrong by studying how light is refracted through water.

Muslim civilization peaked around 1000 C.E. But, as with other civilizations, a higher level of culture tended to make the Arabs soft and open to attack. Also, Arab civilization was also running into problems of internal decay that opened it to several waves of invasions. First came the Seljuk Turks out of Central Asia. Although they did adopt Islam and restore some of its unity, the arrival of these Asiatic nomads initially had a somewhat disruptive effect on Arab culture and its attitudes toward the outside world. Even more upsetting in this respect were the Crusades, wars of conquest waged by Christians from Western Europe to recover Palestine for their faith. Unlike the Turks, the Crusaders were not about to convert to Islam and were much more hostile toward and destructive of Arab civilization, especially in the early years of the crusading era. Finally, the most physically destructive invasions of all came from the Mongol onslaught in the 1200's. The wholesale massacres of populations and destruction of cities that they committed dealt a terrible blow to Islamic civilization. These invasions were such a shock to the Arabs that Muslim culture became much more resistant to new ideas and foreign influences, making it more conservative and inward looking.

This helped cause a religious reaction against putting too much emphasis on science and reason and too little emphasis on faith. Except for the House of Wisdom, science and learning were largely supported by religious institutions and thus subject to their conservative influences. Also there arose a mystical movement known as Sufism, which discredited learning and reason, believing in a more direct and mystical experience with God. From this point on, Muslim science and math started to stagnate.

However, Islamic science spread to Western Europe and survived. By the 1100's, translations of Arabic texts were making their way from Muslim Spain into European universities. These Arab texts stimulated the growth of Western science, which is the dominant scientific tradition today. We should never lose sight of the fact that our own science today rests squarely on the accomplishments of

Muslim science, which, as a result, is still very much alive.

THE RISE OF THE SELJUK AND OTTOMAN TURKS (c.1000-1600)

The Seljuk Turks. Although Islam experienced a golden age under the Abbasids, the empire gradually fell apart as the Arabs became less warlike and one province after another broke away. Weak caliphs under the power of mameluke bodyguards, the size of the empire, and the disaffection of Shiites and various ethnic groups all led to this disintegration. Fortunately for Islam, a new people came in to revitalize it: the Seljuk Turks.

Various Turkish tribes had been known for centuries from the borders of China to the borders of Islam. Fortunately, the Persians and the Arabs had held them in check. Instead of overwhelming the empire, these Turkish tribesmen, infiltrated it, coming in as mamelukes (slave soldiers) and mercenaries whom the Arabs relied on more and more, much as the Romans had relied on Germanic troops. An even more interesting parallel is between the most successful Germanic tribe in Europe, the Franks, and the most successful Turkish tribe in Islam, the Seljuks.

The Seljuk Turks, named after a semi-legendary leader and founder, were the first Turkish tribe to convert to Sunni Islam, thus gaining the favor of the civilized population in much the same way as the Franks' conversion to Catholic Christianity had made them more popular with their subjects. The Seljuks also came to the aid of Islam's spiritual leader, the caliph, who was under the thumb of a Shiite dynasty known as the Buwayids, much like the Franks under Pepin and Charlemagne had protected the Pope from similar difficulties. And in each case, the spiritual leader granted his protectors the title and responsibility for defending the faith. In the case of the Seljuks, their leader Toghril was made king, or *sultan*, of the East and West in 1058 with the job of restoring the political and religious unity of Islam.

Because of their dual mission to unify Islam and expand its frontiers, the Seljuks turned against the Shiite dynasty of the Fatimids in Egypt and Palestine and also against the Christian Byzantine Empire (much as Charlemagne had waged

campaigns for Christianity in Spain and Saxony). One reason for these wars was to divert the ever-growing number of wild Turkish tribesmen away from destroying fellow Sunni Muslims and towards waging the holy war outside its borders. Because of their ongoing decline, the Byzantines were the ideal target, although the Shiite Fatimid dynasty in Egypt was also a useful target. In each case Seljuk victories triggered a backlash.

In 1071, the Seljuks and Byzantines met in the Battle of Manzikert. The result was a resounding victory for the heavily outnumbered Seljuks who then proceeded to take over most of the Byzantine heartland in Asia Minor, settling it so thoroughly that we still call that land Turkey, even though it is a long way from the Turks' original homeland in Central Asia. The Byzantine emperor, Alexius I, called for mercenaries from Western Europe to help him reclaim Asia Minor from the Turks. Instead, he got the First Crusade, which took much of Syria, and Palestine for the Christian faith.

At the same time, the Seljuks were expanding against the Shiite Fatimids, which brought them up against a fanatical Shiite sect known as the Assassins. This group was centered in a mountain fortress and led by Hassan-ibn-al-Sabah, also known as the Old Man of the Mountain. Determined to stop the advance of the Sunni Seljuks, he launched a campaign of political terror and murder that has become legendary. Hassan's followers operated under the influence of the drug, hashish, from which we get the word *assassin*. They showed remarkable determination and ability to infiltrate the most tightly guarded palaces and reach their intended victims with their poison daggers. Among those victims was the Seljuk sultan, Malik Shah, in 1092. His death combined with the First Crusade and the Seljuk custom of dividing their realm between all their sons (much as the Franks had done), created enough turmoil in the Seljuk realm to allow the Crusaders to take Palestine. Despite these setbacks, the Seljuks did manage to restore their power in Asia Minor. Their state, the Sultanate of Rum (Rome), thrived throughout the 1100's. However, much like the Franks with the Vikings, The Seljuks had their own nemesis: the Mongols.

In the early 1200's, a leader known to us as Genghis Khan united the various Mongol tribes in Central Asia into the most fearsome war machine known to history up to that point. Striking at incredible speed (up to 100 miles a day), they burned a path of destruction from China to Europe and the Muslim world unsurpassed until the wars of the twentieth century. Cities daring to resist them were methodically destroyed and their populations put to the sword. The defiance of the Assassins brought the wrath of the Mongols upon the Muslim world. In 1245, the Mongols annihilated the Seljuk army at Kose Dagh. In 1258, they sacked Baghdad and killed the last in the line of Abbasid caliphs. The Egyptian sultan Baibars finally halted the Mongols' relentless advance in 1260, so they eventually settled down and even adopted Islam in the Muslim areas where they ruled. However their rampage had far reaching effects on the Turks and the Islamic world.

Rise of the Ottoman Turks. On the frontier between the Turks and the Byzantines were various warlike groups, known as *ghazis* (holy warriors) for their efforts against the Christians. While the Sultanate of Rum was intact, these bands were largely held in check, since their wild ways were often as disruptive to the Seljuks as to the Byzantines. With the shattering defeat at Kose Dagh, however, these ghazi bands were freed to raid at will. Among them was a leader of particular renown, Osman, who gave his name to the greatest of the Turkish states, the Ottomans.

Osman's leadership in battle attracted many Turkish warriors to his standard and made him the most successful of the ghazi states attacking the Byzantines and neighboring Muslims. His successes brought conquests and plunder which attracted more ghazis to his standard. This would trigger more campaigns against the Ottomans' enemies, which would bring more conquests and so on.

There were various reasons for the Ottomans' success. First of all, their army was the best in Europe and the Middle East. In addition to swarms of tough Turkish cavalry, the sultans also had the age's best artillery and its most dreaded regiment: the *Janissaries*. These were originally young boys

taken from the homes of the sultan's Christian subjects and raised in his service as devout Muslims. Technically, the Janissaries were the sultan's slaves, but slaves with very high status. Trained to a peak of high efficiency, they would rule the battlefields from Persia to Eastern Europe for centuries.

Ottoman government was also well organized. Much of the bureaucracy was a class called *ghulams*, also originally Christian boys taken from their homes by the sultan's men. Like their counterparts in the army, the Janissaries, they were also known for their loyalty and efficiency. At the top of the government was the sultan, who had received "on the job" training as a boy, ruling provinces with the aid of experienced ministers. Upon the death of a sultan, his sons would typically fight for the throne. Such struggles were usually to the death, but, along with the training of the sultan's sons, did tend to produce the toughest and ablest rulers.

The Ottoman sultans also emphasized their religious position to claim leadership of Islam. For one thing, they were ghazis fighting for the faith. Later, they also controlled the holy cities of Mecca and Medina, as well as the last shadowy claimants to the Abbasid caliphate. However, for a number of years, the Ottomans were seen as just one of a number of ghazis. Then, in 1345, they took the opportunity to intervene in a Byzantine civil war in Europe. And once they had crossed into Europe, they were there to stay.

By 1400, the Ottomans had subdued the other ghazis in Asia Minor and were poised to take that long sought prize of the faithful, Constantinople. Then disaster struck when the last major eruption of nomadic tribes from Central Asia burst upon the scene. Their leader was Timur the Lame, whose path of conquest and destruction ranged from India to Russia. In 1402, he destroyed the Ottoman army, captured the sultan, Bayezid, and dragged him around in a cage for the rest of his days as a monument to his triumphs. However, Timur's intentions were to loot and plunder, not to build a lasting state. As a result, his empire disintegrated upon his death, and the Ottomans were able to reassert their control in Asia Minor and Europe. By

1453, they were at the walls of Constantinople, finally ready to claim that prize.

The siege of Constantinople was the last heroic stand of the Byzantine Empire in one of the most desperate and hard fought struggles in history. It saw the destructive power of the newly emerging gunpowder technology being used alongside old style siege towers, galleys, and crossbows. In the end, the defenders were overwhelmed, and the Byzantine (and Roman) Empire passed into history.

For Europe, the fall of Constantinople meant that the old trade routes to the Far East were shut off by the Turks and new ones had to be found. This helped spur Portuguese exploration around Africa and Columbus' famous voyage to America. The fall of Constantinople also caused a number of Greek scholars to flee to Italy where they helped to stimulate the Italian Renaissance, one of the great cultural periods in history. In that way the Byzantines still lived on. For Islam, the victory meant that the Ottoman Turks had arrived as a major power. For the next century and a half, their very name would terrorize the Christian world.

The century from the fall of Constantinople in 1453 to the death of Suleiman the Magnificent in 1566 saw the Ottoman juggernaut roll to an almost unbroken series of conquests against both Christians and neighboring Muslim states. Mohammed II (1451-1481), the conqueror of Constantinople, continued his path of conquest, bringing the Balkan Peninsula south of the Danube River under his control.

Selim I (1512-1520), known to history as "the Grim", concentrated on his Muslim neighbors. To the east was a revived Persia under the Shiite dynasty of the Safavids. In 1514, Turks and Persians met at Chaldiran. Turkish superiority in artillery and firearms proved decisive as the Persian cavalry were swept away by the Ottomans' massed gunfire. However, the Persians, learning from this, changed their strategy, laying waste the land before the Ottoman advance so the invaders would have nothing to sustain them. This proved effective, and a stable, if uneasy, frontier emerged between the Persian and Turkish realms. Selim was more successful against the Mameluke dynasty centered

in Egypt. At the battle of Dabik (1516), the Ottomans once again used their firepower with terrible effect and, this time, with more lasting results. The unpopular Mameluke rule quickly collapsed and Ottoman rule extended into Palestine, Egypt, and Arabia, thus giving the sultan control of Islam's holiest places.

The reign of Suleiman the Magnificent (1520-66) was the high point of Ottoman expansion. His energies were directed mainly in the holy war against the Christians, driving northwest into Europe and due west across the Mediterranean. In 1526, at the battle of Mohacs, Turkish firepower proved its superiority once again, this time against the Hungarians, who left their king and most of their nobility dead on the field. The road to Vienna lay open, and it was here that the Ottoman advance into Europe ground to a halt. The siege of Vienna was the Turks' first major defeat. In its wake, a new frontier emerged between Christian and Muslim worlds, guarded by a complex and expensive series of fortresses on each side.

The Ottoman drive across the Mediterranean also was eventually stopped in two desperate clashes between Turks and Christians. The first was a titanic siege of the Knights of St. John on the strategic island of Malta in 1566. After four months of bitter fighting, a Christian relief force drove the battered Turkish army away. An equally desperate battle was fought at sea at Lepanto in 1571. The fact that there was no place for soldiers to retreat in a sea battle made the hand to hand fighting especially ferocious. After this, the Ottomans' fleet was severely crippled, their tide of victories and conquests pretty much ceased, and their empire entered a long period of steady decline.

[Back to flowchart](#)

THE DECLINE OF THE OTTOMAN EMPIRE (c.1600-1919)

In the late 1500's, the Ottoman Empire started going into decline as a result of both internal and external factors. Internally, the Ottomans suffered from three major problems. First of all, after Suleiman's death, the sultans were less capable and energetic, being raised and spending their time increasingly at court with all its harem intrigues. Without the sultan's strong hand at the helm, corruption became a major problem. Second, the Janissaries became a virtually hereditary caste, demanding increasingly more pay while they also grew soft and lazy. Finally, the size of the empire created problems. The sultan was expected to lead the army, setting out with it each spring from the capital. This meant that as the frontiers expanded, it took the army longer to reach the enemy, thus shortening the campaign season to the point where it was very hard to conquer new lands. This especially hurt the Turks at the siege of Vienna in 1529. They did not reach the city until September, and winter set in early with disastrous results for the troops not used to European winters. Because of these factors, the Turks made few new conquests after 1565 and, as a result, gained no significant new revenues and plunder.

Two external economic factors also hurt the Ottomans, both of them stemming from the Age of Exploration then taking place. For one thing, the Portuguese circumnavigation around Africa to India had opened a new spice route to Asia. Therefore, the Turks lost their monopoly on the spice trade going to Europe, which cost them a good deal of much needed money. The other problem came from the Spanish Empire in the Americas that was bringing a huge influx of gold and silver to Europe. This triggered rampant inflation during the 1500's, which worked its way eastward into the Ottoman Empire. This inflation, combined with the other factors hurting the empire's revenues, led to serious economic decline.

That economic decline hurt the empire militarily in two ways that fed back into further economic decline. First of all, after 1600, the Turks lost their technological and military edge. While European armies were constantly upgrading their artillery and firearms, the Ottomans let theirs stagnate, thus putting them at a disadvantage against their enemies. Also, as Turkish conquests ground to a halt, a stable frontier guarded by expensive fortresses evolved, which drained the empire of

even more money. At the same time, Europeans were reviving the Roman concept of strict drill and discipline to create much more efficient and reliable armies. However, the Turks failed to adapt these techniques and, as a result, found themselves increasingly at a disadvantage when fighting against European armies.

Second, the tough feudal Turkish cavalry that had been the backbone of the army in the mobile wars of conquest were less useful to the sultans who now needed professional garrisons to run the frontier forts. Without wars of conquest to occupy and enrich them, they became restless and troublesome to the central government. That combined with the problems from the Janissaries, caused revolts that further disrupted the empire. (By 1825, the Janissaries would become so troublesome that one sultan would have to surround and massacre them.) Both of these military problems, the failure to keep up with the West and the increasingly rebellious army, fed back into the empire's economic decline, which further aggravated its military problems.

The following centuries saw the Ottoman Empire suffer from steady political and economic decay. By the 1800's, its decrepit condition would earn it the uncomplimentary title of "The Sick Man of Europe". Finally, the shock of World War I would destroy the Ottoman Empire once and for all, breaking it into what have become such Middle Eastern nations as Turkey, Iraq, Saudi Arabia, Jordan, Lebanon, and Israel.

THE DEVELOPMENT OF INDIAN CIVILIZATION (c.1500-500 B.C.E.)

"There was neither the realm of space nor the sky which is beyond. What stirred?...There was neither death nor immortality then. There was no distinguishing sign of night nor of day...Darkness was hidden by darkness...Whence was [the universe] produced? Whence is this creation?...The one who looks down on it, in the highest heaven, only he knows---or perhaps he does not know."--Vedic hymn

Aryan society and the Vedic Age (c.1500-1000 B.C.E.). It is hard to imagine that the same warrior society that took over the Indus River civilization could also compose such philosophical speculations as those quoted above. However, it was these Aryans who would create the core and essence of Indian civilization while they themselves were being transformed by elements of the older Indus River culture they had replaced. Several things distinguished early Aryan society, as seen in the series of four sacred texts, the *Vedas*, our main source of information on this period. For one thing, they were a warlike society of nomadic herders closely associated with the Persians until the two peoples parted ways around 2000 B.C.E. They were organized into tribes ruled by a king and a priest. The Aryans measured their wealth in cattle, which was a standard unit of trade in the absence of coinage and the primary cause of wars and raids. Even today, the cow is still highly revered in Indian society. Aryan society was strongly patriarchal, giving women an inferior status. However, women probably had a say in who they married, could attend public ceremonies, and could remarry when widowed. Some women even attended the priestly schools, composed hymns, and were considered sages.

Another important aspect of Aryan society was its religion. The Aryans worshipped thirty-three gods in human form who were divided into three groups corresponding to the heavens, the sky, and earth. The most frequently summoned god was Indra, a god of war carrying a lightning bolt who ate, drank and lived with gusto. This reflected a similar joy of living in Aryan society that enjoyed music, dancing, gambling, drinking, and chariot racing. Possibly the most distinguishing feature of Aryan society was its powerful priesthood, the Brahmins. Although the Aryans had no temples or images of their gods, just open air sacrificial altars, their priests were the only ones who could perform the highly ritualized and elaborate sacrifices that their religion demanded.

The Later Vedic Age (c.1000-500 B.C.E.)

Around 1000 B.C.E. the Aryans started expanding into the Ganges River valley to the east. Several factors aided them in this. One of these was the use of iron that could cut through the Ganges Valley's thick rain forests and clear the way for settlement. A second factor was the cultivation of rice that has the highest calorie content of any grain, thus supporting large populations. These combined with the renewal of sea borne trade with Mesopotamia in the 700's and the introduction of coinage by the Persians two centuries later led to the creation of powerful kingdoms in the Ganges Valley characterized by three features. First they were heavily populated, thanks to the rice agriculture. Secondly, they were highly centralized under the rule of powerful kings who were needed to supervise the irrigation systems vital to the cultivation of rice. And third, there was a thriving urban culture with a large middle class involved in trade.

These new cities and kingdoms caused the center of power to shift from the more sparsely populated Indus River Valley in the West to the heavily populated kingdoms and cities of the Ganges. However, in addition to this shift in the center of power, the structure of Aryan society was being radically changed. Kings assumed more power for directing the irrigation projects and their wars against neighboring non-Aryans. Also as many Aryans settled from herding cattle into rice agriculture or moved into the growing cities, they had more daily contact with the non-Aryan population. The more complex society that was evolving led to mounting concerns among ordinary Aryans about losing their superior status over the non-Aryans.

Meanwhile, as time passed, the *Vedas*, which had been composed in an archaic form of Sanskrit, became increasingly vague in their meaning to the majority of people. This left the Brahmins as the only ones who could read and interpret them and properly perform the elaborate rituals needed to influence the gods. And that gave the Brahmins an even higher status in society. These changes in society, along with the probable resurgence of many pre-Aryan beliefs, triggered two of the most important developments in Indian history: the caste system and India's unique religious and philosophical ideas.

Caste. Before their entry into India, Aryan society was divided into three loosely defined classes: nobles (who chose king), Brahmins (priests), and the ordinary tribesmen who tended cattle. At that time, there were no restrictions on diet, intermarriage, or occupations. When they took over the Indus River

Valley, the original inhabitants, whom the Aryans had complete contempt for, were lumped together into one class. At first, this simple arrangement had worked for the Aryans until the changes mentioned above made them more defensive about their traditional place in Indian society. The result was a rigid stratification of Indian society known as the caste system. Simply put, a caste is a social group often sharing the same occupation and among whose members intermarriage and dining can exclusively take place.

Justification for the caste system came from commentaries on the *Vedas* known as the *Brahmanas* which defined four divinely ordained castes corresponding to various parts of the body: the *Brahmins* (mouths), *Kshatriyas* (warriors and rulers) who were the arms, *Vaisyas* (productive members) who were the thighs, and the *Sudras* (feet) who performed the humblest tasks, especially those carrying some sort of religious stigma. The first three castes were composed of Aryans, while the non-Aryan *Sudras* were, according to the *Brahmanas*, "fit to be beaten" and could be "slain at will".

