Miasmatic theory was a popular theory on the cause of many diseases, such as cholera, chlamydia and the Black Death, before being supplanted by germ theory. It held that diseases were the result of bad air (from the Greek word *miasma*) and could often be identified by foul smells, such as one encountered in cities and around swamps. Although not quite right, miasma theory did lead to efforts to clean up foul smelling areas, thus at times reducing incidence of a disease. For example, Florence Nightingale, as an adherent of miasmatic theory, concentrated on cleaning the field hospitals during the Crimean War, which did save untold numbers of lives.

However, belief in miasmatic theory could also prolong an outbreak of disease, such as during the cholera outbreak in London in 1851, since it focused attention on London's air (as represented in the painting below), instead of its water.

John Snow's cholera map. During the 1851 outbreak of cholera in London, the scientist, John Snow came to the conclusion that it was the water, not miasma, that was the cause of the disease. Consequently, he made a map, marking where the heaviest concentrations of outbreak occurred. When he found that they clustered around certain wells, he checked their water quality and found a common bacterium that he correctly surmised was the cause of cholera.

Thanks to the work of people like Snow and Edwin Chadwick, the Public Health Act was passed in 1848, despite opposition from those who believed so much in *laissez faire* and the principle of government staying out of people's affairs.

Ignaz Semmelweis (1818-65), a Hungarian doctor working in Vienna, was another one of the first to draw the connection between hygiene and

patient survival. He noticed that the mortality of young mothers and newborns was much lower at an institution where midwives in training were taught to wash their hands than at a teaching hospital where medical students didn't wash their hands. Expectant mothers already understood there was a huge qualitative difference between the two institutions, begging to be admitted to the midwives' institution rather than the disease-ridden hospital. After observing this, Semmelweis implemented more hygienic practices in local hospitals in 1847, a movement that would spread and become a crucial part of modern medicine as well as public and private health practices.

Robert Koch (1843-1910), along with Louis Pasteur, is given credit for coming up with germ theory. Although just a country doctor, he used his limited resources to design research techniques that virtually invented the science of microbiology. Using these techniques, Koch isolated and identified the bacilli for anthrax (1877) and tuberculosis (1883), the latter accomplishment earning him the Nobel Prize in 1905.

Using his methods, Koch's students would later isolate and identify the organisms causing diphtheria, typhoid, pneumonia, gonorrhea, cerebrospinal meningitis, leprosy, bubonic plague, tetanus, and syphilis, along with a number of others.

Louis Pasteur's sheep. In 1881, building on Koch's work and to test his theory that vaccinating a subject with a mild or dead variety of a disease would trigger production of antibodies that would protect the subject from the more deadly disease itself, Louis Pasteur injected 25 sheep with such a vaccine for anthrax. He then injected the actual disease into those sheep and 25 other sheep that had not been vaccinated. As he predicted, all 25 unvaccinated sheep died while all 25 vaccinated sheep stayed in perfect health.

Entertaining the Masses

Along with being a time of life-saving and life-improving advances, the late 1800s also saw new technologies to entertain people in their spare time: cameras, movies, phonographs, and, later on, talking movies. In photography, the oldest surviving photograph was Nicéphore Niépce's "View from his Window at Gras" (1826), which was obtained by exposing a pewter plate for

eight hours. As a result, no people or other moving objects appear in it.

In 1837, Louis J.M. Daguerre invented a more practical process that only required 10-15 minutes of exposure, while by the American Civil War, exposure time was down to 10-15 seconds. This still forced subjects to maintain the stiff poses we associate with photos from back then. By 1900, the camera was cheap enough for much of the public to buy, so anyone could document their own family histories, much as affordable video cameras do for us now.

One thing the camera provided was more realistic documentation of historical events, such as Matthew Brady's photographs of dead soldiers after battles in the American Civil War, although some of them were live soldiers posing for the photos. Even so, such stark realism made it harder to gloss over the more unpleasant aspects of civilization, such as war and child labor. By the same token, the camera made it less imperative for artists to concentrate on trying to achieve photographic realism in their paintings, opening the way for the first revolution in painting since the Renaissance: Impressionism.

Other innovations followed toward the end of the century. The stereograph used two pictures of the same object taken from slightly different perspectives to give a three dimensional effect. The same principle is used in producing 3-D movies today.

When a process was invented for taking pictures in quick succession, movies were born. The first movies, viewed at nickelodeons (for a nickel), were of such innocuous things as people riding bicycles or doing cartwheels. Soon more serious movies were being made with plots and special effects, although they were silent, forcing actors to use exaggerated gestures, much like Greek drama had.

Recorded music. Along with the revolution in chemically and mechanically reproducing images came a parallel revolution in reproducing sound. For the first time, people could listen to music without having to make it themselves or listen to it live. The gramophone, as it was then called, was the progenitor of all our modern stereos, including the personal stereo. What was once an active and participatory activity became increasingly passive and solitary, often done in total isolation from everyone else.

Below is the text describing this product:

“Home is the place for your boys and girls to have a good time; amuse them and give them what they call fun and they will not want to go out evenings. A talking machine is one of the wonders of the world; Mr. Berliner, of telephone fame, has by his recent invention brought this marvellous machine to a point where it may be purchased by every household. It is simple in construction, anybody can use it and it does not get out of order. It sings solos, duets, and quartette music; it reproduces exactly the cornet, clarinet, the banjo and in fact every instrument including an orchestra or brass band. The talking and singing records are upon indestructible disks, which are easily handled and do not wear out. We have an endless variety of these disks, including practically every song you are acquainted with.

The accompanying illustration shows exactly how the machine looks and how it is operated and the pleasure it is giving the people who are hearing it. \$10.00 purchases this marvel of the ages, including two records. Extra records 60 cents each, \$6.00 per dozen.”

Better Living Through Chemistry

Better living through chemistry. The periodic table of the elements is credited to the Russian chemist, Dimitri Mendeleev. After Antoine Lavoisier repeated Joseph Priestly’s experiment of decomposing water (supposedly an element) into two gases, which he named hydrogen and oxygen, and then reforming them into water, the whole question arose about what were the elements if Aristotle’s theory of four elements (earth, air, fire, and water) was wrong.

In the course of the nineteenth century, new discoveries largely added to the confusion, with 56 known elements in 1863 and a new one being discovered nearly every year. In 1869, Mendeleev published his periodic table of the elements arranging the elements according to atomic weight and creating new rows when elements started repeating the properties of lighter elements. He even predicted the existence, weight and properties of several new elements that were soon discovered.

The next year, the German, Lothar Meyer published a nearly identical table, but Mendeleev is given the lion’s share of credit for the periodic table. Thanks to Mendeleev’s synthesis, chemists could now methodically combine chemicals to produce new ones with predictable properties. Over the next century, the burgeoning chemical industry would create some

100,000 new chemicals, such as soaps, bleaches, and dyes, and become an integral part of modern civilization.

Over, Under, Sideways, & Down:

The 3-D City

Pre-industrial cities, built on a horizontal two-dimensional plane, were relatively small in space, making it possible to move relatively quickly from one end of the city to the other. Otherwise, the city could not operate as an integrated unit and would break down into quasi-independent neighborhoods, which may have happened in some of the bigger cities, like ancient Rome, although a waterway like the Tiber River might alleviate some of this.

However, modern cities, in some cases having over a million people, could not function merely on two dimensions. They would either take up too much space or be intolerably congested. The rapidly growing industrial cities of the late 1800s had to operate on three dimensions to be functional, and to do that they needed new and stronger building materials. Along came steel and concrete.

Steel was the result of the Bessemer Process, developed by Henry Bessemer in 1856, which used forced air to create much hotter temperatures and burn off more impurities from molten iron, producing cheap steel which was stronger, lighter, and more flexible than iron. . In 1850, Britain was producing 60,000 tons of iron per year. By 1870, thanks to the Bessemer Process, Britain was producing one ton of steel every minute.

While masonry could create 300-foot spans for bridges, and iron could double that, steel made possible spans of over 1700 feet. The Golden Gate Bridge, built between 1933 and 1937, was the world’s longest suspension bridge at the time. The steel towers the cables are suspended from are 4200 feet apart and rise to a height of 746 feet. Among other things:

- Its two cables contain 80,000 miles of steel wire, enough to circle the equator three times.
- The concrete poured to anchor the bridge could pave a five foot wide sidewalk from San Francisco to New York City.

Steel made possible a whole new type of building, the skyscraper, and that, by maximizing usable

space on a vertical level so that many times more people could occupy the same horizontal space, made possible the modern city. The skyscraper made the city three-dimensional.

However, few, if any, people wanted or were capable of spending all day getting out of their buildings from eighty floors up or climbing sixty flights of stairs to get to their offices. So, for the skyscraper to be practical, one more invention was needed: the elevator.

The first commercial elevator for moving freight was installed by the Otis Elevator Company in 1857 at the E.V. Haughwout and Company department store in New York City. It rose at a speed of 40 feet per minute (0.2 meters per second). Two years later came the first steam powered elevators which were considered slow and cumbersome. However, by the late 1860s, architects and builders realized elevators could make the upper floors of a building valuable, instead of wasted, real estate. In 1870, the first elevator for customers, initially known as the "ascending room," was installed at Lord and Taylor's in New York City, reportedly carrying 10,000 people up and down to the fifth floor in three days. It was such a popular ride that a second elevator was installed in 1874.

In the 1870s came hydraulic elevators, using water pressure from city water mains instead of more expensive steam power. The car sat on top of a piston that rode the cylinder to a height of 111 feet at a speed of 600 to 800 feet per minute (3 to 4 meters per second). The first electric elevator, using an electric motor adapted from streetcars, was installed in Baltimore in 1887. The first moving stairway, with the patented trademark of Escalator, was also installed by Otis in Yonkers, New York in 1898 and moved to France for the Paris Exhibition of 1900.

However, the real breakthrough for the elevator was the gearless traction elevator, which overcame the 300-foot (90 meters) limit of older designs. It basically resembled a pulley lowering a bucket into a well, using a counterweight along with an electric controller and a grooved sheave over which the elevator's ropes looped. The first of these were installed in 1903 in New York City's Beaver Building and Chicago's Majestic Building. Now the skyscraper could really take off.

Thinking and operating in three dimensions led to two other developments that made the modern city possible and practical. One was the subway.

At ground level there was way too much congestion for one to easily move from one end of the city to another. London was the first with the answer: dig a trench through the city, lay tracks in it, and cover it up. Thus mass transit subways could rapidly take people from one end of the city to another while people at street level above would be undisturbed in their daily lives and even unaware of the high-speed transit going on beneath them.

Three dimensions also made possible another vital aspect of the modern city: infrastructure. All the water pipes, sewers, power lines, phone lines, and gas lines needed to keep the city functioning had to go somewhere, and that was down under the streets where they wouldn't disturb people and people wouldn't disturb them.

Of course, subways and other infrastructure needed something strong to support them so the city above didn't cave in. That brings us to the other building material of the modern city, concrete, which was actually a rediscovery of a Roman invention. Concrete actually does not dry, but is a chemical reaction that is 99.7% set after three days, although it takes seven years for it to set 100%. Being a chemical reaction means that concrete can even set under water, thus making possible the construction of bridge abutments and modern harbors.

To that end, steel and concrete together provided the basis for strong bridges, pavement, and support columns in buildings: reinforced concrete, which consists of steel in the form of bars or a mesh with concrete poured over and around it. The concrete provides strength and covers and entire area with a smooth surface, but is brittle and can break under extreme stress. Steel, while also being strong, gives elasticity to the structure so it won't crumble under stress.

The World's Tallest

Much like medieval towns boasting of the largest cathedral or clock tower, modern cities have vied for the honor of having the tallest skyscraper. Chicago's Masonic Temple which, at 20 stories and 302 feet, was the tallest building in the world from 1892-6 and probably until 1898 since it had the highest "occupied" floor. Discrepancies in claims typically hinged on whether one counted spires and towers or only occupied floors to determine height.

The Park Row Building in New York City became the tallest building in the world in 1899 with 30 floors standing at 338 feet not counting the towers and 391 feet counting them.

By 1908, the Singer Building (New York City) had surpassed the Park Row with 47 floors and an altitude of either 612 feet (counting the towers) or 391 feet (not counting them).

However, the following year the Metropolitan Life Building (New York City), seized the title, have 51 floors and a height of 700 feet not counting the towers and 391 feet counting them.

In 1913 the Woolworth Building in New York City, took the title of the tallest building in the world standing at 750/792 feet with 55 floors (25 in the tower). The Woolworth Building kept the title for 17 years until 1930 when the Chrysler Building (New York City) topped it at 1,046 feet and 77 stories.

But that record lasted only one year until 1931 when the Empire State Building passed the Chrysler Building at 1,250 feet and 102 stories. Serving its inhabitants were 58 Otis Signal Control electric traction elevators.

Not until 1972, did the Empire State Building and New York relinquish the title to Chicago and the Sears (now Willis) Tower, which has 108 stories and is 1451 feet high.

Since then, the U.S. has surrendered the title to other countries. First came the twin Petronas Towers in Kuala Lumpur, Malaysia, completed in 1998 and standing at 1483 feet.

In 2004, the Taipei 101 building became the tallest building in the world at a height of 509 meters (1670 ft.), surpassing the Petronas Towers by 188 feet.

In 2010 the Burj Khalifa in Dubai, United Arab Emirates, opened and currently stands as the tallest building in the world at a height of 828 meters (2717 ft). With 160 stories, it far outdistances its nearest rival, the Willis (Sears) Tower with a mere 108. Its elevators travel 64 km/h (40 mph). Unfortunately, its huge cost in the midst of the financial crisis of 2007-10 left Dubai mired in debt, forcing it to ask its oil-rich neighbor, Abu Dhabi, for billions to bail it out. Nearly a year after its opening, 825 of the building's 900 apartments remained empty.

Burj Khalifa's designers, Skidmore, Owings and Merrill, also designed the Willis Tower, and based the Burj Khalifa's design on Frank Lloyd Wright's plan in 1956 for The Illinois, what would have been a mile high skyscraper with 528 stories. As far as we know, it was never built. Neither was the Chicago Spire (AKA the Fordham Spire) set to be the tallest building in North America at 2000 feet. Unfortunately, the Recession of 2008 halted construction and the project was legally defunct in 2010.

In 2007, Japan came up with its own plan for the world's tallest building, the X-Seed 4000 (top), which should reach 13,123 feet, nearly 700 feet taller than Mt. Fuji, have 800 floors and house 500,000 to a million people.

"Unlike conventional skyscrapers, the X-Seed 4000 would be required to actively protect its occupants from considerable air pressure gradations and weather fluctuations along its massive elevation. Its design calls for the use of solar power to maintain internal environmental conditions."

Estimated cost: \$300-900 billion...if and when it gets built.

The Eiffel Tower

If anything symbolized the spirit of progress in the late nineteenth century, it was the Eiffel Tower, which was originally to be a temporary monument for the Paris Exposition of 1889 commemorating the centennial of the French Revolution. Although Parisians ridiculed it as an ugly monstrosity when it was built, they were so outraged when it was to be torn down that it was left alone. Now it serves as the primary icon representing Paris.

It took only 300 men only three months to build the tower, joining together its 18,038 pieces of puddled iron (a very pure form of iron) with two and a half million rivets. Incredibly, thanks to stringent safety precautions, only one man was killed in the exceedingly dangerous construction of the tower.

Impressionism: a New Revolution in Art

Impressionism, much like the art of the Italian Renaissance, approached painting in a whole new and revolutionary way. While the Renaissance art looked at the world through the lens of secular humanism, as opposed to religion, Impressionism viewed it through the lens of pure light and color without intellectualizing what one was looking at as a flower, a door, or whatever. This is much how a newborn sees the world

without any intellectual preconceptions or even language to describe what is seen. Only gradually does a baby learn to isolate certain impressions and see them collectively as a door that it can manipulate to get to the outside world.

Learning to see and paint this way first involved the Impressionists “unlearning” or blocking out all they had learned about trees, flowers, etc. and viewing the world as a bunch of light impressions that, when put down on canvas, made a painting of what we would describe as “trees”, “flowers”, and so on.

Naturally, the Impressionists met with a lot of scorn and resistance to this new way of painting. It started with the *Académie des Beaux-Arts*, an outgrowth of the *Académie de peinture et de sculpture*, founded in 1648, which every year or two put on the Paris Salon, the only public art exhibit in Paris and thus the only chance for unknown artists to become known. Artists would submit their work to the Academy in the hopes of being chosen for display. Unfortunately, the jurors were very conservative in their tastes, thinking only paintings with classical or historical themes were worthy to be shown.

In 1863, when the Academy rejected 3,000 of 5,000 paintings as a “serious danger for society”, the public was outraged, so Napoleon III had a separate art show, the Salon of Refused Paintings, in a separate wing of the Louvre. It was a great public success and is seen as the start of modern art. Probably the most well-known and notorious “refused” painting shown was *Le Dejeuner Sur L’Herbe (the Picnic)* by Edouard Manet (1832-83). What made it so scandalous was its matter-of-fact nudity in a contemporary setting where the model looked the viewer in the eye without a shred of shame or stitch of clothing.

Meanwhile, at the “respectable” salon, Cabanel’s *The Birth of Venus*, a much more provocative painting (except for the eye contact), became the hit of the show and was bought by Napoleon III for his private collection. I guess the difference between art and pornography then was that art had fat little babies with wings flying around the subject to make you feel like you’re in ancient Greece.

Two years later at the Salon Manet displayed *Olympia*. This portrait of a prostitute modeled after Titian’s famous *Odalisque*, raised a veritable howl of protest and criticism because it

wasn’t of a Greek goddess and the subject dared to look the viewer in the eye. Stories abounded of men going mad from viewing it and biting strangers in the street, while pregnant women were warned not to look at it because it might cause a miscarriage.

Impressionism and the critics. The term “Impressionism” comes from Monet’s *Impression: Sunrise* (above) displayed in 1874 at the Impressionists’ first independent show. While cartoonists lampooned it as a weapon used by the Turks to scare enemies in battle, the critics themselves were more blunt and to the point, one of them saying it looked like the artists had fired paint from a shotgun.

This is how another critic described it: "*The rue le Peletier is a road of disasters. After the fire at the Opera, there is now yet another disaster there. An exhibition has just been opened at Durand-Ruel, which allegedly contains paintings. I enter and my horrified eyes behold something terrible. Five or six lunatics, among them a woman, have joined together and exhibited their works. I have seen people rock with laughter in front of these pictures, but my heart bled when I saw them. These would-be artists call themselves revolutionaries, "Impressionists". They take a piece of canvas, color and brush, daub a few patches of paint at random, and sign the whole thing with their name. It is a delusion of the same kind as if the inmates of Bedlam picked up stones from the wayside and imagined diamonds.*"

Manet once got so upset with an art critic that he challenged him to a duel. The weapon of choice was sabers, something neither of them had any experience using. After hacking away for some time, Manet slightly wounded his opponent, which Manet felt badly about. So the two men patched up their quarrel, and Manet, for some reason, gave his shoes to the art critic.

Claude Monet (1840-1926) is probably the best known of the Impressionists. Like Manet and the others, it took nearly 20 years for Monet’s art to be accepted by the critics and public. During that time, he suffered horrible poverty

for his art, begging collectors to take his paintings at any price. By the same token, he once burned 200 of his paintings rather than have creditors seize them.

Monet once said he wished he'd been born blind and then gained his sight so he could truly paint what he saw without any preconceptions. This largely summarizes the essence of Impressionism: trying to capture the pure sensory perception of a scene without diluting it with one's own intellectual interpretations. As a fellow artist, Cezanne, put it: "Monet is only an eye, but what an eye"

For *Women in the Garden*, (1866-7), which is eight feet high, Monet dug a trench to stabilize the canvas and had pulleys to raise and lower it so he could more easily paint the different parts.

In another painting, *Camille Monet on Her Deathbed*, Monet was so struck by his wife's changing pallor as she lay dying that he did a painting of her. Some might call it morbid, but others might see it as a final tribute to this woman whose image graced so many of Monet's canvases.

Among Monet's more famous paintings were series he did of haystacks, Rouen cathedral, a Japanese footbridge and water lilies in efforts to capture the varying effects of light on them at different times of day and year.

Auguste Renoir (1841-1919) is best remembered for his paintings of beautiful women, flowers, children, and outdoor scenes full of people enjoying themselves, making him possibly the most popular of the Impressionist painters. As someone once said of him, "*Renoir is perhaps the only painter who never produced a sad painting.*" Or as Renoir once put it, "*A picture must be an amiable thing, joyous and pretty--yes pretty! There are enough troublesome things in life without inventing others.*"

In the 1880s, Renoir, dissatisfied with what he thought was the insubstantial nature of Impressionism, turned to more classically inspired subjects and techniques.

Edgar Degas (1834-1917) was another "charter member" of the Impressionists. However, unlike the others, he had no interest in landscapes or the changing patterns of light, detested working outside and once said "Art is not a sport". Degas is best remembered for his paintings of ballerinas and humans in arrested motion. He

would have his models move around a room and then paint them from memory. He also used oblique angles, such as from above the stage as if in a theater box, to give different effects.

Berthe Morisot and Mary Cassatt, despite their gender, were considered full "charter members" of the movement. In fact, for the first twenty years they were considerably more successful in selling their paintings than were their male counterparts. However, they still operated under the same restrictions as previous women artists: being limited to painting women, children and only male relatives.

117A. A BRIEF HISTORY OF SURGERY

Until the 19th century, surgery remained a brutal craft often left to barbers simply because they had the cutting tools. The lack of anything to kill the pain of surgery, along with continuing reservations against dissection, created a vicious cycle where there were few people willing to undergo surgery, which led to limited research and knowledge, further discouraging people from undergoing surgery and so on. Thus surgery progressed very little through the centuries. All that changed in the 19th century.

It started with the discovery of the anesthetic properties of ether and chloroform in the 1840s, thus making surgeries painless, although there was plenty of pain after the anesthetics wore off. Still, the number of people willing to undergo surgery rapidly multiplied. However this led to another problem: infections from surgery killing patients after presumably successful surgeries. Previously, with so few people willing to undergo surgery, and so many of them dying on the operating table, infections from surgery itself were relatively rare, and their causes (i.e., unclean surgical instruments and operating conditions) remained a mystery. Then came the answer: germs.

When people such as Louis Pasteur and Joseph Lister first linked microbes to disease and infection, they were met by widespread skepticism from people who refused to believe disease and infection could come from things so small we can't see them without a microscope. However, when Pasteur came up with a vaccine against rabies based on his theory, people took notice. Lister applied this theory to surgery by spraying a fine mist of carbolic acid on patients during surgery to kill any germs. As a result, deaths from infections after surgery dropped dramatically.

Unfortunately, some patients and medical staff reacted badly to the carbolic acid. This had two results. First, experiments showed that patients' infections had the same germs as those on surgeons' hands. Secondly, to protect his trusted head nurse's sensitive hands, Lister had the Goodyear Rubber Company make some rubber gloves. Out of these two things came aseptic procedure, where everything in the operating room was sterilized, thus eliminating the need for the annoying carbolic acid. Ironically, the rubber gloves first developed to protect the hands of Lister's head nurse (whom he later married) were now used to protect the patient from germs on the medical staff's hands.

Aseptic procedure drastically reduced the number of infections from surgery and dramatically increased the number of surgeries being performed. This brought up another problem: blood loss. At first, doctors tried random blood transfusions from other people, saving some patients but killing others. This led to new research and the discovery of blood types. Now blood donors' blood could be accurately matched with that of patients.

Then came World War I and the need for blood donors drastically increased. However, donors' blood clotted soon after being taken, preventing its storage or transport long distances to field hospitals where it was needed. Then someone discovered that sodium citrate kept blood from clotting, thereby saving thousands of lives.

In spite of all these advances, invasive procedures like surgery were still a shock to the system and quite painful during recuperation. Fortunately, one more discovery during World War II helped reduce the need for surgeries: penicillin and other antibiotics that could cure infections without the patient having to go under the knife.

Since World War II a staggering number of advances in surgery have taken place. At the same time germs have mutated quickly, so our arsenal of antibiotics is becoming less and less effective. The battle goes on.

Killing the Pain

William Morton first publicly demonstrated ether's use as an anesthetic in 1846. However, Paracelsus had noticed its pain killing properties in the 1500s. Medical students were also familiar with its intoxicating properties and would use ether-filled balloons as social stimulants at "Ether Frolics" (below) in the 1830s and 1840s.

In January, 1842, William E. Clarke applied a towel soaked with ether to remove a tooth painlessly from a certain miss Hobbie. Despite his success, Clarke was convinced the success of the procedure was due to women's naturally hysterical reaction to pain, so he discontinued experiments.

Two months later in Georgia, Crawford Williamson Long (below) painlessly removed several sebaceous cysts from a man's neck. Like Clarke, Williamson let himself be convinced that

the success was not due to the ether, but in this case to the use of mesmerism.

The first public demonstration of ether's anesthetic properties was done in October, 1846 by a Massachusetts dentist, William Morton. After testing it on animals and then in removing a colleague's molar, he did a public demonstration knocking out a patient with ether while the surgeon, John Collins Warren, removed a jaw tumor from a patient who, could remember nothing of the surgery after waking up. After the operation, Warren declared: "Gentlemen, this is no humbug."

Within weeks, the news had spread across the globe and the Scotsman Robert Liston (below) was the first British surgeon to use ether in an operation to amputate a patient's leg. Before the operation, he explained to the audience "We are going to try a Yankee dodge today, gentlemen, for making men insensible." After anesthetizing the patient, Warren, noted for his speed and accuracy performed the operation in 25 seconds. When the patient, Frederick Churchill, awoke, he asked when Liston would begin, prompting peals of laughter from the gallery. After his success, Liston turned to the audience and declared, "This Yankee dodge, gentlemen, beats mesmerism hollow."

Joseph Lister Revolutionizes Surgery

In 1865, Joseph Lister, having heard of Pasteur's work, treated Carlyle Scotland's sewers with carbolic acid to rid them of their stench, the theory being that the stench was caused by microbes and that if his treatment worked on the sewers, it could protect surgery patients from infection. The stench did indeed die down, and Lister then successfully performed surgery on an 11-year old boy with a compound fracture, a particularly serious injury back then, spraying carbolic acid on the patient's wound during the operation. The low infection and high survival rates of Lister's patients radically changed surgery.

However, there was a problem: carbolic acid could be irritating to the skin, not just of the patients, but also Lister's head nurse, whose services he valued so much he later married her.

In the meantime, he went to the Goodyear Rubber Company and had them make a pair of rubber gloves for his nurse. Ironically, a strategy to protect a nurse would become standard procedure for protecting patients.

More importantly, Lister's success in using aseptic procedure showed that germs in the environment (even on surgeons' hands) were the cause of the infections killing so many surgery patients. Eventually he replaced using carbolic acid locally with cleaning everything to create a sterile field to prevent infections. Lister's work revolutionized modern surgery.

The device Joseph Lister used for spraying carbolic acid as an antiseptic on surgery patients. Before operating, Lister would jokingly remark, "Let us spray."

117B. THE ACCELERATING CYCLE OF MILITARY DEVELOPMENT AFTER 1850.

If the industrial revolution accelerated technological development overall, this was much more true in the case of military technology. Accelerating this process were two other factors. One was the competitive nature of warfare in general, which served as an impetus to coming up with a weapon that would give one side an edge over the other. The other was the competitive nature of nationalist rivalries that became increasingly more intense as industrialization spread to more countries after 1850. The basic problem was that machines multiplied production of goods much more quickly than people could produce babies to consume those goods. As competition in the markets stiffened and unemployment grew, tensions increased between nations whose politicians blamed other nations for their own domestic problems. As those tensions have led to wars, efforts were stepped up even more to develop weapons with which to win those wars. Of course, as the rate of technological growth kept accelerating, especially in the military realm, nation states found, and still find, themselves trapped in a never-ending cycle of rearmament, rapid obsolescence, more rearmament, etc.

A quick rundown of the fruits of those efforts shows the profound effects this process had on warfare in a remarkably short period of time (c.1850-1950). For nearly two centuries before the industrial revolution took off in Europe, the dominant weapon had been the muzzle loading smoothbore flintlock musket with an effective range of up to 100 meters and a firing rate of maybe three shots per minute. In the 1850s (e.g., Crimean War), this was being replaced by muzzle loading rifled muskets with a range of about 500 meters, but the same basic firing rate. In 1866 the Prussians rapidly won the Austro-Prussian (Aka, Seven Weeks) War through the revolutionary use of the breech-loading Dreyse rifle (although it was patented in the 1840s) that increased the firing range by a factor of four to five times. By the Franco-Prussian War (1870-1) the French were using the Chassepot breech-loading rifle, which was more reliable than the Dreyse gun and had twice its range.

While these were all massive changes transforming warfare, the developments that followed in rapid

succession were even more revolutionary. In 1884 came the Maxim gun, the first fully mechanized machine gun, with a firing rate of 600 bullets per minute. With such a rate of fire concentrated in just a few men's hands, combined with the mass production of such weapons and the population explosion also triggered by the industrial revolution, nations could field huge armies wielding a whole new magnitude of firepower. In World War I (1914-18), those armies would be able to spread out and fill a continuous line from the Alps to the North Sea, so that no one could get around, over, or under this continuous front, while trying to assault it frontally proved to be virtually suicidal. The result was a prolonged stalemate in the trenches until two new weapons came along: the tank (inv. 1916) and the airplane (inv. 1903).

While the impact of the tank and airplane was more supplemental than decisive on the outcome of World War I, they definitely defined the nature of the next conflict, World War II (1939-45). Because of the even greater firepower and size of the armies, the continuous front still existed. The main difference was that, instead of confining the damage from conflict to a narrow static front, the continuous front now became mobile, pulverizing nearly everything in its path as the Germans pushed across Europe, and again as they were pushed back. Thus the damage from the Second World War was many times greater than that of the First just twenty years earlier.

However, the end of World War II saw a new class of weapons developed that would dwarf the destructive power of all previous weapons by a thousand times: nuclear weapons. In fact, the industrial revolution had made war so efficient that total war as a rational policy was now effectively obsolete.

118. DISEASE AND THE DECLINE OF THE HAPSBURG EMPIRE IN THE LATE 1800'S

While the multi-ethnic nature of the Hapsburg and Ottoman Empires is often cited as the primary reason for their declines in the nineteenth century, other factors also entered into the equation. One factor that seems to have played a major role in determining the nature of Hapsburg rule and society as well as its decline was disease. In order to understand this we need to look at German expansion into Central and Eastern Europe in the Middle Ages.

As the German people expanded into Central and Eastern Europe and established themselves and the ruling class in such areas as Bohemia, they tended to settle and concentrate in towns and cities from which they could rule the countryside. However, both the crowded and unsanitary conditions in cities then led to serious problems with disease. As a result, the ruling German class could rarely sustain its own population, let alone expand its numbers. Fortunately, there was a gradual influx of native Slavic migrants to the cities to replenish their populations. Since this migration was gradual, the ruling German classes could maintain their dominance until these newcomers had absorbed German culture and values, even adopted German names, and been accepted into the ruling classes. For centuries this pattern of gradual absorption of Slavic migrants served to maintain German cultural and political, if not ethnic, dominance of the cities and power in the empire.

However, two things upset this delicate balance in the later 1800's. One was a cholera epidemic that severely depleted the Germanized populations in Hapsburg cities. The other was industrialization, which created a need for a large factory work force. Together these triggered a huge influx of Slavic migrants into the cities. This much larger Slavic population in the cities proved too much for the Germanized ruling classes to absorb as they had before. It also generated a fear that Slavic culture would overwhelm German culture. This created a growing conservative backlash against the Slavs. That in turn led to growing resistance by Slavic nationalist groups against the Germanized ruling classes which merely caused more conservative reactions and so on.

As this cycle repeated itself, Hapsburg society became progressively polarized between the growing restiveness of its Slavic nationalities and ethnic groups on the one hand and the siege mentality of its increasingly isolated and reactionary ruling classes on the other. Therefore, by the early twentieth century, the Hapsburg Empire was on the verge of collapse. World War I would push it over the edge.

119. NATIONALISM AND ITS IMPACT IN EUROPE (1848-1914)

Introduction. As we have seen, the French Revolution and Napoleon spread the ideas of liberalism and nationalism across Europe. These ideas took root and gave rise to several outbreaks of revolution in the 1820's, 1830's, and 1840's, the most severe being the revolutions of 1848. Although most of these revolutions failed, they continued the spread of liberal & nationalist ideas and also gave reformers a more realistic appreciation of what it would take to achieve their goals. The revolutions of 1848 especially influenced the peoples of Eastern Europe under Hapsburg and Ottoman rule as well as the peoples of Italy and Germany in Central Europe.

Eastern Europe, especially the Balkans in the southeast, saw national independence from foreign rule, rather than national unity, as the critical issue. The spread of nationalist ideas among the various Slavic peoples there after the revolutions of 1848 combined with the steady decay of the Hapsburg and Ottoman Empires to create a particularly volatile situation. These generated growing nationalist movements that destabilized the already crumbling Hapsburg and Ottoman empires. To complicate matters even further, Russia became increasingly involved in Balkan politics, posing as the champion of Slavic liberties and nationalism against the Slavs' Turkish and Austrian masters. This heightened tensions between Austria, Turkey, and Russia and would provide the spark to set off World War I.

Central Europe, Germany and Italy in particular, had been broken into numerous states, a situation which had invited centuries of foreign intervention, conquests, and wars in both countries. Here also, the revolutions of 1848 combined with German and Italian frustration over this situation to generate strong sentiments for national unification in both countries. The middle classes in Italy and Germany especially supported national unification by strong governments that could end internal tolls, build national railroads, and support new industries.

Both Italy and Germany were lucky to have brilliant prime ministers to lead them through unification: Camillo Cavour for the Italian state of Sardinia and Otto von Bismarck for the German state of Prussia.

Both men skillfully combined strong internal developments of their respective states with opportunistic diplomacy and warfare to unify Italy and Germany by 1871. Both nations would also strive to industrialize in the latter 1800's. Germany proved especially successful in this endeavor. However, the presence of two unified nations in place of a multitude of little states, especially that of a strongly industrialized Germany, seriously upset the balance of power in Europe, which would also lead to World War I.

120. THE UNIFICATION OF ITALY (1848-1871)

Italy had last been unified under the Byzantine emperor, Justinian, some 1300 years before. Since then it had been a patchwork of states under Byzantine, Lombard, Norman, German, French, Spanish, and Austrian rulers. Political fragmentation brought economic and cultural fragmentation as well. Without standard gauges, railroads did not cross state boundaries, while numerous tolls and dialects also hindered trade.

Italy's reunification, or *Risorgimento* (literally meaning resurrection), was largely the work of Camillo Cavour, prime minister of the north Italian state of Sardinia (also known as Piedmont). Although not a fiery or charismatic revolutionary leader, he was a cool and clear-headed diplomat and brilliant organizer, one of those realistic politicians who emerged from the failed revolutions of 1848. Cavour skillfully gathered popular support throughout the peninsula by exploiting Sardinia's position as one of the few native ruled states in Italy.

He also saw that Sardinia must be developed internally before it could make any moves against the Austrians, who controlled most of northern Italy, and the Bourbons, who ruled the Kingdom of the Two Sicilies in the south. To that end he reorganized Sardinia's treasury, tax system, and bank system, and then got foreign loans, especially from Britain, in order to build railroads and industries. Careful management of these loans allowed him to turn a profit and pay off the loans, thus expanding Sardinia's credit for larger loans to further develop the economy and so on. By the mid 1850's Sardinia was the most highly developed state in Italy.

Cavour was now ready for the diplomatic offensive to unify Italy. His main opponent was Hapsburg Austria, against whom he realized he needed outside help. Oddly enough, in order to get this, he attacked Russia. This was during the Crimean War (1854-56), one of the more senseless and futile conflicts in history. It mainly involved French and British efforts to stop Russian aggression to the south against the Ottoman Turks. The fighting centered in the Crimean peninsula on the Black Sea where the British and French fleets could supply

armies by sea better than Russia could supply its troops by land. It was a bloody and diseased affair, but it played into Cavour's hands, because Austria had angered France and Britain by refusing to help them against Russia. By sending Sardinian troops to help the French and British, Cavour won Napoleon III's friendship and the promise of French aid if he could make Austria appear the aggressor in a war.

Cavour had no trouble in stirring up rebellions against Austria and drawing it into attacking Sardinia. In the resulting War of 1859, Napoleon III sent 120,000 French troops to Italy by railroad, the first mass movement of soldiers by rail in history. The French won two battles, but suffered such heavy casualties that Napoleon III quickly pulled out, leaving Sardinia in the lurch. Despite this betrayal, the north and central Italian states of Tuscany, Parma, Modena, and Romagna rebelled against their rulers and unified with Sardinia, giving it about half of Italy's population. Events now moved quickly toward unifying the rest of Italy.

The price of Napoleon's aid against Austria was the transfer of Savoy and Nice to French control. This infuriated Giuseppe Garibaldi, a long time revolutionary leader who was as fiery and impulsive as Cavour was cool and calculating. Garibaldi had led the defense of the Republic of Rome in 1848 against French troops who still occupied it. Now the French were taking over Garibaldi's birthplace of Nice, and he intended to attack them there. But Cavour, still needing French diplomatic support, managed to divert Garibaldi and his army of 1000 "Red Shirts" to Sicily in order to overthrow the Bourbon dynasty. Garibaldi's tiny army met with incredible success and swept the Bourbons from Sicily in six weeks. They then crossed to southern Italy and swept the Bourbons from there as well. Practically overnight, southern Italy and Sicily had been liberated, but the question was for whom: Sardinia, who had sent Garibaldi, or Garibaldi himself who bore the title of dictator of southern Italy and Sicily while still wearing a Sardinian uniform?

Between Sardinia and Garibaldi lay the Papal States and Rome, the spiritual capital of Italy and still under French troops. Napoleon III, much preferring Cavour to Garibaldi, told the Sardinians to take the Papal states before Garibaldi got there, but to leave

Rome to the French. Sardinia's king, Victor Emmanuel, did this and moved south to meet Garibaldi. In a dramatic meeting on October 26, 1860, Garibaldi turned his conquests over to Victor Emmanuel. The Kingdom of Italy was born.

Two important pieces of the puzzle remained to complete Italy's unification: Venice and Rome, held by Austria and France respectively. In each case, Italy's alliance with Prussia, then in the process of unifying Germany, proved to be valuable. In 1866, Italy won Venice by helping Prussia against Austria in the Austro-Prussian War. Likewise, Italian help in the Franco-Prussian War earned it Rome (except for the Vatican which remained an independent state inside of Rome). By 1871, Italy was unified.

But, as one politician put it, "Italy is made. We still have to make the Italians." After centuries of disunion huge cultural, political, and economic differences existed in this nation of 22 million people. The biggest gap was between the urban north and agricultural south. The Bourbons in southern Italy and Mafia in Sicily fanned discontent into revolts and violence exceeding that seen in the actual process of unification.

The new government did three things to pull Italy together. It built a national railroad system to physically link its parts. It established a national educational system to give its people a similar cultural outlook and loyalty. And it formed a national army to enforce its policies and also unify men from all over Italy in a common cause. However, 1300 years of disunity were a lot to overcome in a few years, and Italy's efforts at forging a nation met with limited success. Despite this, a patchwork of little Italian states had been unified into a new nation, a nation with ambitions to become a great power. Such ambitions would help lead to World War I.

Pope Pius IX, Papal infallibility, and the Immaculate Conception

Pope Pius IX and the revolutions of 1848. The sudden initial success of the Revolutions of 1848 raised the hopes of Italian nationalists to finally unify Italy. Pope Pius IX, who had a reputation of being very liberal, even granting amnesty to political prisoners, was seen as the natural leader

for a unified Italy. However, Pius backed away from leading (Italian) Catholic subjects to kill (Austrian) Catholics. He was also disillusioned with liberal causes when many of political prisoners he had given amnesty to joined the revolutions. The assassination of his Minister of the Interior, Pellegrino Rossi, didn't help either. Of course, when he dropped out, Italian nationalists felt betrayed, as reflected in cartoons portraying him as a two-faced traitor.

Papal infallibility and the Immaculate Conception. Pius, who reigned longer than any other pope, 32 years from 1846 to 1878, is also known for putting forth two somewhat controversial doctrines: papal infallibility (i.e., the pope doesn't make mistakes) and the immaculate conception, whereby the Virgin Mary conceived the Christ child without engaging in original sin, another polite term for sex) and thus remained without sin her entire life.

The Crimean War (1853-56)

One long-term cause of the Crimean War was Russia's desire to expand toward the Mediterranean and Middle East, leading to its efforts to destabilize an already weak Turkey, referred to then as the Sick Man of Europe. Tsar Nicholas I's aggressive moves soon involved France and Britain who also feared Russian aggression in the region.

Another trigger was a dispute between Catholics, backed by Napoleon III, and Orthodox Christians, backed by the tsar, over who was protector of Christian pilgrims to the Holy Land, who controlled the keys to the Church of the Nativity in Bethlehem, and who could place a star over the exact site of Christ's manger. This dispute even turned to violence as Catholic and Orthodox monks rioted and were killing each other with candlesticks and crucifixes.

While the French and British had little love for the Ottomans, they feared the looming shadow of the Russian bear even more, portrayed below right as an autocratic master of a slave empire. Much of this was the result of the forged Testament of Peter the Great, in which Peter

supposedly outlined a master plan for conquering all Europe.

Thanks to much more widespread influence of newspapers, British and French cartoonists had a field day stirring up public hysteria against Russia. In this sense, along with others, the Crimean War was the first modern war where public opinion, influenced by the press, helped drive government policies. Although probably fabricated by Napoleon as a piece of anti-Russian propaganda for the narrow purpose of justifying his invasion of Russia in 1812, paranoia about Russian aggression stirred up by the forged Testament of Peter the Great would continue throughout the 19th and 20th centuries.

One of the events finally pulling France and Britain into war was the destruction of a Turkish naval squadron by the Russians at Sinope.

While the British secretary of state for war was reading instructions for the generals to cabinet members, nearly all of them fell asleep. Surprisingly, the British didn't adopt this as a strategy against the Russians.

Nicholas expected Austria to side with him, especially after he had sent 100,000 troops to help suppress its revolutions in 1848. Instead Austria backed the allies, ordering Russia out of Moldavia and Walachia along the Danube River, and then occupying them with its own troops. However, that was all Austria did to help its allies, making them a bit mad. By the same token, relations between Austria and Russia progressively soured until finally driving them to war against one another in 1914.

Meanwhile Sardinia seized the opportunity of allying with Britain and France, and actually sending 10,000 troops to help them, hoping this would gain it diplomatic leverage against Austria later on.

Fighting centered on the siege of Sebastopol in the Crimea (thus the name of the war). This was because it was harder for Russia, with no railroads, to supply Sebastopol by land than it was for Britain and France to do it by sea, especially with the new and faster steamships

using the more efficient screw propeller instead of the side-wheeler. On the Russian side, only an estimated one in ten Russians even made it to the front, some being diverted by a peasant revolt, some dropping out from disease or exhaustion, and others just deserting.

A number of military innovations distinguished the Crimean War, among which were ironclad ships (which had to be towed), and exploding artillery shells.

The telegraph also made its debut in warfare at this time. Besides rapidly transmitting and coordinating military information and orders, it provided the home front with daily information on the progress, or lack of it, in the war. This, along with the faster printing press and railroads, which made national newspapers possible, had an impact that can hardly be over-estimated in the age of democratic politics. After all, daily reports from the front give the impression of much slower progress than do monthly ones. Therefore, governments have felt pressured either to push for quick victories, often with disastrous military results, or to censor and/or distort information to keep the public calm.

Adding to that impact were political cartoons with images that added little or nothing in the way of facts but could sway opinions of less literate readers on an emotional level.

This was also the first major war to be recorded in part by the camera, although the long exposure times precluded taking any action shots. Thus the grim pictures of the aftermath of battles with which Matthew Brady would shock the American public about the brutality of the Civil War were missing in the Crimean war.

The Minie rifle or rifled musket. Probably the single most significant military development was the Muzzle-loading Minie rifle, developed in France in 1849. The inside of the gun had a spiral groove, known as rifling. It fired a conical shaped soft lead bullet (below) that was hollow in back, had three grooves around it to catch the rifling, and was slightly smaller than the inside

of the barrel to make it easy to load. When it was fired, the heat would expand the bullet, trapping the explosive gases to give it more velocity. In addition the bullet would get caught in the grooves of the spiral rifling, which would put a spin on it, firing it much straighter and farther than before, about 600 meters.

Such a weapon made the old tactic of attacking in massed formations obsolete, since defenders would be shredding their ranks at six times the range of smoothbore muskets. However, generals, being trained in Napoleonic tactics and unable to come up with anything new, continued using the old tactics even through the First World War—with disastrous results. Wounds inflicted by these high velocity lead bullets would shatter any bone and cartilage, often making it impossible to mend shattered limbs and forcing surgeons to resort to amputation on unprecedented levels.

The Charge of the Light Brigade is probably the best-known action of the Crimean War, although it was only a small part of the Battle of Balaklava. General Lord Lucan, viewing the battle from the heights, couldn't see how the plain below wasn't so flat. Thinking the Light Brigade's commander could see the Russians he wanted attacked, he ordered a frontal assault.

A confused aide gave unclear orders to charge a retreating Russian battery, but the only Russian artillery the Light Brigade's commanding officer, the Earl of Cardigan, could see was in a position that was virtually suicidal to attack. Cardigan ordered the attack anyway, possibly to embarrass his commanding officer (and brother-in-law), Lord Lucan, whom he hated and who had originally given the order. The messenger saw his mistake, but was killed before he could redirect the charge. Making matters worse, the bugler was killed so they couldn't call off the charge once it had started.

Somehow 230 of the original 673 men in the Light Brigade made it through the Russian lines. Of those, only 195 survived this tragic blunder unwounded. Cardigan tried to blame Lord Lucan, but the commanding general was not impressed since it was Cardigan who actually carried out such a stupid charge.

The incident was immortalized in Alfred Lord Tennyson's "The Charge of the Light Brigade."

Half a league, half a league,
Half a league onward,
All in the valley of Death
Rode the six hundred.
"Forward, the Light Brigade!
"Charge for the guns!" he said:
Into the valley of Death
Rode the six hundred.
"Forward, the Light Brigade!"
Was there a man dismay'd?
Not tho' the soldier knew
Someone had blunder'd:
Theirs not to make reply,
Theirs not to reason why,
Theirs but to do and die:
Into the valley of Death
Rode the six hundred.

Cannon to right of them,
Cannon to left of them,
Cannon in front of them
Volley'd and thunder'd;
Storm'd at with shot and shell,
Boldly they rode and well,
Into the jaws of Death,
Into the mouth of Hell
Rode the six hundred.

Flash'd all their sabres bare,
Flash'd as they turn'd in air,
Sabring the gunners there,
Charging an army, while
All the world wonder'd:
Plunged in the battery-smoke
Right thro' the line they broke;
Cossack and Russian
Reel'd from the sabre stroke
Shatter'd and sunder'd.
Then they rode back, but not

Not the six hundred.

Cannon to right of them,
Cannon to left of them,
Cannon behind them
Volley'd and thunder'd;
Storm'd at with shot and shell,
While horse and hero fell,
They that had fought so well
Came thro' the jaws of Death
Back from the mouth of Hell,
All that was left of them,
Left of six hundred.

When can their glory fade?
O the wild charge they made!
All the world wondered.
Honor the charge they made,
Honor the Light Brigade,
Noble six hundred.

As one person summed it up, it was grand but it wasn't war.

The lady with a lamp. Much of the tragedy of the Crimean War came from the abysmal supply system for the British and French soldiers who were given little or no clothing to withstand the Crimean winter. Another scandal of the war concerned the squalid conditions of the field hospitals and the high mortality rate of the wounded.

Enter one of the real heroes (or heroines) of the war, Florence Nightingale. In the midst of the scandal over medical care and after incredible persistence in badgering the authorities, she got permission to go to the front. She and the 38 other nurses she brought with her to the Crimea cleaned up the British field hospitals and reduced the death rate from 60% to 1%. Besides revolutionizing medical care for the wounded, she made nursing the first respectable profession open to women.

Pictures of Florence Nightingale in 1851 and 1856 before and after going to Crimea show the physical and emotional toll the war took on her. Some think she was the victim of posttraumatic stress syndrome, a condition usually associated with combat fatigue.

Not that Florence Nightingale was the only woman involved in the Crimean War. Apparently a group of British wives and their husbands showed up to view a battle while having a picnic. High society from Washington D.C. did the same thing at the First Battle of Bull Run in 1861, with disastrous results when they got caught up in the panic and rout of their army back to the capital.

The end of the war. The death of Nicholas I, fall of Sebastopol, and Russia's overall exhaustion finally led to the end of the war and the Treaty of Paris (1856). This temporarily neutralized the Black Sea until new Russian advances nullified its provisions in 1877 and a new round of Balkan turmoil started up.

The Franco-Austrian War and Birth of the Red Cross

French Zouaves at the battle of Magenta. The valor of the French Zouaves inspired at least two American regiments, one from Louisiana and the other from New York, to adopt their uniforms in the opening years of the Civil War.

By sending Sardinian troops to help the French and British, Cavour won Napoleon III's friendship and the promise of French aid if he could make Austria appear the aggressor in a war. He had no trouble in stirring up rebellions against Austria and drawing it into attacking Sardinia.

The War of 1859 (Aka Franco-Austrian War) marked another unfortunate step in the evolution of modern war, not so much for any technological innovations (except the mass movement of French troops by railroad) as by the concentrated scale of slaughter inflicted in a short period of time. As in the Crimean War, this was the work of the rifled musket with its vastly increased range and killing power and the failure of generals to adapt their tactics to it.

The Battle of Solferino (June 24, 1859) took place on broken ground that made it virtually impossible for either army to coordinate troop movements, creating a confused and bloody battle. About 100,000 Austrian troops and a combined total of 118,600 French and allied Sardinian troops fought here, making it the largest battle since the Battle of Leipzig in 1813. Each side suffered a shocking 22,000 casualties.

The French Zouaves' valor in this war inspired at least two American regiments, one from Louisiana and the other from New York, to adopt their uniforms of bright red pants and blue jackets in the opening years of the Civil War.

Sickened by the carnage of the battles of Magenta and Solferino and threatened with war by German states backing Austria, Napoleon III dropped out of the war after only three months. He and the Austrian emperor, Franz Josef met at Villafranca, excluding Sardinia from the proceedings, and concluded the Treaty of Zurich, trying to appease Sardinia with Lombardy. Cavour was so furious that he temporarily resigned as prime minister. However, Victor Emmanuel realized he had to accept it, hoping to hold this over Napoleon for future favors.

Reactions to modern war. Public shock and outrage at the carnage from this war also helped lead to the founding of the International Red Cross in 1864 and the Geneva Convention on establishing rules of conduct in warfare. After the carnage of the American Civil War (600,000 dead), Clara Barton would found the American Red Cross in the United States.

"A heart of gold and the brains of an ox."

"He has a heart of gold and the brains of an ox," is how one person described Giuseppe Garibaldi in the sense that he was passionately devoted to the cause of a unified Italy, but was also extremely impulsive and prone to act without thinking. He seems to have been a good, if not brilliant commander, especially in guerilla tactics, and he certainly inspired intense devotion in his followers. As a result, he still counts as one of Italy's great national heroes.

Garibaldi had a long history of being in and out of Italy. In 1834 he was exiled from Sardinia for revolutionary activity, so he went to South America where he fought in various wars and revolutions and learned guerilla warfare.

The Red Shirts, Garibaldi's followers, got their distinctive uniforms when a blockade left a Uruguayan merchant with a huge overstock of red shirts, which he sold to Garibaldi at a bargain price.

In 1848 he returned to Italy to fight for the Republic of Rome against overwhelming odds. When Napoleon III's troops stormed the Republic's barricades, Garibaldi made a daring escape, although his wife died along the way. He then went into exile again, this time to New York City, where he worked as a candle-maker. He also spent time in Peru and Britain before returning to Italy in 1854. During the Austro-

Sardinian War in 1859, he fought the Austrians for Italian independence, until he was quickly undercut by Napoleon's surprise peace with the Hapsburgs.

Cavour took the long view of a diplomat, seeing that Napoleon III, despite his betrayal in 1859, might be a useful ally in the future. Therefore he diverted Garibaldi and 1000 Redshirts from Nice to Sicily on two old steamers to attack the Bourbon dynasty ruling there. Of course, Garibaldi and his seasick followers were acting in a completely unofficial capacity to keep from angering the Bourbons against Sardinia.

The Redshirts were armed with obsolete muskets and rusty bayonets, but the 24,000 Bourbon troops on Sicily were not devoted at all to their bosses. At Calatafimi (below) 3000 Bourbons were repulsing 1000 Redshirts and 1600 locals when Garibaldi got hit in the head with a rock. Realizing the enemy was out of ammunition, Garibaldi counter-attacked and won a major victory. Thousands of people now flocked to his standard, and Sicily was cleared out in six weeks. He next crossed into the kingdom of Naples, which he also quickly overran. The Bourbon ruler, Francis II supposedly pouted in his palace while Naples fell without a shot.

Garibaldi, whom Victor Emmanuel favored as a counterweight to Cavour's influence, had declared himself dictator of Southern Italy and Sicily, but also espoused loyalty to Sardinia, even wearing the uniform of a Sardinian general. Therefore, as a precaution and with the blessing of Napoleon III who would rather have the faithful ally, Victor Emmanuel, as his neighbor instead of a loose cannon like Garibaldi, the Sardinian king took over the Papal States with the exception of Rome, which the pope still controlled with French assistance.

***Garibaldi's later years.* In 1861, President Lincoln offered Garibaldi a command as a major general in the Union army. He turned it down because at that point, Lincoln wasn't ready to declare the emancipation of the slaves. After an unsuccessful attempt to take Rome in 1862, the**

Sardinians kept Garibaldi in polite detention on his island of Caprera.

In 1867, he again tried to take Rome, but was driven back by Papal and French forces. He got partial revenge by naming his two mules after Pope Pius IX and the Austrian emperor, Franz Josef. In 1871 he served with his two sons fighting for the Third Republic of France in the Franco-Prussian War. Returning to Italy, he served in the Italian Parliament and worked for various causes, including universal suffrage and the emancipation of women. He died peacefully on his island of Caprera in 1882.

Garibaldi portrayed as a saint with the stigmata.

121. THE UNIFICATION OF GERMANY (1848-1871)

"Not by speeches and majority resolutions are the great questions of the day decided-- that was the mistake of 1848 and 1849--but by blood and iron."-- Otto von Bismarck

Germany had been fragmented into as many as 300 separate states ever since the Investiture Struggle in the Middle Ages had wrecked the power of the German emperors. In the following centuries, it had suffered repeatedly from foreign wars and aggression, most recently Napoleon's rule. However, Napoleon had inadvertently done Germany two favors in the process of his rule. Besides instilling a sense of nationalism in its people, he had also consolidated Germany into 38 states, a giant step toward unification. Since Napoleon's defeat two states had competed for leadership of Germany: Austria and Prussia. Most people would have expected Austria, with its longer imperial tradition and larger territory to dominate. But it was Prussia, with its better organization and more progressive reforms (e.g., its customs union known as the *Zollverein*), which was destined to unify Germany.

The man who would lead Prussia in Germany's unification was its chancellor (prime minister), Otto von Bismarck (1815-94). He was a man of massive size and strength, brilliant mind, and iron will. Childhood stories of Germany's heroes had inspired him with a sense of German nationalism, while stories of foreign conquerors, especially Napoleon, angered him and instilled in him a desire for a unified nation. Bismarck's early career was rather undistinguished, although he did see foreign diplomatic service, which gave him experience in that field. He also witnessed Austrian arrogance toward Prussia in the German Diet (parliament), which set his mind to earn his country respect both inside Germany and outside of it. In 1862, he got his chance.

In 1858, Wilhelm I had succeeded Frederick William IV. The new king wanted to build up and reform the Prussian army. But one obstacle stood in the way: the Prussian *Reichstag* (parliament), formed as a result of the revolutions of 1848, refused to grant Wilhelm the needed money. In

1862, Wilhelm, on the verge of abdicating, appointed Bismarck as his chancellor.

Bismarck, among other things, was no lover of democracy, including the Prussian *Reichstag*, which he said bogged itself down in speeches and resolutions. He believed only clear-sighted decisive policies of "blood and iron" could build a German nation. He figured that once the nation was successfully built, German liberals, inspired by the reality of the long sought for German nation, would come around to his way of thinking. Therefore, he simply ruled without parliament and rammed through his own reforms. Prussia got its army and Bismarck could now turn to unifying Germany. Bismarck was an excellent diplomat who brilliantly manipulated alliances and played different powers off against one another. He was also a master of limited objectives, using each diplomatic step to set up the next one. He started with a revolt in Poland.

The Polish revolt against Russia in 1863 gained a great deal of popular support in Europe. But Bismarck was more interested in power than popular support (unless it was a means to gaining power). He clearly saw that the Czar would put down the revolt, and therefore helped Russia in crushing the rebels. This secured his eastern flank and gained an ally against Austria who had refused to help Russia in the Crimean War even after Russia had helped the Hapsburgs suppress their uprisings in 1848.

With his eastern border secure, Bismarck next championed the liberties of Germans in Schleswig and Holstein, whose Danish ruler was incorporating them more tightly into the Danish state. The resulting Danish War (1864) accomplished three things for Bismarck. First of all, it won him useful popular support among the Germans since he appeared to be defending German liberties. Secondly, it gave the reformed Prussian army valuable combat experience. Finally, it dragged Austria into the war on Prussia's side, since it could not afford to let Prussia be the sole champion of German liberties. This served Bismarck's purpose, since it got Prussia and Austria hopelessly entangled by their joint occupation of Schleswig and Holstein and helped set up a showdown between the two powers: the Austro-Prussian War (1866)

Bismarck laid the diplomatic groundwork for this war with typical thoroughness. Russia, already Prussia's friend and still mad at Austria, was effectively neutral, which suited Bismarck fine. Bismarck kept France out of the war by making vague promises of Rhineland territories if he won. And Italy, wanting to get Venice into its fold, allied against the common Austrian enemy. Prussia's military preparations were equally thorough. The Prussian army was better trained, organized and equipped than the Austrian army. A new breech loading rifle, the "needle gun", gave Prussian soldiers four times the firepower of their Austrian counterparts. A combination of using Prussia's railroad system for rapid movement of its armies with the telegraph to coordinate those movements allowed the Prussians to converge at the point of attack with unprecedented precision and overwhelming force. As a result, the Seven Weeks War, as this was also known, was a rapid and total victory for Prussia, in stark contrast to the drawn out conflict of the Seven Years War a century earlier

Bismarck's settlement looked forward to the eventual unification of Germany. His treatment of Austria was fairly lenient, taking only Venice and giving it, as promised, to Italy. But he also excluded Austria from German affairs, thus clearing the way for Prussian dominance. For Prussia itself, he took Schleswig and Holstein as well as the lands dividing Prussia from its holdings along the Rhine in the West. Bismarck also unified the north German states into a confederation under Prussian leadership, while expecting the south German states to follow Prussia's leadership in war. The confederation was organized along democratic lines to gain popular support, but the real power rested with the Prussian king and chancellor.

Bismarck's next move was to galvanize German support against a common enemy. He found that cause by going to war with France. Napoleon III of France had his motives for war as well. Sagging popularity at home and concern over Prussia's growing power helped drive him on a collision course with Bismarck that erupted into the Franco-Prussian War (1870-1). Once again, Bismarck had laid firm diplomatic foundations. Russia was still Prussia's friend. Italy allied with Prussia in order to get Rome out of French hands. Austria, still licking its wounds from its recent struggle with Prussia,

was neutralized. The one big question mark was: what would Britain do? Bismarck took care of that by taking out a full-page ad in the London Times claiming France wanted to annex Belgium. Public opinion was outraged and Britain left France to its fate.

Few people then would have given Prussia any chance to beat the French, anyway, since France was still considered the foremost military power in Europe. The Franco-Prussian War proved that assumption wrong. Prussian training, equipment, leadership, and organization quickly smashed French armies in rapid succession. Within six weeks the Prussians had surrounded Napoleon III's army at Sedan. After a day of desperate but suicidal assaults against the Prussian positions, Napoleon III was forced to surrender along with 120,000 men. The French mounted sporadic local resistance, especially in Paris whose besieged inhabitants survived on elephant meat from the zoo. In the end, it was too little too late and France had to ask for terms.

The Prussian victory had two main results. First of all, Prussia annexed Alsace and Lorraine, a bone of contention between the two countries since the Treaty of Verdun in 843 A.D. This alone was enough to spark French bitterness. Secondly, Bismarck officially unified Germany by declaring the Second Reich (German Empire) and crowning Wilhelm as *Kaiser* (literally Caesar or emperor). Not only that, he did this at Versailles, for 200 years the symbol of French power and now the symbol of its humiliation. This newly unified Germany would become an economic superpower by rapidly industrializing. For example, German steel production doubled every decade between 1870 and 1910, even passing British steel production after 1900. Both Prussia's treatment of France and its unification and industrialization of Germany would upset the balance of power and trigger a system of interlocking alliances that kept Europe on a knife-edge of readiness for a war that nearly everyone expected to break out. That war, World War I, would be the beginning of the end of European supremacy.

Internally, Germany between 1870 and 1914 presented a picture of seemingly incompatible contrasts. While its economy forged ahead to make it the most advanced nation in Europe, its political

structure resisted any liberalizing trends and remained conservative and autocratic. Likewise, it maintained an increasingly obsolete social structure of rich landowners who had mechanized their farms at the expense of the peasants and even richer capitalists making profits at the expense of a downtrodden working class and shrinking class of small shopkeepers and craftsmen. As the social and political systems lagged behind economic progress, tensions in the form of growing opposition parties (including socialists), protests, and strikes emerged more and more. Discontent was partially diverted away from the government by being focused against such groups as Catholics, socialists, and especially Jews. This and World War I only put off resolving these tensions. Unfortunately, the banner of discontent would be picked up by Adolph Hitler and the Nazis whose terrorist programs would plunge both Germany and the world into a much worse nightmare than even World War I proved to be.

Bismarck's early career

“When you want to fool the world, tell the truth”

Bismarck was the son of a less than ambitious Junker, from whom he got his massive size and physical strength. He seems to have gotten his restless mind and wild temper from his mother. In his early days, he was called the "Mad Bismarck" from his wild drinking and dueling escapades. He supposedly fought twenty-five duels in college, and was only wounded once by what he called a "cheap shot" He once announced his arrival at a friend's by firing a pistol into the ceiling. Another time he released a wild fox into a friend's living room. He supposedly had a dachshund with a flower tied to its tail just to provoke laughter so he could pick fights.

Bismarck married a devout woman and converted to a militant brand of Christianity where he saw himself as God's instrument to do something special. He admired autocracy and

militarism in the tradition of Frederick II. Interestingly, he made a terrible soldier, wanting to give, not follow, orders, declaring, "I will play music the way I like it or none at all."

When asked why he never listened to anyone else, he replied he had enough voices in his head to listen to. Hopefully he wasn't being literal.

After eight boring years as a junker, Otto entered politics in 1848, He served as ambassador to Russia for three years (1859-62) and to France for a few months, although he spent most of that time in London. One thing he learned during that time was the low opinion other powers had of Prussia.

***Bismarck's cigar.* It was the custom in the Reichstag that only the Austrian delegate be allowed to smoke. Then one day the Austrian delegate found Bismarck hovering over him with a cigar in his mouth, “asking” him for a light. Totally intimidated, he lit Bismarck’s cigar who responded by blowing a cloud of smoke back in his face. The Austrian delegate could probably relate to what the British prime minister, Benjamin Disraeli, once said of the young Bismarck: "Take care of that man. He means what he says."**

The Endless Rearmament Cycle

French Mitrailleuse, the 1st machine gun, 1867

In 1858 Frederick-William IV had a mental breakdown and was succeeded by Wilhelm I, who was determined to modernize the Prussian army. This is an issue that has become an ever-growing concern and expense for every modern state, especially with the industrial revolution. As rapid technological growth led to a continuous stream of new and more

sophisticated weapons, governments perceived they had to get these weapons for the state's survival. Of course, as the rate of technological growth kept accelerating, especially in the military realm, nation states found, and still find, themselves trapped in a never-ending cycle of rearmament, rapid obsolescence, more rearmament, etc.

For example, the smoothbore flintlock musket remained virtually unchanged for nearly two centuries. Then in the nineteenth century dramatic innovations replaced it and each other in rapid succession: the muzzle loading rifled musket used in the Crimean War (1853-6) and American Civil War (1861-5), the much faster breech loading and bolt action Dreyse rifle used in the Austro-Prussian War (1866), its much improved successors the Chassepot and Mauser rifles, and the Mitrailleuse, the first machine gun, used in the Franco-Prussian War (1870-1), which could fire 100-125 bullets a minute. Obviously, no state could afford to let itself be left behind by such developments and expect to survive a war.

Napoleon III's Mexican (Mis)adventure (1861-7)

Edouard Manet's painting of the execution of the would-be emperor of Mexico, Maximilian

Poor Napoleon III. Always looking for an opportunity to win glory like his uncle, but never quite hitting the mark. Consider his invasion of Mexico. The excuse for invading Mexico was the refusal in 1861 by Mexican president, Benito Juarez, to continue interest payments to French and other foreign banks. The timing was favorable for Napoleon III, because the U.S. was bogged down in its Civil War and could do nothing to intervene.

On May 5, 1862 the Mexicans defeated a much larger and better equipped French army at the Battle of Puebla (below). This was the basis for Cinco de Mayo, an unofficial Mexican holiday that is observed to celebrate Mexican heritage and culture by ethnic Mexicans both in Mexico and elsewhere. The official Mexican Independence Day is September 16. However, Puebla only slowed the French advance, which took Mexico City in 1863. But this proved of little use since the Mexicans kept control of the countryside.

The next year, Napoleon, with support from some Mexican monarchists and a highly dubious plebiscite run under French supervision, put the Austrian arch-duke, Maximilian, on the throne of Mexico. There is widespread suspicion that Maximilian was not really Hapsburg, but actually the son of Napoleon II, whom he resembled more than his father. He also had a bit of Napoleon III's "man of mystery without a secret" look about him.

After the end of its civil war, the U.S. supplied arms to Benito Juarez and his followers, while Maximilian invited ex-Confederates to come and fight for him. U.S. pressure convinced Napoleon III to withdraw his troops from Mexico in 1866, but Maximilian stayed on, spending much of his time trying to complete a manual on court etiquette (e.g., the most polite way to execute a dethroned emperor). He was captured in 1867. Despite pleas from such prominent people as Victor Hugo and Garibaldi and the fact that he personally liked Maximilian, Juarez had him executed on June 19, 1867.

Maximilian's wife Charlotte, a Belgian princess had accompanied her husband, whom she deeply loved and obsessed about, to Mexico. In addition to being beautiful, she was mentally unstable. Therefore, when Maximilian was executed, Carlota (her Spanish name in Mexico) came

completely unhinged and had to be committed to an insane asylum. For a while, she was so paranoid about being poisoned, that she would keep a live chicken on a leash until it was killed to be cooked for her.

The Needle Gun and Austro-Prussian War

A major factor in Prussia's victories in the Danish and Austro-Prussian wars was the Dreyse Needle gun, patented in 1841. It used a bullet glued in a paper case, known as a sabot, with three parts: a paper cartridge containing gunpowder, a percussion cap or primer, and an acorn shaped bullet. It got its name from a needle that, upon pulling the trigger, would puncture and penetrate the cartridge to detonate the primer, which in turn detonated the powder and expelled the bullet.

The Dreyse was also the first breech-loading rifle using bolt action to open and close the chamber by turning and pulling a bolt. This allowed a Prussian soldier a firing rate of 10-12 shots per minute, at least five times the rate of his Austrian or Danish opponent, and a range of 600 meters. Although no more accurate than its counterparts, hitting opposing soldiers on an average of once every 250 shots, the faster firing rate gave Prussian soldiers a huge psychological advantage. Another advantage was its user didn't have to stand up to reload his gun and present a big target to the enemy. The paper cartridge used for the bullet was known as caseless ammunition, since it burned up upon firing and didn't have to be ejected before putting in a new bullet.

One problem with the needle gun was that a significant amount of gas escaped through the breech, thus limiting its range. This could also burn the soldier's face, forcing him to fire from the hip, thus reducing its accuracy. Also, the fact that the needle was immersed in the powder when the gun fired put stress on it, causing it to break after as few as 200 rounds, making the gun useless until the needle was replaced. Prussian soldiers were equipped with two extra needles for this purpose.

The needle gun revolutionized warfare as much as the rifled musket did and especially proved its worth in the Austro-Prussian War in 1866. At the battle of Podol, 400 Prussians defeated 2,000 Austrians, inflicting ten times the casualties they received. However, by the Franco-Prussian War (1870-71) the Dreyse design was thirty years old and obsolete compared to the Chassepot rifle carried by the French.

Besides excellent weapons, the Prussians also had superior organization, most notably, using the telegraph to coordinate troop movements by rail so they could converge at the point of attack with unprecedented precision and overwhelming forces of fresh troops. Much of this they learned from observing how the North won the American Civil War, concluded just a year before.

The Austro-Prussian War is also known as the Seven Weeks War, comparing Prussia's quick victory in 1866 with its drawn out fight for survival a century earlier in the 7 Years War.

The Ems Telegram and The Road to the Franco-Prussian War

Two cartoons showing French and Prussian feelings about one another by 1870. The one on the left makes fun of how Bismarck duped Napoleon III into staying out of the Austro-Prussian War by promising him "pieces" of Germany. The one on the right shows how Prussia perceived France's dismissive attitude toward it, telling it, "Now you're big enough. You mustn't get any bigger. I'm telling you this for your own health."

In preparing for war with France, Bismarck again laid firm diplomatic foundations. Russia

was still Prussia's friend. Italy allied with Prussia in order to get Rome out of French hands. Austria, still licking its wounds from its recent struggle with Prussia, was neutralized.

That left Britain, which Bismarck neutralized with a full page ad in the London Times saying Napoleon III wanted to annex Belgium. This raised the British public's anger against France to the point that they stayed out of the war. Ironically, it would be Germany's violation of Belgian neutrality in 1914 that would bring Britain into World War I.

Now all Bismarck had to do was convince the German and French people they wanted a war. The opportunity came when the king of Spain died without an heir and the Spanish offered the throne to Prince Leopold, a member of the Catholic branch of the Hohenzollern family. However, Napoleon III, terrified of a Hohenzollern Spain-Prussia alliance, hinted at war with Prussia if Leopold accepted. Leopold withdrew his candidacy in July 1870.

However, Napoleon, also determined to provoke a war with Prussia, had his ambassador to Prussia, Count Vincent Benedetti, confront the Prussian king, Wilhelm I, at Ems and demand he guarantee that no Hohenzollern would ever be a candidate for the Spanish throne.

Bismarck took the Ems Telegram, changed the tone to make both Benedetti and Wilhelm sound more belligerent than they really were, and released this version to the press. Both the German and French publics took this story as an insult to their respective nations.

Bismarck and Napoleon got the war they wanted.

The Changing Face of War in 1870

The Franco-Prussian War served as a transition between the Napoleonic and First World wars. On the one hand, like the American Civil War, generals in it were caught between the older mentality of massed human wave assaults and the greatly enhanced range and killing power of modern rifled muskets and artillery.

On the other hand, rather than understanding the destructive power of modern weapons, generals in World War I would follow Prussia's strategy of a rapid war of movement, thinking it would again produce victory.

They were wrong.

Instead, they should have seen that French blundering in 1870 had lost the war as much as Prussian strategy won it.

And they should have paid attention to the disastrous results of the few frontal assaults made against French soldiers with modern weapons in prepared positions.

Unfortunately, the generals as usual, were preparing for the last war instead of the next.

And, just as unfortunately, it was the common soldiers who would pay the price.

The breech-loading needle gun with a range of 600 meters had given the Prussians a decisive advantage over the relatively archaic Austrian army in 1866. However, by 1870 the Prussian rifle was virtually obsolete compared to the new French Chassepot rifle.

The French Chassepot rifle, patented in 1866, improved on the needle gun in several ways. It used a rubber gasket to seal the breech, allowing it to use all the pressure of the explosion to propel the bullet. As a result, the Chassepot's range was 1100 meters on a flat trajectory, twice that of the needle gun. However, residue from burnt paper cartridges forced frequent cleaning of the gun, so in 1874, the metal cartridge was introduced, which had to be ejected, but overall saved time by not having to clean the gun so often.

First used in 1867 against Garibaldi's troops at the battle of Mentana, the Chassepot inflicted both more numerous and severe casualties than those inflicted by the muzzle-loading Minie rifle. In the Franco-Prussian War, the Chassepot was responsible for most of the Prussian casualties,

forcing the Prussian soldiers to try closing the gap to get within range of the French and taking horrific losses in the process.

Conversely, Prussian artillery, produced by the Krupps, outclassed its French counterparts with a much longer range. It was also breech-loaded, greatly speeding the rate of fire, and fired larger caliber percussion shells that burst on impact rather than the older way of trying to calculate when a time-fused shell would reach its target.

The Mitrailleuse, France's top secret machine gun, could fire 125 bullets/minute at a range of 2500 meters. Unfortunately, it was so top secret that French soldiers didn't know what to do with it. So, since it looked like a cannon, they often lined it up in back with the rest of the artillery where it would be completely useless.

The Franco-Prussian War (1870-1)

One thing that industrialization, and especially railroads, taught Prussian generals was that speed and mobility were vital ingredients to modern warfare. Therefore, a new concept entered military thinking: rapid mobilization. The resulting concentration of 482,000 men at the French border in 18 days gave them the decisive edge for victory. Unfortunately, that lesson overshadowed more sobering ones that both sides should have learned.

Despite these advantages, the Prussians needlessly launched assaults against the French that only produced horrific casualties such as those seen at Fredericksburg, Pickett's Charge, and Cold Harbor during the 1860s in the American Civil War. Ironically, Europeans had followed the American war with great interest, sending military observers to see first hand what modern weaponry could do. However, after taking heavy losses in such assaults, the Prussians did learn to use their superior artillery to bludgeon the French into retreat.

Rapid Prussian mobilization and concentration of its forces led to a series of quick victories against the much more disorganized French. In a sense the war was decided almost before the fighting began as the Prussians deftly

outflanked, outmaneuvered, and trapped one French army inside the fortress of Metz while surrounding Napoleon with another one at Sedan.

However, at this critical time, the French commander at Sedan was wounded. The new commander, Durcot, ordered a retreat, but another general, De Wimpffen, produced orders putting him in command, and he wanted to attack. Supposedly, the French army went through 8 commanders in four hours. By the time the situation was sorted out, the trap was closed and the entire French army, along with Napoleon III, was surrounded. Meanwhile, the Prussian artillery on the surrounding heights was mercilessly pouring shot and shell on the helpless French soldiers below.

French cavalry, trying to break the surrounding ring of Prussian forces, made three charges over broken ground against a devastating hail of fire from Prussian rifles and artillery. A French cavalry officer, when asked after the second disastrous charge if he could mount another attack, replied: "As often as you like mon general, so long as there's one of us left."

After the third charge had been shattered, Prussian officers held their fire and saluted the bravery of their foes, although not necessarily the intelligence of the men who ordered the charges.

Finally, after suffering 17,000 casualties, Napoleon ordered the entire French army, some 104,000 men, along with their guns and equipment, to surrender. The emperor, who was ill, contemplated suicide in the aftermath of this disaster, which also had put an end to his rule.

Three weeks after Napoleon's surrender at Sedan, the French army driven into Metz also

surrendered. By the end of September, there was no effective French army in the field.

After the devastating defeats in the early weeks of the war, very much like their situation against Germany in 1940, French resistance stiffened against the Prussian advance. At Chateaudun 1200 French National Guardsmen held off 5000 Prussians for 9 hours. Unfortunately, also like in 1940, it was too little too late.

Complicating the war were the franc-tireurs (free shooters or freedom fighters), civilians who waged guerrilla warfare against the Prussians. To the Germans with a narrower view of what constituted legitimate combatants, this was a violation of the laws of war.

Never knowing where and when the next attack might come made German soldiers paranoid and prone to acts of brutality either to avenge or to prevent more such attacks. Memories of the franc-tireurs of 1870 would carry over to World War I, when invading German forces would commit pre-emptive acts of brutality against Belgian and French civilians. This would seriously damage Germany's international reputation through much of the twentieth century.

Paris Under Siege (September, 1870-January, 1871). With one French army captured at Sedan and another trapped in Metz, Prussian forces advanced rapidly on Paris and had it under siege by September 19. However, Paris was a formidable target, being surrounded by a 33-foot wall, a moat, a ring of 15 forts, and the will and means to produce 300,000 bullets and 21 cannons a day during the siege.

In addition, France had soon raised 350,000 national guardsmen. Despite their inexperience these raw recruits, gave the Prussians some of the hardest fighting of the war, although they still generally gave way before the more battle-hardened German soldiers.

During the siege of Paris, the American ambassador was the only person in the city allowed to get his weekly copy of the London Times, but only on the condition he wouldn't

share any news with the Parisians. At times crowds of Parisians, desperate for news of the outside world, would surround the American embassy, yelling "We gave you Lafayette...in return...we ask for only one copy of an English newspaper."

One way that Parisians maintained some contact with the outside world was through hot air balloons. During the siege some 65 hot air balloons were released carrying 2.5 million letters. Of those 65 balloons 45 made it. One escapee, Leon Gambetta, raised 100,000 troops and briefly retook Orleans from the Prussians. Unfortunately, his radical views disagreed with those of the new French president, so they didn't join forces to save Paris.

As food started running short, the authorities started slaughtering horses and zoo animals for their meat. In fact, Paris was the site of the first public zoo, an outgrowth of the menagerie of animals the kings had kept at Versailles. It even had a lion that had adopted a dog as its baby. The infamous French taste for horsemeat also supposedly came from this siege.

While only six people starved outright during the siege, diseases resulting from malnutrition claimed another 4800 lives and left others as orphans. Rich Parisians continued to eat well during the siege thanks to a thriving black market. For the poor there was rat meat, although at least one vendor advertised a dish of rats cooked in a rich cream sauce. Only in Paris.

The long-range artillery from the Kruppworks allowed the Prussians to constantly bombard the city. However, these bombardments claimed only 97 lives, and Parisians came to view the nightly bombardments as a sort of fireworks entertainment. Mothers even threatened misbehaving children with not letting them view the bombardment that night. Nevertheless, the bombardment and war did do their damage to Paris and its surroundings.

As the siege wore on, various schemes for saving Paris emerged. Several women claiming to be "reincarnations" of Joan of Arc came forth to

save France. One man suggested attaching a giant hammer to a hot air balloon and dropping it on German headquarters at Versailles. Parisian women prepared to defend themselves against the amorous advances of German soldiers by wearing thimbles with poisoned needles with which they could scratch their molesters.

Much of what made this siege so difficult was the horrible wintry conditions in which it often took place. More soldiers on both sides died from the cold and disease than from battle.

One French army under General Bourbaki made a grueling winter march to seek the safety of neutral Switzerland. In February 1871, some 80,000 French soldiers made it there and were interned for the rest of the war. Bourbaki attempted suicide by shooting himself in the head, but survived.

The Second Reich. As casualties mounted and the siege of Paris dragged on through the winter, Bismarck became increasingly nervous about the German public's support for the war. Therefore, in January 1871, he crowned Wilhelm as Kaiser (emperor) at Versailles and declared the unification of Germany as the Second Reich (the First Reich being the Holy Roman Empire). Bismarck saw Versailles as the only place available for this ad hoc ceremony in the middle of the siege, and probably didn't do it to rub the French people's noses in the dirt. Still, he must have realized the effect it would have on them.

Soon afterwards, Paris finally surrendered. The terms of peace were not kind to France: the surrender of Alsace and Lorraine and payment of a huge indemnity. In addition, on January 28, 1871 the French had to endure the humiliation of the Prussian army marching in triumph through

Paris. Parisian women later scrubbed the streets to rid them of the "Prussian filth."

The Paris Commune (March-May, 1871). The Third Republic, the government created after the surrender of Paris was headed by a very conservative faction led by the historian, Adolf Thiers. This sparked a popular uprising by radicals in Paris who formed the Paris Commune.

As a further humiliation, Germany forced the new French government to use its army to besiege Paris a second time to root out the insurgents.

Some historians, especially Marxists, have viewed the Paris Commune as the first socialist uprising. Upon closer inspection, the Commune's agenda, although radical, wasn't all that socialist or Marxist in nature.

During this second siege of Paris, both sides resorted to escalating levels of executions of prisoners. It started with the Paris Commune executing two captured government generals by firing squad. After retaliatory executions by the government, the Commune executed 51 more prisoners in retribution. Before it was over, reprisals by the Paris Commune claimed more victims than did the Reign of Terror in 1793-4

Even after government troops fought their way into the city, it took another week of hard fighting, known to the French as "Bloody Week", before the Commune's resistance finally collapsed.

Aftermath. The Franco-Prussian War was a bitter pill for the French to swallow. In addition to the defeat and damage France sustained, there was the humiliation of being replaced as the top continental power. The French saw themselves

as innocent victims wrongly crucified by the barbaric Germans.

By the same token, Germans, seeing themselves as disciplined and civilized, viewed the French as decadent. Even Bismarck's wife (who had lost a son in the war) thought all the French should be shot.

French art from this time, such as Edward Munch's *The Scream*, often had a quasi-mystical nature that gave French nationalism an almost religious aura.

For decades, France would be obsessed with revenge against Germany. Unfortunately, the price of revenge, when it came, would be much worse than the cost of defeat had been in 1871.

Revived Anti-Semitism and the Birth of Zionism

As Jews in Europe were emancipated from repression and legal restrictions in the 1800s, many of them joined mainstream society, making them both more visible and vulnerable. However, as the world economy tightened in the late 1800s, anti-Semitism began to surface again, as seen in the cartoon below about Tsarist persecution of the Jews. One man, Theodor Herzl advocated Jews moving back to Palestine to reclaim their homeland. Thus began the Zionist movement, which would start with a trickle of settlers moving to Palestine and become a floodtide after World War II and the Holocaust.

Late 19th Century Art

Vincent van Gogh, *Starry Night*, 1888

Once the Impressionists had broken loose from the confines of traditional art, other artists followed suit. However, rather than taking the Impressionist approach to painting, they explored other avenues. As a result, going along with the rapid technological changes taking place, there was a flurry of new art movements: the "scientific" approach of Seurat, the geometric approach of Cezanne, the emotional and psychological approaches of the Expressionists and Symbolists, the more nostalgic approach of the Pre-Raphaelites, and the more sensuous and commercialized character of Art Nouveau. Together, these are often lumped together generically as the Post-impressionists, although this gives the false impression of some sort of unified movement in art, while in reality art had become, and remains, too fragmented to lump under any one label.

Georges Seurat (1859-91) was the most famous of the Pointillists, who tried to apply a scientific approach to painting by applying individual dots of paint instead of brushstrokes to the canvas. To get different colors, such as purple, other colors of dots, such as red and blue, would be interspersed with one another. Seurat used upward sweeping lines to indicate upbeat feelings and downward sweeping lines to indicate the opposite. Since this was such a time consuming process, Georges Seurat, completed a relatively few paintings compared to the much more prolific Impressionists.

Georges Seurat, *La Grande Jatte*, 1884

Paul Cezanne (1839-1906) was an early member of the Impressionist movement who soon pursued his own artistic direction. In 1886, he was so hurt by criticism saying his canvas was "one of those weird things evolved by hashish", that he left Paris and lived as a virtual hermit for

several years. Much of his approach was to break down and portray a nature scene or still life as a combination of geometric shapes (squares, circles, triangles, etc.). As he put it, saying the painter has both an eye and a brain and should use the two together, “Reproduce nature in terms of the cylinder and the sphere and the cone.” During his career, he did some 30 paintings of Mt Ste. Victoire using the geometric approach. This approach would have great influence on Pablo Picasso and the Cubist movement in the early twentieth century.

Paul Cezanne Mt Ste. Victoire, 1894 Paul Gauguin, Day of the Gods, 1894

Paul Gauguin (1848-1903). Although Gauguin was French born, he largely grew up in Peru. After returning to France and a successful business career, he took up painting as a hobby. He would walk around Paris with an outlandishly dressed Javanese woman and a monkey on his shoulder. Gauguin left Paris for the simplicity of Brittany, which inspired his distinctive primitivism style. Supposedly influenced by Gothic stained glass, his art is best known for its solid fields of color and absence of shading. As he put it: “A meter of green is greener than a centimeter if you wish to express greenness.” Later, feeling more at home in the South Seas, he moved to Tahiti where he spent his last 10 years untainted by “sick civilization”, doing paintings of South Seas life and culture. He summed up his approach to life as: “Eat well, kiss well, work ditto, and you’ll die happy.”

Vincent Van Gogh (1853-90). Van Gogh was one of the more tragic artists in history. After failing at a number of jobs, he turned to art, his goal being to sell paintings for forty cents each, cheap enough to brighten up poor people’s lives. Van Gogh apparently was manic-depressive with alternating periods of lethargic depression interspersed by periods of manic activity. During those periods he would paint non-stop for days

and nights at a time, fixing a candle to his hat so he work at night. He called painting “the lightning rod for my sanity.”

Starry Night (1889) was done in an asylum of Saint Remy in a “dumb fury” of staying up for three nights straight because, as Van Gogh put it: “The night is more alive and more richly colored than the day.” He painted 70 canvases in his last 70 days of life.

Van Gogh’s last painting was Wheatfield with Crows (below). Soon afterwards he went into a field and shot himself. He died two days later, his suicide note saying: “Who would believe that life could be so sad?”

Unfortunately, like so many artists, Van Gogh wasn’t appreciated in his own time and he sold only one of his 800 paintings and drawings before he committed suicide.

In 1990, 100 years after his death his portrait of Dr. Gachet sold at an auction for an unprecedented \$82.5 million.

The famous story of Van Gogh cutting off his own ear apparently started with an argument over a portrait of him by Gauguin, who was staying with him at the time. Van Gogh claimed, “Yes it’s me all right, but me mad.” Later, when they continued the argument in a café, Van Gogh threatened Gauguin with a straight razor, but failing to scare him, he slunk out of the café, cut off his ear, and gave it to a prostitute. Gauguin took the first train out of town, although the two artists were reconciled later.

Henri de Toulouse-Lautrec (1864-1901), contrary to popular belief, was not a dwarf or midget. An accident that broke both his legs stunted his growth to a height of 4’6”. Naturally, this made him quite insecure, so he led a somewhat dissipated lifestyle, consorting with the seedier elements of Parisian society, in particular dancers and prostitutes.

When he turned to painting, his art teacher called his early drawings “simply awful”, which couldn’t have helped his self-confidence any. Lautrec’s portraits tended to be caricatures, often cruel ones. Heightening this effect was his use of artificial interior lighting. He was influenced by wood block prints of Japanese artists such as Hiroshige and Hokusai in his use of different angles of view that might cut off part of a subject by moving it to the side. As he put it: “Only the figure counts. Landscape is, and should always be, only an adjunct.”

Lautrec is best remembered for his lithographs and posters, a new medium that he almost single handedly made a respectable art form, thus making art accessible to many more people. He also popularized a new kind of drink: the cocktail. Like, Van Gogh, Lautrec ended his own life.

Henri de Toulouse-Lautrec, *The Moulin Rouge*, 1892/95

The Arts and Crafts Movement was largely a reaction against Victorian over-ornamentation that borrowed indiscriminately from different periods of history. Its founder, William Morris, formed Morris and Co. in 1861 to try to revive medieval craftsmanship and splendor for everyday objects. Morris’ company and the movement it spawned produced, textiles, tapestries, stained glass, furniture, teapots, and highly decorative wallpaper.

The Pre-Raphaelites were a group formed in 1848 by Dante Gabriel Rossetti and Sir Edward Burne-Jones to protest the low standards of English art. They were admirers of William Blake (1757-1827), a visionary British artist who used asymmetry along with swirling and flame-like lines to create images that were both fanciful, and terrifying, such as *The Dream Of*

Jacob, 1808 (below left). Typically his works had biblical themes, such as scenes from the book of Revelations about the Apocalypse. His technique especially influenced the Pre-Raphaelites and Art Nouveau.

Like Morris, the Pre-Raphaelites admired the art of the Middle Ages and early Renaissance (before Raphael in 1500s). Their art often had a pessimistic world-weariness, as seen in the Virgin Mary’s expression in Rossetti’s *The Annunciation* (above right). It also captured the pessimism increasingly characteristic of European civilization in the years leading up to World War I.

John W. Waterhouse (1849-1917) was a very popular artist of the Victorian era, whose popularity has revived in recent years. He is often included as one of the Pre-Raphaelites, sharing their love of ancient and medieval history, although he was never a member of the group. Still, his paintings, such as *Hylas and the Nymphs* (1896), are probably the best-known examples of the romantic effects the Pre-Raphaelites were trying to achieve.

Art Nouveau: (1880s-1914), a “new art for a new age,” was a reaction to the depersonalization of the Industrial Revolution and the lack of original trends. It stressed sinuous over straight lines and was highly decorative, often with long twisting vines or other types of vegetation. Women were typically portrayed in a both sensuous and somewhat neo-classical way. Art Nouveau’s influences came from several directions: the early 19th century British artist, William Blake, the Arts and Crafts movement, the Pre-Raphaelites, and lithography, a technological innovation allowing mass production of high quality and relatively cheap art prints for the first time. Two noted artists in this genre were Alphonse Mucha (1860-1939)

and Toulouse Lautrec. The Art Nouveau style would experience a revival in the late 1960s in its influence on poster art advertising rock concerts.

Modernisme. The architectural counterpart to Art Nouveau, it was especially centered in Barcelona around the turn of the twentieth century, drawing upon Spanish and Moorish influences as well. Like Art Nouveau, it emphasized curving sinuous lines that had an especially striking effect when applied to architecture. The most renowned architect associated with this style was Antoni Gaudi (1852-1926), especially famous for his Sagrada Familia Cathedral (below left) on which work continues today. It is estimated to be finished between 2020 and 2030. On the right is Casa Lleo I Morera, one of a number of apartment buildings in Barcelona built using the Modnernisme style.

The Symbolists, a group of writers and painters who in 1886 issued a manifesto calling for art that suggested reality as it was felt rather than observed. Their influence can be seen in the work of Gauging, Edvard Munch, and Gustav Klimt. Two of the most famous Symbolists, were Gustave Moreau (1826-98) and Odilon Redon (1840-1916), whose *The Green Death* (1905-16) is seen here.

Gustav Klimt (1862-1918) belonged to a group of artists known as the Vienna Secession. Unlike other such groups, they accepted artists of all different styles. Their patron was Athena, goddess of wisdom and the arts. Like many other pioneering artists, Klimt was trained in classical painting and did his early work in the academic style. However, as he struck out more to define his own style, his work drew increasing criticism. Klimt's portrayal of women, in particular, scandalized many, not so much for their nudity as the independent and even empowered spirit they exhibited.

122. EUROPEAN IMPERIAL EXPANSION IN AFRICA (c.1870-1914)

***"Whatever happens we have got/The Maxim gun and they have not."*—19th century European poem. Actually, the weight of the Maxim gun limited its usefulness in conquering Africa.**

Introduction. Ever since the rise of a capitalist economy and strong nation states armed with efficient military machines (c.1500), Europe had steadily extended its power across the globe. By 1800, European and European derived colonies had extended the dominance of European culture over 35% of the globe. Up until this point, the usual explanation for European expansion was the "three G's": God, gold, and glory. Colonies in South America provided gold and silver. Those in the Caribbean produced sugar, a virtual "white gold", for European markets. West African colonies provided slaves for the Caribbean sugar plantations. And the North American colonies and India provided their governments with markets and raw materials.

In the nineteenth century the nature and motives for colonial imperialism changed dramatically. As with the Industrial Revolution, Britain also led the way in the late nineteenth century in a new wave of expansion (known as neo-imperialism) that would put European civilization in control of 85% of the globe. The classic argument explaining this phenomenon has focused on the Industrial Revolution's growing need for new resources and markets. However, this oversimplifies the case. If one looks at where European colonies expanded, in particular in Africa, one sees little economic sense in doing so. Instead, there were three interrelated causes driving Europeans to go out and virtually conquer the globe: growing economic competition as the industrial revolution spread, internal political stresses caused by industrialization, and rising international rivalries.

1) Economic causes. The 1860's were an economically unsettled time that came to a head with a depression in 1873. While all industrial countries were hurt, Britain especially was feeling the pinch. Its reliance on raw materials was damaging its balance of trade. And it was facing growing competition from newly industrializing nations, especially Germany, who had newer factories and cheaper labor.

2) Internal political stresses. Economic changes have always caused political problems, and Europe in the late 1800's was no exception. Britain in

particular was seeing a transformation of the relatively unified political party system of the pre-industrial era into a more fragmented patchwork of special interest groups: labor unions, land owners, bankers, industrialists, etc. Politicians were desperate for some new cause or ideology to unify the voters behind them.

3) International tensions. In 1871 the fragile balance of power in Europe had been radically altered by the emergence of a strongly unified Germany and Italy, the equally destabilizing process of the rapid disintegration of Ottoman power in southeastern Europe and the Middle East, and the growing rebelliousness in Ireland against British rule. The British public was especially upset by these challenges to the stability of the world they had known and by Britain's apparent inability to act effectively.

Therefore, Benjamin Disraeli, British prime minister in the 1870's, first pushed the idea of renewed imperial expansion as a way to protect vital British overseas markets, resources and jobs, enhance Britain's national prestige, and give it an edge against other European countries without colonies. Never mind the fact that these arguments were grossly exaggerated if not downright false. The lure of new markets was especially misleading since there were often few consumers in Africa and Asia who could even afford European goods. Granted, as Europe's industries diversified in the late 1800's, there was a growing need for certain resources not found in Europe, such as oil, rubber, and non-ferrous metal. However, many of the resources sought by Europeans were unnecessary luxury or consumer items like bananas, coffee, and African palm oil for soap. Despite that, Disraeli had found one issue he could exploit to unify the British voters behind him.

The British public and even Queen Victoria (who was also Empress of India) came to believe in the need for colonies, so opposing politicians conservatives and liberals alike also pushed for imperial expansion to keep voters happy. Justifying these wholesale conquests was easy enough. Britons saw themselves as bringing the benefits of Christianity and European civilization to less developed peoples. The new ideas of Darwinism, in particular "survival of the fittest", were adapted, or distorted, into Social Darwinism. This claimed that human societies, just like some animals, are better adapted to survive than others. Therefore, it was the "white man's burden" to bring his superior civilization to the inferior cultures of Africa and Asia. Social Darwinism was really little more than a polite or pseudo-scientific term for racism.

The "Dark Continent". Before 1870 Europeans had made little headway into Africa, either as conquerors or explorers, mainly because of their lack of resistance to the area's tropical diseases. This left Africa in a shroud of mystery that earned it the title of the "Dark Continent". After 1870, Europeans made rapid inroads into Africa thanks to the industrial revolution which gave them two new weapons: vaccines for combating the diseases and rifles and machine guns for combating the African natives.

Three lines of development got Europeans interested in Africa and triggered a virtual land rush there. First of all was a highly publicized expedition by the journalist, Henry Stanley to find the explorer David Livingston who had been missing for some time. Stanley's best selling account, mostly remembered for the quotation, "Dr. Livingston, I presume", especially interested King Leopold of Belgium who ruthlessly conquered and exploited the Congo (modern Zaire).

The other two lines of development concerned British expansion into Egypt and South Africa. In Egypt, the ruler's lavish lifestyle led to a growing debt and the eventual takeover of his shares of the Suez Canal by British bankers. The loss of revenue from the canal further disrupted Egypt's stability. Therefore, in order to protect the Suez Canal from native revolution, the British government took over Egypt in the 1880's. Control of Egypt led to near hysteria over the outlandish possibility that the government in Sudan could cut off the source of the Nile and turn Egypt into a desert. As a result, the British also conquered Sudan.

Britain had taken over South Africa from the Dutch in 1815 to secure their route to India. The Dutch settlers (known as Boers), unhappy with Britain's abolition of slavery in 1832 trekked inland to settle the Orange Free State and Transvaal. The Boers were left alone until the discovery of diamonds and gold prompted a rush of British prospectors into the Boer territories. Growing friction between the Boers and these newcomers eventually led Britain to take over Transvaal in order to protect British business interests there. This got the British into hostilities with various native peoples, most notably the Zulus. After some hard fighting, including the massacre of one British army by the Zulus and a desperately fought guerrilla war against the Dutch Boers at the turn of the century, the British successfully occupied the area.

In each case, one can see how involvement in one area led to involvement in other areas and so on.

Even more important was that growing British colonial power alarmed other industrializing nations who wanted their own colonies so they could keep up with Britain. Therefore, Disraeli's strategy to mobilize British public opinion also dragged other European countries with economic and political problems similar to Britain's into imperial expansion. The result was a virtual scramble for colonies in Africa and Asia.

The German Chancellor, Otto von Bismarck, held the Congress of Berlin in 1884 to establish the ground rules for all the imperialist powers involved in this land rush. (No Africans or Asians were invited.) The participants agreed to give prior notice before claiming a new colony. However, mutual distrust between the European powers often led them to be more secretive and sneaky in claiming new colonies.

As stated above, largely the same forces drove the other powers in their grab for colonies as drove Britain: a feeling of economic vulnerability that colonies would magically cure, a fear that other powers would get a head start in claiming colonies, and a need to unify the voters behind a common cause. Each country also had its own particular set of circumstances to drive it along.

In Germany, Bismarck saw colonies as more of a nuisance and drain of resources. However, the new Kaiser, Wilhelm II, fired Bismarck in 1890 and pursued an aggressive policy of building an empire (and navy to protect it) in order to claim "Germany's place in the sun." There was also concern about the emigration of Germans to non-German areas, especially America. German colonies would provide homes for emigrants and enclaves of German culture across the globe. France felt the need for a unifying cause after the humiliating defeat in the Franco-Prussian War and the unsettling economic conditions brought on by depression and huge war indemnities to Germany. Colonies would enhance its national prestige and also give it some leverage for future revenge against Germany. Italy, also newly unified in 1871, was still much more politically fragmented and economically undeveloped than Germany. Colonies would provide some focus for national pride and unity.

The partitioning of Africa was one of history's more brutal and insensitive episodes. Europeans came in and carved up Africa along arbitrary boundaries that split some tribes up and threw others together. Europeans legitimized this by having the Africans sign treaties that they did not understand the meaning of. They also used forced labor to build

railroads, etc., killing thousands in the process. By 1914, practically all of Africa had fallen prey to European aggression.

The impact of neo-imperialism was generally negative. For one thing, European colonial boundaries often cut across old tribal boundaries or combined peoples of different (and hostile) tribes. Unfortunately, when African colonies won their independence, it was according to the artificial European boundaries, thus continuing to split up some tribes while throwing other hostile tribes together. Compounding this problem in some colonies was the European policy of favoring one tribe over another, thus creating much more hostility that would be unleashed once the controlling hand of the European colony was released. In the worst-case scenarios, one ethnic group would embark on a campaign of genocide to completely exterminate another group. In 1994 the Hutus tried to exterminate the rival group, the Tutsis, in Rwanda. Although they failed in completely wiping them out, an estimated one million people died before the situation was brought under control.

There was also the humiliation and suffering Africans were subjected to. While Europeans did work to abolish slavery, they still killed thousands through forced labor (slavery by another name) in order to complete their building projects and bring the "benefits" of "superior" European civilization to Africa. For example, Europeans would impose their agricultural techniques on Africans and, in the process, ruin the soil, which was better suited for the traditional slash and burn agriculture. They would teach African school children poems about daffodils, even though Africa had no daffodils. In the end, this cultural policy backfired against Europeans. Many colonial subjects went to Europe to get educated and brought back the dangerous ideas of liberalism, nationalism, and Marxism. That, and the fact that colonials serving in European armies picked up on European firearms technology, helped lead to the ultimate downfall of the European colonial empires.

Even for the European powers, colonies were often more of a liability than an asset. For one thing, many colonies cost more to rule than they brought back in revenues and resources. Second, as the number of available places to take over decreased by 1900, tensions rose between the European powers wanting to take those places. True, by 1914, European or European derived powers controlled 85% of the globe and were definitely sitting on top of the world. But the beginning of the

end was near as the specter of the First World War loomed on the horizon.

Soap and the "White Man's Burden"

"The first step towards lightening the White Man's Burden is through teaching the virtues of cleanliness. Pears' Soap is a potent factor in brightening the dark corners of the earth as civilization advances, whilst amongst the cultured of all nations it holds the highest place—it is the ideal toilet soap."

The White Man's Burden by Rudyard Kipling (1899) expressed the rationalization that it was the "burden" of Europeans to bring civilization to "inferior" peoples around the globe:

***Take up the White Man's burden--
Send forth the best ye breed--
Go bind your sons to exile
To serve your captives' need;
To wait in heavy harness
On fluttered folk and wild--
Your new-caught, sullen peoples,
Half devil and half child***

***Take up the White Man's burden
In patience to abide
To veil the threat of terror
And check the show of pride;
By open speech and simple
An hundred times made plain
To seek another's profit,
And work another's gain.***

***Take up the White Man's burden--
The savage wars of peace--
Fill full the mouth of Famine
And bid the sickness cease;
And when your goal is nearest
The end for others sought,***

*Watch Sloth and heathen Folly
Bring all your hope to naught*

*Take up the White Man's burden--
No tawdry rule of kings.
But toil of serf and sweeper--
The tale of common things.
The ports ye shall not enter,
The roads ye shall not tread,
Go make them with your living
And mark them with your dead!*

Egypt and the Sudan

*"We don't want to fight, but by jingo if we do
We've got the ships, we've got the guns, and got
the money too"*

Britain's interest in Egypt lay with the Suez Canal, which opened in 1869. Originally, this canal was a joint venture between France and Egypt. However, the ruler of Egypt fell into debt and had to borrow money from British banks, using his shares in the canal as collateral for the loan. Unfortunately, he defaulted on the loan, and Britain took over the Egyptian half of the canal.

However, Egypt was rapidly destabilizing, so Britain annexed it as a colony to protect its investment in the Suez.

All seemed safe until an engineer named Sam Baker published an article showing how Sudan, Egypt's southern neighbor, could cut off Egypt's lifeline: the Nile. As ridiculous as this fear was, it prompted Britain to take over Sudan as well.

In 1898, the Sudanese, led by a religious leader known as the Mahdi, rebelled against British rule. At Omdurman (9/2/1898), 20,000 British and Egyptian troops, supported by heavily armed gunboats, shattered the suicidal assaults of the Mahdist forces. The rebels lost 10,000 men as opposed to only 48 British soldiers.