Caste defined the boundaries of an Indian's social world, outside of which he could do little. As Indian society became more complex, literally thousands of castes evolved. Newcomers, such as the British, would be excluded from other castes and thus became castes of their own. The caste system fragmented Indian society in such a way as to make political unification very difficult. As a result, the state has had less power and influence over India's history than its counterparts in other societies. Instead, the more unifying forces in Indian history have come from its religious and philosophical ideas.

The evolution of India's religious ideas. As we have seen, the archaic Sanskrit used in the *Vedas* made the Brahmins the only ones who could interpret them and perform the intricate sacrifices they required. As a result, they claimed and assumed a higher place than ever in society. In fact, their commentaries on the *Vedas*, the *Brahmanas*, played down the power of the Vedic gods and exalted their own since their sacrifices could manipulate the powers of the universe. This exalted status plus the growing vagueness of the *Vedas* caused many Brahmins to engage in some wild speculations on the meanings of these texts and the rites they performed.

Not everyone blindly accepted the Brahmins' claims and the value of the rigid rituals they performed. Instead, a number of Indians went to the forest to live as

ascetics who, much like the early Christian hermits centuries later, performed various feats such as walking on nails or sitting close to fires in the hot sun to mortify the flesh and thus gain enlightenment. Many of these hermits were nobles whose status had been cut down by the rising power of kings. Whereas in most cultures such nobles would stage a rebellion, in India it was common for such men to seek higher knowledge as hermits. Taking a cue from the Brahmins themselves, these hermits also engaged in philosophical speculations. From these speculations came another series of treatises, the *Upanishads*. Although these works were unsystematic and varied greatly in their conclusions, they all shared a common belief in a more mystical and personal religious experience.

The *Upanishads* introduced several key concepts of Indian philosophy. One was a vague universal and spiritual entity known as *Brahman*. Although the various gods still existed, they were mere manifestations of *Brahman*. This would be a key unifying factor in Hinduism that worshipped thousands of gods, all of which were seen as aspects of the one spirit, *Brahman*. Another important idea was *reincarnation*, the belief that we are reborn over and over again in forms that reflect our *karma*, the sum total of our good and bad deeds. The better our *karma*, the higher the form of life we are reborn as. Finally, there is *dharma*, the duty that we are obligated to carry out in our present station in life. If we carry out our *dharma*, our *karma* is improved so we can be reborn in a higher form. Ironically, this belief in *karma* and *dharma* both justified the rigid caste system of India and offered people the hope of rising up from their present station in life to a better one in the next.

Our ultimate goal, according to the *Upanishads*, is not the old Aryan goal of prosperity and good health in this life. Rather it is to shed our *karma* and ego to become one with *Brahman* like a river flowing into and merging with the sea. Since these somewhat obscure and esoteric ideas mainly appealed to intellectuals, the Brahmins were willing to accept them as long as people also paid them honor. As fragmented as India might be politically and socially, these ideas of *Brahman*, *reincarnation*, *karma*, and *dharma* would provide a unifying thread between India's main religions, in particular Jainism, Buddhism, and Hinduism.

Jainism and Buddhism. The radical departure that the *Upanishads* took from the traditional Brahminic religion opened the way for new beliefs that totally rejected the authority of the Brahmins. Two of these

were Jainism and Buddhism. Jainism was founded around 500 B.C.E. by a prince Vardhamana known also as Mahavira ("great hero") and Jina ("conqueror"), which gave Jainism its name. After twelve years of severe austerity and meditation as a hermit, he attained enlightenment and spent the rest of his life sharing his insights with others. Mahavira accepted the Upanishads' principles of Brahman, karma, and reincarnation.

However, rather than seeing karma as an abstract principle, he viewed it as a material substance that clings to us and weighs us down. Thus our goal is to cleanse our souls of karma so we can cease to be reborn. Since nearly every act produces impurities, the ideal life is to retire to a monastery and do nothing. Even rocks and streams were seen to have souls that it is terrible to kill, causing some Jain monks to sweep paths before them and wear masks to avoid inadvertently killing the tiniest life forms. Since even plowing the land can turn over the soil and kill worms, agriculture was frowned upon, causing many Jains to become merchants. The ideal death was seen to be starving oneself, which Mahavira himself did at the age of 72. Jainism was fairly popular since it made karma more concrete and understandable while offering hope for a better existence to its followers.

Buddhism was founded by Siddhartha Gautama who, like Mahavira, at first led the sheltered and privileged life of a prince. A prophecy supposedly foretold that Siddhartha would either unify all India or spiritually redeem the world. His father, wanting him to be a great king, tried to shelter him from seeing any of the troubles of the world. However, this strategy backfired, because when Siddhartha finally did come across humans suffering, he was so shocked that he ran off to live the life of an ascetic. After six years of this severe lifestyle, he left the forest and found enlightenment while sitting under a fig tree. From this he became known as the Buddha (Enlightened one). The basic ideas of Buddhism are found in its four noble truths.

- 1) **Life is sorrow.**
- 2) **Sorrow arises from craving (especially for individual fulfillment).**
- 3) **The stopping of sorrow is the complete stopping of craving.**
- 4) **A noble eightfold path exists to stop sorrow and which we should follow in order:**

- 1) Right belief or knowledge- renouncing worldly things & dedication to humanitarian faith;
- 2) Right resolve- one should aspire to the achievement of Nirvana;
- 3) Right speech- lets one serve as a model for others to

follow;

- 4) Right conduct- acknowledges the sanctity of life (Do not kill animals, be unchaste, drink intoxicants);
- 5) Right livelihood- life of service, not selfishness, preferably monk;
- 6) Right effort- helps one keep his inner self-free of evil thoughts;
- 7) Right mindfulness- constant awareness that craving is pointless; and
- 8) Right meditation- lets one be selfless in thought & acts.

Eventually, following this noble eightfold path should break the chain of reincarnations, and lead to the attainment of Nirvana, a state of bliss where one's ego will melt away and merge with Brahma like a drop of water is lost in the ocean. In its purest form, known as Hinayana ("smaller vehicle"), Buddhism technically is not a religion with rites for such things as birth and death or a developed theology. Instead, one must rely on his or her own efforts to attain Nirvana. However, later versions known as Mahayana ("Greater vehicle") more closely resembled more traditional religions with various rites and reliance on Buddha for salvation.

Buddhism bore some striking similarities to Christianity. Both were egalitarian, treating women and children as equally important as men. Both had a savior god bridging the gap between humans and god. The main goal in each religion was salvation of the soul, not earthly wealth or power. Each of them demanded ethical behavior and had networks of monasteries to spread their respective messages. Both also made room for the invocation of lesser beings. In the case of Christianity, those beings were saints and angels. In Buddhism they were the *bodhisattvas*, people who were on the verge of attaining Nirvana, but chose to stay behind to help others in their spiritual efforts. One major difference between the two was that Christianity was an historical religion with certain defining events, such as the Exodus, Christ's life, etc. In contrast, Buddhism was cyclical in nature, believing that the universe goes through an endless number of cycles of creation and destruction.

Although Buddhism would spread its influence across south and East Asia, it would nearly die out in its homeland of India. This was because the Brahmins would adopt many of Buddhism's ideas and fuse them with their own practices and the pre-Aryan polytheistic beliefs of the people. The result would be that unique synthesis known as Hinduism, a religion that would unify India by taking its many cults and gods and interpret them all as manifestations of the same religion.

INDIA FROM THE MAURYAS TO THE GUPTAS (C.325 B.C.E.-711 C.E.)

The Mauryan Empire (c.325-200 B.C.E.). As we have seen, various factors such as climate, topography, and disease made India very difficult to unify. By the same token, we have also seen how India's religious and philosophical ideas were flexible enough to act as a unifying influence. After 400 BC, the combination of these opposing influences has allowed a succession of states to unify India briefly, only to come apart again.

The first empire of note was that of the Mauryan Dynasty. Its founder, Chandragupta Maurya (325-299 B.C.E.), was the ruler of Maghada, then the largest state in northeastern India. By 315 B.C.E. he had expanded into the Punjab and Indus River valley where he clashed with the Macedonian general, Seleucus. Being preoccupied with the struggles for power following Alexander the Great's death, Seleucus surrendered his Indian lands to Chandragupta in return for 500 war elephants. (Those elephants would play a crucial role in the battle of Ipsus and the subsequent emergence of the Hellenistic Kingdoms).

Chandragupta and his son, Bindusara, extended Mauryan rule over northern India and the Deccan to the south. Their rule was strict, reputedly having an army of some 700,000 men and 9,000 elephants. In the words of the *Arthashastra*, the political manual written for Chandragupta, "Government is the science of punishment." On the other hand, also following the *Arthashastra's* advice that a king's good is what is good for his subjects, Chandragupta and Bindusara built and maintained roads, bridges, and irrigation systems.

Bindusara's successor and one of the most remarkable rulers in history was Ashoka (269-232 B.C.E.). A bloody struggle for the throne and the even bloodier conquest of Kalinga in 261 B.C.E. upset him so much that he embraced the Buddhist concept of non-violence and renounced war, gave up the hunt, and outlawed the killing of any animals not used or eaten. Throughout his reign, Ashoka continued to rule in the spirit of Buddhism (which he may also have seen as a unifying force for his empire). He sent out officers of righteousness to ensure the just rule by his officials. He codified Buddhist laws and principles. And he worked for the welfare of his subjects by digging wells, building rest houses and planting banyan trees for shade, medicinal herbs, and mango trees. Unfortunately, Ashoka's policy of non-violence also undermined his army's efficiency, which allowed revolts, invasions, and the fall of the Mauryan Empire by 185 B.C.E.

The fall of the Mauryan Empire allowed the expansion of the Greek kingdom of Bactria (modern Afghanistan) into northwestern India around 150 B.C.E. The Greeks probably influenced Indian culture in a number of fields: medicine, astrology, drama, and sculpture. There is even a philosophical work, *The Menander*, where the Greco-Bactrian king, Menander has a dialogue with a Buddhist monk.

The Kushans (78-c.300 C.E.). From about 50 B.C.E. to 78 C.E. a succession of Asiatic tribes pushed into northwestern India. One of these tribes, the Kushans, united the others behind them and established a kingdom that encompassed northern India from the Indus to the Ganges valleys and possibly to the Himalayas and the Silk Road. This period also saw the rising influence of a middle class of merchants and craftsmen who took full advantage of their central position for trade. Therefore, the Kushan capital of Purushapura in the rich province of Gandhara became the hub of a lively trade between Rome, India, and China. Indian merchants especially profited from their middleman role of getting spices from South-east Asia and silk from China for Roman traders. The large number of Roman coins circulating in India at this time indicates how extensive and profitable this trade was for India and likewise how costly it was for Rome, being one of the causes for its decline and fall.

India exported and imported more than material goods at this time. Buddhism was especially popular with Indian merchants, since it was one occupation that could stay clear of killing people, animals, and even small creatures in the soil. As a result, merchants spread Buddhism to Southeast and Central Asia and as far away as China. Indian culture was so influential in the emergence of civilization and kingdoms in Southeast Asia that this region along with India has been referred to as Greater India. Buddhist ideas may have even influenced such religious groups in the Roman Empire as the Manicheans, Gnostics, and Neo-Platonists.

By the same token, foreign ideas also influenced India. Greek influence was seen in the Gandharan style of sculpture, which portrayed Buddha with curly hair and made its way as Far East as China. Also the Kushan rulers adopted the Chinese title "Son of Heaven." Even more striking was the influence Christianity might have had on Buddhism, in particular the idea of Maitreya Buddha, the suffering savior who would redeem us through his own pain.

Mahayana and Hinyana Buddhism. Although Buddha himself had resisted any attempts to deify him, such attempts started soon after his death. By the first century C.E., this had created a split in Buddhism. The old belief of each of us being responsible for our own salvation was known as *Hinyana* Buddhism ("the Lesser Vehicle") since we each must strive for salvation on our own. The newer belief was called *Mahayana* ("the Greater Vehicle") since Buddha saves all of us together. One spin-off of this idea was that of the *Bodhisattvas*, people who have earned Nirvana but have chosen to stay behind in this world to help other people attain Nirvana. Over time, various branches of Mahayana would emerge, some having innumerable Bodhisattvas inhabiting complex hierarchies of heavens as stages leading to Nirvana. Hinyana Buddhism would be the dominant form of Buddhism in Sri Lanka, Burma, and Southeast Asia. Mahayana would prevail in India, Central Asia, Tibet, China, and Japan.

The Guptas (c.300-500). The Kushan realm remained a center of culture until its demise in the late third century at the hands of a new power rising in the West, the Sassanid Persians. However, a new native dynasty, the Guptas, emerged in the fourth century to take the Kushans' place. Its founder, Chandra Gupta I (319-335), although from an obscure family in Bihar in the northeast, made a favorable marriage that helped him control the Ganges River Valley by his death. His successors eventually brought Northern India under their rule while states in the Deccan and Sri Lanka agreed to become the Guptas' vassals.

The Gupta period is seen as a golden age of Indian culture. Indian astronomers came up with the idea of a round earth rotating on its axis. Indian mathematicians developed such concepts as Pi, negative numbers, a decimal system with place value digits, zero, and quadratic equations. Unfortunately, these ideas remained the preserve of a select group of individuals. Not until the Arabs came into India and adapted these concepts for their own uses were they made generally available. This is reflected by our still referring to them as Arabic numerals. In literature, India's two greatest epic poems, the *Ramayana*, and *Mahabharata*, which itself contains possibly the most revered work in Indian literature, the *Bhagavad Gita*, were written down in their final forms. India's greatest playwright, Kalidasa, flourished at this time. Unlike Greek drama, the point of Indian drama is to delight the audience and leave it with a serene and peaceful feeling. Both Buddhist and the emerging Hindu art and architecture also thrived. Once again, Greek influence can still be seen in the simplicity and serenity of Buddhist art. Hindu temples were

modeled after caves, which Indians always considered sacred and were decorated with sculptures.

During this time, a major shift took place in the religious climate of India. The Guptas, like many rulers before them, had been active supporters of Buddhism. This, and their popularity among the rich middle classes, led to large contributions to Buddhist monasteries, which became quite wealthy, much like their counterparts in Christian Europe. Besides theological disputes and the corruption such wealth and influence at court might bring, Buddhists tended to move their monasteries away from populated areas. Meanwhile, the Brahmins were renewing contact with the people and winning many converts to their religion, which at this point had evolved into what we now call Hinduism. In the following centuries, Hinduism would replace Buddhism as the major religion in India, although it continued to spread across Asia.

Hinduism. Of the world's great religions, Hinduism is especially unique, since it has no historical founder who had some revelation at some point in time. It has no fixed set of worship, with some people praying, others making sacrifices, and still others meditating. Although it is polytheistic, recognizing millions of gods, it is somewhat monotheistic in that it sees these various gods as manifestations of the one unifying god, Brahma. It is this flexibility that has made it so popular and such a unifying force in India.

While there are millions of gods, there are three that most people worship one or the other of: Brahma, Vishnu, and Shiva. Brahma is seen as the supreme being of creation who put into motion a constantly repeating cycle of destruction and rebirth. Although seen as the supreme god, who all others are reconciled to, Brahma has not been as popular as Vishnu and Shiva. Vishnu is the kind and merciful preserver of Brahma's creation who has appeared in various manifestations, known as *avatars*, to help humanity. The most popular of his manifestations has been Krishna, who as a child was full of mischief and as an adult a great lover and a mighty warrior, qualities once associated with Indra. Shiva combined the attributes of various Harappan and Aryan gods, being at once a god of destruction and rebirth, mercy and wrath, and constancy and unpredictability.

Hinduism maintains the old Brahmanic and Buddhist principles of karma, dharma, and reincarnation. Unlike the old Brahmanic religion, it puts more emphasis on personal devotion to a god than on sacrifices performed by the Brahmins. This made Hinduism especially popular in India and it has dominated India ever since.

However, the coming of Islam in the eighth century offered a new challenge to Hinduism's dominance.

EAST MEETS WEST: ISLAM IN INDIA (711- C.1700 C.E.)

Introduction. Until 711 C.E., India had faced many invaders, but no substantial challenges on both a military and cultural level. The Persians and Greeks had confronted India with highly developed civilizations, but also had reached the limits of their expansion by the time they arrived there. The various nomadic peoples who entered India between the second century B.C.E. and eighth century C.E. may have been more potent military threats, but their cultures were thoroughly absorbed by India. However, in 711 C.E., India faced for the first time a vital people with a culture and religion both as sophisticated and powerful as its own: Islam.

Much of the relationship between Islam and Hinduism hinged on a battle that took place at the Talas River in Central Asia in 751 C.E. between the expanding empires of the Arab Muslims and T'ang China. The Arab victory in that battle not only stopped the T'ang dynasty's expansion to the West; it also led to the triumph of Islam over Buddhism as the prevailing religion in Central Asia. As a result, although India continued to face a succession of invaders from the North, all those invaders had Islam as the common defining element of their cultures, a religion that in its own way was as appealing as Hinduism.

Pattern of development. For 1000 years following the entry of the Arab Muslims into India, a basic pattern of development emerged. Muslims would come into North-western India and expand to the south and east. Eventually, India's environment would slow them down, as Islamic and Indian civilizations would leave their marks on each other. Then another group of Muslims would come in and repeat the process. This pattern repeated itself in three successive waves: the Arabs in the eighth century, various Turkish peoples starting around 1000 C.E., and the Mughal dynasty that entered India in 1526. This cycle may have continued repeating itself except for the intrusion of the British who would present India with a new cultural challenge.

Arabs and Rajputs (711-c.1000 C.E.). The Arab Muslims entered India in 711, the same year their religious compatriots in the West entered Spain. They conquered the area known as Sind in the Indus River valley (modern Pakistan). It is hard to imagine two religions and civilizations so different in their outlooks as Islam and Hinduism. Whereas Islam saw all people as equal before God, India's rigid caste system presented a highly stratified social structure sanctioned by religion. On the other hand, while Hinduism was incredibly

tolerant of a multitude of gods, Islam was strictly monotheistic. For better or worse, the two cultures have co-existed, though not always peacefully, since the Arabs arrived until the present day.

Arab expansion was stopped by various feudal Indian princes known as the Rajputs who themselves may have been descended from invading Huns two centuries earlier. While theoretically loyal to a king, they functioned as virtually independent rulers. As trade increased, so did competition for the control of that trade. As a result, the Rajputs often spent as much time fighting each other as they did resisting foreign invaders. Their warfare was highly ritualized and regulated by an elaborate code of behavior, much like the codes of chivalry and Bushido regulated the fighting of elite nobles in medieval Europe and Japan. Our modern game of chess, originating in India, reflects this ceremonial way of fighting wars. Unfortunately for the Rajputs, this also kept them from adapting to changes in warfare and hampering the Muslim advance across Northern India.

Arab rule was fairly tolerant of Hinduism. They even preserved the temple of a Hindu sun god in Multan, which also prevented Hindu attacks on the city that might damage this holy spot. Although the Arabs only conquered the northwestern part of India, their tolerant rule won many converts to Islam in that region which remains Muslim to this day. This provided a solid base for further Muslim expansion into India.

Turkish invaders and the Sultanate of Delhi (c.1000-1526). By 1000 C.E., the Abbasid Caliphate and Arabs' grip on their empire were in decline because of the empire's vast size, weak caliphs, and the split between Sunni and Shiite Muslims. Like the caliphs in Baghdad, the Arabs in Afghanistan relied increasingly on slave bodyguards drawn chiefly from neighboring Turkish tribes. Eventually these Turkish warriors asserted their independence and took over from the Arabs. From this base in Afghanistan, they launched raids into India, thus resuming Muslim expansion in the subcontinent.

Compared to the Arabs, Turkish raids into India were much more ruthless and destructive. The first of these raiders, Mahmud of Ghazni, earned the title of "the Idol Smasher" for the damage he did to Hindu Temples, while the ruler, Ala al-Din, similarly came to be called "the World Burner." These raids and invasions especially hurt Buddhism, as kings in East India were no longer able or willing to patronize Buddhist monasteries. This led many Buddhists either to convert to Islam or flee to Tibet and Southeast Asia. As a result, Buddhism

virtually died out as a religion in India although its influence elsewhere continued to spread.