African Holocaust: Leopold II and the Congo

"I do not want to risk...losing a fine chance to secure for ourselves a slice of this magnificent African cake."--Leopold II

Leopold II of Belgium (above) was an unhappy king. Having only limited power over a tiny realm, he dreamed of ruling a vast empire. After looking around a bit, he settled on the Congo. He waged a skillful public relations campaign to promote his "Congo Free State" as an effort to drive Arab slave traders from Africa. He even designed a flag for his Congo Free State, a yellow star, representing freedom, inside a blue field. However, this was only a ruse.

The new Congo state is destined to be one of the most important executors of the work we intend to do, and I express my best wishes for its speedy development, and for the realization of the noble aspirations of its illustrious creator."-- Otto von Bismarck

Enter Henry Stanley (above), a journalist and explorer famous for tracking down the "presumed" Dr. Livingstone, (a fairly safe assumption since they were probably the only two white men in Africa's interior). Leopold hired Stanley as his agent to swindle unwitting natives, unfamiliar with European contracts, treaties, and alcohol, out of their lands. Failing that, he would often just kill them.

A typical Treaty handing over African land to Leopold II: Chiefs of Ngombi and Mafela, in return for "one piece of cloth per month to each of the undersigned chiefs, besides present of cloth in hand," they promised to "freely of their own accord, for themselves and their heirs and successors for ever...give up to the said Association the sovereignty and all sovereign and

governing rights to all their territories...and to assist by labor or otherwise, any works, improvements or expeditions which the said Association shall cause at any time to be carried out in any part of these territories....All roads and waterways running through this country, the right of collecting tolls on the same, and all game, fishing, mining and forest rights, are to be the absolute property of the said Association.”. Most African leaders who signed these treaties couldn't read, had a completely different concept of land ownership, and were plied with liquor before signing.

Leopold's men then proceeded to rape the land of its riches, especially ivory, ruthlessly using forced labor to get the job done. "A file of poor devils, chained by the neck, carried my trunks and boxes toward the dock...There were about a hundred of them, trembling and fearful before the overseer, who strolled by whirling a whip. For each stocky and broad-backed fellow, how many were skeletons dried up like mummies, their skin worn out...seamed with deep scars, covered with suppurating wounds...No matter, they were all up to the job."--Congo state official

"It was most interesting, lying in the bush, watching the natives quietly at their day's work. Some women ...were making banana flour by pounding up dried bananas. Men we could see building huts and engaged in other work, boys and girls running about, singing.... I opened the game by shooting one chap through the chest. He fell like a stone...Immediately a volley was poured into the village."--Henry Stanley

"Six shots and four deaths were sufficient to quiet the mocking."--Henry Stanley

What Leopold and Stanley carried out was one of the worst cases of exploitation and atrocities in history. Joseph Conrad grimly portrayed it in *Heart of Darkness*.

The Matadi-Leopoldville Railroad. One of Leopold's first projects for the Congo was a railroad for hauling out ivory. The line from Matadi to Kinshasa/Leopoldville was 366 kilometers long. The initial stage through the

rugged hills around Matadi was especially costly in lives, giving rise to a legend that every sleeper represented a human life.

Ivory. Before plastics and the petrochemical industries of the 20th century, ivory served as an all purpose material for making a wide variety of products ranging from dentures to cue balls and piano keys. At ivory gathering stations company representatives would pay natives virtually nothing for ivory that they would then turn around and sell for outrageous profits in Europe.

Then Leopold discovered another resource that could bring in even bigger profits, albeit with much more labor and suffering. That product was rubber.

Rubber was harvested by climbing the rubber tree, tapping into it and letting the sap run all over the slave's body, where it would congeal. Later he would peel the rubber off his body, taking any body hair with it. Rubber harvesters were given impossible quotas to fill each month. In addition to enduring the hardships of gathering rubber in the jungle, many of them were killed by wild animals. Meanwhile, Leopold's men raped the women kept hostage to force their husbands to go and gather rubber rather than run off. Villages were often burned and converted into rubber plantations, it being easier to clear villages than deeply rooted jungles.

"The station chief selects the victims....Trembling, haggard, they lie face down on the ground...two of their companions, sometimes four, seize them by the feet and hands, and remove their cotton drawers....Each time that the torturer lifts up the chicotte*, a reddish stripe appears on the skin of the pitiful victims, who, however firmly held, gasp in frightful contortions....At the first blows the

unhappy victims let out horrible cries which soon become faint groans....In a refinement of evil, some officers, and I've witnessed this, demand that when the sufferer gets up, panting, he must graciously give the military salute." -- Stanislas Lefranc, Belgian prosecutor

* Chicotte a particularly vicious type of whip made from rhinoceros hide, used as the primary instrument of punishment.

Many natives lost their hands, either because their wrists were tied too tightly or company militia cut them off to claim them as killed and get a reward.

Below, a father looks at the severed hand and foot of his daughter

Leon Rom was the most likely real life model for Conrad's Mr. Kurtz in Heart of Darkness. Along with displaying a row of severed African heads around his garden, he wrote a book on African customs, painted portraits and landscapes, kept a butterfly collection, and killed elephants for trophies.

In 1904, Leopold's bubble burst. A shipping clerk named Edmund Dene Morel noticed how vast loads of ivory and rubber were coming from the Congo Free State and only guns and ammunition seemed to be going back there in payment. Putting 2 and 2 together, he blew the whistle on Leopold and waged a tireless campaign to get the Congo taken from Leopold.

A contemporary cartoons, showed Leopold discussing atrocities with the Ottoman Sultan, whose massacre of the Armenians was the first major case of genocide in the twentieth century. The sultan assures Leopold the public will soon lose interest and do nothing about the Congo.

In this case the sultan was wrong. The Belgian government took the Congo from Leopold in 1908.

Overall, the atrocities in the Congo killed an estimated 5 million Africans, a disaster sometimes referred to as the African holocaust.

*Listen to the yell of Leopold's ghost
Burning in Hell for his hand-maimed
host.
Hear how the demons chuckle and yell
Cutting his hands off, down in Hell.
Listen to the creepy proclamation
Blown through the lairs of the forest
nation,
Blown past the white-ants' hill of clay,
Blown past the marsh where the
butterflies play --
"Be careful what you do,
Or Mumbo-Jumbo, God of the Congo,
And all the other Gods of the Congo,
Mumbo-Jumbo will hoo-doo you ..."
-- Hoo, Hoo, Hoo by Vachel Lindsay*

"Monsters exist. But they are too few in number to be truly dangerous. More dangerous are...the functionaries ready to believe and to act without asking questions."-- Primo Levi, Auschwitz survivor

The British Conquest of South Africa

*"I would annex the planets if I could"--
Cartoon from Punch showing Cecil
Rhodes straddling the length of Africa*

The Zulus were one of the most formidable opponents facing the Europeans in Africa, being numerous, warlike, mobile, and organized. In 1879, they ambushed the British at Isandlwana (above), winning one of the few victories won by indigenous peoples against European armies during this period. After this, however, the British brought in overwhelming firepower and crushed the Zulus.

Dressed to rule. Having defeated the Zulus, the British reinstalled their king, Cetewayo as a client king in 1883, dressing him in a European coat to symbolize where his power really came from. This became a common practice by European conquerors who often ruled through local leaders.

Cecil John Rhodes was a British diamond-mining magnate in South Africa and one of the most aggressive imperialists of the age. He made his fortune from the De Beers Diamond Company, which cornered the world diamond market by 1880 and still controls 40% of the world's diamond supply. As he expanded his holdings, he founded the state of Rhodesia, later renamed Zimbabwe and Zambia. Among his ambitions was to build a railroad the length of Africa from "the Cape to Cairo. British-Boer tensions especially escalated after a new discovery of diamonds in 1886, which led to a rush of "outlanders" into the Boer republics. Finally, in 1899, the Boer War (1899-1902) broke out.

Concentration camps (below) were one of the more unfortunate innovations from the Boer War. The British would confine civilians in them to keep them from providing Boer forces any help. Over 28,000 Boer women and children and 20,000 blacks, as many as half the inmates would die from these camps' awful conditions.

Sometimes native reactions to European incursions would go to self-destructive extremes. For example, Xhosa prophets in South Africa told their people that to please the gods and improve their lot, they must destroy their cattle and crops. Consequently, 400,000 cattle were destroyed and some 40,000 Xhosa people died.

The Scramble for Africa

A cartoon showing Britain as an octopus, grabbing parts of every continent with its tentacles. In the 1880s, other European countries wanted their "fair" shares as well.

The success of Britain and Leopold in their colonial ventures led other European powers into a land rush known as the Scramble for Africa. In 1884 Bismarck hosted the Congress of Berlin to lay down ground rules for this land grab.

No Africans were invited.

Except for Ethiopia, the last vestiges of free Africa were gone by 1914.

French involvement in Africa actually began with the conquest of Algeria in 1836. Later French conquests in West Africa would build upon this base, as useless as it was to French interests. The Algerian war for independence in the 20th century would be a long and bitter struggle that would make French efforts to rule there seem even more pointless.

Madagascar was another target of French aggression. However, their invasion in 1895 lingered too long in the lowlands building roads to support its army and was hit hard by malaria. This forced them to abandon their cumbersome army in favor of a more mobile one of 1500 men.

By contrast, the French had used gunboats on the Oueme River to invade Dahomey in 1892. Rivers, while providing the best invasion routes, were also more susceptible to the spread of tropical diseases.

Most of France's colonial territory consisted of desert lands in the Sahara. Probably the most valuable resource they gained from these

conquests was manpower for the armies. The French, with fewer people to spare for emigration, especially had to rely on native troops to fill the ranks of their colonial armies as well as filling in the trenches on the Western Front in World War I, where Europe's colder climate caused as much suffering for them as the tropical conditions of Africa did for Europeans.

As opportunities for new lands to colonize dried up, competition increased for increasingly barren lands. Such was the case with the Fashoda Crisis between France and Britain in 1898 over a barren patch of the Eastern Sahara.

Largely in reaction to growing German naval and colonial ambitions, the two countries avoided open war whereby Britain got East Africa and France got a huge barren stretch of the Sahara known as French West Africa.

This agreement also paved the way for the Entente Cordiale in 1904 of Britain and France against Germany in World War I.

Also contributing to rising tensions were two crises (1904 and 1911) between Germany and France over Morocco . While on the surface Kaiser Wilhelm II was posing as champion of Moroccan liberties, his actions only served to alarm both France and Britain, driving them closer into an alliance that would fight Germany in World War I.

Germany, as a late-comer to the colonial game, also found little that was worthwhile to colonize in Africa. One colony was German Southwest Africa (modern Namibia), which became notorious for the brutal suppression of a revolt (1904-7) by the Herero and their virtual extermination as a people. Some have described this as the first case of genocide in the twentieth century and a blueprint for the Holocaust in its use of concentration camps and bizarre medical experiments, such as sterilization of subjects and injecting them with diseases like smallpox and typhus.

Ethiopia was the one African country to successfully resist European invasion, defeating

the Italians at Adowa in 1896. Ironically, the Ethiopians had little food and would have been forced to disband if the Italians could have delayed battle a few more days.

The Ethiopians' victory was the result of their leaders seeing what was happening elsewhere and arming themselves with European guns. Despite their success here, the Italians would be back in 1935 and conquer Ethiopia.

123. BRITISH RULE IN INDIA (c.1600-1947)

Introduction. It has been said that the British Empire was picked up in a "fit of absence of mind." Nowhere was this more true than in the case of India which gradually came under British rule, not by the efforts of Britain's government, but by those of the British East Indies Company, founded in 1599 by a group of merchants in search of nothing more than "quiet trade." However, circumstances would thwart these peaceful intentions, and over the next 250 years the British would find themselves more and more in the role of conquerors and governors than traders. Not only would the British have a profound effect on India's history, but the "crown jewel of the British Empire" would also affect Western Civilization. This is reflected in such English words as bungalow, verandah, punch, dungarees, and pajamas, such customs as smoking cigars, playing polo, and taking showers, as well as more profound influences in the realms of religion and philosophy.

Company expansion (1601-1773). Two main lines of development worked to bring the British East Indies Company to India and make it a power there. For one thing, by 1600, Portugal was losing control of the East Asian Spice trade. Therefore, in 1601, the British East Indies Company started sending ships to the Spice Islands to gain a share of this trade. At this point, there was no intention of even going to India, let alone of conquering it, since the Mughal Dynasty had a firm grip on the subcontinent. However, the Dutch also had designs on the spice trade and rebuffed any British efforts to take part in it. As a result, the British East Indies Company gained the right to set up trading posts along the coast of India. Later, some of these trading posts would grow into major cities such as Madras, Bombay, and Calcutta.

The other factor pushing the British East Indies Company toward conquest had to do with the Mughal Empire. This dynasty had ruled most of India peacefully and tolerantly for a century since the 1500's. However, during the reign of Aurangzeb (1658-1707) all that changed as he started persecuting Hindus. Not only did this trigger centuries of religious strife that still continues, it also began the decline of the Mughal Empire, which suffered from weak and corrupt government from this time on. The resulting

turmoil forced the British East Indies Company to defend its trading posts against local princes, brigands, and a new European intruder, France.

The French, to compensate for the lack of European manpower so far from home, initiated the strategy of training and arming native recruits (*sepoys*) like European armies. Such forces were so effective that local princes would trade large tracts of land for French trained sepoys, thus giving the French control over much of Southern India. In response to this new threat, the British responded in kind by training their own sepoys. By the end of the Seven Years War (1756-63), British naval superiority and sepoys under the leadership of Robert Clive had virtually ended French involvement in India. Clive dramatically demonstrated the effectiveness of European trained sepoys at the battle of Plassey (1757) when his army of 2800 British soldiers and sepoys routed a Bengali army of 100,000 men. Clive's victories over the Bengalis and French made the British East Indies Company a major power in India, able to install its own candidate on the Mughal throne and claim the wealthy province of Bengal for itself. British dominance resulting from these victories had three main effects.

First, British power, plus the fact that their "honorable masters" in England were 7000 miles and nine months travel away, left India wide open to exploitation by the company and its employees. Many British took full advantage of the opportunity to "shake the pagoda tree", as they called the collection of "gifts" from grateful local princes (*nawabs*). While a noble in Britain could live well on £800 a year, even minor company employees were making huge fortunes. One merchant was given a profitable saltworks with 13,000 employees while another was given his own mint. A certain Mr. Watts was awarded £117,000 for bravery at the battle of Plassey. And Clive himself received £211,500 for installing one nawab and another £27,000 a year from another grant. Such opportunities for making quick fortunes unleashed a flood of applicants back home for service in India, some applications being accompanied with bribes of up to £2000. Newcomers from England were often shocked when first encountering their colleagues already in India, since they typically mixed freely with the natives and had adopted their customs, food, and clothing. Service in India had its risks for the British, mainly tropical heat and diseases. As

one local proverb put it, "Two monsoons is the age of a man," indicating that few Europeans survived conditions in India more than two years. Bombay was known as "the burying ground of the British".

Growing parliamentary control and rising tensions (1778-1857). However, while company employees who survived service in India were making their fortunes, the company's loose management was costing it a fortune, forcing it to apply to the Bank of England for a loan in 1773 in order to avoid bankruptcy. As a result, Parliament exercised increasing control over the company, establishing governors-general to oversee its activities. This led to a succession of governors with different attitudes and policies. Some governors, such as Warren Hastings (ruled 1778-88) were known for their tolerance of and willingness to learn about the native languages and cultures and to give Indians posts in their government. However, other governors, such as Lord Cornwallis (1788-98), reversed many of these tolerant policies and dismissed most native Indians from higher posts in the administration. Getting into the nineteenth century, tensions grew between two factions: one advocating tolerance and respect for Indian culture and another claiming the superiority of European civilization over that of India. This created a growing gap between the British and Indians that also fostered growing discontent.

Two other developments in the 1800s led to growing unrest among Indians. One was the growing number of Christian missionaries coming to India to preach Christianity, which clashed with the more flexible beliefs of the Hindu majority and the strong beliefs of Indian Muslims. Secondly, the British were bringing in modern technology (especially railroads) and business methods, which disrupted the traditional, slower paced culture and economy of India.

Things came to a head with the Great India Mutiny in 1857. Sparking it was a misunderstanding about what kind of grease was used on the bullets for the sepoy's new Enfield rifles. Muslim troops thought pig grease, which they abhor, was being used, while Hindu troops thought the British were using grease from cows, which they hold sacred. The resulting mutiny developed into a serious rebellion that the British finally managed to put down. However, this was the final straw as far as the British government

was concerned, assuming direct control over India in 1858 and eventually dissolving the British East Indies Company. Just as one British queen, Elizabeth I had signed the charter forming the British East Indies Company some 260 years earlier, so another queen, Victoria, signed it into extinction. Ironically, its career had started with a group of merchants in search of nothing more than "quiet trade." For the next ninety years, direct British rule would prevail in India.

From the British Raj to independence (1858-1947). Britain ruled about 60% of India directly and the other 40% indirectly through native princes who followed British policies. During their time in India, the British developed tea and cotton agriculture and coal and iron industries. In fact, by 1940, the Tata Iron Works was the world's largest Iron factory. Likewise, the British continued developing India's infrastructure with more railroads and telegraph lines, so that by 1900 India had the longest railroad in Asia. British administration and bureaucracy were efficient, as was the British style education system Britain established.

However, even these developments contained the seeds of problems for British rule. As before, the new industries, railroads, and telegraphs, however progressive they may have seemed to the British, disrupted the traditional culture and economy of India. By the same token, however efficient the bureaucracy was, there were large gaps between the higher ranking British and lower ranking Indians that carried over to society in general. Increasingly, Indians were getting tired of their second-class status and worked increasingly for independence.

The Indian National Congress, founded in 1885, led the independence movement. At first, its goal was to gain more rights for Indians and more say in the British administration. However, as its power grew in the twentieth century, it agitated increasingly for complete independence. This led to a parallel, but somewhat separate independence movement of Muslims in India who feared being a minority in a Hindu-dominated state. Therefore, they wanted a separate independent Muslim state in the northwest.

World War I (1914-18) and World War II (1939-45) further catalyzed India's push for independence, since Britain had to rely heavily on Indian recruits

to fill its ranks. In return, Britain promised more political concessions, thus weakening its hold on India, encouraging more demand by Indians, and so on.

In 1920, a new leader, Mohandas Gandhi emerged as the voice of the Indian National Congress. Educated in both traditional Indian culture and British schools, Gandhi developed very effective non-violent tactics of resistance while protesting British policies. The British, not wanting to risk the bad publicity a violent reaction could generate, had to give in to Gandhi time after time. Therefore, at the end of World War II, Britain promised independence for India. Unfortunately, this revived the issue of whether there would be one large Hindu-dominated state or a separate Muslim state in the North, leading to violent clashes between Hindus and Muslims broke out. Finally, in 1947 Britain the region between Hindu India in the South and Muslim Pakistan in the Northwest that also controlled a separate territory, Bangla Desh, in the Northeast. Despite heroic efforts to keep the peace by Gandhi (who was killed by one of his Hindu followers in 1947), tensions between Hindus and Muslims have continued to the present day and still threaten the peace and stability of South Asia.

Cigars, Polo, and Thugs:

India's Impact on the English Language
Several words in our language reflect Indian influence from the time of the Raj (British rule). Among them are Cigar, polo, shower, bungalow, punch, dungarees, and thug.

The English word thug comes from a Hindi word meaning thief or con-man, but also refers to a group known as the Thuggees who infiltrated caravans, winning their confidence, sometimes over hundreds of miles of travel, before strangling them with yellow scarves (possibly from their turbans) and robbing them. Groups of Thuggees could be fairly large and last for generations, with rites of initiation for new members. Many or most groups seem to have been devoted to the Hindu goddess, Kali, their victims supposedly being seen as sacrifices to the deity.

Sometimes large groups would infiltrate caravans bit by bit to avoid alarming travelers.

By the same token, the Thuggees needed to kill all the travelers quickly to keep word of their existence from getting out. The Thuggee movement lasted from the 1600s to the 1830s when the British systematically eliminated it. Estimates of the numbers of their victims vary from 40,000 to 2,000,000.

Medicinal Uses of Spices

Elizabeth I (1557-1603) chartered The British East Indies Company (BEIC) in 1599 to pursue "peaceful trade" in search of spices for use as medicine as well as food. Nutmeg was used to treat rheumatism, while cloves supposedly would relieve toothaches and bad breath. Suppliants at the Chinese were required to chew cloves to clear their breaths before gaining an audience with the emperor. Peppers imported from India would be mixed with wine to ease stomach pain. The warming qualities of peppers could also supposedly relieve the symptoms of excessive cold humors, such as too much phlegm (as in a cold). Other exotic spices, such as ginger, cinnamon, cassia, malabathrum, galbanum, cardamon, nard, pepper, frankincense, myrrh and saffron, would be used in various combinations against venomous bites.

In addition, asafetida, cardamom, cloves, ginger, mace, nutmeg, pepper, saffron, and vanilla reportedly had aphrodisiacal properties. This tradition continues even today, as such spices are used in massage oils and incense under the modern title of aromatherapy.

Cities of the Raj

Among other things, the British had a significant impact on India's urban landscape, in particular the cities of Bombay (modern Mumbai), Calcutta, and Madras (modern Chennai), all three of which had had humble beginnings as Company outposts.

Bombay was originally a barren island leased in 1661 from Charles II for £10 a year. (Charles had gotten it as part of the dowry for his Portuguese wife, Elizabeth Braganza.) It is currently the largest city in India and fourth largest in the world, with a metropolitan population of around 20.5 million.

Calcutta, a forsaken Bengali mudflat, had a harbor with a treacherous approach by way of the Hooghli River. Originally known as Ft. William (and later Calcutta) it would grow into a city of 10 million. In 1639 the company acquired Madras, which was then a five-mile long strip of coast with no harbor.

Sepoy

As the Mughal Empire fell apart and India destabilized, European traders increasingly had to defend themselves and their interests. Given the small capacity of sailing ships and the high mortality rate among those making the long voyage between Europe and India, it was impractical to try bringing European recruits to India, since so many would die on the way (and many or most of the survivors would die from India's tropical conditions). The solution, first tried by the French, was the use of *sepoys*, (a corruption of *sip-ah*, the Persian word for army) who at this time were any Indian soldiers in the employ of a European power. (Today it is the designation for the rank of private in the Indian, Pakistani, and Bangladeshi armies.)

In addition, the French equipped these native Indian recruits with muskets and trained them in the drill-and-march that had made European armies so deadly. As it turned out, Indian sepoys proved as effective as Europeans using these weapons and tactics, were cheaper (especially since they didn't have to be imported from Europe), and didn't drop dead from scurvy or heat stroke before even making it to the battlefield.

The success of this French innovation quickly convinced the British East Indies Company to do the same, and sepoys became the backbone of British forces in India. In addition they would be used in other colonial wars (such as the Second

Opium War) and even World War I, when over 500,000 Indian troops would serve the British Empire on the Western Front and elsewhere.

The Battle of Plassey (1757)

The Battle of Plassey (6/23/1757) was the first major test of British sepoys and is generally seen as the beginning of the British Empire in Asia. The British commander, Robert Clive had 950 Europeans and 2100 sepoys against 50,000 troops of Siraj Ud Daulah, the Nawab of Bengal. However, Mir Jafar, commanding 16,000 of the Nawab's cavalry, had been bribed with a promise of the Nawab's throne if he would defect. So he didn't take part in the battle, leading to the rest of the Nawab's army being demoralized. So it was actually 3,100 vs. 34,000, less than 9 to 1 odds. Causing further confusion in the Nawab's army was the death of his chief general, Mir Madan.

When a heavy rainstorm hit, the British covered their powder, but the Nawab's troops didn't. Therefore, when the rain stopped, the British had all the firepower and used it to drive the Nawab's forces from the field. Siraj Ud Daulah was replaced by Mir Jafir, who later brought the Dutch in to drive out the British, but was defeated and deposed. The British East Indies Company received £2.5 million, while Clive earned £234,000. By comparison, a British noble could live a life of luxury back home on £800 a year.

Robert Clive meets his ally, Mir Jafir, after his decisive victory at Plassey

Adapting to a Foreign Environment

Thanks to the Battle of Plassey, opportunities opened up for making vast fortunes, a practice referred to as shaking the pagoda tree. Company employees developed extravagant and regal

tastes. For example ice for cooling drinks was packed in straw and sent by sailing ship from Maine. An extreme example of the luxurious lifestyle was that of the governor of Bombay who would emerge from his private quarters carried on a palanquin with forty servants led by underlings waving silver wands. A fanfare of trumpets would announce each course at dinner, with some state dinners having as many as 600 dishes. Even if you didn't die from overeating, you still might go deaf.

A British party, c.1825. It was such wild partying while ignoring Company business that drove the BEIC into debt.

Griffins, as British newcomers were known, adapted poorly to India's hostile and less than comfortable surroundings. Their daily work schedule commonly went from 9AM to noon. Afternoons were spent in eating, napping, gambling, drinking, and more drinking. Nights were spent with dancing girls, drinking, and smoking hookahs (some with opium).

“Two monsoons are the age of a man” was a proverb describing the downside of living in India, for the risks were as high as the rewards. Such things as heat stroke, malaria, cholera, snakebites, and jungle fever finished off many British in their first six months after arriving from Britain. Many others turned to heavy drinking to drown their sorrows and homesickness. Consequently, liver disease was one of the most commonly suffered afflictions.

Below: A company employee, in ridiculously heavy garb, is hosed down to keep cool.

Going native. To be fair, some British did adapt to Indian culture and conditions, adopting local dress and diet and even taking local wives

“Cleaning up” British India

Warren Hastings (above) was the first governor general of the company's Indian possessions from 1772 to 1785. He rode eight miles a day, drank only tea, took cold baths, and was in bed by 10 PM. He ruled the company strictly but fairly, raising employee salaries, while restricting their personal business dealings. Hastings hired young men willing to study and respect local languages and traditions and who were more devoted to king and country than to their own personal profits. He also incorporated Indians into the company bureaucracy, thus laying the foundations of the Indian Civil Service.

Hastings, who knew both Persian and Bengali, believed in treating Indian civilization with respect. In a sense, he was the father of Indian historiography, in that he first treated the history of the subcontinent as a unified whole instead of as a bunch of regional histories. He helped scholars introduce Indian civilization to the rest of the world. As a result, he was able to persuade Indian princes to ally with the company.

By the same token, Hastings worked to create a bit of Britain in the middle of India, except intensified and exaggerated by the long distance from home. Well-heeled nobles replaced old rough and ready merchants living like Indian princes. He replaced tom-toms with a fife and drum corps, curried dishes with English recipes, local clothing with London fashions, and Indian style homes with country houses complete with tidy gardens, such as Hastings' Calcutta home below. For entertainment, the British could go to places like the Bread and Cheese Bungalow, Jockey Club, and Eden Gardens.

Just as in England, the days would pass in a long round of social calls, afternoon naps, evening card games, music recitals, balls, and dinner parties complete w/cherbet. Of course, to maintain all this British culture and decorum, they needed real British ladies, so each October English women arrived in the “Fishing” fleet looking for husbands. Those disappointed in these hopes would return to England with the spring monsoon next spring. The cartoon below, “The Sale of English Beauties”, is a satirical comment on the fate of those women.

Despite this influx of British culture, many company employees still chose to live in gilded extravagance. One captain going to war in 1780 took a steward, a cook, a "boy", a horse keeper, a grass cutter, a washer man, his mistress, plus 15 coolies to transport his tent and large bed, camp stools, folding table, up to 6 trunks full of tableware, cases of wine, a hamper of live poultry, a goat, and an extra tent for supplies.

Not surprisingly, disgruntled employees resented Hastings' reforms and had charges of corruption brought against him back home. After a long trial, he was acquitted, but also replaced as governor in 1788.

His successor, Lord Cornwallis (better known for surrendering Yorktown to George Washington), reversed many of Hastings' policies, firing all but one Indian employee and creating a growing gap between The British ruling class and Indian subjects. After Cornwallis came Sir Richard Wellesley (governor-general 1798-1805), who greatly expanded British holdings out of fear of France, especially after Napoleon invaded Egypt in 1798. At this time, India still consisted of 562 states. Wellesley's brother was Arthur, (AKA Duke of Wellington) who defeated Napoleon at Waterloo.

The Great India Mutiny and Beginning of the Raj

Rising economic tensions. When the British first came to India, their goods were not in demand, leading to a poor Balance of trade. However, as the BEIC expanded its power and control in parts of India, it could force exchanges of goods for bargain prices. Artisans were forced to work in company factories and forbidden to leave until they had made their quota. As a general rule they could only work only for the BEIC, making them virtual slaves.

This company monopoly meant Indian merchants couldn't trade directly with Indian artisans, but had to buy from the BEIC at its prices. More and more they also found themselves working as underlings for the BEIC or changing jobs, which ruined many flourishing areas and market towns. If Indians were caught dealing directly with the artisans, their goods were confiscated and they might even be beaten. The BEIC could also trade freely without paying customs duties, which hurt the finances of Indian princes, especially those in Bengal.

When company imports to Britain, especially the lighter more comfortable cotton fabrics, started hurting British textile industries, the government, influenced by Adam Smith's ideas on free trade, abolished the company monopoly in 1813. Even then, Britain still couldn't compete against the superior Indian textiles, so it put huge customs on Indian imports and forcibly flooded Indian Markets with British textiles. In 1826, when the BEIC turned its interests toward China and the tea trade, it forcibly converted many Indian cotton fields to raise opium, which also drastically cut India's competitive edge in textiles.

*"When you're left for dying on Afghanistan's plains
And the women come out to cut up what remains
Just roll to your rifle and blow out your brains."
--Rudyard Kipling*

The Afghan disaster (1842). Afghanistan has always been a problem to control. Alexander the Great conquered it, but needed three years of the

most prolonged and vicious fighting of his career to do it. Not much of anyone else has succeeded since. The Russians tried and failed in the 1980s and the Americans' longest war has still to see victory.

In 1842, the British tried to conquer it, largely as a buffer against Russian expansion, and failed miserably as their whole army was wiped out except for one survivor to take the news back to India.

Even worse, the disastrous defeat of British forces in Afghanistan in 1842 broke the spell of British invincibility in the region and helped trigger the Great India Mutiny.

The Great India Mutiny (1857-8). Things came to a head with the Great India Mutiny. Sparking it was a misunderstanding about what kind of grease was used on the bullets for the sepoys' new Enfield rifles. Muslim troops thought it was pig grease, which they abhor, while Hindu troops thought the British were using grease from cows, which they hold sacred.

Britain may very well have been sensitive to Hindu and Muslim feelings on these matters and ordered the bullets treated with vegetable oil, although the orders may have gotten confused or distorted. As a result 85 sepoys refused to accept the guns with the new cartridges and were arrested, causing their enraged comrades to storm the prison and then set out to kill every foreigner. From there the mutiny rapidly spread, although most of India stayed calm in spite of company employees largely mishandling the situation.

As is typical of such rebellions, atrocities abounded out of frustration from extended misrule. One British force was massacred under truce. At Cawnpore (below), hundreds of European women and children surrendered under promise of safe passage and were promptly and brutally massacred. The most notorious event was the Black Hole of Calcutta, where reportedly 123 of 146 prisoners suffocated from being crammed into an area so tightly they could not breathe. There is controversy over the number of victims listed.

Despite initial successes, prolonged sieges and disunity within the mutiny's disparate elements led to its eventual collapse. One decisive event was the surrender and disarming of 36,000 restive sepoys in the Punjab and replacing them with loyal Sikhs, followed by the brutal storming and sacking of Delhi and other Indian cities.

Only four months after its start and before British reinforcements could arrive, the back of the rebellion was broken, although fighting and guerrilla warfare would continue until late 1858.

In revenge, the British staged mass hangings and bayoneted mutinous sepoys on sight. At Amristar, the incident of the Black Hole was repeated in reverse where 45 out of 332 prisoners waiting for execution in a tiny jail suffocated. As an example to their fellow sepoys, captured rebels were dealt with harshly, some of them being tied to the fronts of loaded cannon barrels that were then shot.

In the aftermath of the revolt, the British government relieved the British East India Company of its last vestiges of control over India, taking direct control of the subcontinent for itself. Thus began the period of British rule in India known as the Raj, from the Indian word for ruler.

British India during the Raj

"The sun never sets on the British Empire". There was a good deal of truth in this saying, since Britain ruled Australia, New Zealand, and extensive parts of North America (Canada), Asia (India and Burma), and Africa. By 1900, in terms of overall territorial extent, the British Empire had become the largest empire in history, although it was scattered across the globe. Therefore, the empire's global extent meant that the sun was indeed always shining on part of it. By the same token, one could say part of the empire was always shrouded in darkness.

In 1876, Queen Victoria was declared empress of India. The next year she toured the subcontinent, which became known as the Crown Jewel of the British Empire.

British rule was secured by a standing army of 250,000 men, four-fifths of them being Indian sepoy taking orders from British officers, such as Sikander's Bengal Lancers, seen here passing in review.

British rule also relied on a modern transportation network of railways and telegraphs. By the end of its rule in 1947, the British built railway system in India was the most extensive in Asia. In addition, the Suez Canal (opened 11/17/1869) proved vital to British and other European countries' hold on their Asian colonies, since this 105 mile long artificial strait of water cut more than 4350 miles off the voyage from Europe to Asia. British rule also helped develop some industry in India, most notably the Tata Iron Works, which by 1914 was the world's largest iron foundry.

On the other hand, there were definite down sides to British rule as well. Even modern developments in agriculture and transportation brought in by the British weren't necessarily good news for Indians, because the more stable food supplies these advances brought triggered dramatic population growth. The resulting burden on the food producing and distribution systems just made more people susceptible to the effects of famine when it did strike.

And as much as the British liked to portray themselves as benign rulers, they still maintained an uncomfortable distance from their Indian subjects, insulating themselves in a carbon copy version of British society back home, with teas, tennis parties, and other social events where the only visible signs of Indians were the servants.

A British tennis party in India in the late 1800s served by Indian servants shows how much the British ruling class segregated itself from the Indian population in order to maintain their customs and way of life thousands of miles from home.

However, the seeds of dissent had hardly been eliminated with the Great India Mutiny, and a new movement for independence was brewing. And like so much else in Indian history and culture, it would be strikingly unique.

Gandhi and Indian Independence

The Indian independence movement can be seen as officially starting in 1875 with the formation of the Indian National Congress. At first, they espoused loyalty to Great Britain, just working for more home rule, but came to be leaders in the movement for independence. Since this was a Hindu dominated group, Indian Muslims soon formed their own corresponding movement. Therefore, from its start, the independence movement was already fractured along religious lines.

The man most associated with India's independence was Mohandas Gandhi (1869-1948). As a young man he was a prosperous lawyer educated in Britain where he learned the best and worst of Western Civilization, supposedly remarking that Western Civilization was a contradiction in terms. He soon became an activist for the rights of colonials, first in South Africa and later in his native India.

The most remarkable aspect of Gandhi's campaign for Indian independence was his tactic of non-violent civil disobedience to protest British policies. If his followers did turn to violence, he would go on a hunger strike until the violence stopped. So great was his moral authority and the loyalty he inspired, that this tactic alone would consistently restore the peace.

earned him the nickname *Mahatma*, meaning "Great soul." It would also be the inspiration for the tactics Martin Luther King Jr. would use in his civil rights movement a decade later.

Gandhi also reverted to the much simpler Indian lifestyle, even spinning his own thread and weaving his own cloth as a tactic to free India from dependence on British manufactured products. To protest India's caste system and show that his revolution was equally for all Indians, he adopted a girl of the untouchable caste. In his efforts to demonstrate regard for all human life, Gandhi would tend to the sick, even lepers, who were thought to be especially unclean.

One of Gandhi's more memorable campaigns was the Dandi Salt in 1930 (below) as a protest against the British salt tax imposed on India. Gandhi and his followers marched 400 kilometers (240 miles) to the sea and evaporated some seawater to get its salt, daring British officials to arrest him for such a normally inconspicuous act.

Gandhi's tireless perseverance in his non-violent campaign finally paid off in 1947, when Britain finally granted India its independence. The sticking issue of whether there should be one unified India or two separate Hindu and Muslim states was resolved by partitioning the subcontinent into Hindu India and Muslim Pakistan.

"Great soul". Unfortunately, India paid a heavy price for its freedom when a Hindu, disgruntled over the partition of India, shot and killed Gandhi. Even in death, Gandhi was thinking of others, being relieved to find that a Hindu, not a Muslim, had shot him, since that would be less likely to renew violence between the two groups. His incredible strength and spirit in guiding India along a non-violent path to independence

124. THE DECLINE OF IMPERIAL CHINA (c.1800-1911)

Introduction. The 1800's were not kind to China. Whereas geographic and technological limitations had once kept China fairly isolated from the rest of the world, other forces, in particular the Industrial Revolution then sweeping Europe and America, were closing in to wrench China out of its self-imposed isolation. As in India, the British East Indies Company would lead this intrusion on China's privacy.

The Opium War and its aftermath (1839-64). In the early 1800's, China, by its own design, was still largely cut off from trade with the outside world. All trade with Europe was channeled through one port, Canton. Even there, Europeans could only trade through specially designated Chinese agents known as *co-hong*. Several Chinese products, such as silk and porcelain, were in high demand in Europe, but the most popular trade item in the early 1800's was tea, consumption of which increased by a factor of 50 times between 1720 and 180. Unfortunately, the tea trade led to a serious drain of silver from Britain. The British East India Company, desperate for something to offset this trade imbalance, found such a commodity in opium, which not only upset China's balance of trade, but the stability of its whole society.

Two other factors revolving around the differing philosophical outlooks of these two cultures added to the growing tensions. First of all, they had two very different attitudes toward trade. On the one hand, the Chinese government viewed trade as a monopoly controlled through its agents, in this case the *co-hong*. Up until the 1800's, this was not such a problem, since most Europeans traded under the mercantilist system that also exercised strong government controls. However, by the 1830's, the British were leading the way in the Industrial Revolution and were pushing for a free trade system known as *laissez faire* ("hands off") that would give their manufactured goods an edge against the more expensive handmade goods their foreign competition was producing. Secondly, there was the relative status of the two nations. The Chinese traditionally saw themselves as the Middle Kingdom and all other peoples as inferior barbarians. Any goods brought as gifts to the

Chinese court were interpreted as tribute that they may or may not graciously acknowledge. By contrast, the British had a strong democratic tradition that refused to recognize another nation's superiority.

The opium problem trapped China in an ever-worsening vicious cycle where the number of addicts each individual's need for opium kept rising. This drained more money out of China and triggered inflation, which landlords and the government met by raising taxes. The increased burden on the poor would drive more of them to turn to opium as an escape from their problems. Thus the scale of the opium problem would grow even more, and so on.

All these economic and philosophical tensions came to a head when the Chinese government had 20,000 chests of the British East India Company's opium burned. This threatened the tea trade, in which the British government had a vested interest, since it charged a 100% customs toll on tea coming into Britain. The result was the First Opium War (1839-42) between Britain and China. The British navy, with its modern weaponry, quickly and easily won a decisive victory. The resulting Treaty of Nanjing (1842) gave the British access to trade through five ports, control of Hong Kong, a huge indemnity from the Chinese government to cover the cost of the war, and abolition of the *co-hong* (merchant guild) system. It also forced China to accept other countries on equal terms, which was a terrible blow to its pride. Finally, the Chinese gentry now assumed the task of quelling any rebellions, which led to the buildup of regional warlords who would be a serious problem in years to come.

Britain's privileged status triggered a rush by other nations such as France, Russia, Germany and Japan to force China to grant similar treaties that gave three main concessions. First of all, they wanted *most favored nation status*, which automatically gave them all privileges that any other nation had from China. Second, they wanted *extraterritoriality*, which allowed their citizens to live under their own laws even when in China, thus making them virtually immune from Chinese justice. In fact, any cases involving a European and a Chinese person were to be tried under the European country's system. Finally, Europeans could recover any debts that the Chinese

government owed them by collecting China's customs dues and other taxes if the customs dues were not enough.

The First Opium War and its aftermath unleashed a vicious cycle that would eventually lead to the fall of the monarchy. China's decline would invite either a disastrous war or intervention in a revolt to push or preserve foreign interests. This would cause many Chinese to wake up to the need for reform. However, the Chinese hatred for foreign barbarian ways would trigger a conservative reaction against the reforms, leading to further decay, and so on. This cycle would repeat itself three times, being triggered by the Taiping Rebellion, war with Japan, and the Boxer Rebellion.

Two other factors would aggravate this cycle even further. For one thing, the introduction of new crops from the Americas and a well-regulated agriculture under the Ming Dynasty had caused China's population to expand to 400,000,000, putting a tremendous strain on China's ability to support itself. Secondly there was the government's recent failure to maintain the flood control projects, which had unleashed terrible floods and food shortages on China.

All of these factors triggered the Taiping Rebellion (1850-64), a peasant revolt started by a frustrated scholar, Hong Xiuchuan who claimed he was the brother of Jesus Christ. Hong inspired his followers with a revolutionary fervor that banned alcohol, tobacco, and drugs, held property in common, and called for the equality of all, including women. His movement swept over much of China before the government finally crushed it with foreign help. The Taiping rebellion was typical of any number of peasant revolts throughout Chinese history in its revolutionary and religious vision of a new world. It was also terribly destructive, probably killing even more people than World War I. Adding to China's misery during this chaos was the Second Opium War (1858-60). This war, fought with Britain and France for the flimsiest of reasons, saw the brutal sack of the Summer Palace in Peking by British colonial troops from India. It is from this event that the Bengali word "loot" entered our language.

Faced with these overwhelming problems from both within and without, a two-fold program of reform

emerged. On the one hand, Chinese scholars tried to revive and stress the old Confucian virtues. However, they also tried to adapt Western technology in order to control the Western "barbarians". This sparked serious debates about how feasible it was for China to be able to adapt Western technology while maintaining the purity of Chinese culture, for the Chinese still despised Western ways as barbaric. Whatever their doubts, reformers set up several factories producing such things as weapons, ammunition, steamships, and textiles. They built railroads and telegraph lines which peasants often tore down since they disrupted the natural harmony of the countryside. The Chinese government even bought one railroad and tore it up for such a reason.

However, several factors seriously limited the extent of China's modernization. In contrast to Japan, which was successfully industrializing in the late 1800's, there was no real central direction to coordinate these efforts. Rather, provincial officials on a local level did them. Also, the influx of Western "barbarians" created a good deal of bitterness against the West and a reluctance to conform to its ways. At the same time, they plunged China further into debt making it more difficult for the Chinese to fund any modernization programs.

Therefore, China saw little progress toward modernization, especially after the rise to power of the dowager empress, Cixi, who ran China's policies for her weak son and nephew (1875-1908). Cixi especially resisted foreign influence and modernization, preferring to spend money on her palace and lavish lifestyle. As a result, by the 1890's, China was more vulnerable than ever to foreign powers carving out spheres of influence. Under this system, the dominant power in that sphere controlled the economy through such things as collecting taxes and constructing railroads and telegraph wires, while still leaving administrative duties and expenses to local Chinese officials. This allowed the various powers to drain China of money without having to assume the more burdensome responsibilities of government.

However, what really shook China out of its lethargy was a war with Japan, which had successfully modernized in reaction to the West over the past 40 years. This clash, known as the

Sino-Japanese War (1894-5) was fought over control of Korea. To everyone's shock, the Japanese navy soundly defeated the Chinese navy and claimed Korea, Taiwan, and a huge indemnity as the price of victory.

Such a humiliating defeat sparked a new movement among Chinese scholars for widespread reforms. This movement was popularly referred to as the Hundred Days Reform because the dowager empress, Cixi, quickly squelched it. As a result, China's problems continued mounting until they triggered another revolt, the Boxer Rebellion (1898-1900). The rebels, fighting under the banner of the Righteous and Harmonious Fists, believed they had magical powers to resist enemy bullets. While their revolt was initially aimed against the government, the empress skillfully turned it against foreign influence. The result was a siege of the foreign embassies in Beijing that was finally broken up by an international force led by the Japanese. Such intervention was not without its price, as China was forced to pay a heavy indemnity for all the recent troubles to the foreign powers, who now installed troops to protect their diplomatic missions.

The renewed humiliation caused by the Boxer Rebellion revived calls for reforms, this time with more success. Between 1900 and 1910, more modern ministries were formed, the old Confucian based civil service exams were abolished, provincial assemblies with the semblance of democracy were established, and a new law code was introduced. More modern schools were set up, while many young Chinese students studied abroad in the West, both of which spread the Western ideas of democracy and nationalism among Chinese intellectuals. Unfortunately, such reforms only raised expectations of more reforms, and a revolution in 1911 overthrew the monarchy and established a republic in its place. However, China's problems were far from over. Almost from the start, the new republic was doomed by the lack of a healthy economy and educated middle class, elements necessary to sustain any strong democracy. As a result, the next 40 years would see China embroiled in two world wars, civil war, and revolution.

China's Sorrow: The Yellow River

To understand China's history, one needs to understand its traditionally autocratic government and the need for massive flood control projects to contain the Yellow River, around which Chinese civilization was born. The main problem has been silting from windblown steppe soil known as loess that fills the riverbed. The response to this has been to build levees to contain the river. However, over the centuries, the riverbed achieved heights up to 10 meters above the surrounding flood plain, precariously held in by levees that were 20 meters high. They were disasters waiting to happen.

One such disaster took place in 1887 when unusually heavy melting snow and spring rains broke the levees and killed thousands from flooding and an estimated 1 million more in the resulting famine.

In 1931, another flood killed between 850,000 and 4,000,000 people, making it the single worst natural disaster in history. Two years later, another flood killed 20,000 more.

And in 1938, the Huang He's levees were dynamited to slow the progress of the Japanese army.

Between 1887 and 1943, drowning, flooding and disease triggered by the Yellow River's floods, claimed an estimated 10 million lives.

No wonder the Yellow River is called China's Sorrow.

Some popular beliefs and practices in Southern China

While most Chinese were Buddhists, they also worshipped a multitude of gods, ghosts and spirits of ancestors and observed a variety of festivals throughout the year. Beliefs would also vary from region to region. Below are some of the common beliefs and practices found in southern China.

For the summer solstice, the Chinese would eat dog meat to ward off malaria. For the winter solstice they would prepare a broth of meat, peaches, and mustard greens to ward off other diseases and also eat dried fish in bulk for good luck. At the end of the sixth lunar month, they carefully watched for signs from Pengzu, China's longest living patriarch, to predict the weather for the coming year.

To gain the Jade emperor's protection they burned bamboo models of houses, stayed awake all night, hung strings of oranges before their doors, and carved peachwood charms for the gods of the gate. Speaking of peaches, their red color was believed to protect against evil, so people would hang red strips of paper from their doors in the absence of peaches. Peach twigs, any crude paintings of tigers, and infants wearing "tiger hats" were used for exorcism and to protect houses from harm.

To greet the mid autumn moon, people would make three kinds of mooncakes (goosefat, hardskin and softskin) ranging from sweet to salty, decorated with colorful pictures of people and animals, which they ate as they hoisted lanterns to greet the moon in the hopes of early marriage and many children. To keep cold winds away, they would eat boiled noodles in ritual vessels.

Roosters were seen as a symbol of universal life, being associated with the sun (thus their crowing) and dispelling disease. Freshly sacrificed roosters were used to guard against demons, except at the new year when a live

rooster was needed to guard against demons escaping from a tiger's jaws.

The Jade Record was a set of books sent to earth by the supreme god after Yan Luo, clarifying what punishments go with what sins in hell and what good deeds could escape them. Those who copy and pass on the Jade Record will avoid the worst punishments of hell and be reincarnated as humans. If really good, men would be reincarnated as higher beings and women as men. Those ignoring, defacing or mocking them will have to go to the lowest depths of hell and pass through all ten hellish palaces before being reincarnated as lower beings such as insects, snakes, or pigeons.

For example, in the first hall, the "Mirror of Reflection," the dead see their own sins, such as committing suicide without good reason, weak faith in the Buddha, stealing, cheating, gambling, drinking, killing live creatures or slaves, drowning baby girls, etc. After the 10th Hall, one went through the Tower of Forgetfulness to forget all previous incarnations before being reincarnated.

The Qing Dynasty tried to suppress the Jade Record because the official state creed, Confucianism, discouraged speculation on the afterlife. Similarly, Hong Xiuchuan banned it when he came to power.

Canton, Co-Hong, and Pidgin Talk

Guangzhou (Canton) was the one port of access for foreigners wanting to trade with China. In addition to various countries' trading facilities and factories, the British East Indies Company's had a garden and terrace considered by other foreign merchants as the port's most elegant spot.

The co-hong were a group of only thirteen Chinese officials who had exclusive rights of trade with foreigners in Guangzhou. Afraid the foreigners would corrupt the Chinese people, it was forbidden, under pain of death, to even teach Westerners the Chinese language. One teacher of Chinese went disguised as a shoemaker and carried poison he would take if caught.

Pidgin was a patois (linguistic mixture or mishmash) of Portuguese, English, and various Chinese dialects that developed from extended trade contacts in the port city of Canton.

The most popularly known adaptations were to transpose the r to l, b to p, and d to j. Therefore, business became pidgin. Thus Pidgin English meant business English (i.e., the language for trade).

Several other examples were:

- Portuguese deos (God) became joss; and religious service was joss pidgin.
- Sex was lof pidgin (love business)
- Chop was document, so chop chop meant urgent document or just urgent.
- Portuguese mandar (command) became man-ta-le (commander or boss)
- Putting ee after dental consonants turned want into wantee and catch into catchee.
- Lac meant 100,000 from the Hindi word for 1000.

A typical sentence in Pidgin might be: “Man-ta-le sendee one piece chop. He come tomollo. Wantee too-lac dollar” meaning: A senior Chinese official is coming to demand a sizable bribe.

The First Opium War (1839-1842)

British ships demolish the Chinese fleet in the First Opium War

The problem Europeans had trading with China was that it didn't want anything the Europeans made while such Chinese goods as silk, porcelain, and tea were in high demand in the West. The only things China would take in trade from foreigners were furs and silver. As a result, some species of seals were nearly driven to extinction. Meanwhile, between 1760 and 1790, Chinese silver imports grew from 3 million to 16 million ounces. Europeans needed something to restore the balance of trade. They found it in opium.

Opium was not a part of Chinese culture until Europeans brought it in starting in 1650. Although China banned it in 1729, smuggling continued, so China reaffirmed the ban in 1799, but to no avail.

Singapore. The British were relatively latecomers to the opium trade, not getting involved until 1819 with the foundation of Singapore (above), which gave them a base closer to China that also controlled trade from the southern tip of the Malay Peninsula. It rapidly grew into one of East Asia's great ports despite the fact that 200 people were eaten by tigers each year. In 1823, Singapore was opened for free trade to all nations, which led to an influx of immigrants that drew trade away from Dutch Indonesia. Its rapid growth at one point created a 15:1 ratio of men to women. In 1946 it was recognized as a Crown Colony and given its independence.

Red Rover, the first British opium ship, arrived in China in 1820. Since opium had been illegal since 1729, the British traded it offshore to corrupt Chinese officials, so they weren't technically guilty of smuggling it into China. Americans also got involved, smuggling lower quality opium that they had bought in Turkey.

History's first international drug cartel is how one could describe the British East Indies Company's opium trade in China. Between 1820 and 1830, the number of chests of opium smuggled in went from 9,708 to 35,445 with each chest worth \$2,000 (not adjusted for inflation). In 1833 the British government ended the

BEIC's Canton monopoly, allowing private merchants to enter the opium trade. In 1838, there were 40,000 chests smuggled in. By then the BEIC had forcibly converted 400,000 acres of land in India from growing cotton to growing opium, which also helped reduce Britain's trade deficit.

By 1835, the number of opium addicts in China was estimated between 4-12 million, including the whole army and many bureaucrats. Chinese addicts were spending two and a half times as much on opium as the entire government budget. By 1837 the opium trade represented 57% of China's imports.

In 1838 the emperor cracked down on addicts, seriously reducing the market and driving opium prices down. Up to 2,000 addicts were thrown in jails and forced to suffer sudden withdrawal, the effects of which were vomiting, cramps, excruciating headaches, nightmares, uncontrollable weeping, nervousness, anger, and paranoia. Many died from this experience.

In 1839 the emperor appointed a rising civil servant, Lin Tse-shu as special high commissioner with extensive powers to stop the opium trade. Lin after researching the trade, the Chinese merchants involved in the trade, opium's effects on users, and even treatments for addicts, arrested 1600 people, confiscated 11,000 pounds of the drug from Chinese merchants, and even wrote a letter to Queen Victoria demanding an end to the Opium traffic.

When that didn't work, Lin confiscated and burned 20,283 chests of opium, costing the British \$40 million. When he refused British demands for compensation and changes in how China dealt with them, British ships launched an

attack to force China to reinstate the opium trade.

The First Opium War was on.

A combination of superior armaments and the addiction of most of the Chinese army led to a quick and easy victory for the British who started with 16 warships and were reinforced by 31 more from India.

When the British government agreed to a ceasefire and treaty, public back home was so outraged at its easy terms they sent a new expeditionary force with 10,000 men to extort better terms. After demolishing coastal defenses (some dating from the Ming Dynasty), shelling several Chinese cities, seizing several ports, including Shanghai, and besieging Nanjing, the Chinese again agreed to peace.

The resulting Treaty of Nanjing (1842) imposed several humiliating terms on China:

- It abolished the Co-hong and Chinese monopolies on foreign trade.
- It opened 5 new ports to British trade: Amoy, Foochow, Ningpo, Xiamen, & Shanghai,
- Import duties were reduced from 65% to 5%.
- Br. could also lease or buy special zones called Concessions, which amounted to virtual spheres of influence where they could collect money and influence policies without taking responsibility for administering or defending its provinces. As a result, the Chinese gentry now assumed the task of quelling any rebellions, which led to the buildup of regional warlords who would be a serious problem in years to come.
- Britain was also awarded a \$21 million ounce silver indemnity to cover the cost of the war and could collect Chinese customs dues to get it.
- Finally, it forced China to accept other countries on equal terms, which was a terrible blow to its pride.

As a result of Britain's expanded trade leverage, tea exports more than quintupled, while silk exports went from 2,000 bales in 1843 to 56,000

in 1855. Because of the lucrative market, many Chinese farmers switched from growing food to raising silk and tea, which further aggravated China's hunger problems while triggering even higher food prices. At the same time, imports from Britain's rapidly expanding textile industry were undercutting China's own textile industries.

The Taiping Rebellion (1850-64)

The Taiping Rebellion was led by Hong Xiuchuan (above) who, after failing the civil service exam several times, fell ill in 1836 and recovered with a somewhat altered personality. He claimed he had a vision (below) that he was the younger brother of Jesus and that an old man in a palace gave him a sword to purge China of the foreign Manchu devils.

Hong believed Confucianism, Taoism, and Buddhism were false teachings of the Devil and that God defeated Confucius in Heaven. Ironically, Jesus wanted Hong to pass the civil service exam that was based on Confucianism and was angry when Hong failed it. Luckily, Jesus' wife softened Jesus' anger for his failure.

Hong's movement in the 1840s grew into full-scale rebellion against the Manchus in 1850. In 1851, after a major victory, he declared himself "Heavenly King" (Tianwang) of a new dynasty, the "Heavenly Kingdom of Great Peace".

Revolution and turmoil spread especially throughout South and Central China where opium addiction was the worst. In reaction against the Manchus who made the Chinese wear pigtails as a sign of submission, the Taiping rebels were instructed to grow their hair long and tie it with a red cloth, leading to the nickname "long haired bandits". They also smashed non-Christian images.

Western mercenary captains trained many Chinese troops, but mainly for local warlords rather than the imperial government. This contributed to the later rise of Chinese warlords and corresponding chaos in the country.

According to some sources, as his palace was being stormed by government forces, Hong swallowed gold leaf (an imperial form of suicide) while several of his wives also killed themselves. By the time the revolt was finally put down, 20-30 million people had died and 600 cities had been destroyed. Meanwhile, America's bloodiest conflict, the Civil War, being fought at the same time, killed 600,000.

The Second Opium War (1858-60)

Adding to China's misery during this chaos was the Second Opium War (1858-60), caused by China's refusal to meet several British demands: renegotiate the Treaty of Nanjing, legalize opium, allow a British ambassador at Beijing, suppress piracy, and release 12 British sailors from the Arrow, a ship flying the British flag but also allegedly involved in piracy. France joined Britain by officially declaring war, while Russia, and the United States were involved to a lesser extent.

The capture of Guangzhou and Tientsin led to the Treaty of Tientsin (1858), giving the British and French the rights to buy land and travel freely in China, guaranteeing Christian missionaries' freedom to actively recruit converts, opening eleven more ports and China's interior to trade, charging indemnities, lowering tariffs, exempting foreign goods from transit taxes, and stipulating foreigners no longer be called "barbarians".

However, that apparently wasn't enough and fighting resumed in 1859 when China refused to instate a British ambassador in Beijing. British and Indian troops sacked the Summer Palace for three days, thus adding the Bengali word loot to our language. China's surrender in 1860 led to the Convention of Peking which opened Tianjin as a port, ceded the port of Kowloon to Britain, established freedom of religion in China, let British ships take indentured Chinese to the Americas, charged another indemnity payable to France and Britain and recognized the legality of the Opium trade.

China and Russia. A parallel Treaty of Aigun with Russia reversed the Treaty of Nerchinsk (1689) and gave Russia lands in the north along the Amur River. This source of tensions would fester for a century and flare up again in 1969, nearly leading to an all-out war between the two countries. American intelligence at the time estimated the chances of such a war going nuclear at one in three.

The Clash of Cultures

The cartoon above satirizes the Chinese as superstitious fools for fearing the modernizing impact of railroads. In fact, Chinese attitudes were probably driven more by reverence for nature than fear of technology. For example, they bought a British-built railroad and tore it up, not out of fear, but to keep it from disrupting the natural harmony of the countryside.

Camera shy. One bit of Western technology that especially frightened the Chinese (and people in other traditional cultures as well) was the camera. After all, how does one explain how your image got on that paper, and is it just your image, or also your soul they have captured? Aggravating such fears were rumors that

Westerners were kidnapping Chinese children and stealing their eyes for the camera lenses.

Attempts to modernize did take place, but only sporadically and on a local scale. One example was Li Hong Zhang who modernized his province with a steam navigation company (1872), a coal mine (1877), a telegraph network (1879), a cotton spinning factory (1882), and a cotton mill (1890). A few other provincial officials also modernized, one building an ironworks at Quhan (1850). However, resistance against railroads delayed the first track being laid in China until 1880. By 1894, there were only 195 miles of track in all of China.

Below: Hiram Maxim (far rt.) demonstrates for the Chinese the use of his machine gun for more efficient harvesting of trees. This was probably one of the less successful uses of technology.

The Boxer Rebellion (1898-1900)

The Boxer Rebellion was especially aimed against Christian influence in China, calling it the "pig-goat" religion and Christian prayers the "squeak of the celestial hog". While mostly careful of foreign clergy, they slaughtered 32,000 Chinese Christians.

Boxers also held the Forbidden City under siege for 55 days before an international force of 16,000 soldiers raised the siege and rescued the foreigners trapped inside. Although only 76 foreign soldiers and 6 children were killed, they massacred thousands of Chinese men in the capital in retaliation,

"The Hun." Kaiser Wilhelm II of Germany had a phenomenal talent for putting his foot in his mouth, as shown as he was seeing off German soldiers to relieve the foreigners trapped by the Boxers in the Forbidden City. As they departed

for China Wilhelm exonerated his men to fight fiercely like the Huns, Asiatic nomads notorious for their savagery. Unfortunately for Germany, the name stuck and Germans were referred to by their enemies in World War I as Huns to emphasize their barbarity.

125. THE EMERGENCE OF MODERN JAPAN (1868-1937)

"Rich country, strong army"--Meiji motto

Decline of the Tokugawa Shogunate. In the early 1800's the peace and stability of Tokugawa rule came unraveled, leading to a period of turmoil and then restructuring from which a modernized and revitalized Japan would emerge. Several forces combined to generate these changes. First, 200 years of peace and being disarmed by the Tokugawa government undermined the power and even the reason for the existence of the Samurai. Second, the encroachment of the British into China and the ensuing Opium Wars led many Japanese to worry about the threat of encroachment on their shores and the ability of the Shogunate to deal with it. Finally, a series of bad harvests in the 1830's triggered inflation, disease, and unrest in Japan. The result of these various forces was a struggle between traditional isolationists who wanted to keep Japan cut off from the outside world and reformers who wanted to open it to the West and institute reforms to shore up the declining shogunate.

However, before Japan could come to a firm policy one way or another, the West intervened to decide the issue. The United States, by taking California in the Mexican War (1846-8), had become a Pacific power practically overnight. In 1853, a flotilla of American warships commanded by Commodore Perry delivered a conciliatory letter from the president to the Japanese head of state and a more belligerent letter written by Perry himself. The gist of Perry's message was that Japan had better open its doors to the West or the United States would kick down those doors and force Japan to trade.

The Tokugawa Shogunate, seeing Japan was no match for the United States, capitulated when Perry returned the next year. The immediate results for Japan, and especially its government, were disastrous. With the Americans came an influx of Mexican silver, which triggered more inflation. A cholera epidemic also hit at this time. These, plus the humiliation this situation brought to the Tokugawa Shogunate, caused its fall in 1868.

The Meiji Restoration (1868-c.1890). Replacing the shogunate was the restored imperial court under the emperor Matsuhito, called Meiji ("enlightened

rule"). The Meiji regime would oversee the transformation of Japan from a largely feudal and agrarian state into a powerful industrial nation. This is often seen as a reaction to and imitation of industrial state building in Western Europe, in particular that of Germany. While this is partially true, Japan during the Tokugawa period had developed in ways that prepared it for the Meiji reforms. For one thing, the Tokugawa Shogunate had maintained a unified Japan for over 200 years, thus helping create a Japanese nation. Also, during this time a strong middle class had evolved along with the financial techniques needed to adapt to industrial capitalism.

As a result, Japan was able to make the transition to an industrial nation state while maintaining its own unique Japanese values of loyalty to the group and the emperor. For example, the Japanese corporation that evolved during this period can largely be seen as an updated version of the paternalistic feudal state, where the workers (peasants) owe lifelong loyalty and service to the company (lord) in return for its protection of their welfare. Japan's transformation into a major power can be seen as taking place in three successive stages: political and social reforms, industrial and military reforms, and early expansion.

Japan went through several Western-style political and social reforms to create the conditions conducive to industrial and military modernization while maintaining a distinctive Japanese character. In order to destroy Japan's feudal structure, the Meiji government replaced Japan's old provinces with seventy-two modern districts. As in the West, all class distinctions were abolished. This especially hurt the Samurai who now were even forbidden to wear their swords or distinctive hairdos. Public education became mandatory for all boys and girls in order to create an educated work force and instill a spirit of nationalism in them. A European style parliament was formed, but like its German model, it had little real power. The emperor kept his exalted position while Shinto was made the state religion, both of these providing points of focus for Japanese national loyalty.

With the political and social reforms in place, the Meiji government proceeded to industrialize Japan, concentrating on heavy and strategic industries: railroads, the merchant marine, mining, modern

agricultural techniques, munitions, and the navy. However, Japan had no large-scale capitalists. Therefore, the government, in keeping with Japan's paternalistic tradition, paid for these industries and then sold them at low cost to a few private investors. These new capitalists, called the Zaibatsu ("money clique"), would come to control 70% of Japan's bank deposits and heavily influence government policies, much as the daimyo (feudal lords) had done in previous times. Thus began the long-time alliance of government and big business, which is still a predominant feature of Japan today. One other reform was that of the military. In 1873 the government began universal conscription, which deprived the Samurai of their privileged position as *the* warrior class. This triggered a Samurai revolt. Surprisingly, the conscripts fought well and crushed the revolt, thus destroying the samurai's aura of invincibility.

Japan's quest for empire. By 1890, Japan had largely industrialized and was ready to look outward to protect what it saw as its interests. In a series of three conflicts, the Sino-Japanese War, the Russo-Japanese War, and World War I, Japan emerged as a major power. Its first concern was Korea, the closest part of the Asian mainland to Japan and which Japan had claimed since the 1500's. The other primary contender for control of Korea was China to the north. In the ensuing war, known as the Sino-Japanese War (1894-5), Japan's modernized army made short work of the outdated Chinese forces, taking Taiwan and establishing its influence over Korea. In addition, this further weakened China's government and helped lead to a revolution in 1911 and eventually to the Communist revolution and victory in 1949.

More shocking was Japan's unlikely victory over the Russian army and navy in the Russo-Japanese War (1903-5). This gave Japan the Liaotang Peninsula and even tighter influence over Korea, which it finally annexed in 1910. It also triggered a revolution in Russia, which, although unsuccessful, helped lead to the Russian Revolution of 1917, and the triumph of the Communists there.

During World War I Japan declared war on Germany, easily taking its possessions in East Asia. However, China, also on the allied side in the war, had claims over those territories. Japan emerged the winner in this dispute, so that by 1919 it had

control of Korea, Taiwan, and the Liaotung Peninsula. Not surprisingly, relations with China continued to deteriorate.

In the 1930's two things made those relations much worse. One was Japan's burgeoning population that forced it to import food. The other was the Great Depression, which cut Japan's trade and its ability to pay for that imported food. This led to growing military influence, violence, and instability in the Japanese government. In 1931, Japan seized control of Manchuria from China. The Western powers, mired in their problems with the Depression, were unable to help China. Throughout the 1930's, military control of the Japanese government tightened. In 1937, that military government invaded China, thus starting World War II in Asia.

Perry's Alien Invasion

A Japanese print showing one of Perry's ships in Tokyo harbor portrays it as a dark ominous presence, much like the alien spaceships in the movie *Independence Day* that nearly blot out the sky. One would think that after all the *Godzilla* attacks Japan has suffered, it would hardly be impressed by a steamship.

The alien ships were commanded by Commodore Matthew Perry who delivered both a conciliatory letter from President Fillmore asking for trade and a much more threatening letter of his own saying he would return next year with more warships for Japan's answer. In 1854 he indeed returned with eight warships and Japan, seeing no alternative, agreed to trade with the U.S.

Techno-geeks. Along with the threat of brute force, Perry also impressed the Japanese with an array of "American" inventions: the steamship, the Colt repeating revolver, the camera (despite the belief that anyone being photographed would die in three years), the telegraph, and the

railroad. For the latter, he brought a one-quarter scale working locomotive and a circular track. Since the Japanese officials were too big to fit inside the locomotive and train cars, they rode on top, looking like a bunch of overgrown children joyously riding a kiddie ride at the carnival, their officials' robes flying in the breeze.

Meiji Tokyo

Edo, the old Tokugawa capital was renamed Tokyo ("Eastern Capital") would become one of the premier cities of the world. At first its population plummeted, as the samurai, who had been required by the shoguns to live there half the time, now left. However, it gradually recovered as the end of isolation sparked industry and drew in foreign trade. By 1910 Tokyo's population was up to 1.8 million.

Not only that, but the nature of Tokyo had been rapidly transformed into that of a modern Western city, with railways, electric tramways, and electric, telephone, and telegraph wires interlaced across the city. Architects, notably the Englishman, Thomas Waters, were commissioned to transform the public face of the city. Thus in the 1870s, a modern business district, the Ginza (above), sprang up with a thousand buildings of cement-faced brick replacing the older ones of wood, along with a Western style newspaper, the Choya News Company, and the Rokumeikan, built in 1883 to entertain foreign diplomats.

As the English authors of Marray's Handbook for the Travellers in Japan (1907) put it: "The two-sworded men have disappeared, the palanquin has given place to the jinriki, and foreign dress has been very generally adopted by the male population."

However, as always, the Japanese put their own distinctive touch on this urban landscape, the rickshaw, invented around 1870 as a convenient form of wheeled transport that could navigate another feature of modern living: gridlock. Ironically, the rickshaw would become the stereotypical symbol of Western exploitation instead of Japanese ingenuity.

As the English authors of Marray's Handbook for the Travellers in Japan (1907) put it: "*The two-sworded men have disappeared, the palanquin has given place to the jinriki, and foreign dress has been very generally adopted by the male population.*"

Below: A model of the Choya News Company office, a popular liberal paper started in 1870

The Real Last Samurai

The real last Samurai was not Tom Cruise, nor even the American, Nathan Algren, who was a fictional character. In fact, believe it or not, he was Japanese. The most commonly cited candidate for the honor was Saigo Takamori (above), on whom Katsumoto, the rebel leader in *The Last Samurai*, is loosely based. Takamori was indeed a high-ranking member of the Satsuma clan, which led the rebellion against the Meiji government.

However, the real history, as usual, was more complicated than the movie, *The Last Samurai*, which conflated into a few months and people the events and a process that took decades.

For one thing, most of the Westerners involved in helping Japan's military modernize were Europeans: French, Italians, and especially Germans, such as those pictured below with Japanese officers they helped train (c.1875).

Secondly, not all samurai opposed modernization, in particular at first. Some, such as the two pictured on the right initially joined the imperial forces to crush rebelling samurai in a civil conflict known as the Boshin War.

However, as more decrees were passed infringing on Samurai rights and privileges, such as the right to carry swords in public and wear the distinctive top knot (known as the Chonmage), samurai resistance stiffened, especially around the leadership of the Satsuma clan.

Bit by bit, the imperial army of some 300,000 men whittled down the Samurai forces from 30,000 to 400 the time of the Battle of Shiroyama, shown as the climatic event in the film. The battle happened much as shown. The samurai charged the much more numerous infantry, hoping to engage them in close order combat where they would have the advantage. However, as the film also showed, their ranks were shredded by gunfire, the last 40 of them by Gatling guns. So that part of the film was accurate.

Japanese Bayonets. While in the West, the bayonet (invented c.1670) was convenient replacement for the common infantry pike, in Japan it assumed greater cultural significance. Since Toyotomi Hideyoshi's Great Sword Hunt, only Samurai had been allowed to carry swords or any kind of edged weapon. Therefore, when Japan modernized its army and equipped its infantry with bayonets to go along with their rifles, it was considered a great honor by the common soldiers to be allowed to once again carry edged weapons.

THE SECRET HISTORY OF THE NORTH POLE

“If events in history are like so many pebbles in a pond, then I’m an avalanche” – Santa Claus

To paraphrase Shakespeare, Santa Claus “doth bestride our times like a colossus”—both literally and figuratively. No single man so dominates a season of the year (from Labor Day to Super Bowl Sunday) like he does. Disregarding what we tell our children, disregarding the two Wars of the Elves which triggered two world wars, disregarding the Great Depression (which he caused), and even disregarding the worldwide flu epidemic of 1919 (which he had nothing to do with), there still is no one who has done so much to ruin such a joyous holiday and turn it into the debt-ridden agony of materialistic overindulgence it has become. Maybe that is why we love him so much.

Geopolitics of the North Pole. The physical environment has always strongly influenced the flow of history, and the North Pole is no exception. For one thing, the North Pole’s cold climate severely reduced the need for refrigerators, which have an unfortunate tendency to fall on top of and kill people. This allowed the Eskimo population to flourish. The money saved from not buying refrigerators could be used to buy guns, a favorite Eskimo pastime, which makes them very dangerous. Also the long winter nights at the North Pole forced the Eskimos to trade light bulbs to the South Pole for extra light trapped by the Antarctic land mass during its equally long stretches of daylight. This also accounts for the fact that light bulbs resemble penguins.)

The North Pole’s position on the International Dateline gave it Christmas twice per year (December 11 and March 3). This inappropriate since the North Pole also has most of the world’s green crude toy ore deposits. Teddy Roosevelt once described a lump of this ore as resembling “a gang of Gumby’s trapped for three hours in a microwave oven,” a remarkable statement since he died decades before microwaves, Gumby, or even accurate time-keeping were invented. The point here is that toy ore needs to be mined and worked. Unfortunately, the one available labor source, Eskimos, refused to work in the mines, preferring

either to hibernate or shoot their guns at any thing that moves or snores.

During the Industrial Revolution in the 1800s when large scale toy mining and processing was taking place, the next closest source of labor for the North Pole toy mines was Canadian Elves who had formed the last wave of migrants from Siberia to America. Central Asia was their ancestral homeland, but in the late 1100s a chain reaction of events starting in Finland displaced them. Finland, of course, was the homeland of the Clowns who, contrary to popular belief, are a highly evolved subspecies of *Homo Sapiens Sapiens* (i.e., me). In addition to such natural features as their large red noses, shocks of brightly colored hair (to attract mates), and big floppy feet, Clowns are also endowed with brilliant minds and superhuman strength. Despite our desire to portray them as good natured and harmless circus performers, they are extremely dangerous. In 1180 their relentless leader, Jingles the Merciless (1178-1213) forcibly unified the Clowns and launched a campaign of conquest unparalleled in both its brutality and physical comedy. Using such unspeakable weapons as seltzer bottles loaded with Greek fire similar to our modern napalm), and catapults firing giant cyanide cream pies, the Clowns carved out a savage empire stretching from Finland to Vladivostok. The Empire of the Bozos (from the clown word meaning “pie throwing maniacs” even handed Genghis Khan’s Mongol Horde a humiliating defeat. The Mongols in turn crashed into the Elves, half of whom fled into Siberia, the other half to North America, where they lived peacefully until the 1800s.

Elves were well suited to toy mining for several reasons. They don’t eat much. They are small and thus easy to push around. And they have big ears that let them hear any stalking killer penguins, a particularly large and vicious type of penguin that inhabits caves, and toy mineshafts. All that was needed was someone to lead the Eskimos in raids to capture the Elves. That someone was St. Nicholas (AKA Santa Claus).

St Nicholas the thirty-eighth son of an impoverished chimney sweep, was born in Norway around 1850. Large size, both in terms of numbers and bulk, was a family trait. His ancestors had been a special

class of Viking berserkers (from the Clown word *Bozo*) who would jump on enemy ships and tip them over with their weight. How he came to be known as a saint is not completely clear, although most accounts revolve around him visiting Rome as a youth and kidnapping the Pope and forcibly extracting the honor from him.

Because of his size, Nicholas (and the rest of his family, for that matter) were ill suited for chimney sweeping, so it remains a mystery why that was traditionally the family profession. In fact, in 1877, young Nicholas got caught in a chimney, a sight that attracted a large crowd of spectators. His solution was both ingenious and lethal. By eating huge amounts of food, his body mass expanded to the point that the chimney exploded, killing 37 people in what has been known ever after as the great chimney massacre. Nicholas was committed to an insane asylum, not just for the killing, but also for thinking he could fit in a chimney in the first place. Soon afterward, he jumped a guard, flattened him, and fled to the North Pole.

The Eskimos made St. Nicholas their leader after he mowed five of them down in a gunfight and promised the rest vacations in Florida. (He actually sent them to Cleveland, but they didn't know the difference.) Then, from 1882-85 he launched a series of savage raids into Saskatchewan ("Land of the Big Ears") where he rounded Elves for working in his toy mines. It was at this time that the Elves gave him the name Santa Claus, most likely a Cheyenne word meaning "fat man with a whip".

But a new problem arose: Canadian Elves may not eat much, but they are picky eaters who require the finest of French cuisine. With Elves dropping like flies from self-starvation, Santa launched a new set of raids, this time into Quebec to get French chefs (1889-92). Meanwhile the United States had been watching events with growing concern and in 1900 invoked the Monroe Doctrine against the "Norwegian Nemesis" as the press called Santa. (Contrary to popular belief, the Monroe Doctrine didn't get its name from US President Monroe. Rather, it was the maiden name of Santa's wife.) What ensued was the First War of the Elves (1900-01).

Although it seemed to most that the United States should win an easy victory, Santa's terrible arsenal of "toys" (typically known as toys of Mass Destruction, or TMD) gave him a decisive edge. For one thing, the Eskimos had harnessed and trained killer penguins to use spiked clubs and fight in packs. In addition, there was Santa's alliance with the Clowns who had been on the run since the breakup of the Empire of the Bozos in the 1600s. Because Santa himself was 1/16th clown, the Clowns elected him Grand High Bozo and followed him into battle with all the ferocious defiance of death known to their kind. In addition to their catapults throwing giant cyanide cream pies, seltzer bottles that shot Greek Fire (the Clowns deployed their newly developed tiny tricycles armed with Martian death beams. Last and most decisive, was Santa's domestication of the flying reindeer who, when hitched to the heavily armed D-1 combat and Delivery Sleigh, proved to be the ultimate weapon of the day.

Early attempts to domesticate the flying reindeer met with limited success. Elf trainers first tried to ride their backs, but were too small to see over the antlers. Next they sat on the reindeer's head and tried to steer them using the antlers as a sort of handlebars. However, the elves' tiny feet dangling down blinded the reindeer, causing them to crash into trees (a most puzzling phenomenon to historians, since there are no trees at the North Pole). Finally, the elves tried hitching the reindeer up to a sleigh, and the S-1 Combat and Delivery Sleigh was born. Given Santa's weight and the heavy arsenal of toys such sleighs had to bear, teams of eight tiny reindeer had to be used for each sleigh. Although its turning radius was extremely wide, the S-1 was lightning quick (literally) and more than a match for the hydrogen-filled zeppelins the Americans used against them.

The American army marched northward, totally unaware of the disaster about to befall them. Suddenly, hundreds of Elf-driven sleighs swooped out of the skies, pouring bombs and razor sharp candy canes on the bewildered and stunned Americans. Then a merciless barrage of cyanide cream pies sent them retreating into hordes of killer penguins who had infiltrated their ranks disguised as household servants.

The First War of the Elves was such a total and unexpected defeat for the United States that American history books never mention it. However, the Americans being a resilient lot, were determined to get revenge. First they developed the airplane in 1903 to combat the flying reindeer. Then in 1914, they cleverly manipulated events in Europe to start World War I, merely as a testing ground for the airplane's combat capabilities.

In 1926 the United States invoked a toy embargo against Santa to provoke him into war. The resulting Second War of the Elves (1927-8) reversed the decision of the first war. The airplane proved to be much more maneuverable and easier to mass-produce than the slowly reproducing flying reindeer. Fake Santa's put in Canadian shopping malls confused the Elves and disrupted Santa's command structure by giving absurd orders that the elves mindlessly obeyed. Finally, the Americans cleverly planted peppermint candy canes in the Elves' rations, giving them terrible tummy aches that making them cry.

The victors forced the harsh Treaty of the Tundra on Santa in 1929. Santa could keep his toy mines and slave empire, but his air force was reduced to one sleigh and his eight smallest reindeer (a clause he flagrantly violated). He must also pay a crippling indemnity of free toys each Christmas to all the good children in the world. In the famous "Big Top Clause", the Clowns were dispersed to circuses across the world and forced to do cruel parodies of themselves while their families were held hostage in nearby trailers. Two of these Clowns, Ronald the Ripper and Rambo MacDonald, escaped with some wild dogs from a circus in southern California and started a well known hamburger chain.

The Treaty of the Tundra had far-reaching and unforeseen effects. In order to meet his huge toy payments, Santa called in his loans from Swiss Banks, and act that reverberated across the Atlantic by triggering the Stock Market Crash and Great Depression. By 1934, most toy mines and refineries had shut down, throwing Christmas into a crisis. Santa's response was swift and effective. First of all, he spread rumors that he did not exist, thus pressuring parents to buy toys to keep their children happy. Secondly, he met with American

business and signed the "November Contract, which established the practice of "shopping days early" starting right after Thanksgiving. These measures spurred toy sales and increased profits to vastly exceed the cost of Santa's toy indemnity each Christmas. Santa was back in business, and the world started to emerge from the Depression.

Then came World War II (1939-45), started by Adolf Hitler who had been a very naughty boy, only getting coal in his stocking each Christmas. Among his victims was Santa's native land of Norway, which caused Santa to shift from toy production to that of weapons. It was probably the most decisive development of the war and would have a profound effect on the direction of toy production after 1945.

With the war over, Santa's profits skyrocketed to new heights. The terms of the November Contract successively expanded the Christmas season to Halloween (the October Contract in 1973), Labor Day (the September Contract in 1984) and Super Bowl Sunday (the January Contract in 1987). Negotiations are now underway to extend it further to Valentine's Day. Much stricter behavior standards plus electronic surveillance of all homes and public buildings allowed Santa to severely restrict the number of children getting free toys and cutting into his profits. Children in communist countries were automatically excluded, largely because of Santa's personal dislike of his distant cousin, Joseph Stalin.

In 1982, Santa moved his headquarters to Oak Brook, Illinois, next door to the headquarters of his old Clown ally and hamburger tycoon, Ronald the Ripper. Pipelines pump raw toy sludge from the North Pole to the United States where toy factories, cleverly disguised as military bases and missile silos process this sludge into toys. The leftover toy slag is processed into guacamole and sold in a popular taco chain, which Santa also owns. Distribution of toys is done by Santa Clones who undergo a rigorous program at Camp Santa outside of Birmingham, Alabama. Here they are trained in how to dress and act like Santa, use a whip and various sorts of automatic weapons, and fly the S-20, the latest version of the combat and delivery sleigh. Santa Clones have been traditionally recruited mainly from ex-convicts and the seedier elements of society. This initially created a

problem of Santa Clones looting and trashing people's homes every Christmas Eve. In 1953, the same year Stalin died, Santa signed the Tollhouse Accord whereby Santa Clones would refrain from looting any homes where there were cookies and milk left out for them.

Operating from American military bases and aircraft carriers, the corps of Santa Clones can easily deliver all their toys in one night to the estimated 280,000 good children in the world. This surprisingly low figure is the result of a loophole in the Treaty of the Tundra that allows Santa to set the standard of what constitute a good boy or girl. The specific terms of these criteria remain a highly classified state secret.

Concern about depletion of toy ore reserves led to a failed attempt at mining Martian toy ore, which unfortunately turned out to be radioactive. The movie, "Santa Claus Conquers the Martians" is based on this attempt, although the only authentic footage of Santa in the film is of the battle scenes. The rest of the movie is totally ridiculous and should not be taken seriously.

Overall, the future looks bright for Santa as he maintains an iron grip on our throats and wallets.

As the popular song warns:

*"He's bringing his elves
And his S-20 Sleigh
He'll get you so fast
There's no time to pray
Santa Claus is coming to town"*

Historical Sources on Santa

There are three main sources of information on the North Pole's history:

- 1) The so-called "Snow Chronicles" that were written on snow since there are no trees at the North Pole & polar bears won't willingly give up hides for parchment. Unfortunately the originals were skied into oblivion in the 1960's by a ski resort that was opened on top of them. Therefore, all we have are fragments of copies made by Eskimos who, apparently to maintain the secrecy of these records, wrote them in Sanskrit that was then transcribed into Chinese ideographs. It's still a mystery how the

Eskimos have become so fluent in these two languages.

- 2) Film footage from "Santa Claus conquers the Martians". The plot is ridiculous, but footage of Santa in battle is authentic.

- 3) Hearsay and cheap gossip

Left: Man wrestling a polar bear to get his hide for parchment

Right: Bear resting after eating the man.

Toy Ore

Green toy ore (above) is a naturally occurring mineral found almost exclusively at the North Pole. In its unrefined state, it resembles green Play Dough in color and consistency. When carefully refined, one pound of toy ore can be processed into 100,000-150,000 toys. The current market value of one pound of toy ore is over \$1,000,000.

Currently, the toy ore mined at the North Pole is mixed with water into toy sludge and piped to toy factories in the US where it is processed into toys. The dregs (known as toy slag), are further processed into guacamole and piped to Taco Bell restaurants, which Santa also owns.

The only other known source of toy ore in the universe is Mars, which Santa colonized in the 1950s. Unlike the toy ore on earth, which is green, Martian toy ore (below) is red, because it is radioactive.

This came to the public's attention in 1958 when lots of toys that glowed in the dark appeared under people's Christmas trees. When it looked like Santa was going to get sued, he pulled off one of the greatest scams in legal history: he sued himself. Creating a fake public interest group, he filed a class action suit against himself, which he not only won, but profited immensely from, not just from the settlement, but also all the publicity and free advertising it generated.

The Strange Evolution of the Light Bulb

The North Pole, unlike the South Pole, is not on a landmass, which, of course, is necessary for trapping light. In the late 1800s when the light bulb was invented, light trappers first went to Africa, which then had abundant light resources. Unfortunately, the primitive and wasteful mining techniques of the times destroyed more photons than they gathered. By 1920, Africa had been stripped of virtually all its photons, thus the term the Dark Continent. This forced the Eskimos to rely on Antarctica for light. Since then, Africa's photon resources have revived to sustainable levels for the people there, but not for export.

In order to gain better access to Antarctica's photon reserves, Santa has relentlessly promoted global warming to melt the polar ice caps.

Christmas 2.0 and Eskimoes

As any satellite photo will show you, the global lines of longitude all converge at

the poles, so theoretically the North Pole could have up to 365.25 Christmases per year. The reason it's only twice (April 15 & December 25) is simply because that's all Santa needs.

To understand this we need to understand the nature of Santa's information gathering until 1978 when computerized electronic surveillance started being installed in all public buildings and most private dwellings. The old saw that "He sees you when you're sleeping; He knows when you're awake" was pure bluff and one of the great propaganda scams of the twentieth century.

Santa's best and only source of information on children's behavior was a massive form that parents turned in every April 15, known variously as Income Tax day or Christmas 1.0. It would take Santa's staff the full eight months until December 25 (Christmas 2.0) to sort through this information and determine who were the 280,000 "good" children in the world.

The origin of gun shaped candy canes goes back to the Great Ammo Famine (GAF) of 1908 when Eskimos couldn't even arm their children for school. Someone came up with the idea of shaping peppermint candy like guns to trick their children into thinking they were giving them real guns. Eskimos, however are pretty smart, and some enterprising Eskimo child devised a way in shop class to convert the candy canes into real functioning guns. The rest is history.

Eskimos not only love guns, but are also crack shots with them. In the 1950s Hollywood tried to boost sagging revenues lost to TV by using Eskimos firing live ammunition. However, this led to two unforeseen problems.

- 1) First, extra revenues were eaten up by having to invent new special

effects to make the Eskimos look thinner since they insisted on wearing their thick fur coats even in the Nevada heat.

- 2) Secondly, the free use of live ammunition triggered vicious feuds that led to an estimated 706 fatalities, including some big name actors. Many of these feuds escalated into actual lawsuits that remain unresolved today.

Eskimoes are also championship bowlers. It's not unusual for an Eskimo to have an unbroken string of 15 to 20 perfect games. As a result, they have so dominated the sport that it was removed from Olympic competition in 1960.

Killer Penguins

Killer penguins (*Penguines raptors*) are the only species of bird that have teeth. And these are just the babies.

With their prehensile wings Killer penguins can wield spiked clubs and whips. However, without fingers, they have no precision grip, so they can't use guns or type. Even if they could type, they wouldn't have anything interesting to say, except for academic discussions on which species of fish taste best.

Despite being bipedal and having very short legs, they can reach speeds of upwards of 70 miles per hour, although they can only sustain that speed for 20 to 30 minutes at a time. Their normal cruising speed is about 50 mph. Killer penguins have been known to run down and kill cheetahs in the African Savannah. What they were doing in the African savannah doesn't make any sense, but neither does anything else in this paragraph.

Most killer penguins are followers of a radical sect of Eckanar, where they can astrally project themselves across vast distances. This is widely believed to be the source of their ability to fly. However, killer penguins are particularly secretive on this subject.

It's true that killer penguins are especially resentful of the movie *March of the Penguins*, because they think it totally misrepresents penguins as a bunch of peaceful wimps.

More Information on Elves

- Elves originated in Siberia, a Mongol word for "Land of the little people easy to push around". The area where they settled in the Western hemisphere is still known as Saskatchewan, a Native American word meaning "land of the Big Ears". Our word for Bigfoot, Sasquatch, comes from the same root.

- Elves not properly fed suffer from a malady called Siberian Elf Rot where their ears fall off, triggering a growth hormone that makes them really big and mean. Most elves suffering from this disease end up either going into professional wrestling or politics.

- Just as Canadian elves require French cuisine, Siberian elves will only eat Mandarin Chinese cooking. This is because the French refuse to deliver in that neighborhood.

Clowns: Mongols of the Big Top

The Western extent of the empire of Jingles the Merciless, sometimes known as Clowntopia (c.1350). The merciless advance of the Bozo war machine mysteriously corresponded to the spread of the Black Death. Notice how the Clowns respected Switzerland's neutrality, probably to protect Swiss banks holding the vast cash reserves earned from selling tickets to the circus.

Clowns are extremely dangerous, having both superhuman strength and intelligence. The average Clown's IQ tops 150. Safety tip of the day: Never play a game of chess with a clown for money. Similarly, never get into juggling contest with a clown.

Clown Weapons. In addition to Selzer bottles full of Greek fire and catapults hurling cyanide cream pies Clowns deploy four other notable weapons:

- The punching Jack, a Jack-in-the-Box with a fist that knocks out its victim
- Crazy glue suction darts that make their victims look ridiculous. As a result, they can't get dates and their population plummets, setting up their eventual conquest
- Exploding tops
- Clown hats (helmets) topped with red balls (maces). Run for your life if a Clown with a hat starts twirling his head

The end of the Empire of the Bozos. As powerful and seemingly invincible as the Clowns may have

seemed, they had one overwhelming weakness: milk. Although impervious to the effects of alcohol, clowns just can't hold their milk and have a bad habit of picking fights with other clowns, usually over some trivial matter, such as who has the reddest nose or nose the floppiest feet. Unfortunately, the Clown code of honor demands they fight to the death, which led to a drastic drop in population that left them open to their eventual conquest by the Mongols.

The Treaty of the Tundra ending the Second War of the Elves contained what is known as the "Big Top Clause", stipulating that all clowns be put in circuses where they had to do "Stupid Clown Tricks" mimicking their battle tactics. The meanest clowns were put into rodeos, where they were ordered to run and jump in barrels rather than fight the bulls, which they could easily kill with their bare hands.

Clown fun fact: Clowns address Santa as Grand Poubah, meaning Double sized Clown with extra sauce and cheese. The significance of this title has been lost for centuries.

Clown art gives insight into how truly twisted their culture is. For example in *Dinner is Served* (below) by an artist simply known as Bruno, we see intense fear Clowns have of cats. Part of the reason circuses feature lions and tigers is to keep their clowns under control. Although regular domestic house cats can do the job equally well, they're not as much of a draw at the ticket booth.

The Great Santa Clone Uprising (1952-5)

Start of the little known Great Santa Clone Uprising (aka Santa's Village Massacre) by Santa Clones over unsatisfied demands to replace milk & cookies with beer. Notice the green creature on the right.

Santa's reliance on ex-cons and common thugs as Santa Clones created serious problems in the early 1950s. Not only did the Santa Clones use their plastic explosives a bit too liberally, they also had a bad habit of looting homes after delivering the toys.

In response to this came the Tollhouse Accord in 1953, whereby Santa promised the public his little "helpers" would refrain from looting homes if their inhabitants left behind milk and cookies as a peace offering.

However, beneath this accord lay a corps of disgruntled Santa Clones seething with revolt, since they had demanded beer and peanuts.

While initially successful, the Santa Clones' overconfidence after seizing control of Santa's Village left them open to Santa's ruthless counter-attack and ultimate victory.

Undercover Santa Clone standing over the body of what the Clones believed to be Santa Claus. In fact, the Clones had been cleverly duped into assassinating a decoy Claus in this, the first act of the ill-fated Santa's Village Uprising

A suicide squad of Santa Clones prepares to assault Santa's bunker. Although the attack was successful, it proved to be an empty victory as the Clones suffered heavy

losses and Santa had made good his escape up the chimney and down Blitzen Blvd.

Rebel Santa Clones fruitlessly try to push in the wall of Coca Cola HQ, Santa's most profitable corporate holding. Unbeknownst to the Clones, inside the building lay a stockpile of nuclear weapons that might have given them some chance of victory.

Santa Clone rebels with an Elf "hostage" that in reality was the spy who provided Santa with the failsafe codes that rendered the Clones' defense systems worthless.

Rodangate and Mothragate (1956-58)

The aftermath of the bloody Santa Clone Uprising was a shortage of qualified Santa Clones for delivering toys on Christmas Eve. One catastrophic experiment carried out in Tokyo in 1956 was the use of giant flying lizards, known as *rodans*, for delivering toys.

Unfortunately, while the rodans were smart enough to make the proper deliveries and had a good work ethic, their huge wingspans created gale force winds that demolished most of Tokyo. And what the winds didn't destroy the colossal weight of the flying lizards landing on rooftops did. Even worse, it was mating season for the rodans and the horrible screeching of the female rodans in heat woke up and scared all the little Japanese children.

An even more disastrous experiment, also carried out in Tokyo in 1958, was the use of giant moths, known as *mothras*, for delivering toys. Besides the same old problems of hurricane force winds, collapsed roofs and panicked little children, there was the fact that mothras are really stupid and rarely delivered the right toys to the right children. Japan's postal system is still trying to sort out the mess.

Santa issued a public apology for the damage and chaos caused by his rodans and mothras for delivering toys. However, despite his promise of restitution for the damage, he never paid one red cent to the Japanese people. Instead he sued the Japanese film companies for using footage of rodans and mothras in their movies, claiming he had genetically modified these creatures, making any footage of them shown without his permission a violation of copyright and patent laws.

Santa won his case

The Physics of Santa

If Santa had to deliver toys to all the good boys and girls in the world, this is what he'd be up against:

Let's say there are 378,000,000 good children in the world with an average of 3.5 per household. That would still confront Santa with 91,800,000 separate delivery stops.

Assuming he would take advantage of the East-to-West rotation of earth various time zones, he would have 31 hours to get the job done.

That would still require 822.6 visits per second, giving him

$1/823^{\text{rd}}$ of a second to park, hop out of his sleigh, go down the chimney, deliver the toys, eat whatever snacks were left, get back up and into his sleigh, and reach his next destination.

If all the houses were evenly distributed over globe, Santa would have to travel an average of .78 miles between houses, making his entire trip 75.5 million miles.

To make that journey, Santa would have to travel 650 miles per second, which is 3000 times the speed of sound.

Our fastest space probe only goes a poky 27.4 miles per second.

Conventional reindeer can only travel 15 MPH...tops.

Then there's the mass of the payload.

Assuming the average delivery weighs only 2 lbs. (based on a typical lego set), the combined weight of all the toys would come to 321,300 tons.

Assuming a flying reindeer can pull 1.5 tons (10X the capacity of a land reindeer), Santa would still need 214,200 reindeer.

This would increase the total mass of the payload to an estimated 353,430 tons, roughly four times the weight of our largest luxury cruiser.

A mass of 353,430 tons travelling at 650 miles per second would create tremendous air resistance. In fact, the lead reindeer would be absorbing 14.3 quintillion joules of energy per second, causing it to burst into flames immediately and create deafening sonic booms. In fact, the entire team of reindeer would be vaporized in .00426 seconds, while Santa would be subjected to centrifugal forces equal to 17,500.06 times our earth's gravity, some 4,315,015 pounds of force.

In conclusion, if Santa ever tried do this, he's dead now.

All this assumes that Santa gives toys to all or most of the children in the world... which he doesn't. This is the result of a loophole in the Treaty of the Tundra that dictated Santa give toys to all the good children in the world, but failed to define what criteria determine whether a child is good or not.

Naturally, Santa immediately exploited this oversight by applying his own strict criteria. By the time it was clear what he was doing, the Depression had hit (caused by Santa pulling his gold reserves from Swiss banks), thus preventing the U.S. from doing anything about Santa and the Great Toy Famine of '32).

Santa decided to declare there are 280,000 good children in the world, the result of careful studies to determine the minimum number and proper distribution of homes needed to give the illusion that Santa actually exists (which he does) and gives all good children toys (which he clearly doesn't).

Santa actually saw this indemnity as "seed money" to maximize his profits. For every child that got toys from him, there were a hundred who didn't, and 200 parents who didn't want their children to be traumatized on Christmas day, sending them on massive spending sprees, since parents, like Calvinists, never knew for sure if they were among the chosen few. So they spent heavily on toys to protect their children from the emotional trauma of not getting any toys on Christmas morning.

Santa considers Black Friday the happiest day of the year

Santa FAQ

Santa II meets his fate over N. Korea on Christmas Eve, 1951

Is the current Santa the original one?

That is both the most common and dumbest question we are asked. The original Santa lost his life on April 30, 1945 in the final assault on Hitler's Reichstag in Berlin at the end of World War II. He was only 118 at the time. There have been 3 Santas since then.

Santa II was shot down only six years later over N. Korea on Christmas Eve, 1951.

His successor, Santa III died in a mid-air collision with a Boeing 707 over LA on Christmas Eve, 1967. Luckily, no reindeer were hurt.

His son and successor, Santa IV, the first in the family to graduate from West Point, currently rules over the vast Santa Empire. He is 112 years old and in prime health.

What are Santa's hobbies?

Hunting and macramé. He also has world-class collections of whips, guns, and Barbie dolls. He is an internationally renowned whipster and current holder of the world championship.

Is it true that the letters of "Santa Claus" can be rearranged to spell the more demonic "Satan Slauc"?

No.

How does Santa deal with houses without chimneys?

William Levitt, the inventor of mass-produced low-cost housing after World War II, is the culprit responsible for this. Levitt cut costs by not putting in real fireplaces with chimneys, thus blocking the traditional portal of entry that Santa's clan has used for centuries. (This is why they were chimney sweeps, so they could ensure clean getaways when they robbed people's homes.)

Anyway, since Santa was still bound by the terms of the Treaty of the Tundra, he and his Santa Clones had to find a different way in. He first tried to declare that all the children in the suburbs were spoiled brats and didn't get toys. However, the precedents set by civil rights legislation and court decisions in the 1950s shot that down as unfair discrimination. As a last resort, Santa turned to plastic explosives to blow locked doors off their hinges. I say last resort, not because he didn't like blowing things up (who doesn't?), but because it was expensive. This was 1958 when there was a downturn in the economy, and Santa didn't want to convert his

liquidity to any new ventures. However, his hand was forced, and that's how he got into the plastic explosives industry, which he now controls.

What are Santa Clones equipped with?

- One fully padded bulletproof Santa suit, 2 fake beards, and 2 whips,
- 1 AK-47 w/50,000 rounds of ammo and 5,000 charges of C-4 explosives for locked houses without chimneys
- 1 copy of *1001 Foreign Phrases any American Should Know*, 1 copy of *Bunker's Magic Techniques for Breaking into Restricted Buildings*, vol. II on Priv. Residences (2013 edition), 1 operating manual for the S-18 combat and delivery sleigh, and one Rand McNally Road Atlas
- One S-18 combat and delivery sleigh equipped with the latest stealth cloaking technology, computer guidance systems, and heat-seeking and laser-guided smart missiles. By law, the technology on these sleighs must be at least two generations ahead of our best aircraft.

126. THE CAUSES AND OUTBREAK OF WORLD WAR I

"The lights are going out all over Europe; we shall not see them lit again in our lifetime."-- Lord Grey

Welcome to the Twentieth Century

What could better illustrate how early twentieth century history as 19th century mentalities running up against 20th century realities than a picture of World War I cavalry and their horses wearing gas masks? Gas masks were also fitted out for dogs that served as regimental mascots.

The century from 1815 to 1914 was one of the most peaceful in European history. This was largely because European powers were preoccupied with internal political events (i.e., liberal and nationalist movements) and economic developments (industrialization) which gave them the power and scope to expand their colonial empires without getting too much in each other's way. However, the same forces that kept Europe tranquil in the 1800's also carried the seeds for trouble in the first half of the 1900's, making it a time of war, revolution, and economic turmoil.

On the surface, European society at the turn of the century had never seemed so peaceful, prosperous, and stable, as seen at the Great Exhibition in Paris in 1900, Kaiser Wilhelm II's annual birthday celebration in Berlin in 1913, and family reunions of Queen Victoria's descendants who made up much of Europe's royalty, including Germany and Russia. Despite mounting tensions in the years leading up to World War I, Europe's elite continued living in a

fantasy world of such high society events. But behind the façade of normalcy not all was well.

Emily Davison's fatal attempt to publicize the suffrage issue by throwing herself in front of the king's horse at the Epsom Derby reflected the deeper social unrest underlying European society in the early 20th century. The appeal of socialism to the working classes was growing under the leadership of such popular socialists and anti-war activists as Jean Jaures and Rosa Luxembourg.

Juares was murdered at the beginning of the war.

Luxembourg would be brutally murdered in its turbulent aftermath.

Unfortunately, the mindset of much of Europe was one of rampant militarism.

"War is the great purifier, making for...the ethical health of peoples corrupted by a long peace, as the blowing of the winds preserves the sea from the foulness which would be the result of a prolonged calm."--Georg Wilhelm Hegel

The history of the early 1900s (1914-45) can largely be seen as 19th century mentalities running up against 20th century realities. Then again, any era's history is largely one of old mentalities running up against new realities. It's just that with the 20th century we start seeing things change at an ever accelerating pace that we can notice in the space of a lifetime... or a decade...or a year.

It's as if our civilization had entered its adolescence, gotten its driver's license, and set off behind the wheel with an incredible sense of power...but with no idea of where the brakes were or why they should be used.

The Great War destroyed more than buildings. Nature paid a heavy price, as did many animals and human beings. Many survivors were scarred for life, such as the French veteran (below) who was fitted with a mask to cover faces horribly disfigured by artillery shells. And for many of those who returned physically healthy, the

horrors of modern war had left deep and permanent psychological wounds for some of whom there was only one way out...suicide.

Civilization as a whole also suffered a collective psychological wound, as seen in art by artists such as Otto Dix and Georg Grosz. Yet Otto Dix's last painting, *Flanders* (1934-6), with its strong anti-war message was strongly disapproved of by Hitler's new Nazi regime then ruling Germany and preparing its people to launch the next big war. And so it goes.

Introduction. People often cite the assassination of the Austrian archduke, Franz Ferdinand, as the cause of World War I. This is true as an immediate, short-range cause, but his murder alone could not have triggered a global war. Rather, World War I was the product of two of the most powerful forces driving European civilization in the 1800's: nationalism and industrialization. Together and separately, they would create three factors that led to war: German unification, territorial rivalries, and economic competition.

Economic competition. The spread of the Industrial Revolution outside of Britain after 1850 expanded the consumer markets available for businesses to exploit. But it also expanded the number of producers competing for those markets, triggering more competition for what seemed to be a stagnant economy by the turn of the century. Intensifying this competition in each country were fierce nationalistic feelings fostered by an expanding public school system that preached its nation's superiority over other nations and the dangers they posed to it.

European nations did two things to protect themselves. First, they (especially France, Britain, and Germany) joined in the rush for overseas colonies. However, by 1900, most good places for colonization had been taken, just causing more competition for what few areas were left. For example, Germany and France had two bitter crises that nearly led to war over control of Morocco.

The second strategy was the use of protective tariffs (import taxes) to raise the cost of foreign goods and make the home nation's goods correspondingly more appealing to its consumers. Of course, other nations did the same thing. Prices went up, trade declined, and unemployment grew, causing internal unrest and turmoil. As a result, politicians looked for scapegoats and conveniently blamed other nations. This led to more tariffs, lower trade, rising unemployment, unrest, blame, and so on.