The Mongol invasions in the twelfth and thirteenth centuries seriously disrupted Muslim civilization, especially in Central Asia. As a result, Muslims left on their own in India built an independent kingdom, the Sultanate of Delhi (1206-c.1500). Also, many Muslim scholars fleeing the Mongol onslaught came to India. This, along with an active sea-borne trade with Southeast Asia, East Africa, and the Middle East led to a flowering of Muslim culture in India. The Sultanate of Delhi witnessed a gradual blending of Muslim and Hindu cultures. Many Hindus learned Persian and Muslim bureaucratic procedures. Helping this process was the introduction of paper, which made record keeping easier, thus, enhancing the Sultan's control over his realm. Islam gained a number of converts from lower castes, especially from such castes as elephant trainers, weavers, and butchers who worked for the Muslims and saw this as a way to improve their station in life.

Muslims also absorbed Indian Culture, with caste distinctions starting to appear among them, Muslim men marrying Hindu women, and a mystical branch of Islam, Sufism, developing that used Hindu techniques such as meditation. Altogether, these developments paved the way for the next wave of invaders: the Mughals.

The Mughal Dynasty (1526-c.1700) was founded by Babur the Tiger, an Afghan leader claiming descent from both Genghis Khan and Timur the Lame. His original intention was the reconquest of Timur's Central Asian empire. However, when the Safavid Dynasty in Persia thwarted this plan, he turned toward India. Using a combination of firearms, artillery, and nomadic cavalry, he defeated the Sultan of Delhi's much larger army at Panipat in 1526 and beat an even larger army of Rajputs the next year. By his death in 1530, Babur had established the basis for over a century and a half of Mughal expansion that would encompass all but the southern tip of India.

The greatest of the Mughal rulers was Akbar the Great (1656-1605). Coming to the throne at the age of thirteen, he soon proved himself a firm and shrewd ruler who quickly crushed any revolts in his inherited lands and expanded Mughal power into the Deccan. However, it was Akbar's talents as a ruler, not a conqueror that earned him the title, "the Great." Instead of trying to rule the stubborn Rajputs by force, he allied with them, using them as his officers and government officials to keep his unruly Muslim nobles in line. He tolerated

Hinduism, married Hindu princesses, and held scholarly discussions on any and all religions each Friday. He even founded his own religion, Din Ilahi, a simple monotheistic faith that would not survive its founder's death.

Akbar looked out for his peoples' welfare by holding a land survey to ensure fair taxes. He would even overrule his own Muslim judges, the ulema, in order to secure justice and prosperity for his subjects. Akbar was also a patron of the arts, encouraging both Hindu and Muslim artists, poets, and musicians.

Akbar established a strong and stable state that allowed his three successors, Jahangir (1605-27), Shah Jahan (1628-58), and Aurangzeb (1658-1707), to keep expanding the Mughal realm. During this time, India experienced another flourishing of the arts with the fusion of Persian and Hindu styles. In painting, Mughal artists combined the Persian tradition of colorful painting with the looser and more natural style of Indian artists. Architecture especially reflected Muslim influence as seen in the Taj Mahal, a mausoleum for Shah Jahan's wife and still considered one of the world's most beautiful buildings. In music, the sultan, Aurangzeb's ban on music caused Muslim musicians to flee to the countryside where they blended their style of music with Hindu folk music to create a style of music still known as Mughal music.

Decline of the Mughals. It was during the reign of Aurangzeb that two major seeds of Mughal decline were sown. One was the over-extension of his empire in the conquest of all but the southern tip of India. The other was his persecution of Hindus, a reversal of the traditional Mughal policy of tolerance. Together, these bred disaffection among the people and drained the empire's resources. After Aurangzeb's death in 1707, the Mughal Empire went into rapid decline, allowing a new people with a new culture, the British, to take over.

[Back to flowchart](#)

EARLY CHINA FROM THE SHANG DYNASTY TO CONFUCIUS (c.1500-500 B.C.E.)

"With harmony at home there will be order in the nation. With order in the nation there will be peace in the world."-- Confucius

The geographic factor. Far to the east of the civilizations developing in Egypt and Mesopotamia another great hydraulic civilization, China, was evolving. As with Egypt and Mesopotamia, geography heavily influenced the development of Chinese civilization. For one thing, the eastward flow of the rivers from the mountains in the west also meant that China's most fertile land was in the coastal lowlands in the east. Even today, 80% of China's population lives in the eastern third of the country. Throughout its history, this factor has given China a vast concentrated reservoir of human resources to draw upon for its wealth and power.

Secondly, China is largely isolated from the rest of the world by rain forests to the south, some of the highest mountains in the world to the west, the Pacific Ocean to the east, and vast grasslands (steppe) and deserts to the north. Direct contact with other civilizations would be rare, although occasional influences have passed back and forth between China and the rest of the world with profound effects. For the most part, however, China evolved largely in isolation and saw itself as the "Middle Kingdom", both unique and superior to other cultures. This attitude would create difficulties, especially in the modern era when growing contact with the outside world forced China to deal with different cultures.

Another dominant feature of China's geography has been its rivers, in particular the Huang He (Yellow), Yangtze, and Xi Jiang. The Yellow River valley in the north was particularly important as the birthplace of Chinese civilization, because its irregular rainfall and devastating floods forced the Chinese to organize massive irrigation and flood control projects. Such organization required a strict hierarchy of authority, which influenced subsequent Chinese history.

The Shang Dynasty (c.1500-1028 B.C.E.). By 1500 B.C.E., China's geography helped lead to one of history's early hydraulic civilizations in the Yellow River Valley under the Shang, the first of the dynasties into which Chinese history is traditionally divided. The Shang and various local nobles who ruled in their name combined both government and priestly functions. As a result, no distinct or elaborate class of priests emerged in China as happened in other early civilizations such as Mesopotamia and Egypt.

China saw several technical developments during the Shang period in the way of silk textiles, carving in ivory and jade, and especially bronze technology. Bronze artifacts from the Shang period are some of the finest examples of metalworking found in any Bronze Age culture. Among those artifacts were bronze arms and armor which, along with the horse drawn chariot, gave Shang armies an edge over their enemies and allowed the expansion of Chinese civilization.

Another advance during this time was writing. Contrary to popular belief, Chinese writing is phonetic, not ideographic, being based on sounds rather than pictures or abstract ideas. The misconception about it being ideographic seems to go back to Spanish and Portuguese missionaries who saw the complexity of the script and assumed it must be ideographic. Chinese intellectuals may have further encouraged this myth to impress Europeans with the uniqueness of their writing. Since then, the ideographic myth has become so engrained in the popular imagination, that most Westerners still believe in it. However, being based on syllables rather than individual phonetic sounds still means Chinese script requires memorizing many more, making it harder to read and restricting the number of literate people.

The pattern of Chinese history. A basic recurring pattern has repeated itself throughout Chinese history. A new dynasty would take over and revive Chinese civilization in two ways. First, it would restore the army, the Great Wall, government and bureaucracy. It would also lower taxes, redistribute land to the peasants, and rebuild the irrigation and flood control systems. Together, these would create a strong and prosperous society until lazy emperors

took over and neglected their duties, allowing corrupt officials, high taxes, powerful nobles who took the peasants' lands, and the decay of the army and Great Wall. This would lead to peasant revolts from within and raids and invasions from without that together would weaken the government, causing more corruption, high taxes, military decay, and powerful nobles oppressing the peasants. Eventually, a new dynasty would seize power and start the cycle over again.

One concept combining religion and politics that was central to this process and China's political thinking was the *Mandate of Heaven*. This said that a ruling dynasty had the mandate or approval of Heaven to rule as long as there was peace and prosperity. However, natural and man-made disasters were signs that the dynasty was not doing its job and that the mandate had been withdrawn and passed to a new dynasty. Thus the Mandate of Heaven was a double-edged sword, justifying the power and rule of a successful dynasty on the one hand, but also justifying revolution when things went wrong.

The Zhou Dynasty (1028-256 B.C.E.). The Shang Dynasty prospered until weak rulers allowed the realm to fragment into various warlord states. Eventually, this situation enticed nomadic tribes from the North-west to come in. One of these tribes, the Zhou, eventually assumed power as the next dynasty to rule China.

By 700 B.C.E., the Zhou had succumbed to the temptation of the softer cities in the East and gone into decline. Powerful warlords carved out their own principalities while giving the Zhou emperors only nominal allegiance. Naturally, these warlords turned on each other with increasing ferocity in a period known as the age of "the Warring States" (481-221 B.C.E.). However, despite this turmoil, Chinese civilization continued to spread and advance thanks to several innovations. First of all, the use of gold and copper coins replacing such things as shells and rolls of silk as the primary mediums of exchange made trade much easier and put more wealth into circulation. Secondly, the use of oxen to draw plows and the introduction of iron farm implements enabled Chinese peasants to clear

more land, produce more food, and raise China's population and wealth dramatically.

Confucianism and Taoism. Still, this was a turbulent period which sparked a good deal of intellectual ferment, leading to two very different philosophies that together would become essential parts of Chinese culture: Confucianism and Taoism.

Kung Fu-tzu (known to the West as Confucius) was born in 551 B.C.E. He started his career as a government official, but later became a traveling teacher who attracted many students. He saw the key to China's stability in a strict observance of rituals and traditions. Among these rituals was ancestor worship, which had been an integral part of Chinese religion for centuries. However, Confucianism was not a religion, but rather a systematic philosophy for maintaining peace and harmony in this world. (Confucius himself said that he knew too little about this world to even begin worrying about the next. That would have to take care of itself in due time.) Central to Confucius' philosophy was a strict hierarchy of relationships, the five most important being those between ruler and ruled, father and son, husband and wife, older and younger brother, and friend and friend. As long as the proper conduct and respect took place in these relationships, overall harmony would prevail. As Confucius saw it, a harmonious society rested firmly on a harmonious family structure. Confucius also advocated a civil service that got its positions through merit (in particular education and knowledge of the classics) rather than through birth or personal connections. Although not too popular in his own day, Confucius' ideas later had a profound impact on Chinese government and society that carry on to the present day.

Lao-tze (600's B.C.E.) founded the other great Chinese philosophy of the day, *Taoism*, which differed from Confucianism much as night differs from day. Whereas Confucianism provided a very strict framework for dealing with civilized society, Lao-tze advocated escape from that society and a return to our natural state through contemplation of the *Tao* (the Way), the cosmic principle through which the harmony of the universe was maintained. He saw everything in nature and the universe as being balanced between two complementary forces:

the active male *Yang* ("sunlit") and the passive female *Yin* ("shaded"). Rather than seeing one as superior to the other, Lao-tze saw a truly healthy and harmonious person or society as being perfectly balanced between the active Yang and passive Yin. An example of this is the Chinese martial art, Tai Chi, which strives to use an opponent's own strength and force to knock him off balance. Lao-tze saw disease, floods, famines and wars as the result of an imbalance in nature, often caused by human actions. By the same token, any attempts to conform to strict government or personal codes of discipline were artificial and deformed human nature. Taoist ideas would strongly influence Chinese art, especially landscape painting, medicine with its idea of keeping a body in balance, and even Sun-tzu's *Art of War* that advocated dexterity and balance in conformity with nature rather than merely the use of brute force.

As different as Confucianism and Taoism were, they each had a profound impact on Chinese culture. Later, with the addition of Buddhism, the three philosophies would be known as the Three Doctrines. However, rather than competing with one another, each philosophy would fulfill a particular need in China's culture. Together they would give it a balance that would make it uniquely Chinese.

China's Sorrow: the Yellow (Huang He) River

The Yellow (Huang He) River, birthplace of China's civilization, gets its name from loess, the yellow wind-blown soil from the Gobi Desert that gets trapped in the river's channel. This makes it the most sediment-laden river in the world, with silt raising its riverbed as much as one inch per year. As a result, the Huang He has

flooded some 1500 times since 600 B.C.E., often with catastrophic results.

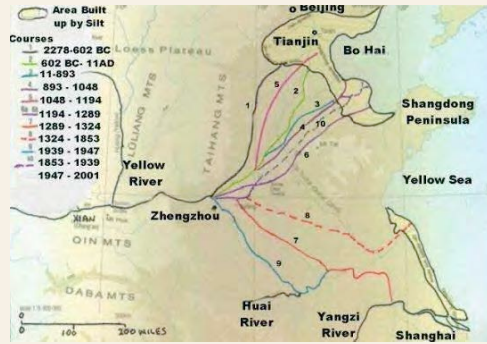

The response to silting has been to build levees to contain the river. However over the centuries, the riverbed achieved a height of as much as 10 meters over the surrounding flood plain, precariously held in by levees that were 20 meters high. It was a disaster waiting to happen...and it has happened many times.

In order to prevent or minimize such catastrophes, China has needed a strong central authority to coordinate massive flood control projects such as this hillside, terraced to conserve rain and protect against soil erosion and flooding.

Such a disaster especially took place in 1887 when unusually heavy melting snow and spring rains broke the levees and killed thousands from flooding and an estimated one million more in the resulting famine. In 1931, another flood killed between 850,000 and 4,000,000 people, making it the single worst natural disaster in history. Two years later, another flood killed 20,000 more. And in 1938, the Huang He's levees were dynamited to slow the progress of the Japanese army. Between 1887 and 1943, drowning, flooding and disease triggered by the Yellow River's floods claimed an estimated 10 million lives.

No wonder the Yellow River is called China's Sorrow.

A map showing how the Huang He has shifted its channels many times over the last 2600 years

The Sanmexia Dam was one modern response to the Yellow River. It was built in the 1950s by the Soviets who, unfortunately, had no experience with the heavy volume of silting that afflicts the Hung He. As a result, the whole reservoir was silted up within a few years, forcing a massive reconstruction project that took until 1978 before any benefits were realized from the dam.

Tourists watch water flush out of the sluice of the Xiaolangdi Dam on the Yellow River in Central China's Henan Province.

Another natural force plaguing China through the ages has been earthquakes, the most recent being the disastrous Sichuan earthquake in 2008, which killed an estimated 69,000 people. Probably the most devastating, although not the strongest, earthquake in China's history was the Tangshan earthquake in 1976, which registered 8.0 on the Richter scale for two minutes, totally devastating an area of twenty square miles. The city Tangshan was built on a five-mile section of the fault line, the west side of which moved five feet north, literally tearing one hotel in half so that its inhabitants had to escape by jumping from one half of the building to the other in order to reach the stairway and escape. The earthquake killed an estimated 655,000 people and injured 780,000 more.

Rice

Rice is the most widely grown and consumed grain on the planet. (Corn is more widely grown, but used largely for other purposes besides direct human consumption. It has the highest calorie content compared to other grains grown in the Eastern hemisphere through most of history, which helps explain the dense populations found in East and South Asia. Research indicates that all strains of domestic rice come from one strain first domesticated in China between 8,200 and 13,500 years ago. From there it spread across East and South Asia and then to Western Asia, Africa, and Europe.

The traditional method for cultivating rice starts with flooding the fields either while or after planting the young seedlings. Although this involves a good deal of planning and labor at the front end of the process, it drowns less robust weeds and pest plants and deters vermin. Flooding is not necessary to cultivate rice, but it avoids a lot of labor in the form of weeding and irrigation later in the process.

Despite that, rice farming is a very labor intensive activity, since the rice seedlings are first planted, and then some 25 days later the rice shoots are transplanted in neat rows in the rice paddy. This, in turn, requires preparing the fields twice, once for the initial planting and again for transplanting.

Women transplanting the rice shoot

Chinese Dragons and other early legends

The Chinese Creation Myth relates that the first man, Pan Ku, emerged from an egg. Each day he grew ten feet taller, the sky ten feet higher, and the earth ten feet thicker. When he died at the age of 18,000 years, his head split into the sun and moon; his body and limbs became the five famous mountains of China; his blood (or tears in another version) filled the rivers and seas; his hair became the forests and meadows; his sweat became the rain, his breath the wind and his voice thunder. Fleas became our ancestors and the two parts of the egg became yin and yang.

Chinese dragons. The first dragon appeared to the mythical emperor Fu-Xi, and filled the hole in the sky made by the monster Kung. Its waking, sleeping and breathing determined day and night, the seasons and weather.

The Chinese dragon consists of a camel's head, a demon's eyes, a cow's ears, a stag's horns, a snake's neck, a clam's belly, a tiger's paws, an eagle's claws, and 117 scales of a carp to cover its body. It is commonly portrayed playing with a flaming pearl, which is believed to be the source of its power.

Unlike the West, where dragons have been seen as evil, the Chinese have seen dragons as benevolent spirits and divine bringers of rain and good weather as long as we behave. The common belief has been that the worst floods have been caused when a mortal has upset a dragon. As bringers of the seasons, dragons rise to the skies in the spring and plunge into the waters in autumn.

Most Chinese dragons have four claws, but the Imperial dragon, representing the emperor has five. Anyone other than the emperor using the 5-claw motif was put to death. Some Chinese emperors even claimed descent from the dragon.

Chinese Pharmacy, according to legend, stems from Shen Nung (about 2000 B.C.), an emperor who sought out and investigated the medicinal value of several hundred herbs. He reputedly tested many of them on himself, and wrote the first Pen T-Sao, or native herbal, recording 365 drugs. Still worshiped by native Chinese drug guilds as their patron god, Shen Nung conceivably examined many herbs, barks, and roots brought in from the fields, swamps, and woods that are still recognized in Chinese pharmacy today. Medicinal plants include podophyllum, rhubarb, ginseng, stramonium, cinnamon bark, and ma huang, or Ephedra.

The Xia Dynasty, according to some accounts, was actually China's first dynasty, predating the Shang. However, by 2000 B.C.E. archaeological evidence shows that many aspects of Chinese culture were in place, including the solidarity of family, ancestor worship, the calendar, and the classic Chinese house design with a peaked roof supported by pillars, with the walls giving no support.

Artist's concept of the Xia dynasty's palace and courtyard at Erlitou (c.2000 B.C.E.).

Fu Xi was the first of three noble emperors, supposedly ruling for 116 years from 2952-2836 B.C.E. According to legend, he taught many arts, such as music, the use of fishing nets, the breeding of silk worms, and the taming of wild animals. Fu Xi is said to have invented the 100 Chinese family names and decreed that

marriages may only take place between persons bearing different family names.

Fu Xi's most original invention is the development of BaGua, the eight trigrams (below) that order the world according to eight principles: Sky, Earth, Thunder, Mountain, Water, Fire, Marsh and Wind. These trigrams are an abstract vision of the world and its changes and are used as a template for Feng Shui, which literally means "wind" (Feng) and "water" (Shui).

Also referred to as "Geo-mancy" or "Earth Wisdom, it is an ancient method of constructing and optimizing residences to bring about happiness, abundance and harmony. It includes architecture, urban planning, interior design, garden design, and placement of objects in our environment. It also involves the layout, framework, materials and colors of building structures.

Bronze Age China: the Shang Dynasty

A Shang era bronze wine vessel

Shang era bronze. Bronze artifacts from the Shang era are some of the finest examples of metalworking found in any Bronze Age culture. Among these were bronze arms and armor, which, along with the horse drawn chariot, gave Shang armies an edge over their enemies and allowed the expansion of Chinese civilization. During this period, bronze objects became symbols of status and power. At first the owners

just engraved their own names on them, but over time the inscriptions became more elaborate with detailed statements and even the texts of treaties.

Shang era shells and bronze implements used as an early form of money to make trading easier and more efficient.

The horse and chariot. As with other Bronze Age armies, the Elite troops of Shang armies were horse and chariot units. Shang chariots held three men and were typically drawn by two horses. Unlike other cultures' chariots, which typically had six spokes, the wheels on Chinese chariots had up to 18 spokes.

War elephants were used in early Chinese armies, although not trained ones. Instead, they would be panicked with torches and driven toward the enemy ranks in the hope of disrupting their ranks and trampling a bunch of them to death.

Human sacrifice, usually of prisoners, was practiced in Shang royal burials, one of the less pleasant aspects of the Shang Dynasty.

The Chinese Writing System

An example of how the Chinese have adapted their traditional script to words borrowed from other cultures

Early Chinese writing. The earliest examples of Chinese writing we have are oracle bone scripts (c.1600-1100 BCE) inscribed on turtle shells and ox bones, while another early Chinese script developed during the Shang era that was inscribed on bronze pots. Before the invention of paper, Chinese writing was typically done on bamboo strips such as this one from the 4th century BCE.

The number of written symbols has grown steadily throughout Chinese history from 3,300 during the Qin Dynasty (c.220 B.C.E.), to 9,353 by the end of the Han Dynasty (220 C.E.), and 22,561 during the Tang dynasty (618-906). By 1915, that number had jumped to 47,000, while one dictionary of the Chinese language compiled in 1971 listed 49,888 characters.

But this only tells half the story, because there is a long history of simplifying the Chinese script, both in complexity of the script and number of characters. Most people associate this simplification with the Communist regime, starting with efforts in 1956 to reduce the system to about 1700 simplified characters. This was later revised upward in 1964 to 2,238 characters and remains the official script used in mainland China.

However, efforts at simplification, as seen in non-official documents such as personal letters and diaries, date in some cases back to the Tang Dynasty (618-906), and form the basis for the vast majority of the current simplified script. The Communist regime in China does deserve credit for spreading the simplified system through public education in its efforts to raise literacy rates in China. Globalization and the internet have only accelerated this process in recent years as China's need to communicate and interact with the outside world has mushroomed. Cultural purists and political opponents outside of the mainland (e.g., Taiwan) have resisted adopting this system. Shop signs and advertisements in China also often use the more complex traditional script for aesthetic reasons.

Despite the different dialects of Chinese spoken across China, everyone can still read the same script and communicate with one another by writing.

Confucius

A portrait of Confucius from the early 8th century, some 1300 years after he lived. No known contemporary portraits of him exist.

Kung Fu-tzu (known to the West as Confucius) was born in 551 B.C.E. He started his career as a government official, but later became a traveling teacher who attracted many students. He saw the key to China's stability in a strict observance of rituals and traditions. Among these rituals was ancestor worship, which had been an integral part of Chinese religion for centuries. However, Confucianism was not a religion, but rather a systematic philosophy for maintaining peace and harmony in this world. Confucius himself said that he knew too little about this world to even begin worrying about the next. That would have to take care of itself in due time.

Central to Confucius' philosophy was a strict hierarchy of relationships, the five most important being those between ruler and ruled, father and son, husband and wife, older and younger brother, and friend and friend, the last being the only one between equals. As long as the proper conduct and respect took place in these relationships, overall harmony would prevail. As Confucius saw it, a harmonious society rested firmly on a harmonious family structure.

Confucius also advocated a civil service that got its positions through merit (in particular education and knowledge of the classics) rather than through birth or personal connections.

Although not too popular in his own day, Confucius' ideas later had a profound impact on Chinese government and society that carry on to the present day.

Although generally associated with a stiff and formal way of running society, Confucius also extolled the value of music and dance, since they brought people together harmoniously.

The wisdom of Confucius. As with many great philosophers, Confucius was not greatly appreciated in his own day. As one contemporary described him: *“Wagging his lips & clacking his tongue, he presumes to be a source of right and wrong in order to delude the masters of Under Heaven.”*

The heart of the Confucian teaching was 'morality'. *Rin* was the key virtue, meaning the qualities of benevolence, humanity and love. It was the duty of governments, parents and teachers to cultivate *rin* in all its aspects. Other Confucian virtues were:

Li: rituals, ceremonies and how to behave. The best influences were ritual & music

Yi: duty or righteous behavior.

Chi: wisdom, derived from both history and experience.

Chung: Reciprocity. *“What you do not want done to yourself, do not do to others.”*

Confucian sayings:

- *“We know so little about how to live in this life that there is no point in worrying about what may happen to us after death. First let us learn to live in the right way with other men and then let whatever happens next take care of itself.”*
- *“With harmony at home there will be order in the nation. With order in the nation there will be peace in the world.”*
- *“A gentle man blames himself, while a common man blames others.”*
- *“Repay kindness with kindness, but repay evil with justice.”*
- *“A great person seeks to be slow of speech, but quick of correct action.”*
- *“The superior person thinks of virtue, the small person thinks of comfort.”*

Lao Tzu and Taoism

The Taoist Symbol for Yin/Yang

Lao-tze saw everything in nature and the universe as being balanced between two complementary forces: the active male *Yang* ("sunlit") and the passive female *Yin* ("shaded"). Rather than seeing one as superior to the other, Lao-tze saw a truly healthy and harmonious person or society as being perfectly balanced between the active Yang and passive Yin.

An example of this is the Chinese martial art, Tai Chi, which strives to use an opponent's own strength and force to knock him off balance. Taoism saw disease, floods, famines and wars as the result of an imbalance in nature, often caused by human actions. By the same token, any attempts to conform to strict government or personal codes of discipline were artificial and deformed human nature. Taoist ideas would strongly influence Chinese art, especially landscape painting, medicine with its idea of keeping a body in balance, and even Sun-tzu's *Art of War* that advocated dexterity and balance in conformity with nature rather than merely the use of brute force.

Wu wei is another concept central to Taoism. Translated as "do nothingness" or creative quietude, it combines supreme activity with supreme relaxation. The basic idea is that the conscious mind is not creative, being more obsessed with sorting and arranging things. True creativity comes when the forces of the subconscious or subliminal self are released. We have all experienced those moments of being "in the zone" where we seem to effortlessly perform, whether in sports, music, dancing, typing, or whatever. That is *wu wei*.

The Tao of water. Water especially epitomizes Tao with its effortless motion and its ability to support heavy weights and wear down rocks. Infinitely supple, it is infinitely strong. Another quality of water, especially still water, is its clarity. Just as water needs stillness to maintain its clarity, we need quiet away from the sensory world to attain clarity of mind and spirit.

Yin and yang animals. Taoists saw everything, including different animals, as being primarily, but not exclusively, yin or yang. For example, the partridge, which flies south toward the warm South wind is yang. Likewise, the horse is yang, because it rises front first, while the camel, which rises rear first, is yin.

Yin and yang time. From midnight to noon is Yang as the sun rises, and noon to midnight is Yin as it lowers. Similarly, summer and fall are yin, because the sun is declining, while winter is yang since it is rising.

Some of Lao-tze's sayings from *Tao Te Ching*:

- *"Those who know don't say. Those who say don't know."*
- *"The way to do is to be."*
- *"The ax falls first on the tallest tree."*
- *"The five colors blind. The five tones deafen. The five tastes cloy"*
- *"When goodness is lost, it is replaced by morality."*
- *"The usefulness of a pot comes from its emptiness."*
- *"The best people are like water, which benefits all things and does not compete with them. It stays in lowly places that others reject. This is why it is so similar to the Way."*
- *"When people see some things as beautiful, other things become ugly. When people see some things as good, other things become bad."*
- *"Try to change it and you will ruin it. Try to hold it and you will lose it."*

54. THE QIN AND HAN DYNASTIES (256 B.C.E.-202 C.E.)

"You won the world from horseback, but can you rule it from horseback?"-- Minister to Liu Pang, founder of the Han dynasty

The Later Zhou (772-221 B.C.E.) The early period of the Zhou dynasty, known as "Spring and Autumn" (722-481 B.C.), saw relative stability and the growth of trade, towns, and a middle class of merchants and artisans. However, this prosperity contained the seeds of the Zhou's decline, since it gave local princes in the provinces the resources to do three things. First, they built canals which themselves had three effects. For one thing, they further increased trade, thus giving the princes more tolls and taxes. They also improved transportation of grain, allowing them to feed their cities, armies, and bureaucrats better. And finally, they led to the cultivation of new lands that the princes could claim for themselves. Together, these effects gave the princes more wealth and power that they could use to develop more canals and so on.

Secondly, princes and local nobles started appointing their own agents to collect taxes instead of doing it indirectly through local village leaders, as had been the custom. Finally, the princes started arming peasants and using them in their armies alongside the traditional feudal levies supplied by their vassals. This especially reduced the distinction between the Zhou emperors and their princely subjects in the provinces.

Together, these developments gave the princes more control over their own local nobles and establish more tightly centralized states. This in turn led to increased warfare between the princes who now had much greater resources for waging war than before. With larger armies using peasant levies as well as noble warriors, the intensity of fighting increased and the old courtesies of warfare and diplomacy that had governed relations between princes and nobles disappeared. The resulting chaos, known as the age of "Warring States" (481-221 B.C.E.), generated a good deal of intellectual ferment that provided the background for such philosophers as Confucius concerned about the decay of values.

Qin Dynasty (256-202 B.C.E.) By the third century B.C.E., seven major warlord states had emerged. Among these was the Qin Dynasty in the north, which built up a powerful state through sweeping internal reforms and the creation of a powerful army using horse archers modeled after those used by their nomadic enemies. By 221 B.C.E., the Qin ruler, Shih Huang Ti, had replaced the last Zhou emperor, and ruled all of China. In fact, his title, Shih Huang Ti, meant *first universal emperor*, while his dynasty's name (also spelled Ch'in) came to represent all of the people of the Middle Kingdom which we today still call China.

Shih Huang Ti was a harsh, but efficient ruler who brought China under a single autocratic rule. He lowered taxes and restored canals and irrigation systems. He also redistributed land to the peasants in an attempt to break up the nobles' power. Along these lines he broke up China's old provinces and loyalties and created new ones ruled by non-hereditary governors who could not build their power up in one place over several generations. Shih Huang Ti also created a unified law code, tax system, coinage, and system of weights and measures so that government and commerce could proceed smoothly.

The Qin emperor had numerous building programs, among which were roads and canals to promote trade as well as the swift movement of armies, a huge capital at Hsien Yang where all the most powerful families of the realm were required to move, and a fabulous tomb guarded by 6000 larger than life terra-cotta soldiers in full battle order armed with bronze weapons, chariots, and terra-cotta horses.

However, the most famous and far-reaching of Shih Huang Ti's building projects was the Great Wall built to contain the nomadic horsemen from the north. In fact, previous generations of warlords had built several local walls to protect their realms from the nomads and each other. Shih Huang Ti, in a mere seven years, connected them into one continuous defensive system 25 feet high, 15 feet thick, and stretching some 1850 miles through mountains and deserts. The cost in human lives was staggering, as thousands died from exposure to the

elements, hunger, and exhaustion, causing Chinese peasants to call the Great Wall "China's longest cemetery."

Manning the entire wall was beyond the means of even the Chinese. However, it was built more against the nomads' horses than the nomads themselves. As long as the wall was kept in repair and the intermittent forts and towers were manned, the nomads would be held at bay by two factors. First, they lacked siege engines for attacking manned forts. Second, they would not scale the unmanned sections, since that would involve leaving their horses behind. Only when the wall was in disrepair and unmanned during times of weak government and turmoil, could the nomads break (or bribe their way) into China. Otherwise the Great Wall served its purpose as succeeding Chinese dynasties would repair, modify, and expand it as the real and symbolic boundary between civilization and the nomads.

Shih Huang Ti's reforms may have unified China into one empire and people, but of the heavy burden in taxes and labor needed to support his building projects made him very unpopular. Another source of resentment was the emperor's refusal to tolerate any dissenting ideas, especially those of the Confucianists who preferred the traditional feudal structure of government to his more impersonal bureaucracy. Therefore, he ordered the burning of all works of philosophy that in any way contradicted his policies. He even had some 460 dissenting scholars executed, supposedly by burying them alive. Although some scholars tried to entrust these works to memory so they could be written down later, there were certainly mistakes in the recopying, and there is no telling how much was lost. This purge also deprived the emperor of good advisors and poisoned the atmosphere at court, making it difficult to create sound policies. Therefore, his death in 210 B.C.E. triggered a number of revolts and civil wars that led to the rapid fall of the Qin Dynasty and the rise of the Han Dynasty.

The Han Dynasty (202 B.C.E.-220 C.E.). Liu Pang, the founder of the Han Dynasty, found China worn out by civil strife and heavy taxes and also facing threats from the northern nomads. Liu Pang

(also known as Kao Tsu) and his successors tackled each of these problems and laid the foundations for one of China's true golden ages. Although the Han reversed the more repressive aspects of the Qin dynasty, they also built upon many of their other policies. In that sense, the Qin and Han dynasties should be viewed together as forming the basis of Chinese imperial power and cultural influence in East Asia.

For one thing, the Han rulers reduced Shih Huang Ti's more excessive demands by eliminating forced labor, lowering taxes, and restoring the Classics, although the accuracy of that restoration is still in dispute. However, they did uphold the Qin Dynasty's more enlightened reforms, especially redistribution of land to the peasants, making them much more popular than the Qin and the foundations for one of the high points in Chinese history and civilization.

In government, the Han ended the Qin policy of using non-hereditary governors and reverted to the older practice of using royal family members instead. However, they continued and expanded the Qin use of professional bureaucrats to run the day-to-day machinery of government. This was the result of growing influence of Confucianism at court, since the Han dynasty saw its emphasis on ritual and tradition as a valuable justification and support for their rule. Therefore, it instituted the civil service exams that determined applicants' potential as bureaucrats by testing their knowledge of Confucian teachings, now the official state philosophy. Although modern civil service exams test supposedly more practical skills, such as math and reading, to choose bureaucrats, the idea of hiring government officials on the basis of ability rather than birth or personal connections traces its roots back to the Chinese civil service exams of the Han dynasty. Despite China's varying fortunes, the Chinese civil service was generally the best in the world until the 1800's.

The backbone of the Chinese bureaucracy was a class of scholars known as the civil gentry who would run Chinese government and administration until the early 1900's. Since gaining admission into this class depended on knowledge of Confucianism rather than birth or connections, many middle class

families advanced their sons' fortunes in society by investing heavily in their education. Even after the demise of the civil service exam system, this emphasis on education has remained a powerful factor in East Asian societies, helping to account for their high literacy rates and rapid economic development in recent history.

Finally, there was the ever-present threat of the northern nomads. The Han emperors, here also continuing the work started by the Qin, maintained and expanded the Great Wall and a huge army to bring the nomads under control. Although Han armies met frequent defeats, their persistence did establish a semi-civilized buffer zone in the north.

However, especially in times of turmoil, semi-civilized nomads would often prove to be even more dangerous to China, since they combined both their own restless nomadic energies with knowledge of Chinese civilization in order to organize powerful states that could conquer China. But, as always, such invaders would eventually be absorbed by Chinese civilization. As the historian, Fernand Braudel put it, China let in such invaders and then shut the door behind them.

For nearly four centuries, Han reforms and rule provided a strong empire which expanded its political and cultural influence southward into the rice growing regions of Southeast Asia, northward into the nomadic regions, and northeastward into Korea and Manchuria. Internally, the Han provided a period of peace and prosperity that largely resembled the Roman Empire then flourishing at the opposite end of Eurasia. Science and technology flourished, making China the leading culture in those fields for centuries. The invention of paper (made from rags), the sundial, water clocks, and surgery using acupuncture were some of the main accomplishments of this period. New forms of literature, especially, history, poetry, and diaries, were developed.

Buddhism started gaining influence in China at this time despite initial resistance from the Confucianists and government. However it gained popularity and became the final part of the Three Doctrines of Confucianism, Taoism, and Buddhism. Whereas the three religions of Judaism,

Christianity, and Islam would compete, sometimes violently, for adherents, the Chinese were able to incorporate all of the Three Doctrines into their culture since they fulfilled various needs, Confucianism being a very practical and structured way to run one's daily life and career, Taoism being a more natural way to enjoy life outside of work, and Buddhism being a preparation for what lies beyond this life. As many Chinese saw it, one is Confucianist during the day at work, Taoist in the evening when relaxing, and Buddhist at night when going to bed.

Trade also prospered as never before, both within China and with other cultures. The most renowned example of this foreign trade was the fabled Silk Road that carried silk, furs, cinnamon, iron, and rhubarb westward across Central Asia through any number of middlemen and eventually to Rome. Silk was a luxury in Rome that was literally worth its weight in gold. In order to stretch it out, the Romans wove silk into a very loose gauze-like fabric that the Chinese would hardly have recognized. Interestingly enough, the Romans and Chinese did not meet face to face until 166 C.E. when a Roman envoy finally made it to China. Unfortunately, both civilizations were on the verge of their respective declines, and contact was lost soon afterwards.

As powerful and prosperous as Han China was, it had an inherent weakness, namely that it was based on a huge army and bureaucracy that put a tremendous strain on the economy. This had two main results. First of all, the peasants, who bore the brunt of the taxes, increasingly lost their lands to nobles whose power grew in opposition to the central government. This caused revolts both by oppressed peasants and power hungry nobles. Secondly, as the economy faltered under the strain of heavy taxes, nomadic raids stepped up, which hurt the economy even more, triggering more raids, and so on. Together, these raids and revolts weakened the Han Dynasty, forcing it to increase the army and taxes, and so on. Finally, in 220 C.E., the Han Dynasty fell, ushering in another period of turmoil.

The Great Wall

The Great Wall we see today that snakes its way over the mountains of China was a later creation of the Ming Dynasty (1368-1644). Shih Huang Ti's idea was much more modest and feasible: build his own sections of wall to connect with natural barriers, (e.g., mountains) and walls previously built by independent princes. Supposedly, his original intention was to completely encircle China's land frontiers with a horseshoe shaped wall, but that proved too ambitious even for him.

The bulk of the Great Wall consisted of packed earth, which was contained by two facing walls of stone and brick, at least in the east where stone was available. According to legend, some bricks were hauled by the tails of mountain goats.

Various sources claim up to 1,000,000 workers were conscripted from all over the empire to labor on the wall in the broiling summer heat and winter cold, and that 400,000 of them died in the process, earning the Wall the title of China's "Longest Cemetery". According to one story, there was a prophecy that Shih Huang Ti must bury "10,000 men" under the wall. By chance, he found a man whose name meant "Ten Thousand Men", which turned out to be good news for 9,999 other men.

The Han Dynasty (202 BCE-220 CE) continued the policy of relying on a Great Wall, expanding it westward to protect the vital Silk Road. The Han also colonized the areas of new wall construction with thousands of settlers to add further to its defenses. In the western regions of China where good building stone wasn't available, the Chinese had to rely on packing earth mixed with sticks and branches to provide binding. The signal towers and the outer facing of the wall were covered with a clay plaster that turned bright yellow when dry.

With the fall of the Han Dynasty in the third century C.E. and the ensuing anarchy, the Great Wall was abandoned. Even the Tang Dynasty (618-906), which expanded China's western border to its greatest extent, relied on a strong military and astute diplomacy instead of rebuilding the Wall.

The fall of the Tang Dynasty led to another period of fragmentation between the Khitan (and later Jurchen) kingdom in the North, the native Chinese dynasty of the Sung in the South, and the nomadic Tanguts to the West. The Jurchens did try to restore the Great Wall against the Mongol threat further north, but were only partially successful. Thus the Mongols found their way around the Jurchen defenses, conquering them by 1234, and completing the conquest of Sung China in 1279.

Naturally, the nomadic Mongols had no use for a great wall, so the Yuan Dynasty they founded (1279-1368) ignored it. Thus Marco Polo's account of China at this time makes no mention the Wall. However, the Wall wouldn't have helped the Mongols anyway, since they fell to a native Chinese revolt that gave rise to the Ming Dynasty (1368-1644). After some initial success against the Mongols, the Ming suffered a decisive defeat at Karakorum and gave serious thought to how they could prevent the return of the Mongols. The result was the Great Wall as we think of it today.

The Great Wall of the Ming Dynasty extended for 1850 miles as the crow flies. However, with all its bends, curves, and various spurs, it totaled

3930 miles in length. It had some 25,000 towers, most of which were 40 feet high and 25 feet wide at the base and 15 feet wide at the top. Ideally, they were situated two bowshots apart from each other so they could provide covering fire for the entire span of wall between them. In addition, there were some 15,000 watch towers stocked with four months' provisions and positioned ahead of the wall. They would give early warnings of any attacks with smoke signals made from burning wolf's dung to quickly alert the entire length of the wall.

Where the terrain gets especially steep, steps were inserted that got progressively narrower the steeper the going got. Elsewhere, the ramparts on top of the Wall were wide enough for five men to walk side by side.

The last dynasty, the Qing (1644-1911), came from Manchuria to the northeast, so its realm straddled the wall, making it largely meaningless again. However, it was during this time that growing contact with the West was taking place, and visiting Europeans were naturally struck by the impressive dimensions of the Wall. The Chinese played off this to promote the myth of the Great Wall being a monolithic creation that spanned all of Chinese history. Yes, walls had been a part of Chinese historical efforts to keep the nomads at bay, but the Great Wall as we know it was a much more recent creation.

Fun fact: Despite popular belief, the Great Wall *cannot* be seen from space.