German unification. Nationalism created other problems. The unification of Italy and especially Germany upset the balance of power in central Europe, replacing many small and vulnerable states with two unified and aggressive nations. Germany's rapid rise as a political, economic, and military giant alarmed its neighbors, particularly France, still burning to avenge its humiliating defeat in the Franco-Prussian War. Nations reacted in two ways: the formation of alliances and military build-ups.

In the two decades since the Franco-Prussian War, Bismarck had masterfully juggled alliances to keep France isolated and Europe at peace. But Bismarck was fired in 1890 by the short-sighted and aggressive new Kaiser, Wilhelm II, who let Germany's alliance with Russia, which Bismarck had carefully nurtured for 30 years, lapse. France quickly seized the opportunity to ally with Russia. As in 1756 with Frederick the Great, the nightmare of a two front war fought on German soil loomed as an imminent threat.

Desperate for allies, Germany attracted Austria (Russia's vehement enemy) and Italy into what was known as the Triple Alliance. France lured Britain into its alliance, known as the Triple Entente, by playing on British fears of the growing German economy, navy, and colonial empire. With all the major powers aligned in one camp or the other,

there was the serious danger that if two members of opposing alliances got into a war or crisis, all the other alliance members and their colonial empires would be dragged in, too. That is exactly what would happen in 1914.

The Industrial Revolution's rapid creation of new technologies was by no means confined to peaceful ends. New and improved weapons such as the machine gun, submarine, and steel clad battleship combined with nationalist pride and fear of other nations to trigger an arms race such as the world had never seen. As soon as one nation started building armaments, its rivals would do the same and try to outdo the first nation. This would only alarm the first power, which would further increase its armaments, and so on. Each nation acted in what it felt was self-defense, but what other nations saw as aggression.

Therefore, France built up its forces to avenge the defeat of 1870 and to protect itself against German aggression. Germany armed itself to guard against French aggression and a two front war with Russia as well. The Russian army expanded to protect itself from German aggression. And the Austrian military grew to counter Russian moves into the Balkans. To make matters worse, Wilhelm II, despite Bismarck's advice, wanted a colonial empire to match those of Britain and France. This involved building a navy, which prompted Britain to build up its navy to keep ahead of Germany. Therefore, in addition to a military arms race, Germany found itself involved in an equally expensive naval arms race as well. In the end, this expensive arms race only weakened everyone's security and economies, added to mutual fears and suspicions, and led to a general expectation of war that became a self-fulfilling prophecy as nations prepared for that war.

Territorial rivalries already abounded among the many competing states and peoples in Europe. Fueling those rivalries were strong nationalist feelings further intensified by the ideas of Social Darwinism and militarism (the belief that there was nothing more glorious than to fight and even die for one's nation). Writings of the nineteenth century abounded with militaristic sentiments, or ideas that could be easily misinterpreted to support such sentiments. One very influential philosopher who

was not so simplistically aggressive as suggested by the following quotations was Georg Wilhelm Hegel, whose ideas heavily influenced such diverse thinkers as Marx and Lenin on the one hand, and Bismarck and Hitler on the other. Hegel saw war as the great purifier, making for

"...the ethical health of peoples corrupted by a long peace, as the blowing of the winds preserves the sea from the foulness which would be the result of a prolonged calm."

"...world history is no empire of happiness. The periods of happiness are the empty pages of history because they are the periods of agreement without conflict."

"World history occupies a higher ground...Moral claims which are irrelevant must not be brought into collision with world historical deeds or their accomplishments. The litany of private virtues-- modesty, humility, philanthropy, and forbearance--must not be raised vs. them. So mighty a form [the state] must trample down many an innocent flower--crush to pieces many an object in its path."

Another German philosopher whose ideas were oversimplified and misinterpreted was Friedrich Nietzsche.

"Ye shall love peace as a means to new war, and the short peace more than the long. You I advise not to work, but to fight. You I advise not to peace but to victory...Ye say it is the good cause which halloweth every war. I say unto you it is the good war which halloweth every cause. War and courage have done more great things than charity."

Playing off these ideas was General von Bernhardi. His book, *Germany and the Next War* (1911), had such chapter titles as "The Right to Make War", "The Duty to Make War", "Germany's Historic Mission", and "World Power or Downfall" that

fairly well summed up its thesis. Another German writer, Heinrich von Treitschke, like Hegel, glorified the state, but more brutishly saw its subjects as basically its slaves and declared war as the highest expression of Man.

"It does not matter what you think as long as you obey"

"...martial glory is the basis of all the political virtues; in the rich treasure of Germany's glories the Prussian military glory is a jewel as precious as the masterpieces of our poets and thinkers.

"...to play blindly with peace...has become the shame of the thought and morality of our age."

"War is not only a practical necessity, it is a theoretical necessity, an exigency of logic. The concept of the State implies the concept of war, for the essence of the State is power...That war should ever be banished from the world is a hope not only absurd, but profoundly immoral. It would involve the atrophy of many of the essential and sublime forces of the human soul...A people which become attached to the chimerical hope of perpetual peace finishes irremediably by decaying in its proud isolation..."

Psychologically and militarily, Europe was ready for war.

There were two regional "hot spots" in Europe in 1914. First, there were Alsace and Lorraine, which France desperately wanted back from Germany since the Franco-Prussian War. Second, there was the Balkans, destabilized by numerous Slavic nationalities, with Russia posing as their champion, wanted to break loose from the Hapsburg Empire. As serious as the situation in Alsace and Lorraine was, people saw the Balkans as a disaster waiting to happen, calling it the "powder keg of Europe" which would hurl the whole continent into war. They were right.

The Road to war (June-August, 1914). On June 28, 1914, Gavrilo Princip, a young member of a Serbian terrorist group known as the Black Hand, murdered the heir apparent of Austria, Franz Ferdinand, and his wife in Sarajevo, Austria. Naturally, this created quite a stir in the papers, but few at that time saw it as important enough to lead to a general war. However, behind the scenes, all the forces of nationalist rivalries, economic competition, military buildups, and interlocking alliances were blowing this murder way out of proportion and driving events wildly out of control and toward war.

Nearly a month passed before events picked up. Although there was no firm evidence that Serbia, a Slavic state bordering Austria, had anything to do with the murder, Austria still blamed it for the murder since the Black Hand was a Serbian ethnic group operating from Serbia and trying to stir up the large Serb population, against Austrian rule. With German encouragement, Austria issued severe demands to the Serbian government on July 23, saying that failure to comply with its terms would lead to war. Compliance with its harsh terms would totally humiliate Serbia. However, Russia supported Serbia and, to show it was serious about the Serbian crisis, started mobilizing its armies.

In the past, this would have been a strong, although acceptable, way of exerting diplomatic pressure, since armies and diplomacy moved slowly, giving each side time to resolve a crisis before it was too late. However, times had changed from the leisurely pace of pre-industrial wars and had drastically reduced the margin of error within which kings and diplomats had to work. Two things specifically made Russia's mobilization unacceptable: Germany's geopolitical position and railroad timetables.

As stated above, Germany's geopolitical nightmare was a two-front war. Russia's alliance with France made that a very real possibility. Since Russia refused to cancel the mobilization order, and France would not reveal if it planned to get involved if war broke out, the Germans could only assume the worst, a two front war. That brings us to the Schlieffen Plan.

The Schlieffen Plan was Germany's strategy for turning a two-front war into two successive one-front wars. It assumed that pre-industrial Russia's armies would be slow to mobilize, thereby giving Germany enough time to concentrate its forces and deliver a knockout blow against France and then concentrate its efforts on Russia.

The key to, and problem with, this plan was the precise timing of railroad timetables necessary for the rapid mobilization of Germany's armies. With Russia already mobilizing, Germany felt compelled to put the Schlieffen Plan into action before it was too late. However, that required war with France, so Germany, with no apparent provocation, declared war on France as well as Russia. That left the question of what Britain would do, which brings us back to the Schlieffen Plan.

Germany's high command considered the terrain and string of French fortresses along its western border with France too difficult for launching a quick offensive. The best route lay through the open low country of Belgium. However, Belgium refused passage to German armies, and so Germany, driven by the strict timetable of the Schlieffen Plan, violated Belgian neutrality in order to crush France and stay on schedule. Britain, outraged by this act, declared war on Germany.

And so Europe, dragging its worldwide colonial empires in its wake, blundered into World War I. Not that everyone saw it in such negative terms. Crowds all over Europe greeted the news jubilantly. Most men saw their nation as superior to all others and expected a quick victory much like that won by Prussia in 1870. Each nation's army would occupy the enemy's capital by Christmas, which meant that anyone not enlisting now would miss out on all the fun and glory. Little did they suspect the scope of the disaster about to befall them over the next four years.

The Assassination

“Probably some damn thing in the Balkans.”
--Bismarck when asked what he thought would cause the next big war

The heir apparent to the throne was Franz Ferdinand, a man who actually favored more home rule for his Slavic subjects. This alarmed the more radical Serbs who feared his policy might lure his Serbian subjects away from loyalty to an independent Serbia. Therefore, they decided to kill him. It was June 28, 1914 at a place known as Sarajevo. Unfortunately, that was the anniversary of the Battle of Kosovo, a major defeat inflicted by the Turks on the Serbs in 1389. Many Serbs took Franz Ferdinand's choice of this day for a military review as a deliberate insult.

The culprits were a secret Serbian nationalist group, the Black Hand, which got several teenage boys involved in the plot. As the procession went by, the first boy felt sorry for Sophie if she were to become a widow and went home. The second boy threw his bomb but hit the wrong car, injuring several of its inhabitants. However, exploding bombs have a way of prematurely ending parades. Franz Ferdinand, mad over this disruption, ordered his driver to go to the hospital where the wounded victims were taken.

Unfortunately, a wrong turn by chance led right to the third conspirator, Gavrilo Princip (below), who seized the opportunity, ran up onto the car's running board and killed Franz Ferdinand and his wife Sophie at point blank range.

Princip was caught soon after the assassination of Franz Ferdinand. Following two failed suicide attempts (one with outdated cyanide) he was sentenced to 20 years in prison, because he was 27 days short of his twentieth birthday, the minimum age for the death sentence. He was kept in harsh confinement at Theresienstadt (later a notorious concentration camp) where he contracted tuberculosis, leading to amputating an arm and his eventual death on April 18, 1918. At the time he weighed only 88 pounds.

The Kaiser's arm and a world war

Sometimes history turns on the most innocuous seeming events. Take Kaiser Wilhelm's traumatic breech birth, which crippled his left arm. This, plus growing up in the hyper-masculine military climate of the Prussian aristocracy, may have given him a Napoleonic complex which some described as megalomania. It didn't help that he was always dressed in one of the 200 military uniforms in his wardrobe. Neither did the fact that there was a history of insanity on both sides of his family.

Wilhelm seems to have been intelligent, but impatient and quick tempered, which, when he became Kaiser in 1888, quickly put him at odds with his "Iron Chancellor", Bismarck and his carefully designed policies. (Bismarck had even briefly manipulated Russia and Austria into joining the League of Three Emperors with Germany.) Wilhelm wanted Germany to claim "its place in the sun", which meant for him a colonial empire like that of his first cousin, George V of England. Bismarck saw that colonies were expensive luxuries that Germany could not afford. However, after firing Bismarck in 1890, Wilhelm embarked on getting a colonial empire, which also involved building a navy, setting Germany on course toward eventual war with Britain.

Kaiser Wilhelm II in Austrian, Turkish, and Russian army uniforms. On the right he poses with his first cousin, Tsar Nicholas II, who is wearing a German uniform

Last Minute Maneuvering

Diplomatic maneuverings. At one point, the German government sent instructions to their ambassador in Paris to demand France turn over its frontier fortresses to guarantee its neutrality in case of war with Russia. Germany, of course would return the fortresses after the war. Before this provocative demand could be delivered, Berlin realized how ridiculous it was and told the ambassador not to present it to the French. Unfortunately, the French had intercepted the original message and knew of it.

Being careful not to appear the aggressor, France pulled all its forces five kilometers back from their borders to make sure the first fighting took place on French soil.

As war moved ever closer, the Kaiser had a last minute failure of nerve and tried to order the troops back. However, his generals informed him that it was too late, that the machinery of war was rolling forward and couldn't be stopped without jeopardizing Germany's safety at the hands of its neighbors.

The railroad timetables had trumped human judgment and Europe rolled inexorably to war.

TOTAL WAR (1914-1918)

At first there will be increased slaughter--increased slaughter on so terrible a scale as to render it impossible to get troops to push the battle to a decisive issue. They will try to, thinking that they are fighting under the old conditions, & they will learn such a lesson that they will abandon the attempt forever. Then...we shall have...a long period of continually increasing upon the resources of the combatants...Everybody will be entrenched in the next war. --I.S. Bloch (1897)

*You smug faced crowds with kindling eye
Who cheer when soldier lads march by
Sneak home and pray you'll never know
The hell where youth and laughter go."*
-- Siegfried Sassoon, World War I veteran

*We are ready, and the sooner the better for us.
--German General von Moltke*

The war of movement (August-September, 1914). When Europe went to war in 1914, many, although not all, people welcomed it as an opportunity for national glory. Soldiers, especially in Western Europe, also marched, or rather rolled, to war much more quickly than ever before. France alone, with its extensive network of railroads, had 7000 trains, some only eight minutes apart, moving troops to the front. Also, rapid population growth and mechanization from the Industrial Revolution, freed many more men than ever before for war.

Europe also marched to war better armed by far than any previous army in history. Germany seemed particularly armed to the teeth, thanks to the Kruppworks at Essen, Germany, a vast complex of 60 factories with its own police force, fire department, and traffic laws. One new weapon would especially change the face of war. That was the machine gun, which could fire 600 bullets per minute and stop any old-style human wave assaults dead in their tracks, literally. It was the machine gun that would put an end to the illusion of a quick victory in a war of movement--but not at first.

In the opening weeks, the Schlieffen Plan went like clockwork. While stopping a French offensive, known as Plan 17, from driving eastward into Germany, the strong German right flank swept the French, British, and Belgian forces back toward Paris, covering up to 20 miles a day, an exhausting pace for infantry loaded with up to 60 pounds of equipment. In fact, that pace plus the German General von Moltke's weakening of the Western offensive in order to meet a Russian offensive unexpectedly materializing in the East may have doomed the Schlieffen Plan to failure. The French and British allies made their stand to save Paris along the Marne River, many troops being rushed to the front in Paris taxicabs. The allies stood fast and the German offensive ground to a halt. Then, somewhat spontaneously and out of simple survival instinct, the soldiers started digging trenches. The Schlieffen Plan and war of movement had failed. The age of trench warfare had begun along what would ever after be remembered as the Western Front.

The new face of war. Making trench warfare especially bad was the fact that the opposing trenches were generally only 500 yards or less apart. This kept soldiers in constant contact with the enemy and constantly immobilized in the mud trenches to avoid the danger above. This contrasted sharply with previous wars where armies would fight a battle, withdraw, and then regroup for several weeks or months before the next battle. This had given soldiers long breaks from the terrors of battle, a psychological safety net that kept them halfway sane. But that safety net no longer existed as soldiers stayed in constant contact with the enemy and became worn out from battle fatigue, producing a catatonic-like state known popularly as the "thousand yard stare".

Life in the trenches, even during relative lulls in the fighting, was a thoroughly wretched experience. It was hot in summer and especially cold in winter. It was also wet and muddy, giving the soldiers little or no chance to bathe, exposing them to infestations of rats, lice, disease, and infection. One of the worst of these infections was trenchfoot, caused by the soldiers' not being able to remove their socks and boots for long periods of time and often resulting in amputation of the infected foot or leg. The following excerpts from the novel, *All Quiet on the Western Front*, by Eric Maria Remarque, himself a

veteran of the war, capture the misery of life in the trenches.

There are rumors of an offensive. We go up to the front two days earlier than usual. On the way, we pass a shelled schoolhouse. Stacked up against its longer side is a high double wall of yellow, unpolished brand-new coffins. They still smell of fir, and pine, and the forest. There are at least a hundred.

"That's a good preparation for the offensive," says Muller astonished.

"They're for us," growls Detering.

"Don't talk rot" says Kat to him angrily.

"You be thankful if you get so much as a coffin," grins Tjaden, "they'll slip you a waterproof sheet for your old Aunt Sally of a carcass."

The others jest too, unpleasant jests, but what else can a man do? --The coffins are really for us. The organization surpasses itself in that kind of thing...

We are in low spirits. After we have been in the dug-outs two hours our own shells begin to fall in the trench. This is the third time in four weeks. If it were simply a mistake in aim no one would say anything, but the truth is that the barrels are worn out. The shots are often so uncertain that they land within our own lines. Tonight two of our men were wounded by them.

The front is a cage in which we must await fearfully whatever may happen. We lie under the network of arching shells and live in a suspense of uncertainty. Over us Chance hovers. If a shot comes, we can duck, that is all; we neither know nor can determine where it will fall.

It is this Chance that makes us indifferent. A few months ago I was sitting in a dugout playing skat; after a while I stood up and went to visit some friends in another dugout. On my return nothing more was to be seen of the first one, it had been blown to pieces by a direct hit. I went back to the second and arrived just in time to lend a hand

digging it out. In the interval it had been buried

It is just as much a matter of chance that I am still alive as that I might have been hit. In a bomb-proof dugout I may be smashed to atoms and in the open may survive ten hours' bombardment unscathed. No soldier outlives a thousand chances. But every soldier believes in Chance and trusts his luck.

We must look out for our bread. The rats have become much more numerous lately because the trenches are no longer in good condition. Detering says it is a sure sign of a coming bombardment.

The rats here are particularly repulsive, they are so fat-- the kind we call corpse rats. They have shocking, evil, naked faces, and it is nauseating to see their long, nude tails.

They seem to be mighty hungry. Almost every man has had his bread gnawed. Kropp wrapped his in his waterproof sheet and put it under his head, but he cannot sleep because they run over his face to get at it. Detering meant to outwit them: he fastened a thin wire to the roof and suspended his bread from it. During the night when he switched on his pocket-torch he saw the wire swinging to and fro. On the bread was riding a fat rat.

At last we put a stop to it. We cannot afford to throw the bread away, because already we have practically nothing left to eat in the morning, so we carefully cut off the bits of bread that the animals have gnawed.

The slices we cut off are heaped together in the middle of the floor. Each man takes out his spade and lies down prepared to strike. Detering, Kropp, and Kat hold their pocket-lamps ready.

After a few minutes we hear the first shuffling and tugging. It grows, now it is the sound of many little feet. Then the torches switch on and every man strikes at the heap, which scatters with a rush. The result is good. We toss the bits of rat over the parapet and again lie in wait.

Several times we repeat the process. At last the beasts get wise to it, or perhaps they have scented the blood. They return no more. Nevertheless, before the morning the remainder of the bread on the floor has been carried off.

In the adjoining sector they attacked two large cats and a dog, bit them to death and devoured them.

Next day there is an issue of Edamer cheese. Each man gets almost a quarter of a cheese. In one way that is all to the good, For Edamer is tasty--but in another way it is vile, because the fat red balls have long been a sign of a bad time coming. Our forebodings increase as rum is served out. We drink it of course; but are not greatly comforted.

For days we loaf about and make war on the rats. Ammunition and hand-grenades become more plentiful. We even overhaul the bayonets--that is to say, the ones that have a saw on the blunt edge. If the fellows over there catch a man with one of those he's killed at sight. In the next sector some of our men were found whose noses were cut off and the eyes poked out with their own saw-bayonets. Their mouths and noses were stuffed with sawdust so that they suffocated.

Some of the recruits have bayonets of this kind; we take them away and give them the ordinary kind.

But the bayonet has practically lost its importance. It is usually the fashion now to charge with bombs and spades only. The sharpened spade is more handy and many-sided weapon; not only can it be used for jabbing a man under the chin, but is much better for striking with because of its greater weight; and if one hits between the neck and shoulder it easily cleaves as far down as the chest. The bayonet frequently jams on the thrust and then a man has to kick hard on the other fellow's belly to pull it out again; and in the interval he may easily get one himself. And what's more, the blade often gets broken off.

Total War. Four factors, all arising from the Industrial Revolution, had totally changed the face of war. First of all, the Industrial Revolution provided enough men (thanks to population growth and the mechanization of many jobs) and firepower (especially the machine gun) to dig and fill opposing trench systems stretching from the Alps to the North Sea, a system several hundred miles in length. The result was the *continuous front* which neither side could outflank since it was hemmed in by mountains and sea. Unfortunately, the machine gun and faster loading rifle which made the continuous front possible also made the technology of defense superior to that of offense. There was no way that unshielded infantry could get across that murderous area of flying metal known as No Man's Land. That is not to say that people did not try. They did, and with disastrous results.

Third, most generals either did not understand the nature of this new type of warfare or felt they could not afford to accept it. After all, most of these generals, many of whom were quite old, had not been able or willing to keep up on the rapidly changing technological changes transforming warfare in recent years. It is often said that generals are always fighting the last war, and nowhere did this better apply than to the generals of World War I. Before we become too critical, however, it should be pointed out that at no time in history had warfare been so thoroughly revolutionized in so short a time. The machine gun and continuous front had created a whole new ball game, but no one had a rule book by which to play. And so for four years, the generals just fumbled around the best they could while soldiers continued to die.

The fourth factor, also resulting from the Industrial Revolution and complicating matters further, was the media, in particular the newspapers. Never before had the public back home been so well informed about the progress, or lack of it, in a war. The generals had promised a quick victory, and the public and press had a close eye on how well they were doing. In the more democratic countries of France and Britain the generals found themselves under severe pressure by the public and politicians to win the war decisively and quickly. This was especially true of France, since the German lines contained northern France along with the bulk of its industries, and the French public was clamoring to get it back.

All of these factors combined to create a tragic pattern of suicidal frontal assaults that would prolong the stalemate. The casualties would be so horrible that governments modified or censored news coming from the front. This created a misinformed public and media that, thinking victory was within their grasp, would put more pressure on the generals for a quick victory. As a result, there would be more disastrous offensives more censorship to misinform the public, and so on.

Such offensives were usually conceived by generals behind the lines without any clear idea of what the front was really like. Preceding the attack for several days would be a massive bombardment that did a lot less damage than hoped for and which also told the enemy where the attack was coming. As soon as the shelling stopped, the troops went "over the top" into No Man's Land where the obstacles of barbed wire (left undestroyed by the bombardment) and craters (actually created by the bombardment) held them up so that the enemy machine guns (also unharmed since they had been taken to the dugouts below during the shelling) could cut them down. The men who suffered through this living hell often give us its most graphic and poignant descriptions.

"We listen for an eternity to the iron sledgehammers beating on our trench. Percussion and time fuses, 105's, 150's, 210's-- all the calibers. Amid this tempest of ruin we instantly recognize the shell that is coming to bury us. As soon as we pick out its dismal howl we look at each other in agony. All curled and shriveled up we crouch under the very weight of its breath. Our helmets clang together, we stagger about like drunks. The beams tremble, a cloud of choking smoke fills the dugout, the candles go out." --Verdun veteran, 1916

."the ruddy clouds of brick-dust hang over the shelled villages by day and at night the eastern horizon roars and bubbles with light. And everywhere in these desolate places I see the faces and figures of enslaved men, the marching columns pearl-hued with chalky dust on the sweat of their heavy drab clothes; the files of carrying parties laden and staggering in the

flickering moonlight of gunfire; the "waves" of assaulting troops lying silent and pale on the tapelines of the jumping-off places.

"I crouch with them while the steel glacier rushing by just overhead scrapes away every syllable, every fragment of a message bawled in my ear...I go forward with them...up and down across ground like a huge ruined honeycomb, and my wave melts away, and the second wave comes up, and also melts away, and then the third wave merges into the remnants of the others, and we begin to run forward to catch up with the barrage, gasping and sweating, in bunches, anyhow, every bit of the months of drill and rehearsal forgotten.

"We come to the wire that is uncut, and beyond we see gray coal-scuttle helmets bobbing about...and the loud crackling of machine-guns changes as to a screeching of steam being blown off by a hundred engines, and soon no one is left standing. An hour later our guns are "back on the first objective," and the brigade, with all its hopes and beliefs, has found its grave on those northern slopes of the Somme battlefield." --Henry Williamson, age 19

"Verdun transformed men's souls. Whoever floundered through this morass full of the shrieking and dying...had passed the last frontier of life, and henceforth bore deep within him the leaden memory of a place that lies between life and death." -- Verdun veteran

The first day's butchery in an offensive, such as the 60,000 British who fell on the first day of the Battle of the Somme in 1916, should have been enough to convince the generals to call off the attack. But that would be admitting failure for all their months of plans and preparations. Therefore, the offensives continued, in some cases for months, with the casualties piling up into the hundreds of thousands. Each successive battle followed the same pattern and would continue that way until someone figured out how to solve the problems that the machine gun and continuous front had created. Until that day, it remained stalemate on the Western Front.

New fronts and new weapons. The continuing cycle of stalemate on the Western Front forced the warring powers to realize modern war is total war, demanding activities in all possible directions to sustain their own efforts and wear down those of the enemy. This led to efforts in five areas: control of material resources at home, control of human resources (including the media and morale), continued attempts to break through on the Eastern Front, the search for victory by opening new fronts, thus making it truly a world war, and the search for victory through the development and use of new weapons.

Material and human resources on the home front. World War I devoured enormous amounts of material resources, forcing governments to closely control production and distribution of those resources. Blockaded Germany, in particular, had to ration food strictly. It also controlled mineral resources and even scientific research, which developed synthetic nutrients and ways to derive nitrates from the atmosphere for explosives. France also had to exert strong central control over production, since its industrial north was largely behind German lines, forcing it to rebuild much of its industry further south by 1918.

Human resources had to be controlled to ensure enough men for the front and a labor force for the strategic industries at home. With so many men gone to war, women entered the work place in unprecedented numbers, taking over many occupations previously reserved solely for men before the war, such as secretaries. After the war, when many husbands and fiancées did not return, many women stayed in the workplace, giving them more economic power and eventually the vote. To maintain morale, governments assumed more control of the media, limiting or distorting the information available to the press and public. Governments also actively tried to harness popular support for the war with brightly colored and illustrated posters that glorified the war effort and portrayed the enemy as less than human.

As the homefront became more of an integral part of the total war effort, governments saw enemy factories and civilians as legitimate war targets. In 1915, a German Zeppelin launched a bombing raid on London, killing several people. Although the damage from this raid was small by later standards,

it pointed the way for much worse to come for civilians in wartime.

The Eastern Front. Allied hopes for a quick Russian victory in the East were quickly dashed in August 1914 when the Germans annihilated invading Russian forces at Tannenberg. (This was the first and only time allied forces set foot on German soil during the war.) Germany also bolstered Austria against the Russians in the south, causing a much looser version of the Western Front to evolve in the East, since the armies (except Germany's) were less mechanized and thus less successful in stopping a war of movement. The Russians were particularly poorly armed (many of them even without rifles), and their offensives against the German positions met with especially disastrous results. By 1917, Russia, bled white by the war, stood on the verge of revolution.

New Fronts. Each side also tried to divert and drain the enemy's strength by opening up new fronts. Turkey was the first new power to enter the war, in this case, on Germany's side. This threatened to cut off British and French supplies to Russia by way of the Black Sea and prompted a British offensive known as the Gallipoli Campaign. This was one of the worst run operations of the war. At least twice, the British generals had victory within their grasp, but chose to nap or have teatime rather than press their advantage, giving the Turks time to bolster their line. For several months, the allies were pinned down to the beaches until disease and casualties forced them to withdraw.

After this, the main British strategy against the Turks was to stir up and support rebellions. In that regard, one of the most celebrated figures of the war was T.E. Lawrence, known as Lawrence of Arabia, a charismatic figure who succeeded in organizing the Arabs and destabilizing the already decrepit Ottoman Empire. The British issued the Balfour Declaration in 1917, which promised a Palestinian homeland for the Jews in return for their help. This promise, in conjunction with conflicting promises to the Arabs, would be (and still is) the source of intense conflict in the Middle East.

Italy, despite being part of the Triple Alliance, joined France and Britain in order to take disputed lands from Austria. However, Austria managed to defeat Italy, making it more of a burden to Britain

and France, who had to keep it supplied with guns, money, and fuel just to keep it in the war. Meanwhile, Bulgaria joined Germany and Austria in order to take Macedonia from Serbia, which it accomplished quickly. Serbia's British and French allies responded by landing 500,000 men at Salonika, Greece, where they did nothing until 1918, earning it the title of Germany's "biggest internment camp."

Europe's African and Asian colonies were also dragged into the war, making it a truly global war. The British were able to seize Germany's African colonies except for German East Africa. In Asia, the Allies persuaded Japan to attack German holdings and spheres of influence in China. This gave Japan a foothold in China that it would expand in the 1930's, laying the foundations for World War II in Asia. Overall, despite mixed results, Germany's allies gradually weakened as the war dragged on.

There was also the naval front. In the years preceding the war, Germany had built a fleet second only to Britain's. In 1915, the two navies clashed at Jutland. It was an indecisive battle, with Germany getting a slight advantage. But the Kaiser, not wishing to damage his nice new navy, called it into port where the British kept it blockaded for the rest of the war. The blockade was soon extended to all German ports and slowly starved Germany to death.

New Weapons. Meanwhile, each side looked desperately for new weapons to solve the problem of the continuous front. Poison gas and flame-throwers, pioneered by Germany, became all too common and horrible features in trench warfare, but failed to achieve a breakthrough. After the war, the Geneva Convention outlawed both weapons as inhumane. However, two other weapons had a big future in warfare. One was the tank, which gained the allies at least limited success in breaking through enemy trenches. Despite their slowness (3 mph) and unreliability (only half making it to the starting line in their first major battle), tanks shielded allied troops, helping them cross No Man's Land with relatively few casualties.

The airplane, first used for observations of enemy lines, was adapted to combat use, being armed with a machine gun to shoot down other planes. At first, aerial warfare consisted mainly of

individual combats (dogfights) between pilots. It was very limited, polite (at least by warfare's standards), and the most glorified aspect of World War I, a sort of chivalry in the skies. Even that changed by war's end, with the allies sending up hundreds of planes to sweep the skies and strafe and bomb the German lines, a strategy that would be developed with much more deadly effect for the next war.

The submarine was Germany's great equalizer in the naval war. While Britain ruled the waves after Jutland, German U-boats (submarines) could still lurk beneath the waves and prey upon allied shipping in retaliation for the blockade on Germany. However, some of the ships Germany sank were from the United States, technically a neutral power but actively trading much needed food and other supplies to France and Britain. While Germany felt justified in sinking any ships supplying its enemies, the United States saw these attacks on its ships as barbaric and unprovoked acts of aggression.

Germany eased up on its attacks for a while to keep America neutral. But in 1917, as the war effort got more desperate, U-boat raids resumed. Then the British intercepted and publicized the Zimmerman Telegram, in which Germany offered Texas, New Mexico, Arizona, and California to Mexico if it would attack the United States and divert its attention from the war in Europe. American public opinion was outraged, and the United States declared war on Germany in March 1917. That same month another ally, Russia, after three years of defeats and shortages, became engulfed in Revolution.

The end of the "war to end all wars" (1917-18). Alexander Kerensky's moderate government that replaced the Czar, needing to look legitimate to the outside world, kept Russia in the war, which only weakened it further and led to its overthrow by Lenin and the Bolsheviks in November, 1917. The following March, Lenin signed the treaty of Brest-Litovsk, taking Russia out of the war while giving up Poland, Ukraine, Latvia, Estonia, Lithuania, and Finland. This also freed one million German troops for the Western Front. The question was: Could the addition of the United States compensate for the loss of Russia?

With virtually no standing army when it declared war in 1917, the United States needed a year to mobilize its industrial and military might. Therefore, in 1918, the war became a race to see who could first arrive on the Western Front in force: the newly mobilizing Americans or the Germans freed from the Eastern Front.

At first, the Germans won the race and launched an offensive, attacking with smaller tactical units to punch holes in the enemy lines and drive them back bit by bit. Also, the attacks were not preceded by artillery bombardments that could warn the enemy where the attack was coming. This strategy succeeded in driving the allies back toward Paris. But, as in 1914, the allies, now bolstered by newly arrived American units, stopped the Germans at the Second Battle of the Marne.

Now the allies went on the offensive. Using the very tactics the Germans had just used, the growing numbers of fresh American troops at their disposal and large numbers of tanks to shield their soldiers crossing No Man's Land, they sent the Germans reeling back step by step toward Germany. At the same time, the British blockade was gradually starving the German homeland to the limits of its endurance.

At this point, all the pressures building elsewhere caved in on Germany, as its allies collapsed one by one: first Bulgaria, then Turkey, and finally Austria. Exposed to attack from the south and east, Germany finally asked for an armistice (ceasefire). On the eleventh hour of the eleventh day of the eleventh month of 1918, after one final flurry of artillery fire, the guns fell silent. Here and there, opposing soldiers met in No Man's Land to pay their respects to men who, like themselves, just happened to be wearing different uniforms, and then turned toward home. The First World War was over. However, its effects would be long-lasting and varied, including the Second World War a mere twenty-one years later.

Marching to war

German soldiers singing on their way to war

Many greeted the coming of war in 1914 as a great adventure. As the German General von Moltke put it: “We are ready, and the sooner the better for us.” In the jubilant crowd celebrating the war in Munich, Germany was a young Austrian, Adolf Hitler, who quickly joined the German army, where he served with distinction.

Never had states been better armed for a war. Already, in 1914, there were some 6,000,000 men under arms including 2,000,000 Germans and 1.65 million French. Germany also mobilized 715,000 horses for cavalry and draught animals in 1914, while Russia mobilized over one million.

And yet never were nations more unprepared for what was to come, as symbolized by the French soldiers who still wore the same bright red and blue uniforms as those worn by the French army since 1830, the colors of a perfect target.

But, as seen in Marc Chagall’s *Leave-taking Soldiers*, not everyone welcomed the coming of war as a grand adventure.

In France, when church bells announced the news, peasants rushed into the villages, the women weeping as if their husbands, fathers, and sons were already dead. Some, such as the artist Kubi in *The Torch of War*, even saw the coming of war as the prelude to a disaster of apocalyptic proportions.

They were the perceptive ones.

The War of movement (August- Sept., 1914)

“If we must die, let us die gloriously.” -- King Albert of Belgium who chose to resist the Germans rather than allow them free passage through his country

Belgium. Once at the Belgian border, the Germans’ access to railroads ended and they had to go on foot. Carrying 60 pounds of equipment on their backs, those on the outer arc of the right flank had to march at an exhausting pace of up to 30 kilometers per day to keep up with the rest of the army.

The initial German assaults on Belgium’s massive concrete fortresses were disastrous. One German general commented on the peculiar thud of bullets hitting human bodies. Therefore, the Germans turned to a whole new generation of monstrous siege guns that quickly demolished the Belgian forts and any claims of their invincibility. At Liege The German general Ludendorf even crashed open the gate of the fort with his car. Overall, Belgium’s forts barely slowed down the German advance.

German Railroad gun for shelling long-range targets, including cities, and the sort of damage such guns could do to Belgian forts

The “Hun”. Bitter memories of French guerrilla actions in 1870 made the Germans particularly nervous and prone to overreact to any perceived civilian resistance, which they saw as illegal rebellion. In Louvain, Belgium, a false alarm over snipers triggered a Germans reaction that

killed over 200 civilians and destroyed 1000 buildings, including the town’s medieval architecture and university, with its library of 230,000 priceless books.

Cartoons showed alleged German atrocities against Belgian and French civilians: plundering homes, raping the women, and even tossing babies in the air and catching them on their bayonets. However true, false, or exaggerated, such images tarnished Germany’s reputation as a civilized nation for years and branded the Germans as the barbaric Hun.

Plan 17. While the Germans advanced quickly through Belgium, the French put into motion their own ill- fated counterpart to the Germans’ Schlieffen Plan: Plan 17 which was to advance eastward through the Rhineland and on to Berlin. However, this went through much rougher ground and met with immediate disaster. On August 22, 1914 alone, 27,000 French soldiers died, making it the single bloodiest day in French military history.

Taxis to the Marne. Meanwhile, to the West, the German offensive marched on. British evacuation in the face of the German advance was so rapid that they had little time to prepare an effective line of defense before having to fall back again. However, the unexpected appearance of Russian forces in East Prussia caused the German commander, von Moltke, to pull forces from France to defend the Eastern front. This shortened the arc of Germans advancing on Paris, exposing their right flank to a French and British attack at the Marne River.

One of the most legendary events of World War I was the transportation of French troops to the Marne in Paris taxis. However, only about 5000 soldiers were actually transported to the front in this manner.

More important in blunting the German offensive was the French 75, a recoilless cannon that eliminated the need to reposition it each time after firing. By September 12, the Germans had been stopped and the Schlieffen plan lay in ruins along the banks of the Marne.

The Hollow Click of Deadlock Called the Western Front

After the Germans were stopped at the Marne, each side spread out trying to outflank the other until both armies stretched in an unbroken line of trenches from the North Sea to the Swiss border. Thus was born a grim state of perpetual deadlock that would drag on for the next four years along what would ever after be remembered as the Western Front.

Since both sides had counted on a quick war of movement, they had only stockpiled six weeks worth of munitions, which were gone by October, 1914. This gave soldiers the relative calm needed to build their trench lines.

Not that all areas were suited to trenches, especially the lowlands in Belgium. The area near the Yser River was so prone to flooding that trenches could not be dug. Rather, the lines were built up with sandbags, making them more vulnerable to artillery fire. Luckily, this was a fairly quiet sector of the lines throughout the war.

The unofficial Christmas truce of 1914 started with British and German troops singing Christmas carols to one another. From there it developed into the two sides meeting in No Man's Land to exchange chocolates and tobacco and eventually a soccer match. As many as two-thirds of the troops in the British-German sector of the line may have participated (above). However, when they tried to extend the truce the next day, their officers forced them to start fighting again.

War in a Ditch

The trenches weren't part of some grand strategy. They were just a natural reaction by the soldiers to escape the metal flying overhead. At first they were just simple ditches, but they quickly evolved into sophisticated systems with multiple layers of defense and 40-foot deep dugouts to escape the especially intense bombardments preceding major enemy offensives.

But the trench wasn't just a temporary device to stay alive. It became a way of life, and death, for millions of men stuck in what was euphemistically called "The Western Front."

There were many ways trench life could kill you.

You could freeze in the winter or die from pneumonia during the spring rains...

...or standing in the muck without changing your shoes or socks for months you could contract a fungus infection called trenchfoot, which would kill you unless the infected limb was amputated.

Or, with plenty of other infectious diseases thriving in that squalor, you could just get sick and die.

Then, of course, there was the business of killing. With the continuous front, there was no maneuvering around the enemy, so you stayed in constant contact with him 24/7. And he had plenty of ways to kill you.

You could be mowed down by machine gun fire with thousands of other men in a huge offensive.

Or you could be blown to pieces in an artillery barrage. That's how 70% of the fatalities in the Great War met their fate.

You could suddenly be exposed by enemy flares and gunned down like a wild animal while on a night patrol in No Man's Land.

You might drown while lying wounded and immobile in a bomb crater in No Man's Land, helplessly watching as it gradually flooded from the spring rains.

Maybe you would suffer a fiery death from a flamethrower....or the prolonged agony of poison gas burning you to death from the inside out.

Then again, a random artillery shell might drop into your section of trench while you were reading a letter from home, or shaving, or just scratching the lice from your body.

The shell's concussion could rupture your internal organs without leaving any outside trace of being hit.

Or it might leave no trace that you had ever existed at all.

Maybe you'd be lucky and a shell's shrapnel would only take part of you: an arm, a leg...or your face.

There seemed to be no justice or logical pattern to the killing. Good men died while scoundrels survived. So most soldiers eventually resigned themselves to fate, whatever it was, and took it.

Even if you escaped the bullets and artillery shells, you could just go crazy. Unrelenting contact with the enemy only 100 yards away meant you could never let your guard down with some sniper always waiting to make you pay for that one unguarded moment. Sooner or later, even the toughest soldier would crack, his nerves and psyche fried by the constant overload.

In World War I they called it shell shock. Other wars of the 20th century had their own names for it: the 1000-yard stare, combat fatigue, or post traumatic stress syndrome.

Whatever you called it, you could no longer function in combat, or even as a normal human being.

Death was written on your face and even your buddies avoided you as a marked man and the sniper's next victim.

Even if you survived the war physically intact, you were often a changed and broken man.

To some, it seemed as if Dante had created a 10th circle of Hell just for them....and there was no way out....except one very desperate way....suicide.

Otto Dix, *Trench Suicide*

"...a place that lies between life and death." : Verdun

In 1916, while the allies planned more offensives like those in 1915, the Germans struck first against a useless salient in the French line near Verdun. Although the Verdun salient was exposed to attack on three sides and encompassed forts that had been stripped of their guns since 1914. The Germans were betting the French would go to any lengths to protect this symbol of national pride.

They were right.

In February, the Germans opened their assault with a tremendous bombardment that drove the French defenders nearly mad. French staff officers tried to explain that Verdun was of no strategic importance, but political pressure forced them to defend it at any cost. Soon they had fed 76 divisions into the "mincing machine"

of Verdun, supplying it via one road heavily exposed to enemy artillery fire. In the first 6 weeks, they lost 90,000 men, averaging over 2000 a day.

So determined were the French to defend this nearly hopeless position that the Germans also convinced themselves that Verdun was a great prize. Eventually 115 divisions from both sides were crammed into a five-mile front.

Supply lines broke down

Medical services broke down

Even the trench lines broke down.

Only the men caught in this madness endured.

And not all of them made it.

“Verdun transformed men’s souls. Whoever floundered through this morass full of the shrieking and dying had passed the last frontier of life

and henceforth bore deep within him the leaden memory of a place that lies between life and death.”--Verdun veteran

In the end, the French lost 315,000 men, while the Germans lost 281,000, making this the only major battle in the war where the attackers lost fewer men than the defense.

However, the French had held Verdun...so they figured they had won.

Anatomy of an Offensive: The Somme (July-November, 1916)

Up till now, the Somme had been a relatively inactive sector. In 1916 it was chosen as the point of attack because it was where the French and British lines met, so the two armies could cooperate in an offensive. However, with the French tied down by the German offensive at Verdun, this became a primarily British operation.

Britain had just begun a draft to fill the trenches with raw recruits. However, to attract volunteers, men from same village could enlist together. As a result, whole towns would have virtually all their young men wiped out in one day. After the Somme, friends and relatives were split up to avoid any more such disasters.

The British prepared a vast infrastructure of roads, RR’s, camps, supply dumps, water stations, and medical aid stations for the 1000’s of casualties the generals were now resigned to and willing to accept.

Some 2,960,000 artillery shells were stockpiled for the initial bombardment. Compare that to Napoleon a century earlier at Waterloo, who had only used 20,000.

The Bombardment. The prelude to an offensive was a massive bombardment lasting up to a week to soften the enemy and tear up his trenches, machine guns, supply lines, and any barbed wire blocking the way across No Man’s Land. Three types of shells were used in a rotating succession.

Trench mortar bombs were used first to destroy trenches and machine guns.

Chlorine gas shells came next. Since the gas was heavier than air, it would seep into the dugouts, but if the defenders were ready, they could disperse it with water sprayers.

Finally aerial torpedoes were fired into a high arc to burrow deep into the ground. Exploding with tremendous force, they could create craters 12' deep and 15' across. The concussion from these shells could put out candles and acetylene lights in the deepest dugouts which "rocked like the sides of a ship" in the foul smelling, sometimes poisoned darkness.

The cycle of aerial torpedoes, trench mortar bombs, and gas bombs continued with only brief respites designed to lull the enemy to relax before being shaken by the next round of explosions.

Over that week, the British hit the Germans with 1.5 million shells along a 15-mile front.

Unfortunately for the British infantry, it had little real effect and did more harm than good in several ways. For one thing, two-thirds of the shells were trench mortar bombs that did only superficial surface damage.

Secondly, it missed the machine guns, which were portable and taken below until the end of the bombardment. Likewise, large sections of barbed wire were left untouched, forcing the advancing British troops to stop and cut their way through or find a way around. Either way, they would be easy targets for the enemy machine guns now back in place and firing.

Finally, the bombardment created huge craters in No Man's Land, thus making more obstacles for the soldiers trying to get across.

Final Preparations. In the nerve wracking hours before the assault, soldiers prepared in different ways.

Some prepared for the end with a church service and/or prayers.

Others wrote their wills or final letters home.

For any who wanted it there was a ration of rum to steady their nerves.

"Over the Top": 7:20 AM, July 1, 1916. After the bombardment stopped, the signal to go "over the top" into No Man's Land was the detonation of eight enormous mines of TNT dug under the German lines.

The Barrage. Preceding the troops was a *creeping barrage*, a moving artillery bombardment with the British troops following only 15 yards back. The idea was to keep the enemy in their dugouts until the British were almost to their lines, thus making it easy for them to jump down into the trenches and take them.

Since the enemy had multiple lines of defense, the barrage would follow a scheduled advance that the British troops would have to keep up with. Unfortunately, if they got delayed by enemy resistance, there was no way to let the artillery far to the rear know. So they would keep advancing the barrage according to schedule.

"...the ruddy clouds of brick-dust hang over the shelled villages by day and at night the eastern horizon roars and bubbles with light. And everywhere in these desolate places I see the faces and figures of enslaved men, the marching columns pearl-hued with chalky dust on the sweat of their heavy drab clothes, the files of carrying parties laden and staggering in the flickering moonlight of gunfire, the "waves" of assaulting troops lying silent and pale on the tapelines of the jumping-off place. I crouch with them while the steel glacier rushing by just overhead scrapes away every syllable, every fragment of a message bawled in my ear. I go forward with them...up and down across ground like a huge ruined honeycomb, and my wave melts away...and the second wave comes up, and also melts away...and then the third wave merges into the remnants of the others...and we begin to run forward to catch up with the barrage, gasping and sweating, in bunches, anyhow, every bit of the months of drill and rehearsal forgotten...

...We come to the wire that is uncut, and beyond we see grey coal-scuttle helmets bobbing about, and the loud crackling of machine-guns changes as to a screeching of steam being blown off by a hundred engines, and soon no one is left standing. An hour later our guns are "back on the first objective," and the brigade, with all its hopes and beliefs, has found its grave on those northern slopes of the Somme battlefield." --Henry Williamson, age 19

Why these assaults almost always failed. First of all, most of the Germans, although shaken by the bombardment, had survived with their machine guns intact in dugouts as deep as 15 meters. The question was if they could get to the top and start firing before the British.

Generally they did for several reasons.

First, bomb craters filled No Man's Land, making an even advance virtually impossible for the British troops loaded down with 66 lbs of gear. Secondly, most of the barbed wire has not been destroyed by the bombardment, forcing the British to try to find an opening or cut their way through while German machine gun fire has started to fire and is shredding their ranks.

Even though some British troops have made it into the enemy's first line of trenches, the trench lines were dug in a zigzag pattern so attackers would have to take each section separately with no clear line of fire to help them. To do this, they either had to go above ground to attack, or hurl grenades into the enemy section and round the corner just after the blast, both of which were very risky. Besides, the defenders often left an empty section between them so the grenades would fall harmlessly.

Meanwhile, German artillery would have laid a stationary barrage on No Man's Land, blocking any British reinforcements or communications. Likewise, with their communications still intact, the defenders could call down artillery fire on the sections of trenches held by the British.

By this point, any British troops who may have carried the first line of German trenches were

too disorganized, exhausted, and scared to advance any further against the support and reserve trenches which were reinforced by concrete blockhouses.

The first day of the Somme campaign cost the British 21,000 dead and 60,000 casualties total. The generals in back, committed to their plan, continued the battle for 4 more months. By November, when the battle finally fizzled out, the allies had lost 620,000 men, the Germans 450,000. Some put a spin on this that since the Germans couldn't afford as many casualties as the allies could, this battle wore them out more and contributed to the allies' final victory in 1918.

A captured German gun emplacement. It took 82,000 casualties to take 900 meters of ground and this gun.

The Wounded

A hospital ward in Berlin

Each battalion had 16 stretcher crews capable of retrieving 16 wounded per trip into No Man's Land....unless they were also shot. If a battalion lost 300 men, as was common on the first day of the Battle of the Somme, it could take hours, even days, to rescue all the wounded. As many as one-third of the 21,000 British soldiers who died on the first day of the Battle of the Somme might have been saved if rescued earlier. Sometimes a truce would be called for the retrieval of the dead and wounded, with specially trained bloodhounds often used to find bodies under the dirt and rubble.

Once brought in, there was a highly developed infrastructure for care of the wounded. At regimental aid posts battalion medical officers sorted wounds, initially sedating and bandaging the serious ones and sending them back to hospitals for better care. However, there was a growing trend to do major surgery close to the front since serious wounds didn't travel well. By 1916 casualty clearing stations were the main sites for life-saving surgery, and there were even special traveling surgical teams that worked within range of enemy artillery.

Medical advances in the past 50 years ensured much higher survival rates for the wounded. The discovery of blood-typing before the war made transfusions much safer and more common by 1917. Also, techniques for removing damaged and infected tissue greatly reduced the incidence of gangrene, often picked up from the soil when the wounded fell. Still, compared to World War II when skin grafts and reconstructive surgery would become common, there were still large numbers of amputations.

On the down side, high velocity bullets and shrapnel from exploding artillery shells created much more serious wounds than in previous wars. During major offensives, there would be so many wounded that they had to be triaged on the field into three categories:

- 1) those needing immediate treatment;
- 2) those who could be sent ahead; and
- 3) those who were hopelessly wounded and sent to the "dying room" to be washed, sedated, and comforted by nurses until they died.

Authorities tried to hide category 3 from the soldiers, but they knew.

The Girls with Yellow Hands

Women played an increasingly vital role in the war effort, maintaining production in the factories and fields back home while also tending the wounded and dying near the front. Women filling artillery shells in munitions plants were at particular risk, having to handle dangerous chemicals that would stain their hands yellow. Continued exposure to these chemicals often led to sickness and, in many cases, death. However, the sacrifices these women made would not show up in the casualty totals for the war. Neither would those of the women who died in munitions plant explosions or mining accidents.

War's first casualty: the Truth

The print media, especially posters, played a larger role than ever in mobilizing support for the war effort. Some posters used patriotism to influence their audiences. French posters would use shining and patriotic vision of Marianne (the personification of France) to enlist support, although by the end of the war they had much grimmer and more ragged images of battle worn soldiers declaring the enemy would not pass. German posters evoked memories of medieval Knights slaying dragons or holding out a hand to the dove of peace.

The German occupation of Belgium was a popular source of propaganda and moral outrage. While the Germans tried to paint a more humane image of their occupation with pictures of their soldiers playing with and feeding Belgian children, allied posters tried to sway public support with stereotypes of the Germans as the barbaric Hun and drawings of various alleged German atrocities, such as bombing innocent civilians and even tossing babies in the air and catching them on their bayonets.

Some posters used women and children to shame men into going to war with a young woman in a sailor's outfit wishing she were a man so she could join the navy, British women practically kicking their men out the door to enlist with the simple word "Go!" and a little girl asking her father: "Daddy, what did you do in the Great War?"

Gaps of information were easily filled with rumors about German spies disguised as nuns (who could be spotted by their hairy legs) and the one million Russian troops supposedly reinforcing the allies on the Western Front. You could tell they were Russians from the snow still on their boots. Russian troops did come to reinforce the Western allies, but were never used, spending the war in southern France doing nothing. By most accounts, the snow had melted from their boots by the war's end in 1918.

The Eastern Front

Contrary to all expectations, the Russians managed to mobilize two armies that invaded Eastern Prussia in August 1914. However, the two Russian generals' mutual hatred for each other and refusal to cooperate, combined with their failure to encode their radio messages, allowed the Germans to destroy their two armies separately. The magnitude of this defeat convinced Turkey to enter the war on Germany's side against its traditional enemy, Russia.

Although brave, Russian soldiers were poorly led and equipped compared to their German foes. Often, there were not even enough rifles for everyone, so those in back had to pick up those of their fallen comrades. A Russian offensive against Austria in the spring of 1915 succeeded initially until German reinforcements stopped them. While they could beat the Austrians, the better-armed and supplied German armies typically mauled the Russians.

In 1915 Austrian forces, heavily reinforced by Germans from the Western Front, "blew apart" the Eastern Front, costing the Russians 750,000 men and driving them back 300 miles before they established a new defensive line. This did have the advantage of shortening their supply lines from Russia.

As in so many other wars, Russia's saving grace in stopping invaders was its winter which helped slow down its enemies. Therefore, the Eastern Front evolved into a looser version of the Western Front with trenches and poison gas, although during lulls in the fighting, peasants might even plow their fields in No Man's Land.

The Brusilov Offensive in June 1916 surprised the Austrians and captured 250,000 prisoners. However, since Russian railroads only went

from east to west, they failed to reinforce this breakthrough. By the same token, the Germans pulled several divisions by rail from Verdun and broke the Russian offensive, costing the Russians 1 million men.

In 1916, Tsar Nicholas II took personal command of the war effort, thus turning a bad situation into a catastrophic one that would push Russia to the brink of revolution by 1917.

Global War

The Gallipoli campaign (1915). The British general commanding the expedition was chosen on the basis of seniority, having no prior combat experience. When the allied force reached the Hellespont, they realized their weapons were in the bottoms of their ships and had to return to Alexandria to repack.

The difficult terrain encountered by allied troops in the Gallipoli campaign

The allies, largely Australian and New Zealand troops (ANZACS), seized the beach but couldn't proceed to the heights above because the British general was taking a nap and his officers were having tea. In the meantime, the Turks dug in on the heights above. Not surprisingly, the Gallipoli campaign created a lot of bitterness among Australians and New Zealanders toward Britain.

After Gallipoli, British strategy in the Middle East centered on the efforts of T.E. Lawrence (aka Lawrence of Arabia). His charismatic leadership unified Arab resistance against Ottoman rule and was largely responsible for British victories in the Middle East. Unfortunately, British promises of Palestinian liberation were broken after the war.

The Balfour Agreement. In 1917, Chaim Weizmann, developed a method for increasing

acetone production by ten times, whereby Britain promised it would provide the Jews a Palestinian homeland after the war. The seemingly conflicting promises made to Jews and Arabs still resonate in the problems besetting the Middle East.

Germany's overseas colonies were especially difficult to defend with its navy blockaded by Britain, In East Asia, both Japan and China declared war on Germany, each hoping to get its colonial possessions there, seeing them as particularly vulnerable. After the war the victorious allies would favor the Japanese claim, thus adding to Chinese bitterness against the West and decades of strife in that region.

In East Africa, the German commander, Paul von Lettow-Vorbeck, used some 20,000 Askari troops to hold off and elude British forces that eventually numbered 350,000. The Askari were excellent fighters, intensely loyal to von Lettow, and proved more resistant to disease than the British, South African, and Indian troops the British used. Von Lettow held out until 11/25/1918, two weeks after the Armistice was signed.

New Weapons for a New Kind of War
The birth of chemical warfare. On April 22, 1915 the human race crossed a new threshold: chemical warfare. Around 5 AM two greenish/yellow clouds moved toward the allied lines like fog. The African colonial troops in that sector were initially transfixed by the cloud's beauty until it swept over them, blinding and burning out the lungs of more than 1500 men. As they bolted in terror from this supernatural horror panic spread along the line, some Canadian troops even retreating right into the gas.

Soon a 4.5-mile gap had opened in the allied line. Luckily the Germans didn't believe it could be

this effective and failed to exploit the gap before it was plugged back up.

Soon the allies were also using gas, and gas masks, and training for gas attacks became standard for soldiers on both sides. Gas masks were made for everyone, even, marching bands, horses and mascots.

The first gas attack by the allies took place at the Battle of Loos in 1915 was a disaster for the British. Despite the fact that the wind was blowing in their men's faces, British officers in the rear ordered the attack to proceed as scheduled, gassing their own men in the process.

British soldiers blinded by a gas attack

Flame-throwers were another insidious weapon that did nothing except make the soldiers' lives more terrifying and miserable. After the war, the Geneva Convention outlawed the use of both flamethrowers and poison gas. Hitler, who was hit by a gas attack in World War I, refused to let the Germans use gas in combat during World War II, although he would use it extensively against the Jews in his death camps.

The airplane. Although still in its infancy, the airplane was quickly adapted for military purposes. At first both sides used it for aerial reconnaissance and occasionally dropping a few darts, known as flechettes on enemy lines. While it's not clear when or how it was first used in plane-to-plane combat, it probably involved one pilot with a pistol firing at another, although one story had a pilot throwing a brick at another plane.

Some planes had separate gunners, but they blocked the pilots' view. When someone devised a mechanism for timing the gunshots to fire between the propeller blades, the pilot could just aim his gun by aiming his plane.

Through most of the war, aerial combat took the form of "dogfights" between individual pilots. There developed a lore about the "knights of the sky" whose fighting wasn't soiled by the mud and filth of trench warfare. Baron von Richthofen (AKA the "red Baron") was the most successful aerial ace of the war, scoring 80 confirmed kills before being shot down, either by British pilots or ground fire from an Australian unit on the ground. He and his squadron, known as the Flying Circus, flew a type of tri-plane that he preferred it for its rapid climbing ability despite it being slower than some allied planes.

The war saw a variety of aircraft. Hydrogen-filled zeppelins, used for observing enemy lines, were also highly vulnerable and volatile targets, making "zeppelin busting" a popular sport for airplane pilots. Specialized bombers were also developed, One such plane, having a wingspan of 100 feet (that folded in storage), could drop a bomb weighing 1650 pounds. However, the first aerial bombing of civilians was done by a zeppelin over London in 1915. It did especial damage to a tavern and its customers.

The first aircraft carriers also appeared at this time, being older ships with their decks cleared and equipped with short runways.

By the end of the war, the allies were flooding the skies with hundreds of planes that effectively swept the German air force from the skies. From now on, "chivalry of the skies" would be shoved aside as control of the skies would be a major strategic necessity in warfare.

Tanks were first used at the Battle of the Somme in 1916, where half of them broke down before the battle even started. However, by 1918, they were working better and helped drive holes in the German lines in the final offensives of the war. They were not very effective until the end of the war, and probably had no appreciable effect on its outcome. However, they would be a decisive factor in the next war.

Although the Germans hardly developed any tanks in World War I, during World War II they would be leaders in both tanks and the tactics (Blitzkrieg) for their use.

The Naval war. In 1916 at Jutland the German fleet so lovingly built up by the Kaiser fought its only major battle of the war. It was basically a draw, but the Kaiser pulled his fleet into harbor where it was blockaded for the duration of the war. That blockade would gradually starve Germany and be a major factor in the allies' final victory.

The Germans countered with submarines attacking British shipping in an effort to starve Britain of vital supplies. Because they had to surface in order to fire their torpedoes, German U-Boats were extremely vulnerable to enemy fire and abandoned international law, which required warning merchant ships before sinking them. The Germans' unrestricted submarine warfare took an especially heavy toll on allied shipping.

In 1915 the Germans sank the *Lusitania* with some 1200 civilians aboard, many of them Americans. This outraged American public opinion, especially when the Germans struck a medallion commemorating the act. Therefore, Germany temporarily stopped attacking civilian ships, but resumed unrestricted U-boat warfare in early 1917. That would be enough to bring the United States into the war.

By the end of the war, the British would develop a system of convoying trade ships with warships, drastically cutting their own losses while sinking many German U-Boats and rendering their campaign ineffective.

1917: The breaking of armies

Life in America in 1917 continued much the same as it had for years, although events loomed on the horizon that would change the US forever.

Unfortunately, half a planet away, life also continued much as it had since 1914.

Factories kept churning out goods for the war.

Soldiers still suffered and died in the trenches and No Man's Land.

Widows and children mourned the men who would never come home.

And generals kept planning hopeless offensives as they had for years.

The Neville Offensive (April, 1917) was the final straw for the Poilus (French soldiers). Following the usual massive bombardment of 11 million shells that only told the Germans where the attack was coming, successive waves of Poilus were predictably mowed down by the thousands.

But then, something different happened. The remaining troops refused to go over the top.

Some bleated like sheep being led to the slaughter.

Others simply got up out of the trenches and walked away.

Soon whole sections of trenches were devoid of defenders as thousands of Poilus just turned their backs on the war.

Luckily for the Allies, the Germans didn't realize their opportunity before the mutinous Poilus were herded back into their trenches.

Of course there had to be consequences. Some 100,000 French soldiers were court-martialed, 23,000 were found guilty, 432 were sentenced to death, and, officially, 55 were executed.

But the French generals had learned their lesson. The *poilus* were promised more leaves from the

front lines and no more suicidal assaults. The French army had been broken as an offensive weapon, but at least it was restored as a defensive one.

Messines Ridge. On June 7, 1917, after five months of digging and as a prelude to an offensive, the British detonated 600 tons of explosives buried in 19 mines under the German lines. The shock wave, which was felt in London, killed 10,000 Germans. That plus three weeks preliminary bombardment led to virtually no German resistance in this sector. However, this offensive, as usual, stalled, producing no useful results.

Passchendaele, (October, 1917). The initial British bombardment in one sector lasted 15 days and used 4.5 million shells. In the process, it destroyed any remaining drainage systems, turning the fields into impassable quagmires during the heavy rains that year. That, plus the German defense-in-depth system that stretched back 5 miles in 9 levels turned the British offensive into a disaster as men sank to their waists in mud, equipment totally sank, and draught animals drowned.

Duckboard walk, 3rd battle of Ypres, October, 1917

When the British prime minister, Lloyd George came over to stop this nonsense, general Haig tricked him into believing the Germans were close to breaking by showing him POW camps stripped of all but old men and boys. Lloyd was fooled and the slaughter went on.

1918: Armageddon....and the end

Hoping to achieve final victory before American troops arrived in overwhelming force, Germany used the troops freed from the Russian Front to

mount one final desperate offensive in 1918 known as the Ludendorff Offensive.

Instead of long bombardments that allowed the enemy to reinforce the area of attack, the Germans used short intensive bombardments to weaken and surprise them. Special storm troopers attached to each unit would then lead assaults to infiltrate enemy trenches and continue advancing until resistance stiffened, and then they would stop.

They would then repeat the process on another part of the enemy line, pushing the allies back bit by bit until they were at the Marne River, scene of the battle that stopped the Schlieffen plan in 1914. However, German progress was so fast it outdistanced its artillery support. That, lack of tank support, and casualties totaling one million men had sapped the offensive of its impetus by June.

“Lafayette, We are here.” At this point, the United States started making its presence felt. The addition of thousands of fresh American troops, prepared for the Western Front by French trainers, helped the British and French stop the German offensive at the Second Battle of the Marne and go on the attack.

American soldiers, eager to prove themselves, at first did not heed the advice of seasoned British and French veterans to be more careful. They paid dearly for it as 50,000 Americans died in action in 1918. An equal number died of sickness, mostly from the worldwide flu pandemic then raging. However, it was the influx of America’s war materiel that turned the tide of war as much as its soldiers

Using brief but massive artillery bombardments and the “bite and hold” tactics employed by the Germans earlier that year, allied troops pushed the Germans out of France and into Belgium. By this point, teenage boys were typical of the recruits Germany was being forced to draft. Also, by late 1918, the British blockade was starving Germany, forcing women to search through garbage heaps for potato rinds.

In late October, Germany's allies started collapsing like a house of cards: first Turkey (10/30), then Bulgaria (10/31), and then Austria (11/3). On November 9th, worn out by war abroad and starvation at home from the British blockade, a revolution (below) replaced the Kaiser with a republic in the hopes of getting better terms for a ceasefire. Forced to abdicate, the Kaiser went into exile in Holland where he lived quietly until his death in 1940.

Thus ended the War to end all Wars.

In the early hours of November 11th, allied officers received a German delegation seeking an armistice. They told the Germans that for a ceasefire they would have to agree to abandon all occupied territories in Belgium, Luxemburg, and France, including Alsace-Lorraine, and surrender their entire fleet along with 150,000 freight cars, 5000 locomotives, 5000 trucks, 1700 bombers and fighter planes, 5000 heavy and field guns, and 25,000 machine guns. They also had to allow the Allies to occupy the Rhine's left bank and establish a bridgehead on the right bank.

They had 72 hours to agree to these terms.

The Germans returned and signed the Armistice at 5:20 AM on November 11, 1918). It was done in Napoleon III's railroad car as a reminder of the Franco-Prussian War and France's determination to reclaim Alsace and Lorraine.

The Armistice was signed to take effect on the 11th hour of the 11th day of the 11th month of 1918.

People liked that kind of symmetry, even if it meant that for 5 more hours, the fighting continued and some 11,000 more men were killed and wounded.

A few minutes before eleven, there was a final flurry of artillery fire as each side tried to get in the last word.

Then the guns fell silent.

Men timidly emerged from the trenches and met in No Man's Land, trading goods and visiting briefly before going home.

THE RESULTS OF WORLD WAR I

Introduction. At 11:00 A.M., on November 11, 1918, World War I ended. The price it had exacted in lives and material was staggering: 37.5 million casualties, 10 million deaths, and \$300 billion (not adjusted for modern inflation) in damages. People referred to a "lost generation" that never survived to come of age and take their turn in leading their nations. And indeed, the leaders of the next war, World War II, were largely from the same generation that had blundered into World War I.

When the guns fell silent, there were jubilant celebrations by huge crowds expecting life to return to the normal conditions that had existed before the war. However, World War I was like a severe earthquake with devastating aftershocks, leaving the edifice of European economic and political power badly cracked and in no shape for another such jolt that might bring it tumbling down. The results of World War I were varied, far reaching, and interlocking. However, they followed five main lines of development: one of them being concerned with the effects on Europe's colonies, two concerning Western Europe (economic effects and the Treaty of Versailles), and two concerned with Eastern Europe (the Russian Revolution and the collapse of the Hapsburg and Ottoman Empires).

Europe's colonies. World War I had been extremely expensive for the European powers. As a result, they sold many of their colonial mines and plantations for the cash needed to fight the war. This weakened Europe's colonial empires and set the stage for eventual liberation after the next big jolt to Europe's power: World War II.

Western Europe was affected in two ways: the peace settlement and the economic cost of the war. First, there was the question of what sort of peace to impose on Germany. Among the leaders at the peace conference held at Versailles was President Woodrow Wilson of the United States, whose presence symbolized America's growing role as a major power in world politics. Wilson, whose country had suffered little from the war, wanted leniency for Germany along with national self-determination for all nations and a League of Nations to safeguard the international peace. However, many leaders had to justify the senseless carnage of the past four years to voters back home

who wanted revenge for their sufferings of the past four years. This was especially true for France, on whose soil the war had been fought. Therefore, amid much bickering that settled nothing, the prevailing attitude that emerged was that someone must be made the scapegoat and pay for the war. And that someone was Germany.

The resulting Treaty of Versailles (1919) punished Germany materially and politically. Germany lost 13.1% of its pre-war territory, including Alsace, Lorraine, and the so-called Polish Corridor, a strip of land separating East Prussia from the rest of Germany. Its army was limited to 100,000 men and its navy to twelve ships. (The Germans scuttled their fleet rather than let it fall into British hands.) Germany could have no submarines, air force, heavy artillery, tanks, or even a professional general staff. It lost most of its merchant marine, one-quarter of its fishing fleet and a good part of its railroad rolling stock. Each year it had to build 200,000 tons of shipping for the victorious allies and also make deliveries of other commodities such as coal and telephone poles. The final indemnity forced from Germany amounted to \$32 billion (not adjusted for inflation). Germany also had to agree to the War Guilt Clause, according to which it accepted full responsibility for the war.

The German people were furious but, for the time being, helpless to do anything but sign the treaty. However, the Treaty of Versailles remained fixed in German minds as an injustice that must be avenged, especially since it destabilized their economy and helped lead to the Great Depression in the 1930's. This in turn opened the way for the rise of Hitler and the Nazis who started World War II.

Economically, World War I had been horribly expensive, both in its immediate cost to fight and its long-range effects on Europe's industries. In addition to selling colonial holdings, the allies had resorted to borrowing heavily, especially from the United States. By the war's end, European countries owed the United States \$7 billion. By 1922, it would be \$11.6 billion. Thanks largely to World War I, the center of world finance was shifting from London to New York City. However, the economic effects of the war went far beyond borrowing money.

For four years, European countries had been producing guns and ammunition instead of consumer goods. This had allowed other countries, the United States in particular, to take over many consumer markets from the Europeans who were preoccupied with the war. Not surprisingly, the Americans did not willingly give up these markets to the Europeans after the war. Because of this and the huge war debts, the United States became the premier economic power of the world, creating a heavy dependency on the American economy. This, combined with German instability, made the world economy vulnerable to a worldwide depression when the American economy crashed in the 1930's. And, as discussed above, that would help lead to the rise of the Nazis and World War II.

Eastern Europe. World War I also catalyzed the Russian Revolution along with the collapse of Austria-Hungary and the Ottoman Empire in South-eastern Europe. In each case, these events would destabilize their respective regions and lead to future conflicts.

The break-ups of the Ottoman and Hapsburg Empires created problems in two ways. In accordance with the principle of national self-determination, the Hapsburg Empire was broken up into four new democratic nation states: Austria, Hungary, Czechoslovakia, and Yugoslavia, while Poland, Latvia, Lithuania, Estonia, and Finland were formed from parts of the old Czarist empire. In addition there were still the various Balkan states whose squabbles had triggered World War I in the first place. While democratic in form, these new nations generally had little economic strength or history of democracy (both requiring a healthy middle class) on which to base strong democracies. Therefore, Eastern Europe was a patchwork of unstable states, providing Hitler ample opportunity for aggression that would start the Second World War. This instability along with World War II also provided fertile ground for growing anti-Semitic feelings that caused growing numbers of Jews to move to Palestine.

The break-up of the Ottoman Empire also profoundly affected the present day situation in the Middle East. The Arabs, instead of gaining their freedom for helping the allies against the Turks, as they were led to believe would happen, passed under French and British control as mandates to be

prepared for independence in the future. This created a good deal of bitterness, made worse by the Balfour Declaration (1917) which had promised the Jews a homeland in Palestine for helping the allied cause. The influx of Jewish settlers into Palestine after Nazi persecution during World War II only made that bitterness worse in the Cold War period following the defeat of Germany.

The Russian Revolution which replaced a corrupt Czarist Russia with a strong communist state, the Soviet Union, created problems in two ways. First, the hostility it generated between itself and the capitalist democracies of the West undermined any joint efforts to contain future German aggression. With the old Triple Entente threatening Germany from east and west broken, Hitler could feel freer to expand eastward in the 1930's, thus providing another catalyst for the Second World War.

World War II would eventually cause a reunion of the old alliance of Russia and the West to crush the Nazis. However, it was an uneasy alliance that would come apart in the Cold War after 1945. The Russian Revolution would also lead to the spread of communism to China and other non-industrialized nations, contributing still further to the tensions of the Cold War.

As the 1920's progressed, the world seemed to be settling down to the normalcy longed for so much since 1914. Russia withdrew into itself to complete its revolution. Germany, propped up by American loans, seemed to have stabilized. And Europe overall seemed to have recovered its prosperity and maintained control of its colonies. However, World War I unleashed unseen forces that would surface with cataclysmic effect to trigger a worldwide depression and World War II.

Aftermath: End of a World

For the victors who celebrated in the streets of cities across the globe it didn't seem like the end of the world...but in many ways it was.

German soldiers returning from the war received a heroes' welcome in Berlin. The mood in Germany was a mixed one of both relief about the end of the war and anxiousness about the future. On the one hand, German forces, while clearly defeated, had not been driven back onto

German soil at the time the Armistice was signed, giving the public the false impression that Germany had been betrayed into surrendering.

However, Germany was clearly hurting, especially from the British blockade that would continue until the final peace treaty was signed over seven months later. Until then Germany's people starved, surviving on the charity of soup kitchens and rummaging through piles of rubbish looking for cast off potato peels. Germans would remember this time as the Potato Winter.

In order to erase the shame of the Franco-Prussian War, the French victory parade celebrating the end of World War I followed the same route the Germans had in 1871 after their victory over France in the Franco-Prussian War. However, even that couldn't cover the horrible costs of the war. In 1919 the French created a tomb to commemorate nearly half of the war dead that could not be recovered or identified. Britain, the United States and other nations followed France's example of creating tombs honoring their unknown dead.

One of eight British soldiers and one of six French and German soldiers were killed in the war. Twenty-five percent of all Turkish and Bulgarian soldiers died, as did 37% of all Serbian soldiers.

Half of all soldiers in combat were wounded, some more than once, while up to 4% of soldiers in the war had their faces permanently disfigured by artillery shrapnel. There were numerous unexploded shells that lay buried in fields, posing a deadly threat to farmers and tourists for years after the war. Another leftover from the war was abandoned equipment, such as tanks, that some French peasants managed to revive and use as tractors for pulling their plows.

Financially, the war cost \$300,000,000,000 (not adjusted for inflation). During the war, Italy spent twice its combined budgets for all the years from 1865-1913, creating volatile conditions that would lead to Mussolini and the Fascists seizing power in 1923. Continued economic instability,

although masked by an illusion of prosperity, would eventually trigger the Great Depression in the 1930s.

Public monuments and buildings also tend to suffer when in the path of hostile armies. Take, for example, the Cloth Hall (below) of the old Belgian city, Ypres, which was built (the first time) in the twelfth century. After three ferocious battles that left the city in ruins, it was rebuilt exactly as it had been in the middle Ages. This pattern has been repeated numerous times since World War I and World War II.

There was also the social and psychological cost, as millions of men didn't return home or returned totally changed by war. Millions of mothers were suddenly single parents who had to both raise their children and provide for them in a world that gave women few job opportunities. The men who did return often brought with them severe psychological trauma that generated violent behavior and at times even suicide. What is especially remarkable is the fact that so many women managed to nurse these men back to health.

On a broader cultural level, there was a corresponding psychological shock against the horrors of modern warfare, as seen in art, literature, and movies. Many people even questioned the validity of a civilization that could do such horrible things to itself. Unfortunately, dictators like Hitler and Mussolini would suppress such views in their drives to revive their nations' enthusiasm for starting the next big war.

The Last Global Pandemic (So Far)

Spanish influenza, the last major worldwide pandemic, struck in 1918 and 1919. It is estimated to have killed between 50,000,000 and 100,000,000 people, (3-6% of the globe's population, making it the deadliest outbreak of disease in history. More people died in India of Spanish influenza than were killed overall in World War I. Using frozen tissue samples from the dead to recreate the virus, it was found to be especially deadly among young adults by triggering an overreaction of the body's immune system against the body itself.

Beyond the death toll, the pandemic had its more subtle effects. For example, although President Wilson himself survived a bout of influenza, there is evidence that it affected the part of the brain concerned with negotiating and that he agreed to deals he thought were victories for his principles, when in fact they were defeats. Similarly, Franklin Delano Roosevelt was deathly ill when he attended the Yalta Conference with Churchill and Stalin toward the end of World War II, seriously impairing his ability to negotiate effectively with Stalin and contain his expansion into Eastern Europe.

The Treaty of Versailles

"Like a riot in a parrot house". That's how one diplomat described the negotiations at Versailles. I've never seen or heard such a thing, and I don't think I want to. The point was that the negotiations were extremely bad tempered as each country's diplomats felt they had to take enough land and money to justify the horrors of the last four years to their people back home. Negotiations for the Treaty of Versailles began on the anniversary and 1871 in the very same room where the Second Reich and unification of Germany had been declared in 1871, just another dig by the French at the Germans.

Before it was over, the Italians would leave because Yugoslavia got part of the Dalmatian coast that they wanted; the Chinese would leave because their lands that Germany had taken were given to Japan instead of them; and the Japanese would leave angry because the victorious European allies refused to put a racial

equality clause in the treaty guaranteeing equal treatment of all races.

The Big Three who dominated the negotiations at Versailles in 1919 were David Lloyd George of Britain, Georges Clemenceau of France, and Woodrow Wilson of the United States. Wilson's participation was the first time an American president traveled outside of the U.S. during his term of office. It also marked the emergence of the United States as a world power in what would be known as the American Century.

Wilson had Fourteen Points, fourteen ideas or principles, which he hoped would bring a fair postwar solution for all involved. As Lloyd George said, God had only Ten Commandments, and here came Wilson with his fourteen. Unfortunately, although Wilson was greeted as a virtual messiah by European crowds, his efforts proved a dismal failure in the poisoned and bitter atmosphere of negotiations at Versailles. Even his League of Nations, the first attempt at a global organization to preserve world peace, was crippled by the inability of nation states to give up any of their sovereignty.

Wilson himself was hit by influenza. Although he survived, there is speculation that it affected the part of the brain concerned with negotiating and that he agreed to deal he thought were victories for his principles, when in fact they were defeats. Similarly, Franklin Delano Roosevelt was deathly ill when he attended the Yalta Conference with Churchill and Stalin toward the end of World War II, seriously impairing his ability to negotiate effectively with Stalin and contain his expansion into Eastern Europe.

Although the Germans were supposed to be given a chance to review the treaty and negotiate some of its points, the allies were so worn out and frustrated by the negotiations of the past five months that they handed the Germans the treaty with the ultimatum they sign in a week or war would resume. It was finally signed on June 28, 1919, five years to the day after the assassination of Franz Ferdinand.

The Polish Corridor, while it provided Poland with a coastline, also split East Prussia from the rest of Germany, much like Brandenburg and Prussia in the 1600s. In 1939 this would be the issue over which Hitler would invade Poland and start World War II.

Mustafa Kemal Attaturk and the Birth of Modern Turkey

After the war, allied forces occupied Istanbul and, according to the treaty of Sevres (1920), proceeded to dismantle the old Ottoman Empire. Enter Mustapha Kemal Attaturk (1881-1938), the man who is seen as the founding father and national hero of modern Turkey. The last name, Attaturk, was an honorific title indicating the reverence the Turkish people had and still have for him.

He first made a name for himself as an outstanding leader of Ottoman forces in World War I at the Battle of Gallipoli. Defying the Ottoman government, Ataturk organized national resistance against occupying Greek, Italian, British, and French forces, and in the ensuing Turkish War of Independence drove out the foreign forces. With the Treaty of Lausanne (1923), he won recognition of the modern Republic of Turkey with its capital at Ankara.

Ataturk ruled Turkey as a virtual dictator until his death in 1938. During that time he instituted a number of reforms to create a modern secular nation modeled on Western ideals. Among his reforms were adopting the Gregorian calendar, the 7-day week with Sunday as a holiday, European law codes, public education, and the Latin alphabet. He also outlawed several

distinctive Turkish customs, such as wearing the fez, which is now only seen on men riding tiny motorcycles in Fourth of July parades.

Attaturk's policies did put Turkey more in line with the West, especially during the Cold War when it joined NATO as part of a joint effort with the West to block Russian expansion southward. Since the Cold War it has tried to integrate its economy with the West by joining the European Union.

Early Twentieth Century Art (c.1900-1945)

Building upon the dramatic artistic changes of the late nineteenth century, painters in the early twentieth century explored progressively more radical approaches to art. Much of the art of this period should be seen in light of the catastrophic events of the period: World War I, the Great Depression, the rise of fascist dictatorships, and World War II ending with the nuclear attacks on Hiroshima and Nagasaki. These, along with the faster and more mechanized pace of modern life, led to a good deal of alienation and disillusionment with civilization.

The giant of the age was Pablo Picasso, who went through a bewildering number of styles that especially reflected the century's rapid pace of change. One such style was Cubism, taking Cezanne's geometric approach one-step further and reducing a scene to a collage of cubes. Another approach was that of Surrealism, where artists such as Salvador Dali and Rene Magritte, influenced by the work of Sigmund Freud, painted images of the subconscious. Finally, the period also saw increasingly abstract and non-representational art, represented by Joan Miro and Fernand Leger.

Pablo Picasso (1881-1973). Picasso is widely considered the giant of 20th century art. He reflected the century's rapid changes and best epitomized its wide range of styles, constantly jumping to or creating new styles throughout his long career. Among his early influences was the sculpture of the West African kingdom of Benin.

Although to many people Picasso is mainly associated with Cubism, that only dominated his style for a small part of his career. For example, paintings like *La Vie* and *The Tragedy*, both done in 1903, came from Picasso's Blue period, a somewhat down time in his life when he used blue as the dominant color in his paintings to express his sadness.

However, Picasso's best-known style is *Cubism*, representing everything as broken up into cubes, almost seeming to anticipate the pixelated images on computer screens. It was influenced by Cezanne's attempt to break everything down into various geometric shapes. One of its best-known examples is *Woman with a Guitar* (1912). (For those who can't tell which end is up, the word *Jolie* is written at the bottom.)

Picasso also was a sculptor, working mainly in metal and wire, although he also did a cardboard guitar. Among his most famous sculptures is the untitled 15.2-meter tall, 162 ton statue in Chicago's Daley Plaza. Not sure whether it represents an angel, a horse or a woman, Chicagoans just call it the Picasso.

Picasso's most controversial work was the huge mural, *Guernica*, (1937), protesting the aerial bombardment of civilians during the Spanish Civil War. This was one of his few political statements.

Expressionism. Starting in the early 1900s, Expressionism is more a term of reference than a specific movement. It largely reflected Friedrich Nietzsche's theory of the dualism between the Apollonian (rational) and Dionysian (emotional) experiences. Expressionism rejected the older academic standards of art in favor of expressing gut emotions, although it didn't go as far as the nihilism of the Dadaists who asserted art had no meaning. Among its most famous artists was Paul Klee (1879-1940),

Paul Klee (1879-1940), "The Mask with the Little Flag", (1925)

Art and the Great War. Art inspired by World War I, while stylistically fitting in with other art of the early twentieth century, deserves its own category, since it expresses the common theme of the psychological scars that conflict left on our civilization. Some of better-known artists were Wynne Nevinson, Paul Nash, William Orpen, Otto Dix, and Georg Grosz.

Paul Nash, *We Are Making a New World*

Dada was largely a nihilistic reaction in the 1920s to the chaos and turmoil of modern society, especially World War I. Dadaists rejected conventional standards of beauty in art and denied their art had any meaning. The term Dada is a nonsense word in German meaning "nothing at all" to emphasize its lack of meaning. Ironically, some would say that, by rejecting conventional standards of beauty

and meaning in art, Dada just set a new standard and meaning defined by Dada. Dadaism was a forerunner of Surrealism.

Surrealism. Growing out of the Dadaist movement in the 1920s, Surrealism also rejected standard academic art standards. However, the Surrealists asserted that ordinary depictive images were important, but should be open to the full range of human imagination. Especially influential was Sigmund Freud's work with free association dream analysis and the unconscious. In that spirit, Salvador Dali would keep an easel by his bed so he could sketch out his dreams as soon as he awoke.

Rene Magritte (1898-1967), *Time Transfixed*, 1938,

Joan Miro (1893-1983) was a Catalan artist whose surrealist approach was one of improvised art removed from any conscious control. He worked spontaneously moving his brush over the canvas, drawing squiggles in a trancelike state or slapping on paint in a frenzy often intensified by hunger from only affording one meal per day.

Salvador Dali, *The Persistence of Memory*, 1931

Salvador Dali (1904-89) was one of the most flamboyant and unusual artists of the 20th century. He was terrified of insects, trains, boats, the metro, buying shoes, crossing streets, and

baring his feet in public. He was prone to laughing hysterically and uncontrollably, which is how he met his wife. He carried a piece of driftwood to ward off evil spirits and promoted himself with such stunts as lecturing at Sorbonne with his foot in a pail of milk, or giving a press conference with a boiled lobster on his head.

One stunt backfired and nearly killed him when he gave a speech in a diving suit sealed on top by a radiator cap. Unfortunately, the radiator cap cut off his oxygen and he couldn't get it off. When he gestured frantically for help to get it off, the audience, thinking it was part of his stunt, started applauding. Luckily, someone finally saved him.

After World War II, a number of Dali's paintings such as *Nuclear Cross*, *Exploding Madonna*, *Maximum Speed of Raphael's Madonna*, and *Three Sphinxes of Bikini* reflected his fascination with nuclear energy. Despite his weirdness, Dali apparently was also religious, doing paintings of Christ's crucifixion and the Last Supper.

Dali also did a very unflattering portrait of Picasso, his explanation/excuse being that he portrayed beauty while Picasso portrayed ugliness.

Art Deco. Popular in the 1920s and 1930s, this new style drew influences from Art Nouveau, Cubism, and abstract art. The austerity and stark simplicity of its straight lines were meant to reflect, and glamorize, life in the modern machine age.

Art Deco also heavily influenced architecture during this time, one of the most notable examples being the Chrysler Building (1930).

The Wreck of Old '97 by Thomas Hart Benton, *Red Canna* by Georgia O'Keefe, and *Gas* by Edward Hopper

Diego Rivera was a world famous Mexican artist whose work reflected his communist views. He is especially remembered for his work in Mexican Muralism, a movement in the 1930s that had strong social and political undertones relating to Mexico. His work also signaled a more global culture emerging as the 20th century progressed.

La Civilización Tarasca

A great art hoax. Paul Jordan Smith, as his “artistic” alter ego, Pavel Jerdanowitch, was the inventor of *Disumbrationism*, a fake school of art he publicized through the Los Angeles Times in 1924. Originally done as a tongue-in-cheek parody of modern art, it was a hit with art critics for three years until Smith revealed it was a hoax.

For example Jerdanowitch explained that *Exaltation* (below), showing a woman waving a banana, represented the breaking of the shackles of womanhood as she has just killed a missionary (if you look closely you can see the missionary's skull sitting on a pole behind her). In addition, she has just taken a bite of a banana, even though women are forbidden to eat bananas on her island. She is waving the banana above her head to represent her newfound freedom.

American Artists. Just as the 20th century has been called the American Century, a number of its artists worked their way into the mainstream of the art world. Three such artists were Thomas Hart Benton, Edward Hopper, and Georgia O'Keefe, especially remembered for her lush close-up paintings of flowers. All three captured the unique American character with its wide-open spaces and emerging urban culture.

BACKGROUND TO THE RUSSIAN REVOLUTION

Causes and background. One of the most startling and far-reaching results of the First World War was the Russian Revolution. Not only did it affect the largest nation on earth, it also had a huge impact on the rest of the world, helping lead to both World War II and the Cold War following it. While World War I may have triggered this Revolution, its roots go much further back into its history and geography in two ways.

First of all, Russia's flat and open terrain made it vulnerable to invasions that forced the Russian Czars to develop a strong absolutist state in self-defense. Second, Russia's huge size, northerly location, and isolation from Europe kept Russia cut off from the mainstream of political, economic and technological developments taking place in Western Europe. Therefore, Russia's geography and history made it a slow moving, autocratic, and backward giant that was constantly falling behind the more advanced societies in the West.

This triggered a vicious cycle of reforms to catch up with the West, a conservative backlash against the reforms, Russia falling further behind the West, more reforms, and so on. Unfortunately, not all Russians felt the West was worth copying. This led to a conservative backlash that would wreck the reforms, causing Russia to fall further behind, and so on. Peter the Great in the early 1700's, Catherine the Great in the later 1700's, Alexander I in the early 1800's, and Alexander II in the mid 1800's' all tried, or at least espoused, the cause of reform which led to conservative backlashes and the cycle repeating. That struggle is still going on in Russia today.

By the 1890s Russians could no longer ignore the forces of industrialization transforming the rest of Europe and leaving it further and further behind. Therefore, reformers targeted Russia's repressive government that used secret police to track down socialist dissidents, its backward social structure that kept the peasants in virtual serfdom, and its equally backward economy just starting to industrialize. Two other factors also pushed Russia toward change. One was the rising popularity of socialism. A more immediate catalyst for change was Russia's

humiliating defeat in a war with Japan (1903-5) that dramatized Russia's backwardness.

All this set off the Revolution of 1905, which took Czar Nicholas II by surprise and forced him to agree to both political and economic reforms. The main political reform was the establishment of a *Duma* (parliament), which attempted to turn the Czar's absolute government into a constitutional monarchy. However, once the revolution settled down, the czar did all he could to crush and eliminate the Duma. Nevertheless, the Duma, however limited in power, persisted in being a voice for reform even as political repression reasserted itself.

At the same time, substantial economic reforms were taking place. The Czar's chief minister, Peter Stolypin, pushed through reforms that distributed land to some two million peasants. This gave peasants an incentive to produce more, and, by World War I, 75% of Russia's crops were going to market, with 40% of those crops going abroad. This, combined with Russia's political repression, created a gap between its economic progress and political backwardness. All that was needed was a catalyst to trigger a full-scale revolution. That catalyst was World War I.

Many Russians, like other Europeans, greeted war jubilantly in 1914, sure that they would win a quick and glorious victory. In fact, Russia was poorly prepared for war. Its troops, although brave, were barely trained, poorly equipped (many not even having rifles), and incompetently led. Their war minister boasted of not having read a new book on military tactics in twenty-five years. As a result, Russian armies met with one disaster after another. Aggravating the situation was the Czar, Nicholas II, a weak willed man who was controlled by his wife, the Tsarina. She herself was German born and of suspect loyalty as far as many Russians were concerned. She was also under the spell of Rasputin, a drunken, semi-literate Siberian peasant posing as a monk. He did have the apparent ability to control the bleeding of the crown prince, who was a hemophiliac, along with an apparent hypnotic power over women. While scandal reigned at court (at least until Rasputin was murdered), Nicholas took personal command of the war effort, with catastrophic results.

Creating the Proletariat

An early attempt to create an enlightened proletariat was a movement known as “Going to the People”, whereby socialists went out into the countryside to educate peasants about the joys and merits of socialism. However, many peasants, fearing this was a trick by the Tsar’s secret police, the Okhrana, to lure radicals into the open so they could arrest them, would often turn in the socialists to the authorities to protect themselves.

Disillusioned and on the run, socialist groups went underground, sometimes literally, to avoid notice by the Tsar’s agents. In addition to secretly printing seditious literature they were constantly playing cat-and-mouse games with the authorities, carrying documents in trunks with false bottoms and writing the real messages in milk between the lines of more innocuous letters, the recipients reading the real messages by holding the letters up to a candle. More radical socialists (aka Marxists) turned to drastic, and even violent, tactics to gain publicity and stir up support for their cause, successfully assassinating Tsar Alexander II with a bomb in 1881 (above).

Alexander II’s emancipation of the serfs in 1861 still required them to make yearly reparations to nobles, leaving them little better off than before. Therefore, when industrialization started in Russia in the 1890s, it triggered a massive flight from farms to jobs in the cities, although workers still had to labor 15-hour shifts in the factories and in 18-hour shifts in the mines.

Many or most of these workers were seasonal migrants (below), working part of the year on their country farms and migrating to work in the factories and mines the rest of the year. As a result, they came into contact with educated workers who taught them about Marxism. Thus Lenin’s assumption that there weren’t enough urban proletariat familiar with Marxist doctrine to carry out a revolution may not have been so true.

Rule of Thumb

A popular Russian urban legend (i.e., a story that isn’t true but we wish it were) concerns the route for the railroad between Moscow and St. Petersburg. Completed in 1851 (with the usual heavy loss of life plaguing nearly any event in Russian history), it ran straight as an arrow except for an eleven-mile (17 km.) bend. This bend gave rise to the story that the tsar, Nicholas I, planned the route by using a straight edge to draw a straight line on a map between the two cities, but inadvertently drew a bend around his thumb or finger that was holding down the straight edge. Since no one dared point out this mistake or defy the tsar’s wishes, they built the railroad with the bend in it. If only it were true.

In reality, the bend was done to circumvent a steep gradient that early locomotives had trouble dealing with. Locomotives on the way up the gradient toward Moscow needed up to four other locomotives to ascend it. Conversely, those going down built up so much speed they couldn’t stop at the next station.

The “Beer Stampede” of 1896

After Tsar Nicholas’ formal coronation in 1894, there were rumors of a free banquet scheduled for the common people where everyone would receive a bread roll, a piece of sausage, pretzels, gingerbread, and a mug). In anticipation of the handout, a huge crowd (one estimate said 500,000 people) gathered early in Khodynka field in Moscow. Unfortunately, another rumor spread that there wasn’t enough beer for everyone, starting a stampede that trampled 1,389 people to death.

Nicholas thought it would seem insensitive to attend a festive ball held for him at the French embassy that night, but his brothers convinced him otherwise, saying not attending would insult the French, whose alliance the Russians were courting. The Khodynka incident and Nicholas’ decision to attend the ball raised a lot of anger among the public and even predictions of his imminent downfall.

The Russo-Japanese War and Revolution of 1905

A Russian cartoon shows Russia's expectations of a quick and easy victory over the "inferior" Japanese. Reality proved radically different and disappointing for Russia.

The first blow in the war between Japan and Russia was a surprise attack that destroyed the Russian Pacific Fleet at Port Arthur. This forced Russia to bring its Baltic fleet all the way around Europe, Africa, and Asia to the Pacific, only for it to be destroyed at Tsushima Strait (6/27/1905) in one of history's most decisive naval battles.

However, that was hardly the end of it, as the war shifted to a land struggle. Despite Japan's early and easy naval victories, the fighting now boiled down to a bloody and prolonged war of trenches, barbed wire and attrition that seemed to predict the fighting of the first World War, if anyone was listening. Unfortunately, few were.

Hampering Russian efforts was the existence of only one thin rail line for moving all their men and equipment thousands of miles across Siberia. Much like World War I a decade later, the battle of Mukden in 1905 (above) was fought along a continuous hundred-mile front. While it cost Russia 61,000 men, Japan suffered 41,000 casualties and was almost forced out of the war. However, the loss of both its fleets and the staggering effort of fighting a war thousands of miles to the east led to the government in St. Petersburg giving up first.

Now watch me make this shot. Supposedly, when a messenger brought news that the Japanese had destroyed the Russian Baltic fleet at Tsushima Straits, Nicholas was playing tennis. He stopped to read the note, crumpled it up, put it in his pocket, and resumed playing.

"Bloody Sunday" (1/9/1905) was the incident that triggered the Revolution of 1905. It started as a peaceful demonstration (below) by the Winter Palace in St. Petersburg to protest bread shortages caused by the war with Japan. However, for whatever reasons, the army opened fire, killing several demonstrators and triggering a stampede that killed still more.

Spoiling for a fight. When officers on the battleship *Potemkin* proposed shooting sailors who refused to eat spoiled meat, the sailors threw them overboard and joined the revolution in June 1905. For a while it was feared the entire Black Sea fleet would revolt.

Despite barring soldiers, sailors, students, and anyone under age twenty-five from membership in the Duma and dismissing it three times, hoping the new Duma would be more passive, each new version proved as independent-minded as the last.

"The Mad Monk"

Rasputin "the Mad Monk" was by most accounts a drunken, lecherous, semi-literate Siberian peasant who claimed to be a monk. He was rumored to belong to the Khlysty, a mystical group that combined flagellation and sexual orgies. Photographs show him having a mesmerizing gaze that gave him incredible power over women, especially the czarina. He also had some influence over Nicholas, convincing him that a comb he gave the tsar before an important meeting was magic and would bring him good luck.

However, Rasputin had an uncanny ability to control the bleeding of the hemophiliac tsarevich, for which reason he became the most

trusted advisor for the already unpopular Czarina. Either hypnotism (which he may have used), some common sense suggestions to relieve stress (which aggravates the condition), or a combination of the two may indeed have helped relieve the tsarevich's symptoms.

Complicating the situation was the royal family's feeling they had to hide the reason for Rasputin's status at court, because revealing the tsarevich's medical condition would make them look weak to their subjects. Not that the tsar Nicholas, who signed letters to his wife "your poor little weak-willed hubby," didn't already appear weak.

The tsarina Alexandra's German origins also created public relations problems concerning whom she was really loyal to during the war. In one joke, the little tsarevich (tsar's son) is found crying. When asked the reason, he replies: "When the Russians lose, my father cries; when the Germans lose, mother cries. When am I to cry?"

Rasputin's murder. On December 12, 1916 Rasputin was murdered by a conspiracy of nobles disgusted with his behavior and influence. But killing him wasn't easy. First, they gave him several cakes and glasses of wine dosed with enough cyanide to kill five people, but with no apparent effect. Therefore, one of the conspirators, Felix Yusupov, got a pistol and shot Rasputin in the back, leaving him for dead. However, when the conspirators returned to check on the body, Rasputin suddenly lunged at Yusopov, trying to strangle him. Therefore the other conspirators put three more bullets in Rasputin, one of them through his forehead. When he continued struggling to get up, they clubbed and castrated him, wrapped the body in a carpet, and dumped it in the icy waters of the Neva River.

Three days later, Rasputin's poisoned, beaten, shot, castrated, and drowned body was discovered. His arms were in an upright position, indicating he had broken loose of his binding and was clawing to get out of the carpet. In addition, he supposedly had water in his

lungs, indicating he was not dead when thrown into the river.

Some believe the British took part in the murder, because one of the bullets came from a British officer's pistol. They had a motive, since Rasputin opposed the war and the British feared his influence would take Russia out of it, thus freeing overwhelming German forces for the Western Front.

Although pressure from the nobles got Rasputin's murderers off the hook, he remained popular with the common people, and legends about the "Mad Monk" subsequently grew and spread. In one of these he supposedly predicted St. Petersburg would change its name three times in the twentieth century, which indeed happened: from St. Petersburg to its Russian form, Petrograd, during World War I, then to Leningrad during the Communist era, and back to St. Petersburg after the fall of Communism.

Rasputin's daughter, Maria, escaped to France after the October Revolution. Later she migrated to the United States, where she worked as a dancer and a tiger trainer in a circus.

AN OVERVIEW AND COMPARISON OF THE FRENCH & RUSSIAN REVOLUTIONS (1917-)

Introduction. As indicated in the discussion of the French Revolution, there is a logical and long-range pattern that revolutions follow. Therefore, understanding the pattern of past revolutions can help us anticipate events in current revolutions, more specifically the final stages of the process now taking place in Russia and China. One word of caution, however: these are likely trends, not absolute certainties. Outside events (e.g., a major war) and other historical forces unique to Russia and China respectively, could divert events in a very different direction from what is indicated here. Still, this pattern generally holds up and should serve as a guide in how we deal with nations still undergoing this process. That being said, following is a comparison of the French Revolution, which after 82 years finally reached a stable democratic form of government by 1871, and the Russian Revolution, which after 92 years is presumably in its final stage of evolution toward democracy.

Forces leading to revolution. Both countries shared three elements that helped lead to war:

1) Both regimes were burdened by heavy debts incurred from wars. In France's case, this was the debt incurred by its support of the American Revolution. For Russia, this was the even higher cost in lives and money suffered during the first three years of World War I.

2) In each country, there was a growing gap between economic progress and social and political stagnation. For the French this was the continued prominence and privileges of the noble class as opposed to the more liberal ideas and progressive economic practices of the middle class. For Russia, this largely came from the peasantry, whose economic progress from Peter Stolypin's agrarian reforms contrasted with the repressive rights and privileges of the nobles. In each case new political ideas aggravated these frustrations. In France these were the ideas of Enlightenment philosophes such as Rousseau and Voltaire. In Russia it was Marxism.

3) Both countries had weak leaders who let events get quickly out of control. In France and

Russia respectively, these were Louis XVI and Nicholas II.

The early stages of revolution. Both revolutions started out with moderate regimes that kept one or more of the old regimes' policies to maintain the look of continuity and legitimacy. In France, that government was the National Assembly, which kept the king as a figurehead and honored the royal debt. In Russia, it was the Duma, which kept Russia in World War I. In both cases these policies just worsened the situation, leading to more unrest. Further aggravating both situations was the fact that replacing an old system with a completely different one (whether in politics, business, or sports) typically sees things deteriorate further before they improve. Unfortunately, the high expectations for rapid improvement did not give the new regimes the time they needed to turn things around.

The crisis stage of revolution. Faced with growing unrest at home and military defeats abroad (the French having rashly declared war on Austria and Prussia in 1792), the moderate governments in France and Russia saw the rise of more radical factions supported by the urban working classes, which alarmed foreign powers and spurred them to intervene before the respective revolutions got out of control. Such intervention (by the First Coalition in France's case and Russia's erstwhile allies in World War I) in the short run just destabilized France and Russia further, which led to more military defeats, more support for the radicals, and so on.

In each case, this was the crisis stage of the revolution, where extreme radicals seized power and imposed harsh dictatorial rule to deal with the current emergency. In France it was the Jacobins, supported by the Sans Culottes, who imposed emergency economic measures, a universal draft, and the reign of terror. Similarly, Russia saw the Bolsheviks, supported by the working class soviets who imposed war communism to deal with the economic crisis and the Red Terror, which they consciously copied from the French Revolution's Reign of Terror.

Conservative retrenchment and the dictator stage. In both revolutions, final victory and

exhaustion from the crisis stage led to a brief conservative retrenchment to help their respective peoples recover. In France this was the period of the somewhat loose and corrupt Directory (1785-99). In Russia, this was Lenin's New Economic Policy that allowed a degree of free enterprise to return so the economy could recover.

However, the overthrow of the Directory by Napoleon Bonaparte and Stalin's rise to power after Lenin's death in 1924 led to ruthless dictators who masked their repressive regimes with the revolutionary ideals they supposedly represented. Although Napoleon was finally defeated and Stalin won World War II and kept power till his death in 1953, both dictators effectively ruined their respective countries with their harsh policies.

Gradual evolution toward stable economy & democracy. Therefore, Russia has taken longer in its evolution toward democracy than France did, because it took another thirty-five years for Russia to finally collapse beneath the weight of the Stalinist system. Despite, this, Russia has continued to follow a path similar to France's. After Napoleon France would undergo two more revolutions (in 1830 and 1848) and abortive attempts at democracy that would lead to a second dictatorship, this time under Bonaparte's nephew, Napoleon III. Unlike his uncle, Napoleon III was much less aggressive in his foreign policy, focusing on France's economic and industrial development. As a result, when Napoleon III fell from power in 1870 during the Franco-Prussian War, he left behind a strong economy and politically active and savvy middle class that ensured the stability of France's Third Republic.

Likewise, Russia would see the overthrow of communism in 1991 and the establishment of a republic. However, as with France in 1830 and 1848, Russia's economy was a shambles and it had virtually no middle class with which to sustain a viable democracy. Since then, Vladimir Putin has taken charge and, much like Napoleon III, has ruled with a firm hand while promoting economic growth. Presumably the middle class emerging from that growth will establish a stable democracy sometime in the future.

THE RUSSIAN REVOLUTION AND CIVIL WAR (1917-20)

"We are not carrying out war vs. individuals. We are exterminating the Bourgeoisie as a class. We are not looking for evidence or witnesses to reveal deeds or words vs. the Soviet power. The first question we ask is to what class does he belong, what are his origins, upbringing, education or profession? These questions define the fate of the accused. This is the essence of the Red Terror-- M. Y. Latsis

The 1917 Revolution and Bolshevik triumph. Not only was Russia bleeding from war, it was also starving. This situation sparked bread riots in Petrograd (renamed that from the German St. Petersburg) in March 1917. Day after day the riots escalated as the government failed to respond decisively to the crisis. Many soldiers joined the demonstrators, Nicholas abdicated his throne, and the *Duma* set up a moderate republic under Alexander Kerensky.