Shih Huang Ti's Terracotta Army

Just a few of the 6,000 larger-than-life terracotta warriors along with horses and chariots that Shih Huang Ti had guarding his tomb

Among the most startling archaeological finds and evidence of Shih Huang Ti's megalomania is his tomb at Xian, which contains an army of over 6,000 larger-than-life terracotta warriors, including horse and chariot units, all there to protect the emperor in the next world. At two meters in height, these soldiers were considerably larger than life-size, making them even more imposing guardians for the emperor's grave. For further insurance against grave robbers, loaded crossbows connected to trip wires were set up. Through painstaking work, scientists have been able to re-create how the terra cotta warriors were painted, making them even more lifelike.

Besides showing us what Chinese soldiers looked back then, their arrangement in Shih Huang Ti's tomb tells us a lot about Chinese military organization back then. Kneeling and standing archers would rain arrows down on the enemy while saddled cavalry and chariots teamed with infantry attacked the enemy's weak points. Standing in reserve would be another force of chariots.

Other building projects that Shih Huang Ti initiated included roads and canals on an unprecedented scale, some roads reportedly 100 meters wide, with the central 10 meters reserved for the emperor's use. He also had a huge central capital at Hsien-yang, where all the most powerful families in his kingdom had to move. He ordered an exact copy of the palace of every prince he had defeated to be built and furnished with that state's dancing girls, musicians, cooks, etc. That way he just had to go outside the city to visit different parts of his realm. His tomb was at the foot of a mountain with a huge bronze relief map of China containing rivers and seas filled with quicksilver and the roof of the cave painted to resemble the night sky.

The Fall of Qin and the Rise of Han

A major defeat of the Qin army in 207 B.C.E during the turmoil following the death of Shih Huang Ti that led to the collapse of the Qin Dynasty.

Shih Huang Ti's Megalomania extended to his personal safety. After three assassination attempts, he had a giant magnet installed at the palace gate with which he could detect any iron weapons being smuggled in.

Fall of the Qin Dynasty (210-202 B.C.E.). When Shih Huang Ti died in 210 B.C.E., they covered up his death by packing his body with dead fish to mask the smell of his decaying body. Unfortunately, that didn't help his successor whose minister assassinated him, set up a new emperor, and was in turn killed by him. However, by then, everything was coming unraveled with revolts and civil wars all over.

One of the rebels was Hsiang Yu, a giant of a man who wore the head of his suicidal wife from his belt. He succeeded in seizing and sacking the capital and burning the last copies of the classics that Shih Huang Ti had stored in his library, an act that some called the true "burning of the classics." He also sacked Shih Huang Ti's mountain tomb, which made him unpopular, leading to four years of civil war finally won by a minor postal official of peasant stock named Kao-Tsu, but mainly remembered to history as Liu Pang.

Sage advice. Having won the throne after a bloody civil war, the humble and poorly educated Liu Pang would sit on the floor and let his followers tear up the palace until one day he was confronted by a sage with the question: "You won the world from horseback, but can you rule it from horseback?" Liu Pang got the point and established a good responsible government that set the stage for one of China's greatest eras.

Han China and the World

A map showing Han China at its height

Diplomacy with the "barbarians". It was often more cost effective to use diplomacy or buy off the nomads than to fight them. One practice that evolved to buy off the nomads while saving face was providing "gifts" in return for accepting "tributary status". Such "gifts" could be very expensive, such as in 25 B.C.E. when the Chinese gave out 20,000 rolls of silk and 20,000 pounds of lower grade silk floss in return for tributary status. At times, "accepting tributary status" could take up ten per cent of the state's revenues. Somehow, this evolved into the idea that any gift given to the Chinese emperor was tribute that recognized China's superiority, even if that was not the intention.

Another strategy that started under the Han Dynasty that must have been a bit cheaper was to marry off Chinese princesses to nomadic leaders. Hopefully, this would help soften their attitudes toward the Chinese and encourage them to adopt civilized ways. Apparently it had at least some effect, because some nomads started building their own walls against other nomadic tribes.

But progress was extremely limited in civilizing the nomads, whose ways seemed incomprehensible to the Chinese, as seen in this complaint:

“If only they had a fraction of our needs, they would become our tributaries. But we have sent them silk costumes; they have torn them to shreds hunting in thickets and then declared that silk was not as good as their sheepskins. We have sent them delicacies to eat; they have found them inferior to their milk and their koumiss [fermented mare’s milk].”

However, even successful campaigns against the nomads could be disastrously expensive in lives and money and prove more costly than diplomacy. Extending the Great Wall further west, maintaining a huge army, often with costly mercenaries, and in particular procuring enough horses for the army from the nomads also ran up the bill. Even after establishing its own horse farms, the Chinese were always desperate for more horses, as seen in Chang Ch’ien’s legendary embassy to the west in search of the Heavenly Horses, which reputedly could travel 300 miles per day. Unfortunately, Chang Ch’ien’s mission failed.

As it expanded westward into more open lands, the Han had to rely increasingly on cavalry to combat their nomadic neighbors.

Expansion to the South was largely the result of millions of peasants fleeing, floods, nomadic attacks and heavy taxes. It was especially difficult because of the dense jungles and tropical diseases. The Chinese, who saw the rice cultivators of the South as reptiles who slithered through the rain forests, used symbols for reptiles or apes to describe them.

However, as the Chinese were adapting to conditions in the South, the Chinese court sent bureaucrats and soldiers to rule and tax both them and the natives. It would take centuries for the Chinese to adapt to the climate and diseases of the South, but when they did, it would become the most populous and prosperous area of China, and the center of Chinese civilization would shift there accordingly.

Indo-China. The Chinese referred to the people of Indo-China further south as the Dog People (i.e., wild animals). According to legend, a king offered his daughter to anyone who brought him the head of a mighty enemy warrior. Surprisingly, a wonderful dog named Pan Hu, succeeded, and the king reluctantly gave up his daughter. The happy couple took up residence in a cave, where they had dozens (or litters) of sons and daughters who became the non-Chinese races of the South. In fact, Pan Hu continued to be revered by some tribes in Vietnam as their ancestor.

The Vietnamese were by nature a cooperative and peaceful people, but also fiercely warlike when faced with invaders such as the Chinese. There was the story of one woman leading a revolt who went into labor during battle, stopped to have the baby, strapped it to her back and went back to the fighting. Down through the centuries the Vietnamese have resisted Chinese expansion, a lesson the United States would have done well to learn before committing itself to an equally fruitless war there in the 1960s. In 1978, soon after their victory in that war, the Vietnamese were again trading shots with the Chinese to the North, using American artillery they had capture several years before.

First contact between Rome and China was not easy, thanks especially to Rome's eastern neighbors, the Parthians, who wanted to continue to profit from their middleman role in the silk trade and thus had a vested interest in preventing the two cultures from meeting. It was only when the Chinese general, Pan Chao, pushed China's borders to the eastern shore of the Caspian and heard of a powerful kingdom (i.e., Rome) to the west that he sent an envoy to make contact. However, the Parthians diverted the envoy from the overland route, saying it would take two years of sailing against bad winds to reach the Romans. So he turned back. Finally, a Roman envoy made it to China to establish direct contact between the two civilizations in 166 C.E., just as the two empires were about to go into decline.

Silkworm cocoons wrapped in silk threads which women unravelled and wove into silk.

The cocoons are heated to kill the pupa inside before it can break through and ruin the silk, then soaked in hot water to loosen the fibers. The silk thread is unraveled, washed with oil or soap, dried, and then twisted, the type of twisting determining the texture of the silk, such as twisting two or more threads together. After that, the end of the silk fiber is threaded through a porcelain eyelet and wound on a wheel.

In order to produce one silk saree, 50,000 silk worms are killed.

Various routes of the Silk Road

The Silk Road was not one particular road, but an ever-shifting route westward across the centuries through whatever nomadic tribes that could be controlled or trusted to maintain safe trade with the West. At times it was relatively safe, such as under the Mongols who kept it so stable that even the Black Death was able to travel along it. At other times it was notoriously dangerous and virtually dysfunctional as a trade route.

As the name implies, the main product that traveled along it during the Han era was silk, which the Romans paid dearly for thanks to the mark-up on the price levied by every middleman between Rome and China. The Romans were so removed from China that they thought silk was

Silk and the Silk Road

Silk worms feeding on mulberry leaves

In the ancient world, silk was one of the most valued trade items in the West, the Romans paying up to its weight in gold. Silk comes from the cocoons of silkworms feeding on mulberry leaves. One silkworm can produce 1000-2000 feet of silk thread. Only the healthiest moths were chosen for breeding, being meticulously tested for infection. Normally, they only breed once a year in the spring, when mulberry trees leaf, but artificial intervention has increased this to three times a year. Women chop up mulberry leaves and feed them to the larvae, which voraciously consume them every few hours for a period of 20 to 35 days, when they are ready to spin their cocoons.

matter combed from trees or animals. They did know it came from some mysterious land to the East they called *Seres*, from the word for silk.

Silkworms and the secret of silk manufacture supposedly reached the West when some monks stuffed a bunch of silkworms and mulberry leaves into the hollow of their bamboo canes and traveled all the way back to Constantinople where they presented their prize to the emperor Justinian. The Byzantines established their own silk industry as a state monopoly, but over silkworms and the secret of how to use them got and spread to Byzantium's neighbors. In later centuries, other highly prized products, such as Chinese porcelain, would dominate its trade, but it would still be known as the Silk Road.

Technical Innovation during the Han Era

Model of a Chinese seismometer from the Han Dynasty period

Although technological innovation over the last 300 years has generally been associated with the West, China has actually led the way in that field through most of history. Such things as paper, gunpowder, and clocks that the West has made its own had their origins in China. The period of the Han Dynasty was a period that especially saw technological innovation flourish.

Chinese inventors came up with calipers for making precise measurements, scissors, the crank handle for turning fans to separate wheat from the chaff, and waterwheels for turning gears to operate trip hammers, polish metal, or operate chain pumps for lifting water into raised irrigation ditches. They also developed an odometer that would sound a drum or gong at regular linear intervals.

In navigation, the Chinese were the first to use a stern rudder (mounted behind the ship) instead of a side-mounted steering oar. Since a stern rudder is much less prone than a steering oar to come out of the water in rough seas, this freed Chinese sailors to venture farther into open waters.

In math, the Chinese came up with mathematical proofs for the Pythagorean theorem, a more precise calculation of pi, and negative numbers, something not accepted in the West until the 1500s. In astronomy they calculated the length of a year to a more accurate $365\frac{385}{1539}$ days and the lunar month to $29\frac{43}{81}$ days.

One of the more amazing inventions was a seismometer, invented in 132 C.E. by the court astronomer, Zhang Heng (78-139 C.E.). It could detect the direction of an earthquake hundreds of kilometers away through the use of a highly sensitive inverted pendulum. When disturbed by ground tremors, it would trigger a set of gears that dropped a metal ball from one of eight dragon mouths corresponding to the direction from which the tremor had originated.

Leading the field of military innovations was the repeating crossbow, a weapon with a magazine of 10 crossbow bolts loaded on top (below). After firing one bolt, the user just had to push a lever forward to catch the string and release the next bolt into place, pull the lever back, and he was ready to fire. It could fire four bolts per minute, four times its hand-loaded counterpart. Its main drawback was a limited range of about 60 meters and poor penetrating power. Reportedly, the Chinese would compensate by dipping the tips of the bolts into poison. The repeating crossbow was also popular for defending households, since intruders would be close targets and probably not armored.

55. THE PARALLEL IMPACTS OF DISEASE ON CHINA AND ROME

"In the area south of the Yangtze, the land is low and the climate humid; adult males die young"
-- Ssu-ma Ch'ien, father of Ch. historiography (145-87 B.C.):

By 500 B.C.E., the earliest civilizations on the Middle East had expanded their empires to the limits of the Middle East and a fairly stable balance had been achieved where they had at least partially adapted to the parasitic and infectious diseases of the region and evolved into "childhood diseases" where concentrations of populations allowed them to survive as a chronic, but usually not fatal, nuisance.

However, the newer areas of Eurasia where civilization spread, the Yellow River in China and the Mediterranean in the West, were relatively free of infectious diseases. This was largely because wheat, and barley, the main crops grown there, were native to the regions, thus causing relatively little biological disruption. This contrasted with areas that practiced irrigation for non-native crops, which exposed people to water borne parasitic diseases. Although there was irrigation in the Yellow River area of China, its cooler and drier climate led to considerably fewer problems with parasitic diseases than the earliest hydraulic civilizations encountered. However, when the Chinese spread southward into the Yangtze River region with its hotter and more humid climate, they encountered water and insect borne diseases to which it took centuries for them to adapt.

In the second century C.E., as Rome and China established trade links across Eurasia, they also encountered the older infectious diseases of the older civilizations in between. As a result, these diseases spread to the eastern and western fringes of Eurasia with very similar results.

In the East, small pox and measles, diseases never previously encountered there, hit China in 161, 310, and 322. Such unprecedented disasters led people to question traditional Chinese beliefs and opened the way for the rise of Buddhism. The severe population loss these outbreaks caused also

contributed to the fall of the Han Dynasty and several centuries of turmoil, until the revival under the Sui and T'ang Dynasties. However, in the 600s, the eruption of a new disease, arising from India or Africa, bubonic plague, caused another huge loss of life and probably contributed to the decline and fall of the T'ang Dynasty by 906. After 900, the Chinese had adapted somewhat to this scourge, and China saw its population and towns expand rapidly under the Sung Dynasty.

In the West, the Roman Empire also suffered the initial onset of smallpox and measles in 165 and 251, helping lead to a period of anarchy in the third century and the eventual fall of the Empire by 500. And, like in China, people questioned the old pagan religions, leading the growing popularity and eventual triumph of Christianity. Then, as population and prosperity were recovering, especially in the Eastern Mediterranean, bubonic plague hit in the 500s, allowing the sudden rise of the Arab Muslims in the 600s. By 900, the plague had also subsided in the Mediterranean and Western Europe, allowing the revival of towns and trade.

Unfortunately, these newly revived cities with their concentrations of populations were especially vulnerable to onset of a new strain of the plague in the 1300s, triggering possibly the greatest demographic disaster in history.

Parallels Between Buddhism in China and Christianity in the West

Mt. Wutai, in northeastern Shanxi Province is sacred to Manjusri, the bodhisattva of wisdom. It has 53 Buddhist monasteries and was named a UNESCO World Heritage site in 2009.

Among the more profound parallels between Rome and China was the rising popularity of salvation religions in each empire: Christianity in Rome and Buddhism in China. Looking at them more deeply, the similarities are even more striking.

- Both grew in popularity as their respective empires went through periods of political turmoil and epidemic, causing people to look for more long-lasting spiritual comfort.
- Both gained most of their popularity outside of their original homelands.
- While Buddhism didn't start out as a salvation cult, variations developed, such as the Amida (Pure land) sect which did worship Buddha and believed in a heaven and purgatory.
- Both suffered periods of state persecution, before becoming virtual state religions, although Buddhism's influence wasn't as predominant as Christianity's. In China, there was a more potent adversary in the form of Confucianism, which at various times held sway at court. Among other things, Confucianists objected to the Buddhists' refusal to pay taxes or homage to the emperor and their practices of shaving their heads and cremating the dead, since this deprived one's ancestors of offerings from their descendants. Buddhists replied that praying for the souls of those in purgatory was the utmost act of piety towards one's ancestors.
- Both developed influential monastic movements that served as vehicles for spreading their faith.
- Both had cults of saints or bodhisattvas who served as intermediaries between heaven and the common people.
- Both promoted pilgrimages to holy sites important in the lives of their deities and saints/bodhisattvas. In China, the most famous of these sites was Mt. Wutai, supposedly the abode of the bodhisattva, Manjusri.
- Both even developed the veneration of relics, which, according to legend, transported magically from India to suddenly

appear in a Chinese monastery or in the palm of a Chinese monk's hand. For example, at the Famen Monastery in present-day Shaanxi province, worshippers of a finger-bone relic would burn or sever parts of their bodies as part of their ritual.

- Both were popular with women and promoted a bit more status and freedom. Originally, bodhisattvas were gender-neutral, but some, including the most popular local goddess, Guanyin, attained fully feminine form. Compare this to the rising popularity of female Also, as in Europe, a convent was the one place a woman could escape male authority.

Portrait of Guanyin holding a child, much like paintings of the Virgin Mary and child in Western Christianity. Like the Virgin Mary, Guanyin was associated with mercy and compassion.

THE FLOWERING OF CHINESE CIVILIZATION: THE SUI AND T'ANG DYNASTIES (220-907)

The Six Dynasties Period (220-581 C.E.). The fall of the Han Dynasty brought in a period of political anarchy known as the Six Dynasties Period. During this time, China was divided into three main kingdoms: Wei in the north where wheat and millet were grown and nomadic pressure was most intense, Shu Han in the west, and Wu in the rice growing regions of the south-east where many Chinese fled to escape the chaos in the north. The kingdom of Wei, which was situated between other nomads in the north and the Chinese in the south, was the first kingdom to successfully combine nomadic culture and Chinese influence. As a result, it was more organized than its nomadic neighbors while still keeping its nomadic energy, making it able to protect Chinese civilization in the south from the wilder nomads in the north. In addition, there were several technological innovations to compensate for labor shortages at this time: the wheel barrow, watermill, and a primitive seed-sower, all of which allowed Chinese culture to prosper more than the Germanic heirs of Rome were able to at this time in Western Europe.

The Sui Dynasty (581-618). After several centuries of various dynasties competing for power, the Sui Dynasty reunited China. Much as the Qin Dynasty had laid the foundations for the Han Dynasty's greatness, the Sui Dynasty, despite the shortness of its reign, laid the foundations for the T'ang Dynasty's accomplishments through several endeavors. The Sui restored the Great Wall and mounted a number of huge expeditions against the northern nomads. They helped restore foreign trade, especially along the Silk Road. Likewise, they restored internal trade by connecting China's main rivers, which all run from west to east, with a north-south channel known as the Grand Canal. As a result, trade and travel between North and South China became much easier. Unfortunately, much as with the Qin Dynasty, these military expeditions and building projects involved a tremendous cost in lives and money. This triggered widespread revolts and the overthrow of the Sui Dynasty by a new dynasty, the T'ang, which would take Chinese civilization and imperial power to new heights.

The T'ang Dynasty (618-906). The T'ang were a military family from the wild northwest frontier and were especially skilled in the use of cavalry. The T'ang, themselves devoted horsemen, bred thousands of horses for their cavalry and imported polo from Persia, which even ladies from court played. Using their cavalry along with large numbers of allied nomadic cavalry and peasant infantry, the T'ang could deal with the Northern nomads and expand Chinese rule in several directions. After stubborn resistance, they conquered Korea in 668 and saw Chinese culture take deeper root in Japan. The T'ang also conquered North Vietnam, then known as Annam (modern Annam), meaning "pacify the South". They drove westward against Turkish tribes in Central Asia, established their power and influence in Tibet, Afghanistan, and India. In 661, Chinese forces even briefly restored the last Sassanid Persian ruler, Peroz, against the rising tide of Arab Muslim conquest. When the Persian king was finally overthrown for good, he found refuge in the Chinese court. Later, the Arabs would defeat a Chinese army at the Talas River in 751 and bring T'ang expansion to a halt.

The unprecedented foreign influences that empire brought into T'ang China were welcomed with a new open-mindedness. Foreign fashions, music, cuisine, art, and religious influences from Central Asia, India, and Persia found favor at the court in China's capital, Ch'ang-an. Islam, Judaism, and Zoroastrianism all found their way to China, while Nestorian Christians, who were branded heretics and exiled by Rome in the fifth century, gained converts across Central Asia and were granted toleration in China as well. Later on, religious persecution (841-45) would eliminate Christianity, although the other religions would survive. Buddhism especially became absorbed into the fabric of Chinese religions, assuming a place alongside Taoism and Confucianism as one of the Three Doctrines which complemented one another rather than acting as competition against each other, as happened between Judaism, Christianity and Islam further west.

Cultural influence worked both ways, however, as Chinese culture and technology spread to Korea,

Japan, and even the tribes in Central Asia. One example of this influence was the spread of rag paper, which was invented, in the early Christian era. Most likely it reached the Muslim world as a result of the Battle of the Talas River in 751, when the victorious Arabs captured Chinese technicians skilled in its manufacture. Eventually, it would spread to Western Europe where it would be combined with another Chinese invention, block printing to create the printing press, one of the most dynamic and important inventions in history. While it is a European invention, its roots lie deep within Chinese history.