The Russian Revolution followed a course very similar to that followed by the French Revolution. For one thing, its first government, like France's National Assembly, was a moderate government that tried to maintain respectability by following many of the old monarchy's policies. The most ruinous of these policies was its commitment to stay in the war against Germany. This merely intensified the turmoil and anarchy that the war had already generated, which led to more defeats, and so on. The more radical elements agitated for more sweeping changes to undermine the government's power while exploiting its tolerance and weakness.

The most important of these groups was the radical Marxist party known as the *Bolsheviks*. (meaning "majority" although they only represented a minority of Russian socialists, let alone the population). Their leader, Vladimir Ilyich Lenin, was a hardened revolutionary and prolific writer, whose career had involved avoiding the Czar's secret police, spending time in a prison camp, and publicizing Marxism through his writing while in exile. Ironically, when revolution broke out, the Germans sneaked him into Russia, hoping he would

destabilize Russia and knock it out of the war. He did that and much more.

When Lenin arrived in Petrograd, he immediately set to work to organize a revolution that would overthrow Kerensky. The steady deterioration of Russia from the prolonged war effort played into his hands, and the Bolshevik program, summarized in the slogans "Bread, peace, and freedom" and "All power to the Soviets" won many followers, especially among the *soviets* (workers' councils organized in the factories). Finally, on November 7, 1917, the Bolsheviks made their move. Having already seized key strongpoints such as bridges, railroad stations, and telegraph offices, they easily overthrew Kerensky's government.

Lenin acted quickly in both domestic and foreign policies. In foreign affairs, as he had promised, Lenin pulled Russia out of World War I by signing away large territories in the Treaty of Brest-Litovsk in March, 1918. Russia's allies were furious since this freed one million German soldiers for the Western Front. They also feared and hated the Bolsheviks for their claim that they would overthrow Capitalist society. Therefore, the allies, especially Britain and the United States, landed troops in Russia to try to overthrow the Bolshevik government.

Facing strong opposition at home and abroad, much like the Jacobins had in 1793, Lenin followed strict domestic policies. Private property was abolished, industries and banks were nationalized, and the press, briefly free under Kerensky, was once again strictly censored. This combination of internal resistance and foreign intervention led to civil war.

The Russian Civil War (1918-20). At first the Bolsheviks (also known as the Reds), like the Jacobins in the French Revolution, were heavily outnumbered by their enemies (the Whites) and controlled only about 10% of Russia. That was mainly around Moscow, which they had switched to their capital since it was inland and harder for invaders to reach. The fighting was very confused and brutal, with massacres on both sides. However, the Bolshevik leader, Leon Trotsky, starting with a few units of militia known as the Red Guard (similar to the National Guard in the French Revolution) built the Red Army into a strong and effective force of 5,000,000 men.

Desperate for experienced leaders, he forced old royalist officers into service. To ensure their efficiency and loyalty Trotsky held their families hostage and used a system of political advisors, *Commissars*, similar to the French Revolution's representatives on mission. Trotsky's methods were successful, and by 1921, he had cleared Russia of the foreign invaders and crushed the Whites.

The Women's Battalion of Death and Mother Russia

Russia's patriarch blesses the 140 members of the women's Battalion of Death in 1917.

As the war effort became more desperate, the provisional government recruited a special unit of women known as the Women's Battalion of Death. Many women enthusiastically supported the Revolution as an opportunity to raise their own status. While pictures of these women make them seem very modern and military with their uniforms and shaved heads, closer looks show that some of them were still wearing high heels. Sources differ over whether this battalion took part in any serious combat.

However, the battalion's very existence and Russian women's active participation in the thick of combat in World War II, both as partisans and regular soldiers, says a great deal about the traditional Russian view of women compared to that of the West. While the West saw women as frail, dainty, and weak, being unfit for combat nursing, not to mention combat, the Russian stereotype of a woman tended to be larger and stronger than her counterparts in the West, fit for hard work in the fields and even combat if the need arose.

Workers' and Soldiers' Soviets

A meeting of soldiers in March 1917 who have formed their own soviet.

Soviets were councils formed by the workers themselves. In Petrograd workers formed a soviet the same night the Duma's government was established. This threw Lenin for a loop, because, according to his theories of revolution, the workers didn't have the political consciousness to organize themselves. However, since the soviets tended to favor some sort of socialism, he used them to further the Bolshevik cause and then worked to bring them under control after the Russian Civil War.

Soldiers' soviets also formed as a sort of communist fifth column within the ranks. At first, the Bolsheviks just used them to express their views while still showing respect to their officers, with only a few instances of violence. Not until the Civil War did open hostility break out between old and new elements in the army.

Lenin

Lenin (1870-1924) was the pseudonym for Vladimir Ilyich Ulyanov. Like most of the early Bolshevik leaders, he came from a well-educated middle class family that put high value on education and hard work. Young Ilyich was very precocious entering high school at age nine and graduating with a 98% average in his courses.

His older brother's execution as a revolutionary profoundly affected young Ilyich. For one thing, it made it hard for him to get into the University of Kazan, and when he did, his own

revolutionary activities quickly got him expelled. Therefore, he studied on his own, earning a four-year degree in one year. In 1890, he discovered Marxism and pursued revolutionary goals through writing. He was a prolific author, writing some ten million words during his life, most of them presumably in coherent sentences.

Lenin was hard working and physically fit, had no real vices, and liked little jokes and playing chess. However, his brilliant abstract ideas and total devotion to the revolution made him somewhat brusque and insensitive to the more human aspects of what revolution is about.

In 1897 the tsar's secret police caught Lenin, earning him a year in jail and three more years in Siberia, where he met his wife and formed the Russian Social Democratic Party, an underground movement unlike any other in Europe. In 1900 he was allowed to leave Russia and lived in a number of European cities where he edited various socialist journals such as *Istra* (*The Spark*).

Lenin's mug shot after being arrested for political activities

Bolsheviks and Mensheviks. During this time, Lenin's faction split with another group over how they should carry out a revolution. Lenin's group wanted a small rigidly disciplined party to organize workers and peasants for the revolution, ruling them with an oxymoronic sounding government known as the Dictatorship of the Proletariat. The other group wanted a broadly based, liberal, middle class movement. Because Lenin's group had more votes at that particular meeting, they took the name **Bolsheviks** ("*Majority*") while the opposition was stuck with **Mensheviks** (Minority). The irony, of course, was that the Mensheviks represented a much larger section of the population than the Bolsheviks did.

Lenin hailed Russia's defeat in the war with Japan as the beginning of a Russian and European revolution, as "progressive" Asia defeated retarded reactionary Europe. (Radicals in the U.S. did much the same thing during the Vietnam War whenever American troops suffered a setback.) When revolution broke out in 1905, Lenin secretly entered Russia to organize the Bolsheviks. To support the party's activities, he "liberated funds" (AKA robbed banks) along with another young Bolshevik, Joseph Stalin. Two years later he left Russia with the police on his trail and would be gone until the next revolution broke out ten years later.

When Revolution broke out in 1917, the Germans smuggled Lenin and other radicals into Russia in a sealed train, hoping to destabilize it and take it out of the war. (That's a move the Germans probably wished they could take back.)

Upon his arrival in Petrograd (the Russified new name for St. Petersburg), Lenin immediately gave a speech denouncing the war as a capitalist scam:

"Capitalist pirates are destroying Europe for the sake of a handful of exploiters. The defense of the Fatherland is the defense of one set of capitalists against another!"

Growing Anarchy and the October Revolution

"Capitalist pirates are destroying Europe for the sake of a handful of exploiters. The defense of the Fatherland is the defense of one set of capitalists against another!"--Lenin denouncing Kerensky's government after arriving in Petrograd (April, 1917)

At the first All Russian Congress of Soviets in Petrograd (June 1917) the Bolsheviks only had 105/822 delegates and maybe 20,000 followers in a country of 160 million. Yet that didn't stop Lenin from claiming that the one party strong enough to rule Russia was the Bolsheviks, who would publicize the war profits of up to 100 capitalists and pull Russia out of the war. While the Mensheviks drew the most applause from the

Congress' delegates, the mob in the gallery cheered Lenin.

Meanwhile, Russia was coming apart at the seams, as peasants seized lands for themselves and looted the homes of the rich. In the cities, workers, urged on by the Bolsheviks, agitated for bread and control of the means of production. In one case, they tied a factory manager up in a bag and threw him into the Moscow River. Meanwhile, in non-Russian areas such as Finland and Ukraine independence movements were emerging.

The war effort was doing even worse, as discipline deteriorated and the Bolsheviks even urged Russian soldiers to fraternize with the Germans, disobey their officers, and erase any distinctions between ranks. A disastrous offensive by Kerensky led to a million deserters wandering the Russian countryside, creating more havoc and spreading Bolshevik propaganda.

A loyalist soldier tries to stop some of the million deserters as Russia's war effort fell apart

In July 1917 military defeats triggered protests and a failed attempt to overthrow the Provisional government Alexander Kerensky, who took formal control of the government on July 21, ordered Lenin shot on sight as a German agent. As a result the Bolshevik leader went into hiding for the time being.

Soon afterward, Kerensky's top general, the conservative Lavr Kornilov, led a counter-revolution. Kerensky called on the various socialist groups in the Petrograd Soviet, including the Bolsheviks, to unite with him to stop Kornilov. Railway workers, who were largely Bolshevik, managed to divert some of Kornilov's trains and stop others, convincing the soldiers to give up on the coup. This incident

further discredited Kerensky and raised the Bolsheviks' status.

Lenin in disguise to help him sneak back into Russia. He wanted to go as a deaf-mute, but his wife reminded him that he talked in his sleep.

As Bolshevik influence grew in Petrograd and the countryside, they won numerous soviet elections until September 12 when the Petrograd Soviet overwhelmingly supported a resolution to nationalize the land and industries and to make peace. Lenin, who was directing operations from exile, sensed the time to strike was nearing, especially after two Bolsheviks published an article publicly declaring they were about to overthrow Kerensky's government. Lenin returned on October 23, and after a ten-hour meeting to debate whether the time was ripe, decided to seize control of the government.

On the night of November 6-7, the Red Guard (consisting largely of young toughs and the unemployed) seized key strong points (bridges, railroad stations, power stations, and telegraph offices). In addition, the cruiser, *Aurora*, showed up to shell any government resistance. That morning, the Bolsheviks made their move, and it was over almost as soon as it began as Kerensky's quickly collapsed.

"Go where you belong from now on-- to the trash heap of history"--Leon Trotsky to Kerensky's followers after seizing the Winter Palace.

Historical reenactments. Since virtually no fighting took place in storming the Winter Palace, it had to be reenacted (below) with some "professional embellishment." Similar reenactments would be done to "record" the Russians closing the trap on the Germans at Stalingrad in 1942 and the meeting of the Americans and Russians at the Elbe River at the end of World War II.

Russia Drops Out of the War

Russian & German soldiers dance together upon news of the ceasefire in December 1917

Brest-Litovsk. Negotiating the treaty to pull Russia out of the war was complicated by the Bolsheviks' rhetoric openly claiming their worldwide revolution would topple capitalism forever. Declaring one's intention to destroy someone's way of life never helps resolving individual personal differences, and it doesn't help in international diplomacy either.

In addition, Trotsky, the leader of the Russian delegation, refused German demands for territory by declaring a unilateral withdrawal of Russia from the war without a treaty, summing up his position as "no war—no peace." When the Germans responded by resuming the war and seizing more territory, the Russians gave in, surrendering Finland, Lithuania, Estonia, Latvia, Ukraine, and Poland, costing Russia one-quarter of its population and industry and 90% of its coal. Germany took most of these territories, but quickly lost them when it surrendered to the Western allies eight months later. Except for Ukraine, the lost territories became independent nations until World War II, after which Stalin would rule or dominate them again.

Taking all those lands from Russia may have seemed a good idea in March 1918, but it backfired a year later, since it had set a precedent that the allies could use to justify in taking German lands in the Versailles settlement.

Lenin's "Dictatorship of the Proletariat"

"Turning the world upside down". Following is a series of decrees designed for, as Lenin put it, "turning the world upside down" & moving Russia towards being a truly socialist society: Nov. 10- Peter the Great's Table of Ranks was abolished.

Nov. 22- House searches were organized to confiscate fur coats for the poor.

Dec. 11- Schools were taken from the Church and made public for all.

Dec. 14- The state seized the banks and put industries under worker control.

Dec. 16- Army ranks were abolished.

Dec. 21- A new law code was established for "Revolutionary courts."

Dec. 24- All factories were nationalized by the workers (i.e., the state).

Dec. 29- Interest and dividend payments were ended and withdrawals were severely limited.

As one Russian described it: *"Every morning the inhabitants carefully studied the new decrees, still wet & crumpled, pasted on the walls; they wanted to know what was permitted & what was forbidden."*

The reality of what people wanted from the revolution was somewhat different from Lenin's cerebral goals of a Marxist utopia and a dictatorship of the proletariat. Out of 100 petitions submitted by workers in March 1917, 51 wanted shorter work shifts, 18 wanted higher wages, 15 better work conditions, and 12 wanted more rights for workers.

One election every 74 years isn't so bad. In November 1917, right after the October Revolution, the Bolsheviks held free elections for the Constituent Assembly. However, they only got 24% of the vote, while Kerensky's supporters got 58%.

Therefore, on January 5, 1918 the newly elected Assembly found (pro-Bolshevik) sailors from the Baltic fleet guarding the building. Despite this intimidation, the delegates voted 237 to 138 against declaring the Bolsheviks the ruling party, causing the sailors to dismiss the meeting and dissolve the Assembly. In a subsequent peaceful demonstration protesting this, several people were killed, and with them died democracy in Russia.

The next free election would be in 1991, only 74 years later.

Freedom of the press didn't last long either. Claiming they were "sowing sedition through demonstrably slanderous distortions of fact" (i.e., telling the truth), Lenin shut down virtually all newspapers, except the state paper *Pravda*, which, ironically, means *Truth*.

The logic of Lenin's "dictatorship of the proletariat". To see how Lenin justified his harsh rule, just follow the reasoning below step by simple step.

The working class (proletariat) is the voice of the people as a whole

...and the Soviets are the voice of the proletariat

...and the Party is the voice of the soviets

...and Lenin is the voice of the Party.

...Therefore, Lenin's "dictatorship of the proletariat" is the highest expression of democracy.

It's just that easy.

The Russian Civil War (1918-21)

American troops guard Bolshevik prisoners during the Russian Civil War

The Russian Civil War was an especially confused conflict, since it involved foreign intervention, multiple factions, including peasants who were hostile to both sides, and even

a foreign army (the Czech Legion), which was just trying to escape Russia by going all the way east across Siberia and then sailing around Asia and Africa to get home.

Cossacks usually fought for the Whites to gain freedom from the Reds. Therefore, the Whites usually had better cavalry than the Reds, a crucial factor in warfare ranging across Russia's wide expanses of flat land.

Who needs ranks anyway? One of the stranger Bolshevik reforms was abolishing military ranks as part of the bourgeois hierarchy. In addition to electing their officers, soldiers' councils voted on strategy and whether to work beyond one shift or defend a particular position. The only reason the Red Army survived these conditions, which lasted through the first half of 1918, was the weakness of the opposing forces. By 1922, the Red Army had a regular and traditional chain of command.

An armored train typical of those widely used during the Russian Civil War since much of the fighting centered on control of rail lines.

The Czech Legion consisted of 42,000 Czech deserters from the Austrian army who joined the Russians to fight for their homeland's independence. After Russia dropped out of the war, they wanted to go home to their new nation of Czechoslovakia, but the Germans blocked their way.

Therefore, they decided to travel 5000 miles eastward to Vladivostok and sail home all the way around Asia and Africa. To that end, they seized railroads and rolling stock and started fighting their way across Russia.

The Czechs' prosperity and firepower grew over time, especially when they managed to seize the tsars' gold assets, worth \$25 billion (in 2008 currency). Later they traded twenty-nine cars of

this gold for clear passage east. Their train included a post office, daily paper, and cars painted with scenes of the Czech countryside. When they reached Vladivostok, they booked passage home, finally reaching Czechoslovakia in 1920.

A poster shows White leaders as “running dogs” of the American and British imperialists

The Propaganda War. The twentieth century was an age of mass media, and for the Russian Revolution and Civil War, as with World War I, the primary medium was the poster. Thanks to lithography, high quality color posters could be mass-produced to bombard the people with whatever message was being pushed. The Bolsheviks especially made use of this weapon, portraying themselves as heroes and the Whites as short, fat, and cowardly. Artists even incorporated modern abstract techniques, using sharp angles along with lots of red to create a powerful effect.

The disasters of war. The fighting was confused and brutal, abounding with cruelty on both sides.

- At Stavropol, Whites executed 370 officers to get 3000 Red prisoners to join them,
- A Siberian partisan band massacred 6000 Russian men, women, and children.
- Red sailors in Sebastopol killed hundreds of women and children.
- Whites at Omsk massacred 1500 prisoners.
- Reds nailed the epaulettes of White officers to their shoulders.
- Whites roasted a Red guerilla in the firebox of a locomotive.
- Whites in Southern Russia killed 100,000 Jews, equating them with the Bolsheviks.
- Lenin’s secret police, the CHEKA, killed 500 people for killing one Red official.

The Tsar’s fate. As the Czech Legion approached, the Bolsheviks holding the royal family executed their prisoners to keep them from falling into enemy hands. They were more than thorough as they shot, bayoneted, and clubbed the Tsar’s family to death, chopped them up, burned the pieces, and threw them down a mineshaft.

The price of revolution & civil war (1917-23).

- In World War I, an estimated two million Russians died.
- Another 750,000-2,000,000 died during the Civil War.
- In addition 200,000-400,000 died in prison or from the Red Terror.
- Add to that 50,000 executed by the Whites.
- Russia’s industrial workforce fell from 3,600,000 to 1,500,000.
- Up to 3.5 million, many of them educated and skilled, fled Russia.
- Russia lost 35.1% of its draught horses, 24.4% of its cattle, 42.2% of its hogs, and 24.8% of its sheep and goats 1916-1921).
- Fertilizer use fell from 700,00 to 20,000 tons (1913-21).
- Tilled land fell from 214 million to 133 million acres (1916-22).
- Between 1913 and 1921 the grain crop fell 57%.
- The resulting famine (1921-2) probably killed 5,000,000 Russians.
- Typhus, typhoid, cholera, and influenza killed 3,000,000 more.
- *Official* figures say the civil war and its aftermath killed 9,000,000.

That’s a conservative estimate. No one knows the real cost. For example, it’s anyone’s guess how many refugees fled the fighting, hunger, and disease in search of their old homes or new ones.

“Psychologically, this talk of feeding the starving is nothing but an expression of the saccharine-sweet sentimentality so characteristic of our intelligentsia.”—Lenin

Things would get much worse under Stalin.

THE COMMUNIST DICTATORSHIPS OF LENIN & STALIN (1920-39)

Lenin's rule. After the devastation of World War I, the Revolution, and Civil War, Russia was a total wreck. Factories were in ruins and half the working class gone, either dead or returned to the farms. Millions had died, mainly from the famine and disease accompanying war. Two million more, mostly nobles, middle class, and intellectuals, had emigrated to other countries. Now it was up to Lenin to restore some degree of prosperity and order. There were four main policies he followed, one that loosened his control for the time being and three that tightened his control.

Lenin eased up a bit with his New Economic Policy (NEP), which allowed some degree of free enterprise to encourage higher production by the peasants. While Lenin had little choice but to let free enterprise return, he could also justify NEP in Marxist terms since, according to Marx, Russia would have to evolve through a capitalist phase before it was ready for Socialism. For several years in the 1920's, Lenin's Russia saw widespread experimentation in the arts and social engineering as well as economics. Cubist and futuristic art flourished. Avant-garde theater featured acrobats as well as heavy political messages. The family was also under attack as a bourgeois institution with women as the oppressed working class. Therefore, women gained equal rights and pay as well as access to easier divorces and legalized abortions. Some young communists even saw free love and public nudity as revolutionary acts of liberation from bourgeois values. Older Bolsheviks frowned on such acts, but tolerated them in the spirit of creating a new socialist society. Lenin made similar concessions in government, giving tsarist bureaucrats and technical experts more authority in running the government and factories since most communists were uneducated and untrained in the technical expertise needed to run a country.

However, this is not to say that Lenin relinquished any political control over Russia. For one thing, the old non-Russian provinces of the tsarist empire were brought back under tighter control, the rationale being they needed Russia's help in establishing a socialist paradise more than they needed national independence, which would be

irrelevant once the workers' revolutions had swept the globe. Of course, to these subject peoples, this new Soviet Union looked suspiciously like the empire of tsarist Russia.

Lenin exerted greater control over local governments through the Communist Party. One problem he had from the earlier days was that the local soviets had seized control of local governments. Although the Bolsheviks themselves had used the slogan, "All power to the Soviets" and could do little to control the soviets during the crisis of the civil war, Lenin was determined to eventually get tighter control on local matters. What he did was create a party structure parallel to that of the government. The local party officials were much more tightly controlled than the soviets and correspondingly more efficient in carrying out Lenin's directives. As a result, control of the Communist party was as important for the rulers of the Soviet Union as was control of the government as a means for ruling the country.

Finally, Lenin, like Marx, felt the workers could not achieve true revolutionary consciousness on their own, but needed a strong centrally directed party of Marxists to lead them to socialism. Therefore, he had to resort to what he called "Proletarian dictatorship" to ensure the workers got what they deserved. However, this was not rule by the working class, but rather rule by the Communist party with working class members in it. Of course, Lenin strictly ruled the party, thus theoretically making his will that of the party and the people. Enforcing "proletarian dictatorship" and the "Red Terror" was the CHEKA (the All Russia Extraordinary Commission for Combating, Counterrevolution and Sabotage). This was Lenin's secret police, except that it was much larger, more effective, and deadly than the Czar's secret police had ever been.

The harsh and autocratic nature of the Soviet system that emerged was influenced by several factors. First, there was the dictatorial nature of Lenin's personality that largely determined the course of the revolution. Second, there was a certain continuity from the tsars' absolutist regime to Communist rule. Finally, many more Communists had joined the party during the revolution and civil war than before 1917. As a result, they saw the revolution in military terms as a sort of brotherhood in arms, and

it assumed a military aspect with party members wearing military uniforms and using military jargon for political offices and concepts.

However, before Lenin could enact a thorough program of reform in the Soviet Union, he died in 1924. He was a brilliant leader and sincere revolutionary who oftentimes ignored human feelings in pursuit of his Communist revolution. His harsh measures must be seen in light of the harsh conditions that demanded them if the Revolution were to survive. Lenin is remembered as the father of the Revolution, but his early death left to his successor, Stalin, the job of carrying out the real revolutionary transformation of Russia.

Stalin's revolution (1924-40). Lenin's death led to a power struggle between Leon Trotsky, the creator of the Red Army during the Russian Civil War, and Joseph Stalin. Stalin was one of the few real working class members of the Communist party's upper ranks. The name Stalin, meaning "man of steel", reflected his willingness to take on jobs no one else wanted, gathering a lot of power into his hands in the process. He was also a cold and ruthless politician who managed to squeeze out the more intellectual Trotsky. Not content with a mere political victory, Stalin's agents later tracked down Trotsky in Mexico and murdered him in 1940.

While Trotsky had wanted to focus on spreading the Communist revolution worldwide, Stalin wanted to concentrate on building up the Soviet Union internally first. He felt a need for a revival of the revolutionary spirit since many Communists thought Lenin's NEP had steered Russia away from a true socialist society. His first step was to purge the moderate wing of the party that still wanted to continue Lenin's policies. Among his victims were the middle class and non-Communist bureaucrats and technicians that Lenin had relied upon to keep the state and economy working. While this was popular with the more radical Communists, it also deprived Stalin of the very people he needed to develop Russia's industries. Stalin then launched a campaign to build the Soviet Union into a great power. His program had three parts: the transformation of the Soviet Union into an industrial power, collectivization of the farms in order to support the populations in the new

industrial cities, and a purge of any elements Stalin suspected of disloyalty.

Stalin's industrialization was carried out in a series of Five Year Plans where the government set projected goals for economic growth. However, the first Five Year Plan (1928-32) in particular was as much political rhetoric as economic planning, which seriously hampered efforts to meet its goals. For one thing, human and material resources were not adequately figured into the plan, causing constant confusion and work stoppages. However, at least officially, each of Stalin's Five Year Plans more than met their goals. How much of this was the truth, Stalin lying to the world, or nervous officials lying to Stalin is hard to say. There were harsh penalties, even executions, for officials failing to meet their quotas, thus providing strong incentives to meet their quotas by padding their figures or even sabotaging each other's efforts.

Whole new cities and even lakes appeared where none had existed before, many of them named after Stalin himself. Oil production trebled, while coal and steel production rose by a factor of four times. Stalin also established a massive system of public schools and universities to provide a literate (and more easily brainwashed) work force as well as engineers for his factories. By 1940, the Soviet Union had an 85% literacy rate and was the third largest industrial power in the world behind only the United States and Germany.

However, this was done at a price. For one thing, Stalin concentrated on heavy industries, such as steel, electricity, and heavy machinery, and consequently ignored the production of basic consumer goods, including even housing, for his people. He also used virtual slave labor by taking millions of peasants and others whom he saw as threats to his regime and using them in building his massive canal, hydroelectric dam, and factory projects. Thus millions died for Stalin's dream of an industrial state.

Collectivization of the agriculture was mainly a means to an end: to produce enough food to support an urbanized industrial society. Marxist doctrine forbade private property, and Stalin, wanting as much centralized power as possible, used this principle to gather the farms into giant state-run operations. In theory, organizing the farms along

the lines of industrial factories should increase productivity enough to support the Soviet Union's new industrial cities. However, there were several flaws with this. First of all, such a scheme demanded a level of mechanization far beyond the Soviet Union's capacity, which, at that time, still had 5.5 million wooden plows in use. Also, Stalin failed or refused to recognize that people work harder if they feel they are working for themselves instead of a landlord, even if that landlord is the state. Since many peasants had gained possession of their own land before and during the Revolution, collectivization met with strong resistance from these landholders, known as *kulaks*, and that led to untold troubles.

Stalin saw the kulaks as traitors to the Revolution and launched an all out campaign against them. Police and soldiers surrounded villages and hauled the peasants off to collectives, labor camps (which provided slave labor for Stalin's industrial projects), or mass executions. Collectivization was also a disaster for Soviet agriculture and its people. Peasants burned their own grain and butchered their livestock to keep them out of government hands. That and the disruption caused by Stalin's harsh policies led to widespread famine that killed millions more. Any gains Soviet agriculture may have made were probably in spite of Stalin, not because of him. This brings us to the third feature of his regime, the Stalinist terror.

Stalin was an extremely paranoid man who easily imagined both that anyone not meeting his expectations of performance was a traitor to the state and that anyone exceeding his expectations was an ambitious conspirator against him. In 1936 Stalin purged a wide range of people whom he saw as traitors or threats to his regime: government officials, military officers, old Bolsheviks, and teachers in addition to kulaks and inefficient factory managers.

The trials of these people were an absolute farce, where the accused were forced to read contrived confessions of their alleged crimes against the state before being sent to Stalin's labor camps, providing much of the slave labor needed for Stalin's industrial projects. However, the purges did great harm to Russia. Besides stifling initiative and poisoning society with an element of fear, they also eliminated most of the Red Army's top officers,

replacing them with men who were inexperienced and subservient to Stalin. Russia would pay a terrible price for this in World War II.

Those replacing the bureaucrats and engineers eliminated by Stalin's purges were young men from working class backgrounds educated in the new schools and universities established by Stalin. Instead of the radical and somewhat independent-minded Bolsheviks in military uniforms agitating for more revolutionary reforms, Stalin now had an elite corps of educated engineers and bureaucrats loyal to him and more concerned with technical matters and industrialization than factional politics, Marxist ideology, and loyalty to a fighting Marxist brotherhood. Instead of uniforms and eccentric cultural ideas, they wore suits and attended classical concerts and ballets. They were the products of the revolution, but they were hardly revolutionary themselves, being prone to conserving the gains made by their party rather than pushing toward new frontiers. Stalin's two successors, Khrushchev and Brezhnev, both came from this generation and reflected its more conservative tendencies. The revolution had come full circle.

Regardless of the cost, the 1930's saw the Soviet Union emerge as a major power, which seemed all the more remarkable since the rest of the world was mired in the Great Depression. This provided great publicity for Communism when resurgent Russia was compared to the ailing capitalist world. Communist membership grew in the western democracies, while a number of poorer countries adopted their own five-year plans in imitation of Stalin's "socialist miracle." All of these underscored the fact that the 1930's were a time of great economic hardship, which led to rising political tensions and eventually World War II.

The Kronstadt Uprising (1921)

In March 1921 the sailors at the Kronstadt naval base rebelled, claiming the Bolsheviks had betrayed the revolution. While the Kronstadt uprising was put down with typical Bolshevik severity, it was the first time the Bolsheviks had turned guns on their own followers, and it revealed an embarrassing split between the party and workers. This was especially revealing, since Russian sailors were notoriously radical and among the Bolsheviks' staunchest

supporters. Lenin apparently got the message, replacing his unpopular War Communism with the more lenient NEP.

Poster showing Lenin and Trotsky sacrificing Russia on the altar of Marxism

Bolshevik symbolism and Jargon

Constructivism is the term used to describe the art movement in Russia under Lenin. It was often very modern and even abstract in form, rejecting the idea of art for art's sake and trying to instill some sort of social purpose into it. After Lenin's death, his successor, Stalin, would keep the social purpose of Constructivism, but return to a more representational style known as Socialist Realism.

Bolshevik double-speak. Below are some Bolshevik euphemisms and their meanings.
Bourgeois Tyranny: National resistance
Proletarian Self Determination: forced adherence
Democratic Centralism: reuniting tsarist Russia

The hammer and sickle on the Soviet flag symbolized the alliance between the industrial workers and peasants. Numerous posters from the period also emphasized this relationship.

Comintern was the Communist International formed in 1919 to plan and direct the worldwide spread of communism. While it had little success in creating new communist regimes, it did help scare the capitalist West and trigger a serious Red Scare after World War I.

Purging Soviet society of its “insects: The Red Terror

The CHEKA, formed at first to control looting and banditry, consisted largely of the young thugs and Cossack deserters it was designed to fight. But Lenin needed more than that to keep Russian under control, so the CHEKA became the primary instrument of the Red Terror. It was very much a continuation of the Tsar's *Okhrana* (secret police), which itself had roots going all the way back to Mongol rule in the 1200s. However, while the *Okhrana* had around 15,000 agents, the largest in the world at that time, Lenin's CHEKA would grow to 250,000.

Felix Dzerzhinsky, founder of the CHEKA

The CHEKA became a virtual state within a state, with its own headquarters separate from the rest of the government and answering only to Lenin. It acted as police, judge, and executioner all at once, with its own secret courts, firing squads, and concentration camps that would become the nucleus of Stalin's gulag system.

In the last eighty years of Tsarist rule, the *Okhrana* carried out an average of seventeen executions a year. In the last half of 1918, the CHEKA killed an average of 1,000 people a month. In 1919 they executed 10,000 “insects”, that number rising to 35,000 in 1920. Lenin himself advocated shooting one in ten idlers, then speculators, and then takers of bribes.

So who were the “insects” that Lenin wanted to purge? A partial list would include homeowners, teachers, members of parish councils and choirs, priests, monks, nuns, and even trade union officials. As M.Y. Latsis put it: “*We are not carrying out war against individuals. We are exterminating the Bourgeoisie as a class. We are not looking for evidence or witnesses to reveal deeds or words against the Soviet power. The first question we ask is to what class does he belong, what are his origins, upbringing, education or*

profession? These questions define the fate of the accused. This is the essence of the Red Terror.”

After the Civil War, the CHEKA was replaced by the GPU (Chief Political Administration), which eased up on the terror, relying more on legality, bureaucracy and discretion.

A Top-heavy Government

Even after their victory in the Civil War, the Bolsheviks’ actual authority in local affairs across the vastness of Russia was very limited, forcing them initially to concede a lot of power to local and provincial officials. However, over time, the central government managed to assert its power indirectly through party officials without doing away with them.

Step 1 was to establish provincial and local party offices to “help” government officials.

Step 2 was for party officials, who were professionals and firmly controlled from the top, to gradually take over the duties of local government officials.

Much like Cardinal Richelieu’s creation of intendants in the 1630s to take over the duties of the local French nobles, this created a more efficient, but also a somewhat top-heavy, central government. It also could make it confusing to outsiders when a change of leaders took place and more emphasis was given to who controlled the party than who was head of state. For example, when Khrushchev visited the U.S. in 1959, there was a minor crisis about him only being entitled to a 19 instead of 21-gun salute, since he technically was not the head of state, although it was clear to everyone that he called the shots.

The Rise of Joseph Stalin

“To choose one’s victim, to prepare one’s plans, minutely, to slake an implacable vengeance, and then go to bed...there is nothing sweeter in the world.”-- Stalin

The real Stalin. His real name was Iosif Vissarionovich Dzhugashvili, but he is best remembered by his assumed name, Stalin, meaning Man of Steel. Being from working class rather than intelligentsia background, he did not have the theoretical background on Marx as other Bolshevik leaders, releasing one book of highly derivative ideas to give himself some intellectual credibility.

Physically, his face was badly scarred from smallpox; he had webbed toes, and was only 5’4”. Because of an early accident with a carriage that led to blood poisoning, his left arm was stiff and 3” shorter than his right one.

Although he could be charming when he had to, Stalin’s cruder nature would occasionally come out, such as when he called Lenin’s wife a “syphilitic whore.”

He was also known for his temper, once ripping a phone out of the wall when he kept getting a busy signal.

Note: Phones used to be attached by wires to little boxes in the wall that were connected by wires to central distribution points connected to all other “land line” phones everywhere. I know it sounds silly, but that’s how phones actually used to work back in the Second Millennium.

Another time, when Stalin’s pet parrot mimicked his stomping around, swearing, and spitting, he killed the bird with his pipe.

He had an equally cruel and bizarre sense of humor. When his head of security, Pauker,

impersonated Zinoviev's screams for mercy while being executed, Stalin laughed hysterically.

Soon afterwards, he had Pauker executed.

The struggle for power after Lenin. Stalin wasn't given much of a chance against Trotsky, who dismissed him as the "party's most brilliant mediocrity". However, Trotsky's intellectual arrogance and complacency tended to alienate those whose favor he should have been courting. In addition, younger party members were generally less educated and intellectual than most of the old timers, making them more susceptible to Stalin's cruder tactics and rhetoric.

There were five main players in the struggle for power after Lenin's death: Stalin, Trotsky, Nikolai Bukharin, Lev Kamenev, and Grigori Zinoviev. At first, Stalin allied with Kamenev and Zinoviev to oust Trotsky. Then, in a classic double cross, he allied with Bukharin to get rid of Kamenev and Zinoviev. Having taken care of them, he eliminated Bukharin to seize sole power.

Leon Trotsky

If only Stalin had Photoshop. Stalin was one of the most paranoid characters to walk across the stage of history. This especially showed in his obsession with rewriting history and always putting himself at center stage. To do this he would airbrush himself into, and his enemies out of, older photographs. Numerous photos of Stalin close to Lenin exist, but few are authentic and/or not retouched.

Probably because he didn't want to admit he needed directions, Stalin even altered a simple picture of a common worker giving him direction to a convention hall, air brushing him out of the picture. I'm not sure if erasing the

worker was purely metaphorical. Knowing Stalin, probably not.

One of his more childish alterations was done to a picture of a telescope near the head of Lenin's wife (whom Stalin hated). By slightly moving the telescope, he made it look like a gun was pointed at her head.

Even after he died, Stalin insisted on manipulating his image. The concerned faces of the Politburo members in a photo of his funeral were pasted over their real expressions, which were probably blissful glee that the *vozd* was finally gone.

Stalin's paranoia extended to looking out for his personal safety. He refused to sleep in the same place twice in a row, and all his quarters in the Kremlin were identical to confuse any would-be assassins. He always traveled in motorcades of several identical limousines for the same reason.

One of Stalin's favorite pranks was to call subordinates late at night and talk really weird to them just to make them wonder if they were in trouble and about to die. He also liked to get people drunk and ask them cryptic questions to make them slip up and incriminate themselves somehow.

In his later years, he stayed at his dacha at Kuntsevo. His ministers would gather there like a bunch of court jesters to get drunk and play practical jokes on each other for Stalin's amusement. Then they would watch Hollywood Westerns, Stalin's favorite.

The Stalinist System

Stories abound concerning the absurdity of the Soviet system under Stalin. In one case, two distant furniture factories, each with forests for timber close by, would get their lumber from the other factories' forests. The trains carrying this lumber would even pass each other on the track.

Although Yerevan, Armenia needed teaspoons, the Kremlin bureaucrats told it to make accordions.

Since replacement parts didn't count towards production quotas, factories didn't make them. As a result, entire tractors on the state collective farms were often used for spare parts, severely hampering the actual growth in the supply of factors. Also, because no replacement windshield wipers were made, people would steal them from other cars. Therefore, people kept their wipers locked inside their cars, so that when it rained, everyone had to pull over to the side of the road and attach the wipers in the pouring rain. Another strategy was conserve the wipers by only leaving one attached on the driver's side.

Although massive plans were made for producing things, there were often no plans for providing the resources actually needed to make them, leading to fierce competition between factories to make the list of top priority industries to get what resources there were. Plants and factory managers desperate for supplies even hijacked rival factories' supply trains.

In the intense competition between Sverdlosk and another city for a new state factory, Sverdlosk started building a factory with its own money to pressure the government to give it the grant. Instead, the state was impressed by both candidates and granted each a factory, even though there were only enough resources to supply one factory's needs.

Despite the caption on the poster below, Stalin's dream of matching Henry Ford's assembly line production techniques might have worked if someone had taught the workers what an

assembly line was. Conveyor belts often stood idle for years as workers pulled the parts off the line and painstakingly assembled tractors one by one on the shop floor.

There were a number of industries using Western technicians to train Russians. However, not only would Stalin deport the Westerners, he also had the Russians they were training shot or imprisoned as Western spies, leaving no one capable of running the industries, which then shut down.

*"Tomorrow is the Opiate of the Masses":
Life under Stalin.*

Peasants eating from the same bowl (1931)

"Tomorrow is the opiate of the masses." –Russian commentary on constant government promises to improve peoples' lives and provide them with more consumer products. As late as the 1970s, the average Soviet citizen was only allotted one new pair of shoes every eighteen months. And Soviet shoes were of notoriously shoddy quality.

Thus there was little or no incentive to do a good job, since under the Soviet system, people were paid the same no matter how hard or long they worked, if they were drunk on the job, or were chronically absent.

"We pretend to work and you pretend to pay us."—Soviet saying

Technically, there were strict laws and punishments against absenteeism and laziness on the job, but they were rarely enforced. Stricter laws and enforcement in 1938 and 1940 that punished anyone even twenty minutes late for work just led to more resentment, largely because the unreliability of most Soviet public transport and clocks often made it nearly impossible to get to work on time.

The “success” of Stalin’s economic policies. Despite posters claiming it fulfilled its goals with “maximum overachievement” in only four years, the first Five Year Plan most likely only produced one-third the pig iron, tractors and woolen cloth, one-half the steel and cotton cloth, three-fifths the electricity, one-quarter the linen cloth, and one eighth the mineral fertilizers that Stalin claimed.

“We pretend to work. You pretend to pay us.”— Russian joke. It was generally taken for granted that Russian goods were inferior to any foreign products that might be available (especially in stores reserved for members of the Communist Party), and that anyone buying Russian over foreign goods was a fool.

Soviet-made shirts were sometimes missing sleeves. Shoes fell apart at their first wearing. Matches wouldn’t strike. New pot handles fell off. Bread had non-nutrients baked into it.

And nothing could get repaired, because private businesses for crafts such as shoe repair, carpentry, locksmithing, and plumbing had been outlawed with the end of the NEP. Even those with the skills to do such repairs were banned from getting the materials needed for home repairs: nails, boards, paint, etc. Even needles and thread were unavailable for mending clothes. Recognizing this problem, the state finally re-legalized these crafts in 1936.

This was all based on the false assumption that one could get the basic consumer products that needed to be repaired. Shoes, for example were in extremely short supply because the huge numbers of animals slaughtered by peasants resisting collectivization created an acute leather shortage. State monopolization of metals for heavy industries made forks, spoons, and especially knives nearly impossible to get.

The one readily available product was vodka. After a brief prohibition period, Stalin’s people realized it was a major source of state revenue and brought it back to pay military expenses. Within a few years, vodka was the most important commodity in state cooperative stores, accounting for one-fifth of government revenue.

During the First Five Year Plan Soviet citizens might have money. They just didn’t have anything to buy with it. Purchasing the most basic consumer items might involve standing in long lines for hours, or in some cases, days. It was customary for people to automatically get into a line before finding out what they were standing in line for. Even if they didn’t need it, they probably had family or friends who did.

Women waiting to buy milk (1934)

This was especially true for women who, despite having jobs and careers, still ended up doing the cooking, childcare, and other chores at home, as well as frequent shopping trips for groceries after work. Having to walk or take mass transit limited what a woman could carry, as did wasting time in line, making such trips almost daily. Because most of the women would shop at the same time (i.e., at the end of the daily work shift), the lines and waits were especially long. Sometimes several women would cover the job for one of their number so she could leave midday to beat the rush and do the shopping for everyone.

Soviet housing was no bargain either, there being too little of it and that being cheaply built. Aggravating this was the fact that between 1926 and 1939 the Soviet Union’s urban population more than doubled. Not until the Khrushchev era (1953-64) did the state make any serious effort to alleviate the situation.

Urban dwellers typically lived in apartments with one family per room (the lucky ones), poorly-built and crowded dormitories, or even mud huts. During the 1930s the average living space for someone living in Moscow dropped from 5.5 to 4 square meters (roughly the size of a king-size bed). Some cities, such as Magnitogorsk and Irkutsk had even less, while Krasnoirarsk had only 3.4 square meters per person.

Sometimes families sharing an apartment had no kitchen because there was a family settled in there too, while other families would be living in the hallways. A report in 1933 described how “conversion of coalsheds, warehouses, cellars, and substair spaces has become a mass phenomenon in Moscow.” One Moscow family of six lived in a six square meter cubbyhole under some stairs, leaving only one meter per person.

People had no choice in what families lived with them, so it seemed in each apartment there was at least one boisterous drunk and one crazy person, usually suffering a persecution complex and thinking everyone was conspiring against him or her. After a while, they were often right. A report from 1935 described the sorts of behaviors one found in many or most apartments, including drinking, cursing, threats, fights, and beatings of women and children, immoral sexual behavior, and malicious pranks, such as throwing other peoples’ stuff out of the kitchen and intentionally spoiling food others had made.

One result of such cramped living conditions was higher divorce rates because young couples often had to live with one of their parents in very cramped conditions that easily led to life’s little irritations escalating into major conflicts. Making matters worse, after getting divorced, a couple might have to remain living with each other or one of their in-laws because there was no place else to go, resulting in high rates of domestic violence.

Out of desperation for living space, people falsified marriages or relatives living with them, or paid up to half their wages to rent out a bed

or corner in an apartment. In Simferopol in the Crimea, authorities found the decomposing body of a woman in an apartment for which she had been murdered by relatives.

Those not “lucky” enough to share apartments typically lived in barracks or dormitories, long one or two-story structures that all looked alike, often making it hard to even find where you lived. They often lacked electric lights, plumbing, central heating, and insulation, while the tarpaper roofs leaked. Men and women usually lived in separate quarters, but if they didn’t, flimsy curtains were put up to provide some privacy for women and families.

Outside of the home, things got even worse, as sewer facilities were nearly non-existent, trash was picked up only sporadically, and public transport was woefully inadequate. In addition, many towns had few paved streets, a situation that only got worse as one drove into the countryside.

Blat. So how did Soviet citizens survive in the Stalinist economy? To a large extent, they didn’t. Rather they got by through a “second economy” based on speculation, stealing, bribery, and patronage known as *blat*. A Soviet dictionary from 1935 defined *blat* as “thieves’ jargon” for crime or theft. However, for Soviet citizens, it was a system of reciprocal relationships used for acquiring goods and services that were nearly impossible to get in the official state economy, including apartments, train tickets, and even a pass to a good vacation resort.

Anyone working at any level in the state trade system, from factory production lines to cooperative stores, was likely to be involved in procuring goods either directly through theft or indirectly through trade or bribes from someone who did the actual stealing. Another method was to buy goods normally available only in big cities and sell them for a profit in the country. Train conductors were especially involved in this type of trade. While most people practiced this on a small scale, there were big-time operators, one who was arrested with 70,000 rubles in cash

(a huge sum then) and another worth 1.5 million rubles.

The Kolkhoz markets where peasants could sell produce raised on their tiny personal plots, were the most important sites for illegal trading of all sorts of goods, including ration cards and fake passports. But much of this trade took place in apartments between friends and neighbors. As one Russian put it: "One must have not 100 rubles, but 100 friends."

Although officially tainted with the stigma of being illegal, most Soviet citizens saw blat as based on friendships. Housewives were probably the largest group involved with blat. However, drinking, especially vodka, was a way of establishing a blat relationship. One brought a bottle of vodka, not as a gift, but as something to drink together. Thus the Russian expression "sharing a bottle" applied to sealing a deal.

How to Ruin your Country's Agriculture: Collectivize

The state of Russian agriculture in the 1930s was comparable to that of Western Europe in the 14th century, with 5.5 million wooden plows still in use.

Kulak was the term for the wealthier independent peasants before the Revolution, but no longer existed since peasants had seized their own lands. Although Stalin tried to stir other peasants up against the "kulaks", now a mythical class, most peasants aspired to be kulaks themselves rather than exterminate them.

Some collectives were so big that peasants couldn't even reach the outer fields in time to work. One collective in the Caucasus had 130,000 hectares (over 300,000 acres) with 300 tractors.

Collectives were taxed up to 40% of their crops, double or triple the old quota and contributing to the famine of 1932-3.

Kulaks trying to escape their collectives were rounded up and their possessions taken from them. Some resisting "kulaks" were shot, some arrested and sent into the Gulag camps, and the rest exiled to remote parts of the country.

"I am an old Bolshevik. I worked in the underground against the Czar and then I fought in the Civil War. Did I do all that in order that I should now surround villages with machine guns and order my men to fire indiscriminately into crowds of peasants? Oh no, no, no!"

In 1935 bread rationing was abolished, but prices were ten times those of 1928.

Between 1890 and 1935, the average peasant's annual consumption of grain fell from 419.2 to 261.6 kilograms.

In the 1930s, 20-33% tractors were not working at any given time.

In 1940 private plots equaled 3.8% of the Soviet Union's land while producing 37.25% of its meat, 34.5% of its milk and butter, and 93.5% of its eggs, a total of 21.5% of the country's entire agricultural production.

So the party reduced the size of private plots to reduce dependence on them.

So Peasants illegally farmed collective plots as their own.

During the chaos of World War II, peasants reclaimed 14 million acres of land.

But Stalin recollectivized the farms 1947.

So many peasants fled the collectives, that Stalin tied them down to the land with internal passports restricting their movement.

Stalin's legacy: The Madness of the system continues. Even after Stalin's death in 1953, his

system of collectives continued all the way to the end of the communist era in 1991 with the same dismal results as before.

In the 1950s A. N. Larionov, the First Secretary of Ryazan Province vowed to double the province's meat production in one year. He did...by slaughtering all the cattle in the province.

In 1960 he was forced to commit suicide.

In the 1950s, one collective's peasants, either through indifference, incompetence or both, allowed their entire herd of dairy cows to die from eating wet clover.

In one year, a collective received 773 directives from the government. Even more astounding, the government had sent it over 6,000 such messages, which raises serious questions about the Soviet postal system.

In 1982, the Soviet Union had only 65% of the mechanical harvesters it needed, with over 100,000 out of action.

From 1976 to 1980 the net number of tractors in use in the Soviet Union increased by 200,000 from 2,400,000 to 2,600,000. However, during that same time Soviet factories produced nearly 3,000,000 tractors.

In 1982, one-third of the fodder crop was lost: 12-15% due to failure to harvest it on time, 7% from failing to stack it, and 11% from having only 25-30% of the needed storage facilities.

Still, the mania for large collectives persisted, some of them so big the peasants couldn't reach distant fields, leaving crops untended and cows unfed.

Agitprop

“Let's merge shock detachments to draught brigades.” (1931)

Agitprop was a combination of the words agitation and propaganda. In Russia, the term propaganda originally just meant dissemination of ideas and had no negative connotations. The idea of agitprop was to impact both the intellect and emotions with powerful and striking posters and slogans. Much of Stalin's goal was to keep the Soviet people constantly agitated by fear of an external enemy (i.e., Western capitalists) so they would be more compliant to his will. To emphasize this permanent state of crisis, he used a lot of military terms.

“In the socialist offensive, we'll break class enemy resistance, hardships, and augment our achievements.” (1930)

Even attending conferences was promoted with the urgency of a military offensive: “All to the showing! Take part in the All-Union inspection of production conferences” (1929)

The Moscow Metro

If Stalin did one thing right for the Russian people, it was the construction of the Moscow Metro, a project that combined the modern efficiency of rapid urban mass transit with aesthetic sensitivity by designing each station in

a different artistic and architectural style. In addition, Soviet Metro stations were often built very deeply underground so they could also double as bomb shelters.

Stalin's "Terror Famine" in the Ukraine (1932-3)

In addition to the famine caused by collectivization, Stalin stripped Ukraine of what little food it had to crush its aspirations for national independence. As a result, one in five Ukrainians, an estimated 5,000,000 people, died. One person called it "probably the most massive warlike operation ever conducted by a state against its own citizens."

The case of Maria Tchegotareva was typical of millions. Trying to feed her four hungry children during the massive 1932-1933 famine, the peasant mother allegedly stole three pounds of rye from her former field which had been confiscated by the state as part of collectivization. Soviet authorities sentenced her to ten years in the Gulag. When her sentence expired in 1943, it was arbitrarily extended until the end of the war in 1945. Even after her release, she was forced to live near her Gulag north of the Arctic Circle. She was not able to return home until 1956, after the death of Stalin. She never found her children.

"...The most terrifying sights were the little children with skeleton limbs dangling from balloon-like abdomens. Starvation had wiped every trace of youth from their faces, turning them into tortured gargoyles; only in their eyes still lingered the reminder of childhood. Everywhere we found men and women lying prone, their faces and

bellies bloated, their eyes utterly expressionless."—Former Bolshevik activist

Those not swollen with hunger were suspected of hoarding food and careful searches of their houses were made.

A woman 7 months pregnant was beaten to death with a board for plucking wheat.

A mother of 3 young children was shot for gleaned corn. Her children starved.

The dying were carried to mass graves with the dead to save an extra trip. Some of them lived in the burial pits for days before dying.

People made biscuits and porridge from weeds and bread from nettles.

They ate dogs, and then cats, making meat jelly from their brains.

Those caught collecting acorns to make bread were charged with laziness, a state crime.

They chopped up casks formerly holding fat and boiled them for any residue left in the wood.

They picked through horse manure for whole grains of undigested wheat.

Peasants hiding bread were denounced as fascist terrorists and shot or jailed

Stealing potatoes, corn, onions, or wheat stalks earned a 10-year Sentence.

Several peasants were shot for digging up and eating a horse that had been buried for fear of epidemic.