Drawing upon these foreign influences and combining them with its own dynamic energy, Chinese culture prospered and flourished under the T'ang Dynasty in three areas: the economy, government, and culture. China's economy prospered largely through trade that thrived both within China and with the outside world. Foreign trade prospered, especially along the Silk Road that maintained commerce and contact with other cultures further west. Although trade certainly thrived, little is known about it, since so much was controlled as government monopolies (e.g., salt, wine, iron, and tea) or interpreted as "tribute" from foreign lands and reciprocal "gifts" going back out. China's internal prosperity was especially reflected in its cities, which were the largest and most populous in the world. Foremost among these cities was the capital, Ch'ang-an with a population of some 2,000,000 people. It was laid out in a rectangular grid five miles wide by six miles long and facing the cardinal directions in accordance with the Chinese concept of the cosmic plan.

One of these monopolies had a profound influence on the history of finance. In the early 800's, merchants selling tea to the government received government notes worth the hard cash value of the tea. These exchange notes, known as "flying money," proved to be popular, since they eliminated the need for carrying heavy coins. The use of credit slips soon spread among Chinese merchants and moneychangers and eventually westward to the Arab world, where they were known as *sakk*, and eventually to Western Europe where the term *sakk* became check. Meanwhile, in 1024, the Chinese

government would expand the use of credit slips by issuing the first true paper currency in history.

Chinese agriculture also prospered under the T'ang Dynasty. For one thing, careful censuses and an equitable system of distributing land and the tax burden among the peasants strived to ensure their prosperity. Second, the system of canals connecting China's rivers meant that relief could be brought to famine stricken areas. Finally, agriculture saw particular progress in the South where new strains of rice and better farming techniques dramatically increased crop yields with resulting population growth. Eventually, under the next major dynasty, the Song, the balance of power and population would shift from the North, where Chinese civilization first evolved, to the South.

Power and prosperity also brought a flowering of the arts in China. Buddhism, coming from India, had an especially profound influence on Chinese sculpture. However, it was in poetry and painting that one could especially see the Chinese genius at work. Both poetry and painting showed a typically Taoist love of nature through their portrayals of flowers, mountains, rivers, and clouds, but rarely the sea, since the Chinese were traditionally a land loving people.

Another development was the further improvement of the civil service exam system and the emergence of the official gentry who had passed these exams as the main bureaucrats of China. This system had been used by the Han Dynasty, but only in conjunction with the older patronage system favoring nobles and political connections. Now the exam alone determined who attained bureaucratic positions in China. However, since education was expensive, only the rich could afford to train one son per family to take the exam. As a result, the officials became a virtually hereditary class. The training and exam stressed Confucianist classics more than mathematics and law, the purpose being to cultivate wisdom and morality in China's officials. In the centuries to come, China's stability and resilience would largely be based on these official gentry.

In 690, the official gentry's fortunes rose further when the only woman to rule China in her own

right, the empress Wu, seized power. Her fear of the T'ang military aristocracy in the Northwest probably spurred her to complete the transformation of the civil service in order to favor a completely civilian class of bureaucrats whose status was based on merit. However, their rise to power meant a corresponding decline of the military nobles, which eventually would weaken China's defenses and help lead to the decline of the T'ang Dynasty.

Fall of the T'ang Dynasty. Several factors led to the fall of the T'ang Dynasty, three of them related to the triumph of the official gentry and the civil service system. For one thing, the government granted the gentry estates, thus taking land from the peasants and increasing their tax burden. This, along with a series of famines partly caused by government corruption and neglect of flood control and irrigation systems, triggered peasant revolts. Secondly, the gentry's dominance of the government caused the emperors to ignore the army and start relying on nomadic mercenaries who were more expensive and much less reliable than native recruits. As a result, T'ang armies suffered a number of defeats, notably at the Talas River against the Arabs in 751, making Islam rather than Buddhism the dominant religion in Central Asia. The weakened army invited invasions from without and revolts from within. Finally, the rise of the official gentry unleashed a Confucianist reaction against foreign influences in China. From now on, China would be more inward looking, sometimes blocking out new ideas that could have been of great use.

Sui Yangdi and the Grand Canal

Emperor Sui Yangdi (604-617),

Sui Yangdi (604-617), son of the founder of the Sui Dynasty, Sui Yendi (581-604), was a tyrant much like Shih Huang Ti of the Qin Dynasty. And like him, he overextended himself with elaborate projects.

His biggest project, something of a counterpart to Shih Huang Ti's building of the Great Wall, was the Grand Canal. Building it was expensive and required 5.5 million workers and 50,000 overseers. Of those, 2 million were lost, most of them probably from desertion.

Also, like Shih Huang Ti's wall, the Grand Canal was largely a continuation of older projects, connecting and extending them to points further north and south. The oldest section, the Hong Gou ('Canal of the Flying Geese', or 'Far-Flung Canal'), probably dates to the sixth century B.C.E. The Han Gou ("Han-country Conduit") connected the Yangtze and Huai Rivers by 483 B.C.E., using intervening waterways and marshes for part of the route.

By the time of the Sui, much of the Hong Gou canal was silted up, thus blocking water traffic between North and South. When construction resumed, much of the old canal was by-passed to avoid further silting. Locks were built to regulate water levels between sections of the canal, while parallel to the Grand Canal there was also an imperial road with courier stations and a long line of trees planted for shade.

The primary purpose of the Grand Canal was to supply grain from the South to the army guarding the frontiers in the North. Previously, soldiers had to serve as part-time farmers to feed themselves. Now they could devote all their time to defending the borders. Besides trade and meeting military needs, the Grand Canal served to tie the northern and southern parts of China more closely together culturally.

Succeeding dynasties continued to maintain and expand the Canal, although the Song Dynasty did destroy part of it to stop the invading Jurchen from the North. The Canal still functions as a major artery of trade, although now it mainly

carries bulk goods like coal, diesel fuel, and construction materials.

The modern canal today, which follows much the same route as the original canal did under the Sui Dynasty

The grand opening of the canal was correspondingly extravagant, with a flotilla of dragon ships one hundred kilometers long taking Sui Yangdi to his capital in the South. Unfortunately his extravagance didn't stop there. In addition to forty palaces built as personal resting places along the Grand Canal, he also had an artificial lake with three islands and sixteen villas built for his favorite concubines. He supposedly stripped whole provinces of their birds to get feathers for his pillows and wives' gowns. When the leaves fell in autumn, he had silk leaves attached to the trees in the imperial gardens and silk lotuses floated in his lake so he could think it was still summer.

His lifestyle while on campaign in the North was also ridiculously expensive, supposedly having a baggage train "300 miles long" and a giant silk screen to surround his part of the camp painted with scenes to remind him of home.

Sui Yangdi's invasion of Korea was as disastrous as it was expensive, as he allowed himself to get bottled up by the opposing Turks. Luckily, he escaped when a small relief army led by the future Tang emperor, Tai Tsung, scared the Turks off with the beating of drums and wild waving of banners to give the impression of a much larger force.

Chang'an: Tang China's Premier City

A map of Chang'an with the palace complex at the north end and main gates facing South. Chinese maps considered south the primary cardinal direction since that was the source of the warm spring winds.

Chang'an ("Perpetual Peace"), had a long history of being China's capital. Under the Ming Dynasty, its name was changed to Xi'an ("Western Peace"), which is what is known by today. Under the Tang dynasty it was probably the largest city in history before the industrial revolution in the nineteenth century, having a population between two and three million people. It covered an area of thirty square miles and was surrounded by a thirty-mile circuit of walls that were 5.5 meters high. These were apparently not that effective in keeping out enemy forces, or even wild animals, since there are records of tigers (in 769 and 782), and a bear (in 830) scaling them. Being close to water, however, city walls also served as flood breaks.

China had two types of cities: government centers and trade and manufacturing centers. Chang'an, like Washington D.C., was an example of the former, with a large number of civil servants, even more underclass to serve their needs, and a large number of foreigners. One law under the Tang Dynasty outlawed Turkic Uighurs from dressing or acting like the Chinese or marrying Chinese women.

Such a huge city required a lot of planning. For one thing, based on the traditional pattern established long before by the Zhou Dynasty, it was laid out in a rectangular grid, although side streets and alleys tended to wind more randomly.

This would influence urban planning in other parts of Asia, notably Japan and Korea. The city was divided into 108 wards, which were the main focus of community pride and spirit. Each ward had a wall roughly three meters in height and a guarded gate.

There were six major roads meeting at right angles and dividing the city into nine districts. The narrowest of these was 25 meters wide, while the main road connecting the palace to the South gate was 150 meters wide. Each of these had three lanes, the outer two for regular traffic and the middle one for government business. Besides, minimizing traffic congestion, such wide avenues created effective fire breaks so that a fire in one district would not spread to another one. Making the city even more pleasant were rows of fruit trees planted along the main avenues.

The closing of the gates at end of each day was announced by 400 drum beats (for the palace) and 600 beats (for the city and wards). Opening the gates in the morning was signaled by 3000 beats. There were strict laws for traveling outside the city or wards past curfew.

The Giant Wild Goose Pagoda in Chang'an, built in 652 C.E.

Shopping. The city had two main marketplaces, one in the eastern part of the city and one in the west. Each of these covered over 466 acres and was divided by roads (each 100 paces wide) into nine sectors marked with signs saying what they specialized in. Commandants enforced standard weights and measures, the quality of goods, and stopped price fixing and monopolies. Weights were sent in every year to be tested and given an

official seal of approval. Prevailing prices were established every ten days. Market commandants were responsible for releasing government grain to keep prices low.

Markets maintained strict business hours from noon to 1.75 hours before dusk, announcing their closure with 300 beats of a gong. However, the government failed in its effort to ban night markets, which were crucial to the lives of the people.

Spare the Rod and Spoil the People: Corporal Punishments in Tang China. Following is a list of how many blows with a rod one received for committing various transgressions.

- 90 blows with a thick rod for climbing ward walls
- 50 blows with a thin rod for speeding in a horse & carriage; 60 blows with a heavy rod if someone is hurt; strangling if someone is killed;
- People rushing w/urgent business (e.g., get a doctor) not fined if no one was hurt
- 90 blows with a thick rod for entering city via canals, the city defenses' weak point
- 70 blows with a thick rod for encroaching on roads (only 50 if you were farming)
- 20 blows with a thin rod for traveling outside wards past curfew without a good reason (e.g., government business, or medical emergency):
- Ignoring watchman led to twang bowstring as warning, shooting a warning shot if that was ignored, shooting the person down if that was ignored

A Cosmopolitan Culture

A sculpture of a horse from the Tang Dynasty, a common motif for artists then and indicative of the foreign influences then active in China

The Tang Dynasty, which was actually descended from Turks along China's northwestern border, were particularly open to foreign influences, making this era probably the most cosmopolitan in Chinese history. The son of the dynasty's founder even wore pigtails like his Turkish ancestors, lived in a tent he had pitched in the palace, roasted lambs whole, carving them with his sword; and recreated Turkish funeral fit for a Khan by lying down as the Turks rode around him shouting. Adding to this influence, many Chinese nobles had intermarried with foreigners during the turmoil of the Six Dynasties Period (220-581).

A gilt-silver jar from the Tang Dynasty in the shape of a northern nomad's leather bag

There were three main sources of foreign influence in China at this time: military, religious, and trade. Military influence, in particular increased reliance on cavalry, was something the Tang brought with them from the West. Also indicative of outside military influence was the fact that by 751, all China's generals on its northern borders were foreign.

Armored cavalry of the Three Kingdoms period (c.500 C.E.), much like that being used by other peoples across Eurasia at this time, such as various nomads, the Persians and Romans. Notice the wheel barrow in back, a major labor saving invention of this time.

Religious influence came mainly from India in the form of Buddhism, which flourished at this time. In addition to Indian monks coming to China, many Chinese traveled to India to learn Sanskrit texts. Also indicative of the lure of Buddha's homeland was the adoption of zero, elementary trigonometry, and the 360° circle. In addition, three clans from India provided the court with royal astrologers.

Another factor making China more open to the outside world was trade. The stimulus for this was the meteoric rise of the Arab Empire after 650 and the exploration by its merchants and traders of the sea routes from India to China. Canton, China's greatest port, traded silk and ceramics with for perfumes, wood, drugs, dyes, and jewels. Trade also brought new ideas as well, most notably Islam, as Canton had a large community of people from Arabia and Persia, as well as Southeast Asia and India living in special foreign quarters under their own laws. Typically they would show up in the spring and stay for several months until the northeastern monsoon took them home. Archaeologists have even found a cemetery of Nestorian Christians in China from this period. Although Islam and Christianity were tolerated, they didn't make serious inroads into Chinese religious beliefs at this time.

After the Tang, foreign pressures from northern nomads, especially the Mongols, would sour the Chinese on foreign "barbarians and make them more wary of the outside world.

Chinese Society in the Tang Era

A ceramic model of an ox drawn cart, like those used in China

Peasants in China, as in most pre-industrial societies, made up the bulk of the populations and provided the base upon which the privileged few could live. The Chinese state took quite seriously its responsibility to protect the welfare of the peasants. New dynasties typically inaugurated their reigns with land reforms to restore the peasants' prosperity. Conversely, decadent rulers tended to ignore this duty, letting the rich oppress the peasants and take their land. Luckily, Chinese political theory saw this and the resulting problems as a sign that Heaven had withdrawn from that dynasty its mandate to rule and was ready to give it to a new dynasty willing to restore the balance.

The Tang Dynasty took a number of measures to ensure the peasants' well being. They were allowed to have bows, spears, swords and shields for hunting and protection against bandits and wild animals. (Keep in mind that until quite recently lions, tigers, and bears were a very real threat to people, sometimes even scaling the walls of the capital city Changan.) The biggest threat to peasants was starvation from famine, droughts sometimes coming four years in a row and even drying out the wells. Other hazards included hailstorms and plagues of locusts, rats, and even bunnies. (Anyone with a garden knows what I'm talking about.)

The inauguration of animal drawn plows in the Han era allowed dramatic expansion of Chinese agriculture and population

To guard against such disasters, the government annually collected 3.5 bushels from each family to be stored in granaries for redistribution in times of famine. It also established a graduated system of tax remissions during famine. A 40% loss of crops exempted peasants from the grain tax; a 60% loss also eliminated the cloth

(especially silk) tax that the women had to make and pay; and a 70% eliminated the *corvee* (annual forced labor, usually for twenty days, on government projects).

All that being said, peasants in China (and just about everywhere else) had it pretty rough. Fixed taxes not adjusted for deflation might quintuple a peasant's tax load. Meanwhile, the rich were always trying to get the peasants' lands, typically with predatory loans at high rates of interest that the peasants might never repay, thus losing their farms. Then they could become either agricultural laborers, having to accept whatever wages the landlords might offer, or tenant farmers who paid half their crops as rent in addition to interest on loans they might take out for tools and seed. Landlords, like the state, could also impose forced labor on their tenants.

Another ruinous burden occurred when the state conscripted peasants for military duty, usually for three years at a time. This could leave farms untended and allowed to go to ruin. When the Tang resorted to just hiring mercenaries, that might relieve peasants of the burden of military service. However, it also could raise taxes to ruinous levels to pay for the mercenaries. And late in the dynasty, they didn't even do a good job of protecting the peasants from invaders.

For many peasants, the best option was to run away to the South, despite the anguish of leaving their ancestral lands and enduring the uncertain hazards of travel. Of course the attraction of migration was the (often false) illusion of fertile lands and other forms of riches to be had there. One notable example was the "goose poop gold rush" (c.700) when a peasant noticed a glint of gold in some goose poop and tracked the poor birds to where they fed. Two centuries later, peasants were still trying to extract gold from goose poop.

In the absence of pockets, Chinese coins, known as cash, which were strung on necklaces. The next highest denomination was a group of 1000 cash.

Merchants. The traditional Chinese view of society put merchants at the bottom of the social scale, the reason being that they didn't produce anything, but only lived as parasites off the rest of society. Officials were forbidden to deal directly with merchants and high officials couldn't even enter markets where they operated. Merchants were also forbidden to take the civil service exams (although after 803 their sons could).

Still, the authorities figured out ways to make money off the merchants. Extracting forced loans was one method. Another was allocating meager salaries to officials who would have to "loan" money to merchants, who would then loan that out at interest, and then repay the officials with interest.

As time went on, officials, nobles, and even soldiers ignored restrictions on mercantile activity and openly ran shops in the markets. In one case an official made a huge fortune from selling horse manure for fertilizer. In this case, the emperor put a stop to this practice so the Tang wouldn't be remembered as "sellers of horse manure."

Of course, merchants, having money, could live far above their official station in society. On the other hand, instead of investing in new businesses and technologies, they often spent their money on educating their sons to break into the more prestigious class of civil officials. Western Europe in the late medieval and early modern eras would see a similar mindset as enterprising merchants sold off their businesses

to buy noble titles and settle into an idle lifestyle on their landed estates.

Clergy. As in Western Europe, the clergy (i.e., Buddhist monks and priests) were among the most privileged people in society. By 845 there were an estimated 360,000 monks and nuns in China, all of them exempt from taxes and compulsory labor. Many more people would buy fake ordination as monks to get out of paying taxes, while forgoing celibacy.

Also like the West, people donated fortunes to monasteries to avoid the "ten hells of purgatory" and ensure a better reincarnation. Peasants working the monasteries' lands would pay 10 to 20 times the dues to their landlords as free peasants paid in taxes. (According to the principle of *ahimsa* (non-violence) monks didn't work the land since it would involve killing insects.

Monasteries used their profits to invest in such lucrative industrial enterprises as waterwheels operating gristmills or trip hammers. Since waterfront property for tapping into free waterpower was so expensive, monasteries were often the only ones able to buy it. They also built oil presses for sesame seed oil, since monasteries burned oil lamps so much.

Another source of revenue was loan-sharking. Short-term loans for seven months were typically given to peasants for spring planting and repaid at harvest. If a peasant defaulted, the monastery got his movable prop. While tenants of some monasteries were not charged interest, others were charged up to 50%. For high risk loans to officials monasteries would charge up to 120% interest, since if they didn't repay, there wasn't much monasteries could do about it. Some monasteries got up to half their income from interest on loans.

China's Only Female Emperor

dramatically into Central Asia and Korea. Even more telling, China under her rule seems to have continued much as before. Wu promoted men of ability that gave China excellent government for years after she was deposed. Most likely these were men of lower social status who could be little threat to her.

[Back to flowchart](#)

Wu Zetian (ruled 690-705) was the only woman to rule China in her own right, claiming to found her own dynasty, the Zhou, and taking the title of *huangdi* (“emperor”). She was a concubine of the emperor Taizong and became first concubine or empress of his successor, Gaozong. When he was debilitated by a stroke, she ruled in her own right until he died, overthrew his first son, set up and ruled through his second son for six years, and then overthrew him to establish the Zhou Dynasty and rule in her own right until 705 until she was finally overthrown at the ripe old age of 80.

During this time, imperial princesses reportedly assumed titles, kidnapped people as slaves, sold state offices and had 12,000 Buddhist monks fraudulently ordained. In 710, five years after Wu Zetian’s overthrow, her daughter-in-law, the empress Wei, poisoned her husband and tried to rule, but was overthrown eighteen days later, thus restoring the Tang Dynasty.

As is typical for women in power throughout history, Empress Wu got a lot of bad press from the predominantly male sources, who accused her of carrying on a reign of terror using secret police and torture, and even smothering her own daughter so she could blame a rival consort to the emperor. She supposedly was so vain that she refused to let people say she was as beautiful as a lily or rose. Rather they had to say a lily or rose was as beautiful as her. While she had to be somewhat ruthless to maintain her unique position, we have to be careful not to take such hostile sources too literally.

To her credit, during Wu’s reign, Chinese armies expanded the empire’s borders

THE SUNG DYNASTY (960-1279) AND MONGOL RULE (1279-1368)

The Sung Dynasty (960-1279). The fall of the T'ang Dynasty ushered in a brief period of chaos referred to as the Five Dynasties and Ten Kingdoms (906-960). Despite this turmoil, Chinese civilization maintained itself, especially in the South where many people fled to avoid the northern nomads. Out of this chaos, two new kingdoms emerged.

First of all, the semi-nomadic Khitan built a powerful realm in the North that even encompassed the Great Wall. What made the Khitan so dangerous was that they had partially absorbed Chinese culture, thus fusing their nomadic energy with Chinese sophistication. In the middle Ages, many people mistook the Khitan as the Chinese and referred to China as Cathay (land of the Khitan). Throughout this period, the Khitan kept up pressure against a new Chinese dynasty, the Sung, who brought all but the northernmost provinces and the Great Wall under their control. Sung government was efficient, maintaining the irrigation and flood control projects to ensure economic prosperity. The Sung also weakened the influence of the military in favor of the bureaucratic gentry who were hostile toward the military. This and the lack of pasture for good cavalry horses in the south caused the Sung to pay less attention to maintaining a good native-born military and to rely more heavily on expensive mercenaries and paying tribute to keep their northern enemies at bay. Therefore, when the Sung did finally attack the Khitan, they were no match for their mobile horse archers who forced them onto the defensive.

In the early twelfth century, the Sung called in another nomadic people from further north, the Jurchen ruled by the Chin dynasty, to destroy the Khitan realm. Unfortunately, the Jurchen, proving less civilized and more dangerous than the Khitan, turned against the Sung and forced them even further south after 1126. One advantage of ruling in the South was that its numerous waterways and lack of pasture impeded invasions by any nomadic cavalry, thus keeping Sung China relatively secure.

Despite these pressures, the Southern Sung Dynasty (1126-1279) still flourished with a thriving economy based largely on rice agriculture. This helped create a more urban society, with five Chinese cities reaching populations of one million. Ironically, the more comfortable urban culture hurt the status of Chinese women, since their labor, which was so vital on the farm, was not needed nearly as much in town.

Economically, the Chinese were the first to use paper money, getting the idea from the bills of credit used under the T'ang Dynasty. The advantage of paper money was that it saved the burden of transporting heavy cash (which was all in copper coins), especially taxes, long distances. As its nickname, "flying money", implies, paper money was easy to print (thanks to block printing also invented by the Chinese), and its overuse later on triggered inflation. Even such measures as scenting it with perfume or sewing in threads of silk failed to solve this problem that still bothers governments today.

The Chinese economy, largely blocked from overland trade to the northwest, saw rapid expansion through the vigorous pursuit of sea-borne trade to South-east Asia and into the Indian Ocean. Unlike the northern Chinese, who preferred to remain on land, the Chinese in the South were more at ease with the sea. (Even today, a preponderance of Chinese immigrants to the United States originates from the southern parts of China.) Several technological innovations helped the Chinese in their maritime ventures. First of all there was the Chinese sailing ship, the *junk*, which was faster and several times larger than any European ships then sailing. It also had a sternpost rudder and separate watertight compartments, something European sailing ships would not be able to match until the 1800's. Another invention brought back by Arab traders to Europe that would be vital to later European explorations was the compass. For centuries, the Chinese had used the compass for divination and fortune telling before applying it to navigation. Chinese compasses pointed south, since that was where spring winds came from and was considered the most important direction on Chinese maps.

By 1200, the Chinese had replaced the Arabs as the dominant commercial power in the Indian Ocean, trading books, paintings, and porcelain along with silk, tin and lead. All this trade brought large numbers of foreign traders to China, many of whom settled down in self-contained communities where they could live under their own laws. One of the most prominent of these was a Jewish community that survived into the 1800's.

Two other Chinese inventions deserve mention here: the water-powered clock and gunpowder. The Chinese clock was powered through a complex system of gears and escapements. In addition to keeping daily time, it also tracked celestial time and the movement of the sun, moon, and planets for astrological purposes so the emperor would know the best time to embark upon various projects and ventures. Although it was an imperial monopoly, the clock made its way to Europe where it would be adapted in the later Middle Ages to tracking daily time. Eventually, the clock would heavily influence Western Civilization's concept of time by breaking it into precise and discrete units that still regiment our lives today.

Gunpowder, according to legend, was the accidental result of a Taoist alchemical experiment for replacing salt with salt petre (the active ingredient in gunpowder). Contrary to popular belief, the Chinese did use gunpowder for military purposes in the form of rockets and firing projectiles out of bamboo and metal tubes. Most likely, it made its way westward to Europe thanks to the Mongol conquest of China in the 1200's. Eventually, the Chinese invention of gunpowder would be instrumental in the rise of the nation state in Western Europe and Europe's colonial dominance of the globe in the late 1800's and early 1900'.

The arts, in particular painting, flourished under the Sung Dynasty. Chinese painting heavily reflected Buddhist and Taoist values by emphasizing nature and even empty space. Some painters were so brilliant that they could create a painting that had to be viewed from multiple perspectives. This contrasted greatly with European painting, which

put more emphasis on humans as the center of attention.

The Mongol Empire (1279-1368). Although the overland routes to the West were mostly cut off, the Sung Dynasty did see some trade, largely in the form of superior iron weapons, going north through the semi-civilized Jurchen to the much more dangerous Mongol tribes further north. In the late 1100's, the most remarkable nomadic leader of all time, Genghis Khan (1167-1227), combined the use of Chinese weapons, Mongol fierceness, and his own genius for organization and generalship to launch the conquest of the most far-flung empire in history. He succeeded in conquering northern China, but the large fortified cities, lack of pasture for the Mongol horses, and the vast network of waterways obstructing the way kept him from conquering the Sung Dynasty in the South. Therefore, he left it to his successors to complete the conquest, which his grandson, Kublai Khan, did in 1279. By that time, Mongol conquests spread from the Pacific to Eastern Europe and the Middle East. Although there were several virtually independent Mongol khanates, Kublai Khan was recognized, at least in theory, as the supreme ruler over all.

Mongol rule led to several changes in China and Asia. For one thing, the Mongols protected safe travel across Asia and reopened trade along the Silk Road. Because of this, Western Europe, then recovering from the Dark Ages, re-established contact with China, allowing numerous traders and missionaries to make their way there. Among these travelers was Marco Polo, whose account of his travels and the wonders of the East sparked a growing interest in China which would help stimulate the Age of Exploration some two centuries later.

The Mongols ruled with a brutal efficiency that not only discouraged any criticism of them, but also discouraged innovations in the arts. Among the Mongols' ruling policies was replacing the civil service exam system with the use of non-Chinese governors and officials and even a foreign script. However, in the 1300's, the civil service exam was restored as the Mongols in turn succumbed to the influence of Chinese civilization. Mongol rule was

especially unpopular with the Chinese, who looked for any opportunity to revolt. Two factors helped provide that opportunity, dissension within the Mongol ranks and corruption among their bureaucrats. Finally, in 1368, the Chinese overthrew Mongol rule and established a new dynasty, the Ming, which would once again restore Chinese power and wealth.

Chinese Painting

Loquats and a Mountain Bird by an unknown artist of the Southern Song period

Traditional Chinese painting followed a path completely separate from Western art (at least until the late 1800s). One of the most important differences is how Chinese painting was closely tied to the art of calligraphy, using a brush dipped in black or colored ink rather than oil paints. They were typically painted on paper or silk that could be mounted either on handscrolls or as hanging scrolls.

However, as in the West, Chinese painting went through a number of phases during its long history. From the Han through the Tang periods (c.206 BCE to 906 CE) artists focused mainly on human figures, sometimes depicting court life or daily life of the people, other times emphasizing Confucian virtues, such as a wife's obedience to her husband. During the later Tang Dynasty, landscape paintings became increasingly popular.

During the era of the Five Dynasties and Northern Song (907-1129) the landscape came into its own as a subject, and was seen as the highest form of painting, as it still is in China. This especially reflects the Taoist emphasis on nature, showing humans as tiny specks in a

massive landscape. By contrast Western art after 1500 CE would emphasize humans as the center of the world, for a long time seeing the landscape as an inferior subject.

“Buddhist Temple in the Mountains”

Chinese landscape painting is noted especially for two things: multiple perspective and empty space, which give free rein to the viewer's imagination and emotional reaction to the painting. Also, to provide a sense of depth in these paintings, artists depicted closer objects in striking detail while creating a blurrier effect for such things as mountains in the background. One might compare this to the sfumato (smoky) effect developed by Leonardo da Vinci for such paintings as the *Mona Lisa*.

Under the Southern Song (1129-1279), painting followed the political trend of Neo-Confucianism of focusing on reform from the bottom up. Therefore, one saw more detailed paintings of small subjects, such as birds, without any background.

During this time there was a growing split between professional and amateur scholar-gentlemen. Scholars, who also served as art critics, saw professional artists in the same light as butchers and craftsmen, just making paintings for money, not to express their feelings. They saw painting as one of the Four arts, the others being musicianship (in particular on the *guqin*, a stringed instrument), playing the

strategy game of Go), and calligraphy. One thing they developed was the Three Perfections, combining painting, calligraphy, and poetry, whereby a painting would also have a poem written in the best calligraphy. The poem might inspire the painting or vice versa. The scholar-gentleman, though not as technically proficient as the professional artists, maintained their traditions down through the centuries.

Ma Yuan “*On a Mountain Path in Spring*”.
 The Poem translates:
 “*Brushed by his sleeves, wild flowers dance in the wind,
 Fleeing from him, the hidden birds cut short their song.*”
 To the right is a larger view of his calligraphy

The mixture, known as a slurry, was cooled in a large brick tub where a specialist dipped a silk screen, then extracted it, letting most of the water drain through the silk, leaving a thin layer of slurry. The screens were stacked and allowed to partially dry, after which the slurry, having coalesced into sheets of paper, was dumped from the screens onto a stack of similar sheets. After drying some more, the sheets were hung outside to completely dry, after which they were full sheets of paper.

Chinese movable type. A Chinese inventor, Bi Sheng, actually came up with movable type in the 1040s, carving Chinese characters into uniformly sized clay blocks that he fired. He then arranged them in vertical rows inside a rectangular frame, inked them with a mixture of gum and soot made from burned pine, and pressed a piece of paper over them to get a printed page.

The problem was that storing and cataloging a writing system of literally thousands of characters was extremely tedious and impractical. Bi Sheng tried storing characters in different boxes organized according to how their sounds rhymed. A later system used rotating tables to bring the characters to the typesetter. This was still too tedious, so the Chinese reverted to the simpler technique of carving entire pages of text out of wood, a system devised back in the eighth century. Supposedly, there were 500,000 copies of one Buddhist text printed with this technique.

“*Flying money.*” Chinese block printing made possible the next step: paper money. During the Tang dynasty, the government, instead dealing with the hassle and risk of carrying hard cold cash to pay officials in distant provinces, sent credit slips that could be converted into cash by local bankers and officials. This was known as “flying cash” for its ability to blow away in the wind.

Real paper currency came into being during the Song Dynasty, when bankers started regularly

An Era of Innovation

Chinese movable type

At no time did the Chinese show a greater spirit of innovation than during the Song era, coming up with the spinning wheel, smallpox inoculation, movable type, paper money, clocks, and gunpowder, to name a few.

Chinese paper was made from bamboo stalks that were stripped of leaves from smaller branches, and then boiled in a tub for three days to break them down into thin hair-like fibers.

issuing these paper credit slips during business transactions.

In 1023, the government replaced these banknotes with its own paper money. The crucial thing about paper money is having something of real value to back it up so people will accept it. At times the Sung would try to give it some inherent value by dipping it in expensive perfume or sewing silk threads into it.

Paper money issued in 1160

The Jin (or Chin) Dynasty in the north adopted the practice of issuing paper money, but did little to ensure its value, thus triggering an inflationary cycle.

Marco Polo wrote about Chinese paper money with great admiration, but governments in Europe wouldn't adopt the practice until the 1700s.

"The Cosmic Engine." The first mechanical clock was built during the Sung Dynasty in China around 900 CE. By 1100, a man named Su Song had developed it into a 39-foot high astrological/astronomical clock to mechanically track the motion of the sun, moon, and five known planets at that time (Mercury, Venus, Mars, Jupiter, and Saturn) as well as tell time.

In order to keep accurate time, Su Song's Cosmic Engine, as it was called, had a tank always full of water (for equal pressure) to release water into a scoop mounted on a wheel (below right). After fifteen minutes, the weight of the full scoop would pull it down and turn the wheel, putting the next scoop in place. Each time, this would also beat a drum. The mechanism also turned an armillary sphere that tracked the motions of the known heavenly bodies.

The clock was a royal monopoly to help emperors decide propitious times for acts of state, such as making war, or deciding which son was most favored as heir to the throne. The emperors relied on it so much that, when an ambassador to the north reported that the heavenly bodies were not in line with the clock, the emperor replied that the clock was right and the sky was wrong. When Kaifeng, the northern capital, fell to the Jurchen in 1126, Su Song's clock was dismantled and taken away.

The idea for the clock eventually spread to Western Europe where it was adapted to a system of weights that didn't freeze in winter the way water does. Ironically, a Jesuit priest from Europe would reintroduce the mechanical clock to China in the 1500s, presenting a windup clock to the emperor. However, Ricci kept the key, so the emperor had to give him an audience every week to rewind the clock.

"Fire medicine." Gunpowder may be the invention the Chinese are most famous for. Ironically, it was the result of alchemists trying to find an elixir for immortality. When the lab exploded, the Chinese figured out other uses for this volatile chemical. Besides fireworks displays and a remedy for stomach ailments, gunpowder was applied to warfare. A charge of gunpowder was wrapped in oiled paper at the top of a shaft close to an arrowhead, with an iron weight was attached at the other end of the shaft to provide a balanced flight. Using the wheelbarrow, another Chinese invention, they could transport multiple-rocket launchers to the battlefield able to fire up to 320 arrows at a time.

The Chinese had different kinds of rockets with such colorful names as “Five-tigers-springing-from-a-cave-rocket-arrows” and “Mr.-facing-both-ways-rocket-arrow-firing-basket.” Even if these and primitive bombs encased in bamboo or porcelain weren’t very accurate or lethal, the initial psychological impact of such devices on peoples who had never encountered them before could be devastating.

The Civil Service Exams

Some of the 7500 individual cells in one hall where candidates took the civil service exam

One of the most admired aspects of Chinese civilization for centuries was its system of civil service exams, which ensured possibly the most consistently efficient and honest bureaucracies until modern times. Even today, although exams are no longer based on knowledge of Confucianism, the principle of appointing civil servants on the basis of merit is still very much alive and can trace its roots back to traditional China by way of Enlightenment Europe.

The exams were given about every three years on three levels: provincial, metropolitan, and palace.

The provincial exam was given in each of China's roughly 300 districts to around 10,000 contestants. Each contestant was searched at two

different gates for cheating materials and then placed alone with his own food in a sparse cell to take the test.

- On day one the applicant would have to answer three essay questions on Confucius plus compose a poem.
- On day two, he would answer questions on the Five Classics and repeat part of the previous day’s test to ensure he had indeed written those answers
- On day 3: he would answer a question on some past or present government policy.

There were usually around 10,000 contestants across China taking the exam, of whom 1% or less passed. Even at this level, someone who passed could feel assured of a somewhat secure and comfortable career.

For those who passed the provincial exam and wanted to further advance their careers, there was the metropolitan exam, which was much like the provincial exam. Proctors copied each contestant’s test answers so that the graders couldn’t recognize someone’s calligraphy.

For those wanting to reach the highest positions in government, there was the palace exam, which was taken in the presence of the emperor. There were four tests: two on physique and two on knowledge. The candidate was checked for his physical appearance, calligraphy, and to make sure he didn’t have a foreign accent. Later, he would also write his life history, largely to ensure that his calligraphy matched that on his exam. A typical civil service exam question and answer:

Question: “Confucius said of Zuchan that in him were to be found 4 virtues that belong to the way of the gentleman. What are these virtues? “

Answer: “In his private conduct he was courteous; in serving his master he was punctilious; in providing for the needs of the people he gave them even more than their due; in exacting service from the people he was just. I answer the question with respect.”

The Mongols

The Mongol Empire by 1279 with the conquest of China. No other empire in history has covered so much territory and touched so many cultures at the same time.

Of all the nomadic tribes that stormed out of the Central Asian steppe to attack the civilizations to the south and west, none inspired more terror and fascination than the Mongols. While they largely fit into generalizations made about other nomadic peoples, such as the Huns, Turks, and Avars, the Mongols seem to have been the extreme example of the most frightening of those generalizations, being especially removed from and untouched by their civilized neighbors. The Persian historian, Tarikh-i Jahangushay-i Juvaini, gives the following description of the Mongols before Genghis Khan united them into a virtually unstoppable force:

“Before the appearance of Genghis Khan they had no chief or ruler. Each tribe or two tribes lived separately; they were not united with one another, and there was constant fighting and hostility between them. Some of them regarded robbery and violence, immorality and debauchery as deeds of manliness and excellence...Their clothing was of the skins of dogs and mice, and their food was the flesh of those animals and other dead things. Their wine was mare’s milk.”

Mongol yurts were basically the first mobile homes: tents that could be put on wheels.

Big ones, such as the double-wide seen here required large teams of oxen to move them to a new trailer park.

The harsh conditions of the steppe made the Mongols particularly tough and vicious. They lived solely off the meat and milk of their horses and flocks of sheep, even being known to open veins in their horses’ necks to drink their blood when in dire need. Coming from the kill-or-be-killed environment of the steppe, they could be especially merciless to defeated enemies. Unlike many of their civilized opponents who fought according to a code of honor or chivalry, the Mongols would ruthlessly pursue any tactics to gain an advantage: ambushes, feigned retreats, even poisoning (which is how Genghis Khan’s father died).

Another thing that made the Mongols so terrifying was the speed of their armies, or more properly, the horses that carried them. Although comparatively small, Mongol horses were also incredibly tough and, in the eyes of civilized commentators, ugly. Unlike horses in civilized lands, steppe ponies didn’t need a cumbersome supply of fodder brought along to feed them, being able to survive solely on grazing. Reportedly, they could survive on the bark and leaves of trees being fed to them and knew how to dig through the snow to find food.

Rumors of the Mongols eating human flesh and their horses eating trees may have had some basis in fact concerning the horses.

They were incredibly hardy and durable, one Mongol supposedly covering 900 miles in six days on one horse, while Genghis Khan’s army once covered 130 miles in two days without a break. Making such a feat possible was the fact that each Mongol had a string of sixteen mounts

that he could keep switching to. Throw in a couple more horses for meat, and a Mongol army could campaign for six months without a supply train.

Possibly the one thing that made the Mongols stand out compared to other nomads was their discipline. For all the nasty qualities their neighbors ascribed to them, they were also noted for their unquestioning obedience to authority. This, and their ability to coordinate the movements of their armies over vast territories came from the unique way the Mongols hunted, a massive annual event that Genghis Khan may have invented, called the *nerge*.

Each year, the entire Mongol army would be mobilized as if for war and arranged in a vast ring that would drive any game toward the center. An unprecedented level of coordination was required to maintain a tightly closed formation among all the parts of the ever constricting ring, and that required highly developed level of communication, since the parts of the ring might start as much as 100 miles apart from one another. Once the animals were enclosed in a tight ring so they could hardly move, the slaughter began. In such a situation, many of those animals would fight desperately, making this a very intense and dangerous struggle, requiring a high degree of cooperation and teamwork. Anyone letting an animal through or showing any hesitation in the fight would be severely punished.

Besides providing meat for the coming winter, the *nerge* also trained and conditioned the Mongol army for war as a single fighting unit, giving it a huge edge over its enemies. In fact, Genghis Khan would even start a campaign against an enemy with a *nerge* to get his army ready for the fight ahead. Once you've fought a wild animal that is cornered and desperately fighting for its life, you're ready for about anything a human army could throw at you.

The *nerge* especially prepared the Mongols for the coordinated tactics they would use against

their various enemies. Their primary weapon, as with other nomads, was the composite bow which, when combined with the horse, gave them an immense amount of mobile firepower. While a Mongol army would have a small force of heavy cavalry, they weren't used until the enemy formations had been broken up either by a continuous firestorm of arrows or some variation of the feigned retreat to draw their opponents out into the open. The feigned retreat could either be short-term to lure the enemy into a prepared ambush or longer to wear out and break up their formations in pursuit.

Once opponents caught on that they couldn't beat the Mongols in the open field, they typically retreated into strong fortified cities, the thought being that the Mongols were ill prepared for long sieges. Initially, they were right, but the Mongols adapted quickly, mainly by sparing captured technicians skilled in siege warfare. To spare their own manpower, they would also use captives to build the siege works, clear moats, and lead the initial assaults, forcing the defenders to kill their own people or even stop fighting. Once a city was taken, it was usually sacked and destroyed, its inhabitants being slaughtered en masse except for valued technicians and a few choice women. Bodies or skulls of the dead would be left in huge piles as warnings to others concerning the fate of those who dared resist the Mongols.

The Mongol conquest of China was a drawn out affair, lasting close to seventy years (1211-79). It occurred in two phases corresponding to the two kingdoms China was divided into at the time, the Jurchens under the Jin Dynasty in the North and the Song Dynasty in the South.

The campaign against the Jin (1211-34) took the form of yearly invasions, at first largely to plunder the countryside and later to besiege cities. Repairs or additions to the Great Wall were defeated either by storming, bribery, or circumvention, the latter also involving splitting the Mongol army into widely separated but still highly coordinated forces. Even when the Mongols failed to take a city, their plundering raids served the purpose of weakening and demoralizing the enemy. By 1215, most of the Jin Empire was under Mongol domination, but several major cities remained to be taken.

After a brief lull following Genghis Khan's death (1227-30), his successor, Ogedei resumed the offensive and finished off the Jin in 1234 with the epic siege of Kaifeng. (1232-3). The Jin defenses relied heavily on gunpowder. At first they used soft-cased "thunderclap" bombs, which evolved into the much deadlier iron-cased "thunder crash" and "heaven shaking thunder" bombs which, having two-inch thick iron shells, produced deadly shrapnel. A contemporary account describes their effect:

There was a great explosion, the noise whereof was like thunder, audible for more than a hundred li, and the vegetation was scorched and blasted by the heat over an area of more than half a mou. When hit, even iron armor was quite pierced through. Those who were not wounded by fragments were burned to death by the explosions."

As the Mongol siege trenches approached the walls of Kaifeng, the defenders lowered thunder crash bombs by chains so that "when these reached the trenches where the Mongols were making their dugouts, the bombs were set off, with the result that the cowhide and the attacking soldiers were all blown to bits, not even a trace being left behind."

Kaifeng fell in 1233 and the last of the Jin committed suicide the next year.

Now there remained the Song Dynasty in the South. This created new problems for the

Mongols. In addition to a lot of heavily fortified cities, there was also the hotter subtropical climate and the diseases it produced. Another problem was the landscape, in particular rivers and massive rice paddies that were harder to traverse and provided no forage for Mongol horses. In 1265, the Mongols defeated the Song in a major battle at Diaoyu and captured 146 ships. These proved crucial for conquering a land with so many rivers, and the Mongols adapted to naval warfare much as they had to sieges.

Song riverboats run the gauntlet of Mongol thunder crash bombs in order to relieve the siege of Xiangyang). Chinese riverboats were paddle wheelers, with power coming from men operating a treadmill in the back.

The climax of the conquest was another of the great epic sieges in Chinese history, that of Xiangyang (modern Xiangfan), which lasted five years (1268-73). By this time, the Mongols had their own thunder crash bombs, but even they weren't enough against the city's massive fortifications. Luckily for them, their conquests of Muslim lands in the West had given them the technology to build a new kind of siege weapon, the counterweight trebuchet.

Centuries earlier, the Chinese had actually developed a traction trebuchet, powered by people pulling from one end to slingshot a stone against enemy walls. Now China's weapon had come back to haunt them in a new form, the counterweight trebuchet that could launch a 200 pound stone, ten times the delivery load a traction trebuchet was capable of. Thus an old weapon with a new twist proved more effective than modern gunpowder, bringing down an entire tower of Xiangyang's defenses with a single shot.

This proved to be the difference in taking Xiangyang and the remaining cities in the South, some of them surrendering just at the sight of the fearsome trebuchets. By 1279 the last remnants of the Song Dynasty were gone and a new dynasty, the Yuan, took power under Kublai Khan.

THE MING AND EARLY MANZHOU DYNASTIES (1368-c.1800)

The Ming Dynasty (1368-1644). The expulsion of the Mongols from China in 1368 ushered in a new period of peace and prosperity for China under the Ming ("brilliant") Dynasty. The early Ming emperors revived Chinese power and wealth through their foreign, governmental, and economic policies. In the realm of foreign policy, several strong emperors aggressively extended Chinese power to the old borders of the Han Empire. Not surprisingly, the Ming Dynasty was especially concerned with the threat of the northern nomads who had so recently humiliated China. Therefore, they put forth a tremendous effort to subdue the nomads (with very limited success) and partially restored the Great Wall. The fortifications around the first capital, Nanjing, were 60 feet high and extended in a perimeter 20 miles long, the most massive urban fortifications in the world. In 1421, the Ming moved the capital to Beijing, only 40 miles from the northern frontier in order to keep a better eye on nomadic movements. Not only did this endanger the capital, since it was so close to the nomads, it also removed the government from contact with and understanding of the more economically vibrant South. As it was, the nomads posed no real serious threat to China during most of the Ming Dynasty's rule.

Beijing itself became a magnificent city with 40-foot high walls around a perimeter of 14 miles. Central to the capital was the emperor's palace complex, known as the Forbidden City. Unlike Western architecture, which reaches ever skyward away from earth, as seen in Gothic cathedrals and skyscrapers, Chinese architecture aims for a more balanced and harmonious effect in the true Taoist spirit. The Forbidden City especially shows this, being spread out on a broad horizontal plane under the overarching dome of the blue sky, which counterbalances the effect of the high roofs of many of the government buildings and palaces. The overall effect is one of horizontal stability, emphasizing the permanence of the regime of the Son of Heaven (Chinese emperor).

The Ming reversed the unpopular policies of the Mongols and reinstated the system of civil service

exams for selecting officials, thus restoring the Mandarins to prominence in Chinese society. They also retained the other features of government used by previous dynasties, such as the Six Ministries and the Censorate. The Censorate was largely concerned with preventing corruption and abuses by sending traveling censors to the provinces to hear complaints and investigate the conduct of local magistrates. Unfortunately, many censors were young officials being asked to report against senior officials who could seriously damage their careers later on. Since the censors had little protection against such reprisals, they often shrank from doing their jobs properly. However, the overall effect of Ming policies was to provide fair and efficient, though strict, government.

Ming economic policies similarly provided for China's prosperity during this period. Dikes and canals were repaired, while extensive land reclamation programs were instituted, since some regions of China were totally depopulated from earlier Mongol depredations and neglect. The government offered tax exemptions lasting several years to any peasants who moved into the ruined areas, a policy which effectively revived much of China. Another policy was to encourage extensive reforestation, probably for shipbuilding purposes, although palm, mulberry, and lacquer trees were also planted for other economic purposes.

As a result of the Ming Dynasty's policies, China was again a strong and prosperous empire, making it the dominant political and cultural power in East Asia. China's cultural vibrancy can be seen in several aspects of the Ming era. For one thing, architecture flourished, as the Chinese constructed arched bridges and tall pagodas with graceful curved roofs. As stated above, the setting of these buildings in broad horizontal planes provided a more balanced effect than the lofty spires of cathedrals one found in Europe at that time.

Chinese science and technology at this time was largely bound up with newcomers from the West. The expulsion of the Mongols in 1368 effectively cut China off from the West for nearly two centuries. In fact, Columbus was still looking for the Mongols in 1492, since Europe had not received word of their fall over a century after its occurrence.

However, in the 1500's, the Portuguese and then the Spanish arrived in China by sea. Most of China's contact with the West at this time was through the Jesuits who skillfully presented Christianity in Confucian terms in order to gain entrance into China and win converts to their faith. Ironically, the Jesuit leader, Matteo Ricci, won court favor by presenting the emperor with a wind-up clock, which, of course, was ultimately derived from the Chinese water clock. (He kept in their good graces by keeping the key, so he would be summoned to court each week to rewind the clock.) Over time, the Jesuits provided the Chinese with a good idea of the state of Western science and technology, especially in the areas of mathematics, cartography, astronomy, and artillery. Europe learned a great deal from China as well, such as the idea for its first suspension bridge, built in Austria in 1741, over 1000 years after the first such bridge had been built in China.

Extensive maritime expeditions into Southeast Asia, the Indian Ocean, and as far as East Africa and Arabia, were another feature of the early Ming period. Between 1405 and 1433, no less than seven major expeditions were launched under the command of the admiral, Zheng He (1371-c.1434). Some of Zheng He's expeditions comprised over 25,000 men sailing in ships that were 400 feet long, many times larger than anything Europe, just then embarking on its age of exploration, could put into the water. The purpose of these expeditions is not entirely clear, probably being more to display Chinese power and influence than cultivate trade, although profitable trade was certainly carried on, especially in fine porcelain, which we today still call china. Then, in 1433, the expeditions suddenly ended, once again for vague reasons. One idea is that the mandarins, resentful of the profits made by the middle class merchants running these expeditions, pressured the emperor to end them. Whatever the reasons, it is tantalizing to think of what might have happened if these expeditions had continued, possibly with China discovering a route to Europe. As it was, Europe was left to find those routes and eventually dominate the globe.

The end of these expeditions had other far-reaching results for China, since they deprived the government of vital trade revenues. This, combined

with two other factors, led to the decline and fall of the Ming Dynasty. First of all, the later Ming emperors lost interest in government, retreating to the comfort and pleasures of the Forbidden City and allowing abuses and corruption to multiply in the provinces. At the same time, the practice of making military offices hereditary led to the gradual deterioration of the army. Together, these factors weakened China and encouraged a growing number of peasant rebellions, attacks by nomads in the North, and raids from pirates in Japanese and Chinese ports. In 1644, another northern people, the Manzhou from Manchuria, replaced the Ming Dynasty and founded a foreign, and China's last, dynasty.

The Qing Dynasty (1644-1911). The Qing Dynasty founded by the Manzhou, although of nomadic origin, had absorbed much of Chinese culture and did everything it could to portray itself as a legitimately Chinese dynasty. As a result, the emperors revived the civil service exams and other governmental institutions, restored the mandarins to the levels of prestige they had enjoyed before Mongol rule, and maintained interest in classical scholarship. (However, the Manzhou also outlawed the crippling practice of binding Chinese women's feet and forced the Chinese peasants to shave their heads except for wearing Manchurian-style pigtailed.) Militarily, the Manzhou extended China's borders to their greatest extent ever, encompassing Manchuria, Mongolia, Siankiang, Tibet, Korea, Burma, Taiwan, and Vietnam.

All this time, contact with the West continued. However, in the long run, it caused problems for China in two very different ways. For one thing, several new crops, such as corn, sweet potatoes, and better strains of rice, were imported, thus making China's agriculture much more productive. In the short run this was good. But, in the long run, these new crops and improved transport of food along China's canals and waterways, both of which allowed specialized cash crops suited to local soils, triggered a population explosion that pushed China's population to nearly 400,000,000 by 1800. At the same time, China's agriculture was expanding into Manchuria, which held the upland and drainage areas of some of China's rivers. Extensive farming here caused soil erosion and

deforestation that triggered disastrous flooding downstream. These floods plus overpopulation put severe strains on China's ability to feed so many people and seriously weakened it.

The second problem had to do with religion. As we have seen, the Jesuits were allowed to preach Christianity in China, because they presented their religion in Confucian terms and were tolerant of Confucian practices. All that changed when Franciscan and Dominican priests arrived and started behaving in a much less tolerant manner than the Jesuits, condemning, among other things, the venerated Chinese custom of ancestor worship. Also, unlike the Jesuits, who concentrated on the educated ruling classes, the Franciscans and Dominicans preached more to the masses, which made Chinese authorities suspicious and resulted in a crackdown on Christianity in China (although the Jesuits still maintained some status at court) and a curtailment of trade with the West in the 1700's.

Unfortunately for China, Europe's power and interest in Chinese goods, especially tea, were growing beyond China's ability to hold these western "barbarians" back from its gates. The result would be a century of humiliation at the hands of the West and a revolution that would at once transform China and maintain its unique culture and integrity as a nation.

Chinese Sailing Technology

A comparison of Zheng He's flagship, which was around 400 feet long, compared to Columbus' ship, the *Santa Maria* that only measured 85 feet in length.

Although it was Europeans who led the way in global exploration and colonization starting in the 1400s, there has been the common impression that the West always led the way in sailing and navigation. In fact, for centuries Chinese ships greatly outclassed Western ships in terms of size and navigational capabilities.

Probably the best-known Chinese navigational innovation is the compass. The Chinese, like the Greeks, discovered magnetic properties at an early date. In China, the first emperor, Shih Huang Ti, supposedly had a giant magnetic gate to detect any iron weapons being smuggled into his palace, presumably to assassinate him.

The first mention of compasses being used by the Chinese for navigation was in 1117 C.E. While previously believed that Europe got the compass indirectly from China, its earliest recorded use in Europe was in 1187, even before its first mention in Arab sources, who presumably would have been the middlemen passing it on to Europe. Therefore, some historians believe the navigational compass was invented independently in both China and Europe.

A Chinese compass/ladle balanced on a bronze plate. It points south, the primary direction on Chinese maps since that was where the warm spring winds originated.

Nautical compasses faced the problem of being disrupted by rocking ships. One solution was to place a magnetized needle in a floating straw, the water's fluidity maintaining some stability to compensate for the ship's rocking. Another version was to balance a magnetized needle on one's thumbnail.

The best-known Chinese ship is the junk, a word that became a term of derision in the West as its ships started surpassing those of China in size. However, in its day the Chinese junk was the premier ship on the high seas using features that would be adapted by the West.

The junk's hull design, possibly inspired by the interior structure of bamboo, had separate bulkheads (compartments) to prevent an entire ship from being swamped by a hole in the hull. As late as 1787 Ben Franklin was urging the

construction of ships with individual compartments “after the Chinese manner.” Chinese design and techniques allowed them to build ships far bigger than their European counterparts. The most famous example, Zhen He’s flagship in the 1430s, may have been 400 feet long.

Sail design was also radically different. Junks had up to nine masts hung with bamboo sails that could be turned for efficient navigation, being able to sail 30° closer into the wind than square-sailed ships. Each sail had several horizontal bars known as *battens*, which effectively divided the sail into a number of individual sails. Their advantage was that if during a storm the wind tore a hole in the sail, it only affected that part of the sail, not expanding beyond the neighboring battens.

Between 1405 and 1433, the Chinese admiral, Zheng He led seven voyages into the “Western Seas” to trade and collect tribute. The first voyage reportedly had 317 ships and nearly 28,000 men, many of them soldiers. The size of these voyages indicates a military/diplomatic component. Although the large military component was mainly to overawe other rulers, Zheng He was not afraid to use it when he thought necessary. Therefore, among his accomplishments was the suppression of piracy in Southeast Asia, while another time he captured the king of Ceylon and brought him back to China. Zheng He’s voyages ranged progressively further west, exploring the east coast of Africa and twice visiting Mecca. (Zheng He had a Muslim background and he may also have been Muslim or shared many Muslim beliefs.)

After Zheng He’s death in 1433, the Ming court sent no more voyages west, leaving it to the Portuguese to find the way around Africa. If the Chinese voyages had continued, they might have “discovered” Europe before the Portuguese had found their way to India.

There is controversy over why the expeditions were stopped. One theory is that the scholar-bureaucrat faction at court was jealous of the influence Zheng He’s faction that promoted the voyages. Another factor could have been increased pressure on the northern borders by the Yuan Mongols who even destroyed a Ming army and captured the emperor. The increased costs of defense and the fact that the Ming court moved the capital north to Beijing adds weight to the argument that China couldn’t afford expensive naval expeditions. Of course, the two theories on why the expeditions stopped are not mutually exclusive.

Just how far did the Chinese get? Consider this account from the Fra Mauro world map made in Portugal about 1450:

“About the year of Our Lord 1420 a ship, what is called an Asian Junk (lit. “Zoncho de India”), on a crossing of the Sea of India towards the “Isle of Men and Women”, was diverted beyond the “Cape of Diab” (Shown as the Cape of Good Hope on the map), through the “Green Isles” (lit. “isole uerde”, Cabo Verde Islands), out into the “Sea of Darkness” (Atlantic Ocean) on a way west and southwest. Nothing but air and water was seen for 40 days and by their reckoning they ran 2,000 miles and fortune deserted them. When the stress of the weather had subsided they made the return to the said “Cape of Diab” in 70 days and drawing near to the shore to supply their wants the sailors saw the egg of a bird called roc, which egg is as big as an amphora.”

If nothing else, this account of the Chinese circumnavigation around Africa helped debunk the belief that the Indian Ocean was an inland sea and encouraged the Portuguese to sail directly to India half a century later.

Chinese Architecture and Feng Shui

The Forbidden City inside Beijing, built by the Ming Dynasty, is a perfect example of Chinese architecture, especially its emphasis on covering a broad horizontal space to give the impression of stability and the all-embracing character of imperial China.

China's influence throughout East Asia is especially apparent in the realm of architecture, which has remained surprisingly consistent through the centuries. Although little was written on the subject itself, there are several basic principles that distinguish Chinese and East Asian architecture.

Bilateral symmetry is one prominent feature of Chinese buildings, which provides a sense of balance. Chinese gardens, by contrast are asymmetrical to give a sense of natural flow, probably a Taoist influence.

Enclosure around an open space is another aspect of Chinese architecture. This contrasts sharply with the West where buildings and houses typically have an open space or yard around them. Courtyards have a practical purpose in terms of regulating temperatures and providing ventilation. In the North, courtyards are generally open at the southern end to provide more sunlight and warmth. In the South, courtyards, known as *sky wells* are typically closed and mainly provide light.

Horizontal, rather than vertical, orientation is another important characteristic of Chinese architecture. This contrasts with the West, where the emphasis is on height and buildings are often ranked by how tall they are. In China, the importance of horizontal expanse is further stressed by the roofs, which extend beyond the walls and seem to float over the base.

Ironically, the one type of architecture many or most people associate with China is the pagoda, such as the The Fugong Temple Wooden Pagoda pictured above. While pagodas are oriented vertically, they are also not a native design, being imported from India along with Buddhism.

Popular folk beliefs also influence Chinese buildings. These include statues of door gods to ward off evil spirits and encourage good luck, anthropomorphic representations of the Fu, Lu and Shou Stars, which bring good fortune, prosperity, and longevity respectively, and rebus signs representing pomegranates (for good fortune) and bats (for prosperity).

Feng shui (literally “wind-water”) is a traditional Chinese system for orienting buildings to take best advantage of *qi*, basically the various life forces surrounding and affecting us. It takes into account the cosmological orientation of the building as well as local landforms and magnetic readings. For example, having a raised landscape behind a building and water in front of it is considered good Feng Shui.

The Boxer Rebellion in 1900 was partly a reaction against the Western powers building railroads and other structures contrary to Feng Shui principles. During Mao's Cultural Revolution in the 1960s, Feng Shui was outlawed as one of the Four Olds (traditional superstitions) and its practitioners were heavily persecuted. Even today, it is technically illegal to practice Feng Shui professionally, although a growing number of people, including Communist Party members, are adopting it. Interestingly, Feng Shui also has a growing following in the West.

59. EARLY JAPAN TO 794 C.E.

Introduction: the geographic element. Certainly one of the most vibrant and influential cultures in modern history has been Japan. Despite the fact that it is mountainous, small (being roughly 2 percent the size of the United States) and has few natural resources, Japan is still one of the most productive industrial nations in the world. At first glance, Japan seems to be a mirror image of Great Britain, since both are small island nations just off the coasts of Eurasia. Indeed similarities do exist, such as the relatively independent existence each island nation has maintained in relationship to the respective continental cultures with which they are most in contact. However, significant differences also exist between the two cultures.

Three main geographic factors have influenced the history of Japan. First of all, Japan is an island nation consisting of four main islands (Hokkaido, Honshu, Shikoku, and Kyushu) and thousands of islands that reach nearly to Taiwan. Japan's closest point to Korea on the mainland is still 115 miles away, some five times the distance between Britain and France. This relative isolation has had two main results. For one thing, it has led to fewer invasions of Japan, thus creating less need for a strong central government. It has also let Japan pick and choose the influences it has taken from other cultures, in particular China, since it is close enough to the continent to absorb foreign influences, but isolated enough to be able to reject the aspects it does not want. One of the most striking characteristics of Japanese culture has been its ability to blend select elements of foreign cultures with its own native innovations to create something uniquely Japanese.