Ukrainians were reduced to eating frogs, mice, birds, and leaves off bushes and trees. Others, driven to extreme hunger, resorted to

cannibalism...some even eating their own children.

In the United States and Canada, people of Ukrainian descent sent food to relieve the hunger, but all food shipments were stopped at the border. Official Soviet policy was to deny there was any famine. In the Soviet Union, anyone even uttering the word “famine” could be arrested.

Foreign correspondents and celebrities were given carefully stage-managed tours of the Ukraine, which gave them favorable, and misinformed opinions of the Soviet Union. Meanwhile, in some parts of the Ukraine grain was visibly piled up and surrounded by barbed wire and armed guards.

As a diversion, Stalin arrested several foreign correspondents for a show trial. Naturally, the other reporters wanted to cover these trials. Stalin said he would let them do so if they ignored reporting the terror famine in Ukraine.

Stalinist Terror: The Great Purge

“Root out spies and Saboteurs.” (1937)

A classic false flag event. In 1936 the popular party boss in Leningrad, Sergei Kirov, loyally informed Stalin of a plot to replace the Soviet leader with himself. Stalin promptly took care of the conspirators, telling Kirov that he [Stalin] owed him.

Soon afterward, Stalin “repaid” Kirov by having him murdered and then blaming the murder on Zinoviev, Kamenev, and most of the party’s old leadership, probably “repaying” them for old “debts” as well.

Thus began the great purge.

Who was Stalin targeting? One major category of victims was old-time Bolsheviks who were less awe-struck or impressed by Stalin than the younger generation was. Nearly all of them were killed, as were all five surviving members of the original politburo. Similarly, 1108 out of the 1966 delegates attending the 17th Party Congress in 1934 were arrested, and 848 of them were executed. However, over half of his victims (376,202 executed out of 669,929 arrested) were peasants designated as kulaks.

One victim of the purge was tried on charges of casting spells on Stalin.

Wrapping fish in paper that had Stalin’s picture on it could get one purged.

If Stalin suspected someone whose brother was a colonel, and that colonel was friendly with another colonel, and he had patronized a captain, they all had to be purged, along with their families and friends.

Stalin’s “logic”. So what was the logic behind all this seemingly random violence? Constantine Pleshakov in his book *Stalin’s Folly* gives this analysis:

“The vozhd [leader, i.e., Stalin] killed those who could betray him and those who were close to those who could betray him. He killed people who one day might think of betraying him. He killed almost everybody of high rank and their families so there would be no one to retaliate. He killed people who had relatives abroad. He killed former czarist officers. He killed children of aristocrats, priests and shopkeepers. He killed Ukrainians who insisted on speaking Ukrainian and Russians who insisted on teaching Dostoyevsky. He killed police officers so they wouldn’t get the wrong idea about their place in society. He killed people who read the Bible or the Koran, but he also killed people who read only Stalin. He killed people who failed to report political jokes and people who reported them. He killed people in their nineties and people in their teens. He killed Russians and he killed Georgians. He killed marshals, pilots, housewives, journalists, plumbers, peoples’ commissars of the interior (two of them), writers,

gardeners, spies, fishermen. The dreadful progress of his ax seemed irrational, but it was not. He pursued a clear goal: to reach a point where nobody in the country, be it miner or a marshal, could be certain whether he would see the dawn. After he reached that point, he stopped. Then, instead of killing people, he sent them to the eastern wilderness, where the gulag camps were waiting for them.” (Stalin’s Folly, pp.40-41)

"Friend of the Little Children" was the title of this picture of a smiling Stalin holding a little girl named Gelya Markizova who has just presented him with a bouquet of flowers. However, even this has a dark story behind it, as Stalin had executed her father for allegedly plotting against him. Her mother, Dominica, also died under mysterious circumstances.

So what was the toll? According to declassified Soviet archives, Stalin’s police arrested 1,548,367 people, and shot 681,692 of them in 1937 and 1938. That’s an average of nearly 1,000 executions a day. Robert Conquest, one of the top authorities on the Stalinist era, thinks the total should be closer to two million, speculating that Stalin’s secret police falsified documents to give the impression of a smaller death count. Another historian, Michael Ellman, thinks the best total estimate (including those who died from torture, abuse, neglect, and exposure to the elements is between 950,000 and 1.2 million. Unfortunately, in 2008, Russian authorities, probably under Putin’s orders, confiscated twelve computer hard disks containing the entire digital archive of Stalinist atrocities, so we may never know the full cost in lives of the purges.

In one Kiev jail, they reportedly shot between 70 and 120 prisoners each night.

Decoding Stalin. Complicating matters was Stalin’s habit of vaguely indicating directions of policy in speeches and communiqués rather than directly ordering specific actions. That way, he could dissociate himself from disastrous or unpopular policies and blame subordinates for them instead.

In addition, Stalin often secretly sent different messages to two different people or departments, such as an official, but secret, memo to one agency allowing the production of a certain play, while indicating to others his displeasure with the play. Years later the recipient of the memo was begging to be allowed to publish it in defense of his policies.

Of course, this created the problem of trying to interpret just exactly what Stalin wanted done. Add to that the fact that subordinates were often too incompetent to interpret Stalin’s ambiguous signals and too scared to ask for clarification.

Take, for example, "Dizzy with Success", an article in March 1930 in which Stalin seemed to do an about face, denouncing forced collectivization as "stupid & reactionary", blaming officials for exceeding their authority, and even ordering animals returned to the peasants. In response, officials started reversing collectivization, so that by June, peasants had “decollectivized” half of the collective farms. Except that wasn’t what Stalin had intended so officials had to go back to the "stupid & reactionary" policy of collectivization.

Stalin’s Personality Cult

“Q: Why is the swimming pool closed today?

A: They’re developing new pictures of Stalin.”

--Russian joke

Thanks to mass media, Stalin set the pattern for personality cults copied by any number of twentieth century dictators, including Hitler, Mao Zedong, Saddam Hussein of Iraq, and Kim Jong Il of North Korea. His personality cult was a natural outgrowth of his megalomaniacal rule.

“The Soviet country captain is leading us from victory to victory” (1933)

A number of new towns were named after him: *Stalino* (6 of them), *Stalinsky*, *Stalingrad*, *Stalinabad*, *Stalin-Aul*, *Staliniri*, *Stalinissi*, *Stalinogorsk*, *Stalinsk*, *Stalinskoye*, *Stalin Bay*, *Stalin Mt. range*, & *Mt. Stalin* (highest peak in USSR & later for those in Czech. & Bulgaria).

Stalin did stop Moscow from being renamed Stalinodar

He was also honored with all sorts of complimentary epithets:

Man of Steel, the Granite Bolshevik, the Brasshard Leninist, the Iron Soldier, the Universal Genius, the choirmaster of science, Hero of Socialist Labor

The following came from just one speech: *Leader of Genius of the Proletarian Revolution, Inspirer & organizer of the Victory of Socialism, Supreme Genius of Humanity, Experienced Proletarian Commander, Theoretician of Genius and Organizer of Collective Farm Construction, Leader of Genius of the Toilers of the Whole World*

People claimed they had fainted or gone into ecstasy on seeing or hearing Stalin.

*“Thou Bright sun of the nations! The unsinking sun of our times
And more than the sun, for the sun lacks wisdom.”*—Alexei Tolstoy

“When a son is born to me, when he learns to speak, the first word he utters will be ‘Stalin’.”
--Alexander Avdeyenko after being reprimanded by Stalin

Stalin enjoyed endless standing ovations because no one wanted to be first to sit. When an old man

was so tired he had to sit, he was arrested the next day.

An 8-sided record of Stalin speech was released with the 8th side entirely of applause.

“Little Stalins”

As typically happens, especially in tyrannical regimes and organizations, subordinates typically behave in a manner reflecting that of the boss. Stalinist Russia was no exception. For Russians in general, bureaucracy was seen at best as a necessary evil, and, in a system where the state came to control all aspects of production and redistribution of goods, local officials and their bureaucracies were especially burdensome. Below are some of the more ridiculous examples of micromanagement by local “little Stalins”, the results of ideological fanaticism, egotistic power trips, or desire for money from fines.

- A manager, who had opened a hairdresser’s station in the starch factory he ran, categorically forbade his workers from privately shaving and cutting their hair. He even had two officials checking to see if any of the workers were shaving or cutting their hair at home and bring charges for criminal prosecution against violators.
- The chairman of a kolkhoz (agricultural collective) decreed that each house in the village must display pots of flowers, believing the flowers absorbed moisture and thus helped prevent rheumatism. Three days later he inspected several houses and was furious for not finding any flowers blooming, despite pleas by the women that there were no flowerpots available and that it takes more than three days for seeds to germinate, grow, and blossom into flowers.
- Another kolkhoz chairman fined a peasant 25 rubles because “in his hut the floors were not washed.”
- In Stalingrad, in order to push “man into a cultured attitude to himself,” people were fined 100 rubles for wearing dirty clothes in public.

(Keep in mind that in the Soviet Union, people might only have one suit of clothes, pair of socks, or one set of underwear, making it difficult to keep in clean clothes.)

- In Astrakhan, a man was fined 100 rubles for wearing a hat.

- Other decrees ordered people to keep only singing birds in cages and forbade storing food between the outer and inner windows, the only place that was cold enough to preserve food in the absence of refrigerators.

- In Turov districts, 100-ruble fines were mandated for old people and children lighting matches (even though people had to keep fires for heat and cooking).

- Similarly, in the city of Rechitsa, failing to paint one's house the dictated color for that street made one liable for a fine of 100 rubles.

The Gulag Archipelago

The Gulags were a system of Soviet labor camps and prisons that from the 1920s to the mid-1950s housed millions of political prisoners and criminals. The term (an abbreviation of the Russian words for Chief Administration of Corrective Labor Camps) was largely unknown in the West until the 1973 publication of A. Solzhenitsyn's *Gulag Archipelago*.

The secret police controlled the Gulags, which consisted of hundreds of camps where prisoners felled timber, worked in the mines, or labored on construction projects. At least 10% died each year from harsh working conditions, inadequate food, and summary executions.

The Gulag reached its height during Stalin's collectivization of Soviet agriculture (1929-32), his purges (1936-38), and immediately after

World War II. Not until Stalin died in 1953 did the system shrink. Meanwhile an estimated 15-30 million Russians died in the camps.

Stalin's gulag master was Naftali Frenkel a former Turkish merchant who was arrested in 1923 for "illegally crossing borders", a label that covered smuggling as well as being a merchant who was too successful for the Soviet Union to tolerate. While serving a sentence of ten years' hard labor, he was promoted from prisoner to guard in a surprisingly short period for proposing that the low productivity of slave labor could be increased by labor camps that linked rations to productivity. He estimated one could get six months work out of a worker before he was used up. Not only was Frenkel released from prison, he was given a high-ranking post in Stalin's emerging gulag system.

In 1949, Ivan Burylov, a beekeeper, protested the absurd mockery of elections in the Soviet system by writing the word "comedy" on his "secret" ballot. Soviet authorities linked the ballot to Burylov and sentenced him to eight years in camps for this 'crime'.

One of the main differences between Stalin's gulags and Nazi labor camps was that Stalin won World War II, and therefore could keep the world from seeing the atrocities he was committing. Word of the gulags did get out though, largely due to the works of Alexander Solzhenitsyn (below) whose books *The Gulag Archipelago* and *One Day in the Life of Ivan Denisovitch*, exposed this atrocity to the world.

Nikolai Getman, a Ukrainian born in 1917, served in the Red Army during World War II, and then was sentenced to eight years in the gulag, including the labor camps in Kolyma, considered some of the worst. He was released in 1953 after Stalin's death. His art, which captured the agony of life in Stalin's gulags, had

to be smuggled out of the country for the West to see what the Gulags were really like.

Getman did a self-portrait at age twenty-eight, while boarding a ship at the port of Vanino. During spring and summer, up to 6,000 people were transported on every trip from Vanino to the labor camps at Kolyma. Getman was lucky to arrive at the port in the fall when it was icebound thus letting him live in a transit camp until the water became navigable in the spring, a circumstance that he believed contributed to his survival.

Millions of prisoners were transported by rail to the camps. The journey could take up to fifteen days. Fifty or sixty people were packed into each freight car and given water only every three or four days when the train stopped to replenish its water supply for the boiler. Food, when provided, was generally salt herring, which only increased the prisoners' thirst. Not eating the fish however, meant starvation and death. Even minor infractions of the rules brought a death sentence, and the prisoner was left to die on the permafrost. Given the lack of nourishment, inadequate clothing and cramped quarters, only the very strong, usually the young, reached the camps alive.

The journey to the camps left prisoners nearly emaciated upon arrival. Within a month or two, hard labor and further malnutrition often resulted in scurvy and dystrophy. Inmates who worked in the permafrost, in the mines, or in the lime works were more subject to physical ailments than the others. Terminal patients shared special medical barracks with the doctors, who were also prisoners. They tried to help, but had neither proper equipment nor medicines, only iodine and streptocide. All they could do was try to make the prisoners more comfortable until they died. The authorities were indifferent, since new laborers were constantly arriving. Doctors could only grant exemption from work when a convict was too weak to stand or had a life-threatening illness.

Women prisoners were also assigned work for the day, to be guided by armed escort to the

work site and back again at the end of the day. Typically, one woman had been elevated to a favored position, but the price for such power or privilege was steep, having to give the guards whatever they demanded. Such women were detested by their fellow inmates, and their power was often short lived, especially after being cast aside by guards who had grown weary of them.

For even a minor infraction, such as a harsh word to a guard, a prisoner could be stripped naked, hung crucifixion-style to a pine tree and left to be fed upon by mosquitoes, a torture known as komariki (little mosquitoes). After thirty minutes to an hour he would be taken down, by which time he would have lost so much blood that a slow and painful death was almost inevitable. Such executions were carried out beyond the barbed wire, in full view of the other prisoners.

The burial ritual of the zeks (political prisoners) amounted to tagging their toes with ID numbers and dragging the bodies by sleigh to the hills for burial in the snow. The bodies of those who had starved to death were so light that one could often pick up several of them at a time.

"...and no one will ever learn where my grave is."—gulag prisoners' song

"Those who cast the votes decide nothing. Those who count the votes decide everything."—Joseph Stalin

POST WAR BOOM AND BUST (1920-29)

The illusion of prosperity. The 1920's have been popularly seen as a decade of political stability and economic prosperity. Indeed, Germany did settle down, and seemed to stabilize after 1923, new democracies were established in Eastern Europe, and prosperity did seem to return. A whole barrage of new technological breakthroughs and products signaled this: affordable mass-produced automobiles, vacuum cleaners, refrigerators, cellophane, radios, talking movies, and commercial air travel to name a few. But in reality, the 1920's presented largely an illusion of prosperity, for beneath the surface were three serious problems, all arising from World War I and undermining the stability of the world economy.

The first problem largely stemmed from the nature of American dominance of the world economy in the 1920's compared to previous British dominance in the 1800's. The British had maintained a fairly balanced cash flow in world trade since they had to buy raw materials with much of the money they made from selling manufactured goods. This prevented too severe a drain of cash from other countries, thus assuring Britain more stable markets. In contrast, the United States was not only an industrial power selling manufactured goods in markets it had claimed from Europe during the war; it also had its own vast natural resources. Therefore, little money had to leave the United States to buy the raw materials needed to manufacture its products. This created an unbalanced cash flow from the rest of the world to the United States. As a result, European nations, still recovering from the war, needed loans, which they got from American banks. This sent even more money to the United States in the form of repayments and interest, just making an even more unbalanced cash flow, and so on.

The second problem had to do with Europe's recovery from World War I. European industries did revive to their old pre-war levels of production by 1925, but they failed to reclaim their old markets from the United States or create new markets to compensate for the losses. As a result, the intense economic competition between nations that had largely caused World War I continued after it. Therefore, nations still maintained high tariffs,

which raised prices, cut world trade, and further weakened the world economy.

Finally there was an agricultural crisis in the United States. This was the result of dramatic expansion of farmland in order to meet the food demands of the European countries during the war. However, European agricultural production revived after the war, causing overproduction. Grain prices plummeted, and American farmers went into debt, many of them losing their farms when they were unable to maintain mortgage payments on their newly expanded farms. Therefore, although America's industries seemed to be thriving, its agricultural sector, still a large part of its population and economy, was in trouble.

The Crash. Ironically, while all of these problems led to an unstable world economy, they also created an illusion of prosperity. This was especially true in the United States where investing in the stock market had become a virtual national sport. However, the American stock market in the 1920's had a fatal flaw, since investors only had to pay as little as 10% cash for their stocks. Banks financed the balance at 10-15% interest. This made it easy to buy stocks, so the stock market rose at an unprecedented rate in the late 1920's. But this also meant the market must rise 10-15% per year for investors to break even after accounting for their loans plus interest. This created an increasingly uneasy atmosphere as investors worried about how much the already inflated value of stocks could rise. For those realistic enough to pay attention, there were danger signs for the economy in the fall of 1929. In October, the market crashed.

Much of what happened was a classic case of panic psychology running wildly out of control. When some investors started selling stocks, this left other investors in debt to the banks nervous about stock prices falling, something they could not afford. Therefore, when some of them started selling, stock prices fell more, which caused more panic selling, even lower prices, and so on. In a matter of hours, millions of investors were ruined, with some stocks falling \$75 per share. It got worse. By November 1, investors had lost \$40 billion, and by November 13, the stock market had lost half of its value.

This spilled over into the rest of the American economy, causing an overall lack of faith in the

future, which led to a drop in investment and buying. Therefore, production was cut, which cost workers their jobs, further undermining faith in the economy, and so on. This only hurt the stock market, which then fed back into the cycle of economic decline. By 1932, industrial production in the United States had fallen by half, national income by 75%, and the value of some stocks from \$100 to \$.50 per share. This led to the collapse of 5000 American banks, many of which had over-invested in the stock market. These banks called in loans from Europe, whose economies were already unstable and overly dependent on American loans. The result was a worldwide depression spreading from America and Europe to the rest of the world that was tied into their economies.

Any color you like as long as it's black

Henry Ford's assembly line

While mass production and mass consumption were born in the 1800s, Henry Ford took them to a whole new level in the early 1900s with the assembly line process where a car's frame moved along a conveyor belt and workers stationed along it would attach various parts to it until by the end of the line it was a complete car. Although such repetitive work could be mind deadening, it was also very efficient, cranking out 6,000 new cars every day.

Assembly lines also led to more standardized products. As Ford put it, you could have a car in any color you liked, as long as it was black.

This had two major effects. It lowered the price of building (and selling) cars, vastly expanding the potential. It also raised profits, allowing Ford to pay his workers more, thus creating an even bigger market that could afford his cars.

Not only did other car manufacturers, most notably General Motors, adopt the assembly line production, so did other types of products, which just accelerated the process toward a more widely based mass consumption society.

The First Era of Electronic Mass Media

One of the great innovations of the century was the revolution in reproducing sound. For the first time, people could listen to music without having to make it or listen to it live. The gramophone, as it was then called, was the progenitor of all our modern stereos, including the personal stereo. It also began a trend with music, much like the printing press had 450 years earlier, of making its enjoyment a much less social, as well as more passive, experience. Later innovations, such as the iPod, would accelerate this tendency to fragment society in favor of more private experiences.

Talkies. In 1927, the first movie with sound, *The Jazz Singer*, debuted. Although the parts with Al Jolson's singing were the only scenes with sound, *The Jazz Singer* set a new standard for movies, and silent films were soon a thing of the past.

So were a lot of silent film stars. For one thing, some of them didn't have voices suited for talkies. Also, the new type of film required a new more natural and subdued style of acting, because the exaggerated gestures of silent films were no longer needed. Movies from the late 1920s and early 1930s, such as the Oscar winning *All Quiet on the Western Front*, reflect this transition, being more natural than older silent films, but still retaining a bit of their more exaggerated gestures and blocking.

Early films and sound recordings also tended to play back a bit fast, creating a higher pitch and tinny quality to the voices. Only in recent years have the recordings of early blues musicians, such as Robert Johnson, been re-mastered for proper pitch.

Radio came into its own, especially with regular commercial broadcasting in the late 1920s and

became a fixture in millions of homes. In one sense, it helped create a more global community as people listened to the same entertainment and news (starting in the 1930s)

In another sense, radio created less of a sense of local community as families stayed at home gathered around the radio. Like the phonograph, it also made listening to music a more passive and private experience instead of an active and social one.

Radio also provided a medium for politicians to spread their messages to millions of people at once, however benign or malicious those messages might be.

Architects such as Frank Lloyd Wright tried to counter this trend away from the social and toward the private realm by designing houses with small bedrooms to force people together into a central space. However, other inventions in the twentieth century, such as television, portable record players, personal stereos, and air conditioning, would further separate families from their communities and family members from each other.

Power to the People: the Birth of the Electrical Grid

Samuel Insull, creator of the electrical grid

The new technology of the 1920s (light bulbs, telephones, radios, movies, vacuum cleaners, and even lie detectors) all had one thing in common. They ran on electricity. At first, small generators produced power for a limited market at high prices. The belief then was that each street or family needed its own generator. One problem with electricity was that it couldn't be stored, thus making it expensive and limiting its market to a few wealthy people. For example,

Chicago in the 1890s had twenty generators serving only 5,000 customers.

Enter British-born Samuel Insull (1859-1938), who, after working for Thomas Edison, moved to Chicago in 1892. Using more efficient steam turbine generators (that could be stepped up at little cost during times of peak need) Insull saw that if he could generate electricity for large numbers of customers, he could count on more consistent demand, operate more efficiently with less waste, and charge lower prices per kilowatt. The lower prices would attract more customers, allowing him to expand his operations, and so on.

Insull also expanded his customer base by wiring houses cheaply & giving away electric appliances. By the late 1920s, he had wired Chicago, the state of Illinois & had 4,000,000 customers in thirty-two states. Thanks largely to his vision, cheap electrical power became available to the masses as the price of electricity per kilowatt (adjusted to 1992 dollars) went from \$4 in 1892 to \$1.56 in 1912 to 55¢ in 1927 to 9¢ in 1967.

Insull built the Civic Opera House in Chicago in 1929. It was built in the shape of a throne facing west, away from New York City, which had supposedly spurned his efforts.

From capitalist hero to villain. To finance his enterprises, Insull had sold low-price bonds and stocks to over a million middle-class Americans. Unfortunately the stock market crash of 1929 made their investments worthless, and almost overnight Insull went from hero to villain, owing \$16 million dollars more than he was worth, making him "too broke to be bankrupt", as one banker put it. In 1934, he was charged with fraud, acquitted of the charges, and moved to Paris where he died in 1938.

Girls just want to have fun: The New Woman of the 1920s

The new modern women of the 1920s not only had the vote, but an unprecedented amount of social freedom. While most women still followed more traditional roles and lifestyles, there were a number of young women, typically referred to as flappers, who exhibited a freer lifestyle than ever before.

A flapper was typically urban, single, socially free, and affluent enough to pursue such a life, either from having her own job or an indulgent father (known commonly as a dapper).

The flapper's hair was short, typically in a pageboy cut known as a bob. Her dresses were loose (thanks to the demise of the corset) and also short, showing an unprecedented amount of leg up to and even above the knee. Adding to the more liberated and waif-like image was a preference for a more flat-chested look to de-emphasize traditional female roles of the past. This is a trend that has alternated with the more full-bodied look ever since.

From the early 1920s to the early 1930s the standard headgear for women was the cloche hat, which went well with the much shorter hairstyles for women.

Flappers tended to wear a good deal of eye make-up, something only women of ill repute were previously allowed to do. Thus for women in the 1920s, wearing makeup was seen as liberating. A flapper might even be a smoke-eater (i.e., woman who smokes cigarettes).

"Flapper speak." Along with the flapper's new lifestyle came a profusion of new words and expressions. Below are a few select terms that

suggest women's rapidly changing status and attitudes in the twentieth century:

- *Petting party*- Social event devoted to hugging
- *Snugglepup*- Man who likes petting parties
- *Alarm clock*- A chaperone
- *Father time*- Any man over 30 years old
- *Fire alarm*- A divorced woman
- *They*- refers to objecting parents
- *Cat's Pajamas or Frog's eyebrows*- Anything that's good
- *Goof*-Flapper's sweetheart
- *Biscuit*- A pettable flapper
- *Barney-muggin*- Lovemaking
- *Drop the pilot*- Get a divorce
- *Police-dog*- Young woman's fiancé
- *Handcuff*- Engagement ring
- *An alibi*- A box of flowers
- *Forty-niner*- Man prospecting for a rich wife
- *Strike breaker*- A woman who dates a friend's "steady" during a coolness
- *Mad money*- Carfare home if she has a fight with her escort

Coco Chanel was a French orphan who revolutionized women's fashions in the 1920s by introducing clothing that felt as good as it looked. Among her innovations were sports clothes, red lipstick, bobbed hair, and even trousers for women. Thanks partly to her pioneering efforts, flappers of the 1920s shocked their mothers by showing their natural shapes.

Prohibition and Cocktails

The 18th Amendment (1920), which prohibited alcohol production and consumption in America, may have been another (fleeting) victory for women, since it was largely pushed by women suffering neglect and abuse because of their husbands' alcoholism. However, Prohibition hardly slowed down alcohol production or consumption. It merely made it the realm of gangsters, such as Al Capone in Chicago, and illegal bars, known as speakeasies, where one could buy "bathtub gin."

Because of their typically poor quality and taste, these drinks were often mixed with each other and different beverages. Thus was born the cocktail and a new character on the social scene: the bartender who knew the secrets of mixing the

hundred or so new drinks made popular at the time. In addition, really good bartenders had their own secret formulas for cocktails that made them especially popular. There was even a novel, Poet's Pub by Eric Linklater about people trying to track down a bartender with the formula to the Blue Cocktail.

132. THE GREAT DEPRESSION (1929-39)

Efforts to solve the Depression. As the Depression spread and deepened, governments desperately sought ways to revive, or at least protect, their ailing economies. One tactic was to raise tariffs and establish import quotas, trading blocs, and bilateral trade pacts. However, by 1933, this had helped cut world trade to one-third of its 1929 level. Another policy was to reduce government spending by cutting public works programs and civil servants' salaries. But this only created more unemployment and fewer consumers to revive the economy.

A third tactic, started by Britain, was to go off the gold standard and then devalue the British currency, which now had no gold backing it up. The idea was to make other nations' currencies and goods more expensive in comparison to Britain's and thus make the cheaper British goods more appealing to British and foreign customers. However, other countries followed Britain's lead, so nothing was gained, and everyone's currencies were devalued and less stable. Therefore, the Depression deepened even more and international tensions grew.

Keynesian economics: a new view of the state's role in the national economy. As the situation worsened, there emerged a growing realization that the *laissez faire* economics of the nineteenth century was no longer working and that governments must take a more active role in reviving their national economies and looking after the welfare of their citizens. Among the more innovative theories along that line was that of John Maynard Keynes, a British economist whose Keynesian Economics has been one of the most influential economic theories of this century.

The problem as Keynes saw it was that during a depression businesses need sales in order to provide jobs to families, while families need jobs to get the money to provide businesses with sales. However, neither individual businesses nor families have the resources to help themselves or each other out of the downward spiral of depression. Keynes saw the modern industrial state as the only institution with the power and resources to help both businesses and families and to revive a national economy.

However, the state's role is not to respond to changing economic conditions in the same way as a

business or family would. Rather, it should act in an almost contrary way in order to maintain stability. Therefore, the state should tax high and spend low in prosperous times in order to build up treasury surpluses. Then, during times of economic hardship, governments would tax low and spend their surpluses to provide jobs for families in such things as public works programs. The money earned from those jobs would lead to increased sales for businesses and an overall revival of the economy. Governments would then go back to taxing high to restore their surpluses in anticipation of the next economic downturn.

While governments generally did assume larger roles in trying to solve the Depression, they did it in different ways. The United States, under Franklin Delano Roosevelt, set up the New Deal, which supported vital industries, banks, agriculture, and public works to provide jobs and stimulate the economy. It also set up a social safety net, Social Security, which provided relief for the aged and unemployed. Later, this would be expanded into a virtual retirement fund, although that was not its original purpose. Britain reversed its earlier austerity policy of cutting government salaries and public works, and funded new industries such as shipping, electricity, and, later, armaments as the clouds of World War II loomed on the horizon. In both cases, the United States and Britain were in better positions to act when war came.

More fascist governments, such as Germany, Italy, and Japan, followed more aggressive and militant policies. Nazi Germany and, to a lesser extent, Italy embarked on rapid rearmament programs that provided jobs, but poured money into weapons industries that are unproductive unless they are used in the one thing for which they are suited: war. Japan was especially hard hit by the Depression since it had virtually no natural resources and had lost the trade needed to buy them. This situation prompted a military takeover of the government and an invasion of China to secure a food and resource base. In both Europe and Asia, these events were already undermining the collective peace and laying the foundations for World War II.

Growing Poverty and Unrest

Squatters' shantytowns in the Depression were popularly named Hoovervilles, a commentary on the unwillingness of President Herbert Hoover's administration to do anything to relieve their suffering.

The Bonus Marchers. In 1932, 60,000 World War I veterans marched on Washington D.C. to pressure the government to give them service bonuses not due until 1945. However, the government, itself mired in the Depression, couldn't meet the vets' demands and managed to send most of them home peacefully. Washington police forcibly drove out those who refused to go.

Labor violence. When factory owners threatened to pay workers lower wages or replace them with jobless men waiting outside, workers would sit down on the job and occupy their factory. Strikes often turned violent, as owners would bring in police, the army, or hired thugs to clear out the strikers.

The apparent success of Stalinist Russia during the Depression made socialism appealing to many workers in the United States, making it even more unpopular with the authorities. Joining the Communist Party and other pro-socialist organizations also became somewhat trendy among intellectuals and on college campuses. Unfortunately, this would come back

to haunt many of these people in the 1950s, when Joe McCarthy would dig up membership lists of these groups, haul their former members before the House Committee on Un-American Activities and ruin their careers.

FDR's New Deal and "Alphabet Administrations"

In his first 100 days of office in 1933, FDR initiated fifteen major pieces of legislation that became the New Deal. Such programs refinanced mortgages and provided emergency relief for those who could not then support themselves.

- AAA (Agricultural Adjustment Act)- Gave money to farmers to curtail production;
- NRA (National Industrial Recovery Act)- Established codes of fair competition to regulate industry, and for the first time in American history, guaranteed the rights of labor to bargain collectively;
- PWA (Public Works Administration)- Constructed roads, dams, and public buildings;
- FDIC (Federal Deposit Insurance Corp.)- Insured deposits in banks;
- TVA (Tennessee Valley Authority)- Developed Navigation, flood control, hydro-electric power and economic development in the Tennessee River Valley, at the time one of the poorest and least developed regions of America;
- SEC (Securities and Exchange Commission)- Regulated stock market practices, such as insider trading;
- CCC (Civilian Conservation Corps)- Planted trees, built public parks, drained swamps to fight malaria, restocked rivers with fish, worked on flood control projects and a range of other work that helped to conserve the environment.

THE DUST BOWL OF THE GREAT DEPRESSION (1929-39)

“Miles to water, miles to woods and only six inches to hell.” The Dust Bowl on the western High Plains during the 1930s was the greatest ecological disaster in American history, if not in history overall. Vegetation of the High Plains of western Texas and Oklahoma, eastern Colorado, and northeastern New Mexico was typically referred to as short grass prairie. On average, it received barely twenty inches of rain per year, so that it was covered largely by short grasses that could grow there and hold the soil in place.

One species that thrived here was the bison, which fed on the grasses and could take the severe winters and hot summers the area had to offer. In the early 1800s, settlers passed up this area because they deemed it too dry for agriculture. They were right, unless you wanted to grow grass.

However, after the Civil War, ranchers started taking cattle into this region, where they ran up against the Plains Indians tribes whose sustenance was the herds of millions of bison inhabiting this region. Therefore, to get rid of the Indians, ranchers waged a methodical ruthless campaign to exterminate the bison. The campaign worked, and cattle were moved in to graze where the bison had once roamed.

Cattle could survive on the grass, but there were two problems. One was overgrazing to maximize profits, which seriously degraded the long-term ability to support cattle. The other was that, while cattle could survive on the prairie grasses, they couldn't survive the harsh winters that occasionally hit the High Plains, in particular the disastrous winter of 1886-7. Thus ranching seriously declined, leaving a lot of open land, if anyone wanted it.

Therefore, speculators started promoting this area as a new promised land, showing pictures of thriving towns they claimed were on the High Plains (which they weren't). They also claimed that the noise of civilization moving westward produced more rain, basing this on the common belief that huge battles, such as Gettysburg, were always followed by rain. The most notorious land grab was the Oklahoma Land Rush in 1889 when the Oklahoma territory was opened to settlers, letting 50,000 people race to

claim the choicest lands as their own.

Unsuspecting immigrants were especially vulnerable to these promotions, including a group of German Mennonites from Russia who had been lured there in the 1760s by Catherine the Great with the promise they would not be drafted into the Russian army. However, in 1871, tsar Alexander II revoked this promise, and the Germans fled again, this time to America.

They brought two things with them. One was a hardy strain of winter wheat that they had grown in the Ukraine where there were similar weather conditions, thus making farming in the High Plains more feasible. They also brought Russian thistle (AKA tumbleweed), which could even survive more severe conditions than wheat could. In the early 1900s, farming in the High Plains did prosper as thousands of settlers tore up the sod to plant wheat.

Then came World War I. As European farmers left their farms for the trenches, the price for American wheat skyrocketed along with the prices it could fetch. So settlers took out mortgages to buy more land and farm machinery and tore up more sod to make room for wheat.

As the war ended and soldiers returned to the land, the price for price of wheat plummeted. However, instead of cutting production, farmers took out more mortgages to buy even more machinery to tear up even more sod, thinking that, if the price of wheat was only half of what it had been, they could make just as much money by producing twice as much wheat. A stretch of years in the late 1920s with unusually abundant rain encouraged further expansion, which produced record crops, but with no one to buy them.

Then came the Depression. The price of wheat dropped further. Banks started foreclosing on farms, while speculators who had developed land when it was profitable moved back east, leaving millions of acres of exposed soil. Worse than that, the 1930s were years of severe drought in the High Plains, farmers could grow practically nothing....except tumbleweed. After June 1931 normal rains wouldn't return for nearly 8 years. This left a vast expanse of once prosperous grassland.... but without grass to hold down the soil.

In the 1930s it started to blow away.

The coming of the “dusters” (1930-2). On September 14, 1930 came the first dust storm. At this point it was a novelty that excited meteorologists as to what exactly it was. Unlike other storms, it rolled, was black, and hurt like being swiped by coarse-grained sandpaper. It also carried enough static electricity to short out a car.

On January 21, 1932, a black cloud 10 kilometers high appeared outside Amarillo, whipped along by 60 mile per hour winds. The storm moved through parts of Oklahoma, Colorado, and Kansas, dropping coal black dust on towns and farms in its path. Weather bureau men were fascinated since it defied explanation, calling it “most spectacular”. Other people just called it a black blizzard.

The weather bureau counted 12 black blizzards in the Oklahoma Panhandle in late winter alone. Sometimes the storms were so bad they blinded cattle. One storm in April 1932 blew out the windows of a school. In the fall, many farmers didn't even bother planting a winter crop.

The second year of drought brought multitudes of bugs into homes: spiders (including black widows), centipedes, and tarantulas, one with legs two inches long and a body the size of an apple. There were also infestations of rabbits that ate what little food there was, leading to periodic rabbit drives that might kill 6,000 rabbits in one square mile. Making life even less tolerable, the 1930s saw record heat, hitting as high as 115 degrees.

In 1933, there were 70 severe dust storms. This was also the driest summer on record, so far. Wells started failing after two years of drought. Dust seeped through the tiniest cracks in houses and covered everything. Sections of roads disappeared for miles under waves of drifting dust, so people always traveled with a shovel and had to use telephone poles as guideposts.

In March and April steady winds killed what little winter wheat had been planted. A dust storm in late April lasted 20 hours, scraping paint off houses and getting into cows' digestive systems. People would wake up some mornings and not recognize their land because of the dunes. At the approach of

storms, people had to take cover or else get lost and choke to death.

In late May a rain and hailstorm on top of a duster rained mud pellets while hail smashed roofs, buckled car hoods and made cows cry out in pain. Then a tornado hit, followed by another hailstorm of mud pellets. Summer winds blew over telephone poles and grain silos. Dust choked chickens or clogged their digestive tracts, killing 90% of them in one county. Milk cows went dry and cattle starved or dropped dead from “dust fever”.

In 1934, the Government offered to buy cattle, slaughtering the good ones for meat and just killing the remaining third as not worth butchering. In March, a snowstorm dropped 21” of dirty snow, earning it the title of a “snuster”. On March 17, a duster obscured the sun for 16 hours. In late March, another duster obscured the sun for six days in a row. In early May, temperatures reached 100° in N Dakota.

On May 9, 1934 a huge duster some 1800 miles wide blew east covering Chicago the next day. On May 11, it reached New York City and Boston plunging them into partial darkness with only 50% normal sunlight, forcing the use of streetlights and headlights in midday. Baseball players had trouble tracking fly balls. Dust reached Washington D.C. and seeped into the White House. It even reached ships 200 miles at sea.

There were 54 dust storms in 1934. And this wasn't even the worst year. None of these storms made the sky go completely black...yet. Respiratory masks were blackened in less than an hour and people still were inhaling dust. Hospitals delayed operations and flourmills shut down because dust was in everything. Dust storms now reached Nebraska, cutting productions from 20 bushels per acre to less than one as 8,000,000 acres yielded nothing and two million more were left fallow, further eroding the soil.

Dust storms generated an incessant crackling of static electricity from metal windmills. Static electricity was so bad men avoided shaking hands. They put cloth on doorknobs and metal oven handles. Car owners dragged chains to ground their cars against static electricity. Static electricity even singed and killed crops. One man claimed he saw a

jack rabbit electrocuted.

The next year, 1934, was the driest year to date, with less than 10 inches rain in the Oklahoma Panhandle. Remaining pockets of grass were smothered with up to 10 feet of sand. To bring grain prices up, the Government started offering cash to farmers to not plant. People started canning tumbleweed in brine for human consumption and harvesting flowering yuccas to feed livestock, which kept milk flowing, but tore up more land.

Crime from petty theft to bank robbing flourished, as people like Bonnie and Clyde became Robin Hood type heroes to common folk. People even abandoned their babies on the doorsteps of churches. The 1930s were the first decade in US history where the number of young children declined. Many believed this was God's punishment for their sins.

In the first four months of 1935, the health board of Dodge City, Kansas counted only 13 dust free days. February 1935 was the coldest in 40 years. By March, less than one-half inch rain had fallen. Late March 1935 saw twelve straight days of black blizzards with the wind clocked at 40 miles per hour for 100 straight hours.

Prairie dust has high silicone content that tears at a lung's honeycombed web of air sacs, leading to silicosis, much like what coal miners get after prolonged exposure. Doctors called it dust pneumonia. It was one of the biggest killers of the 1930s, especially for the very young and very old. An estimated 7,000 people died of dust pneumonia and other dust related ailments. Many families gave up land to the government in return for train passage to a healthier area.

The Red Cross opened six emergency hospitals across the High Plains, but many people in dire need couldn't get to them because dust storms made roads impassable. In April, 1935, over half of those admitted to hospitals in southwestern Kansas were for dust related respiratory ailments. Nine people died in one hospital. The Red Cross advised people not to go outside unless necessary, and then only with respiratory masks.

A train from Kansas City to Dalhart had to stop three times because passengers were choking.

Sunlight took on eerie hues, even green, from the dusters. Shoveling dust from front doors was a daily task. Sometimes it was so heavy that boys had to climb out windows to get to it.

People were driven mad by incessant dust storms. In one case a woman's house was nearly buried in dust and overrun with centipedes and black widows. The winds were incessant and her children were hungry, dirty, coughing, and dressed in soiled clothes. One day she just snapped and wandered the streets crying incoherently. The judge saw no alternative but to send her to an insane asylum and her kids to the care of the state.

The weight of the dust crushed trees, broke windows, and dented cars. It seeped in under pitched roofs and built up, threatening to cave in ceilings. Cars shorted out by static electricity were abandoned and buried in the sand. A caravan of people trying to leave one town was forced to turn back by roads covered in dust for 1/4-mile sections. No sooner had the CCC (Citizens Conservation Corps) dug one drift out and another appeared.

People tried various methods in efforts to coax rain out of skies. One was to kill snakes and hang them belly up on fences, creating miles of such fences in Kansas. Aerial bombing was especially popular, the theory being the noise of battles always led to rain. Napoleon even fired artillery into the sky to muddy roads for approaching enemies. Memories of rainy years during World War I led to the belief it was due to fighting in Europe.

In the 1890s Congress had appropriated money to test the concussion theory in Texas. In 1910, Cereal magnate, CW Post, tried carpet-bombing the skies with dynamite tied to 150 kites, but it started to rain before he could launch them. The next year he tried doing it with howitzers, but with no success. A more practical solution to the water problem was to dig wells to tap into the Ogallala Reservoir.

“Like three midnights in a jug”: Black Sunday. April 14, 1935 started out bright, sunny, and clear with no wind after suffering through 49 dusters in 3 months. For once, people could come out without masks and goggles. Windows were unsealed and opened, if they weren't stuck. People shoveled out rooms & roofs, did laundry & hung it outside to dry. Livestock could stretch out and breathe. A

scheduled rabbit drive proceeded after a month-long delay, though a preacher said they shouldn't club rabbits on Sunday.

Meanwhile, in North Dakota, the collision of a cold front barreling down from Yukon churned up violent winds, forcing temperatures to drop 30° in two hours. Callers bombarded the Weather Bureau about why it was so dark and where had the sun gone? Reportedly 200 miles wide, the storm rolled along like a tornado on its side, hitting without warning with winds of 65 miles per hour.

For some people the first warning was a stampede of birds and rabbits fleeing south. It hit so suddenly, people were knocked to ground, unable to see or even breathe normally. It created a ferocious clanking noise as the dust scraped everything in its path. Spikes on barbed wire fences glowed with electricity. People couldn't even see the person next to them. Some thought it was the end of the world & considered killing their children to spare them the terror of the Apocalypse.

Kerosene lamps indoors went out from lack of oxygen. One small child ran for home, got lost in the blackness and suffocated a half-mile from home. Dust getting under one man's eyelids permanently blinded him. Woodie Guthrie, watching it in Pampa, Texas, wrote "So Long, It's Been Good to Know Ya"

"There goes Oklahoma": Friday, April 19, 1935.

The super-duster rolled eastward toward Washington D.C. Meanwhile, Hugh Bennett who was trying to get Congress to fund soil conservation, kept dragging out his speech while getting frequent updates on the storm's progress. Suddenly, a senator interrupted Bennett: "It's getting dark outside." As senators ran to the window to see the sky darken for the second time in two years, Bennett told them: "This, gentlemen, is what I'm talking about. There goes Oklahoma."

Congress quickly passed an act creating the Soil Conservation Service.

The government started giving loans to families to start over or buy new land. Federal authorities had the power to buy back much of the land it had given in homesteads over the last 73 years. But things didn't get any better in the Dust Bowl, causing

some, but not most, people to pull up stakes and leave. "Okies" typically were met with hostility and the belief they were stupid, prompting H.L. Mencken to call for their sterilization.

Soil conservation efforts were introduced, such as plowing in terraces & furrows so the wind would ripple, not rip off the soil. A couple decent rains in June 1937 plus soil conservation measures led to some revival of crops. But in July, the heat returned to 110° & with it came a new scourge.

But government aid did nothing to stop the record the heat or the dusters. In May 1935, the temperature hit 105°, the earliest it had ever gotten that high. An autopsy on a cow showed its stomach was clogged with dirt. People were urged not to drive unless it was an emergency. One duster caused a fatal head-on collision between two cars going only 15mph.

Between 1930 and 1935, Nearly a million people left the High Plains. By March 1936, one county had only 8 of 136 homesteads left. Broken Bow Kansas went from a population of 3,000 to 3. Four times in July and August temperatures reached 118°, the hottest ever recorded in that area. August 1936 was the hottest month of the century in Oklahoma.

The journalist, Ernie Pyle described the region: "*I saw not a solitary thing but bare earth and a few lonely, empty farmhouses.... There was not a tree or a blade of grass, or a dog or a cow or a human being—nothing whatsoever, nothing at all but gray raw earth and a few farmhouses and barns, sticking up from the dark gray sea like white cattle skeletons on the desert.... It was the saddest I have ever seen.*"

"In Nebraska you don't have to die to go to hell.

Just when they thought they had seen it all, a new scourge hit: grasshoppers. People would first hear a weird buzzing & then saw a cloud some 900 meters across descending on their fields: Grasshoppers which consumed every bit of plant fiber above ground in its path. They would eat 50% of their weight every day. Making matters worse was the fact that farmers had killed off prairie birds & snakes, which fed on hoppers. Drastic efforts to stop them included spraying an arsenic/bran mixture from the air, which killed the hoppers... and

everything else. In April 1938 came another blizzard & then a 3-day duster as dark as Black Sunday, but much longer.

Epitaph. On July 11, 1938, FDR visited Amarillo Texas to kick off Operation Dustbowl where 100,000 people came to greet him. The sky darkened in midday as it had so many other times. Just after FDR's train came in, the skies opened up and let loose a downpour of rain. The worst was over.

FDR's CCC eventually planted 40 million trees as wind breaks across the High Plains. The Government also bought 11.3 million acres & tried to return it to grassland, leading to the creation of 3 national grasslands. One of them, Comanche National Grasslands covers 600k acres.

World War II brought new wheat subsidies for farmers, encouraging agriculture in the High Plains again. In the 1950s a 3-year drought brought back the dusters, but nothing like Black Sunday had been. From 1974-6 there were droughts, but no dusters thanks largely to Hugh Bennett's soil conservation measures.

Efforts to pump water from the Ogallala reservoir led to a new wave of settlers intent on big profits as if the last 20 years hadn't happened. They are now pumping water eight times faster than it can be replenished. Some people think major parts of it may be gone by 2010.

133. BENITO MUSSOLINI AND THE RISE OF FASCISM IN ITALY (1919-25)

"Books are good. Muskets are better."--Fascist slogan

Introduction: the response to Communism. World War I and the Treaty of Versailles apparently solved nothing and satisfied no one. Although the Western democracies, such as France and Britain, were regaining some stability and prosperity, no one else was. Ethnic and territorial disputes arose among the new democracies in Eastern Europe. The Bolsheviks in Russia threatened to spread their revolution and overthrow Capitalism. And Italy and Germany, the one a "winner" and the other a loser in the war, were both bitter about the Treaty of Versailles and anxious to reverse its verdict.

These conditions gave rise to *Fascism*, the belief in a totalitarian dictatorship controlling nearly all aspects of the state: government, army, press, schools, etc. However, unlike the Soviet model of Communism, it allowed free enterprise and private property, thus appealing to the business-oriented middle class since it gave them economic security. Finally, Fascism was also intensely nationalistic and aggressive in its foreign policy.

Mussolini and the rise of Fascism in Italy. The first successful Fascist takeover was in Italy under Benito Mussolini. He was born in 1886 in the rough hill country of North Central Italy. His mother was a devout Catholic and schoolteacher, while his father was an atheist and anarchist who liked to smash ballot boxes on Election Day. Benito himself was a troublemaker who had a bad habit of knifing his classmates. As a young adult, he fled to Switzerland to avoid the draft and was converted to socialism there. In 1904, he returned to Italy and served his time in the army in return for a pardon. He then became the editor of several socialist newspapers in which he advocated both political assassination and pacifist resistance to a war with Turkey, calling the national flag a rag fit to be planted on a dung heap. When World War I broke out, he first advocated neutrality, and then, probably after accepting French bribes, called for Italian involvement on the Allied side.

Italy made a poor showing in the war and paid a heavy price for it. Government expenditure during

the war was twice its expenditure for the whole period 1861-1913. As a result the economy was in shambles and the country was plagued with unemployment, inflation, riots, strikes, and brigandage. It was then that Mussolini first joined and soon became leader of the Fascist Party, which stood for upholding claims of veterans and the nationalist interests of Italy while crushing any anarchist elements in the country. Ironically, the Fascists did more to promote anarchy than anyone else in Italy at that time. Mussolini would send out his gangs of thugs, the Blackshirts, to riot against Communists and other groups while claiming his men were protecting the peace.

Oddly enough, Mussolini's strategy of spreading chaos in the streets while posing as the champion of law and order who could save Italy started paying off. Even without the Blackshirts' antics, Italy needed law and order, and many people, especially the middle class who feared the Communists, looked to the Fascists as the answer to Italy's problems. In October 1922, they made their move.

It was actually the local party bosses who started a series of riots that stormed various city halls and forced concessions from local governments. This encouraged them to march on Rome and seize control of the national government. Benito himself was hesitant to take part, but when the Ras went ahead without him and it looked as if they might succeed, he put himself at the head of the march as if it were his idea all along. The march itself was a fiasco, getting bogged down in a massive traffic jam, but it scared the government enough to offer Benito the power to form a new government, which he did with typical bombast and bluster. Then, through intimidation and rigged elections, Benito tightened his grip on Italy. He bullied the Italian Parliament into giving him emergency powers that allowed him to shut down other parties, censor the press, and end other civil liberties. By 1925, Italy was a fascist dictatorship.

The riots and strikes did settle down after Mussolini took power, but little else went right for Italy and the Fascists. Mussolini claimed he made the trains run on time, but that was a gross exaggeration, as was just about every other claim he made. He did try to build up Italy's aircraft, shipping and power industries, but the Depression and Italy's lack of natural resources, along with poor planning and

corruption, severely limited any economic progress. Mussolini's big dream was to make Italy a major power, thus reviving the Roman Empire. Here again, little progress was made, although Benito made wildly inflated claims about Italy's military strength.

Whatever his failures as a national leader, Mussolini appeared to be a shining example of Fascist strength when compared to the more timid democracies in Europe, and was a hero to other aspiring Fascist leaders of the day. Among these was a struggling German politician by the name of Adolph Hitler.

The Allies' Best Friend (?): How Mussolini Helped the Allies Win the War

In 1941, as Hitler was preparing his surprise assault on Russia, Benito invaded the Balkans, was defeated, and needed Hitler to bail him out. By Hitler's account this delayed the invasion of Russia for a critical five to six weeks, during which the Russian winter set in, bogged down the German advance, and allowed the Russians to mount a counter-offensive and save Moscow. If Moscow had fallen, that could have been the end of Stalin's regime and World War II would have followed a very different course.

A Chip off the old Block

Young Benito was such a hell-raiser that his Mother sent him to a strict religious school, where he was expelled for knifing a classmate. Later, he knifed another classmate while at a state training school for teachers. After teacher's college, he got a job teaching in a small town where he had an affair with a woman whose husband was away with the army. Eventually, in a jealous rage, he knifed her too. On the bright side, he probably didn't have many discipline problems as a teacher.

Father knows best. Thoroughly disenchanted with his son, Benito's

father told Benito's future wife, Alessandra, that she'd be better off throwing herself under a train rather than marrying his son.

The Birth of Fascism

In March 1919, the first meeting to form Fascist party took place. According to Mussolini an estimated 145 showed up of whom about one-third signed up. It announced three goals:

- 1) Uphold claims of veterans
- 2) Oppose any imperialism harmful to Italy

Italy

3) Stop w/all their might anarchists who were "milk & water" Italians

Fascism gets its name from the ancient Roman fasces, a bundle of rods carried before Roman consuls as a symbol of their power.

A major issue after World War I was Fiume, a free city established by the League of Nations, but claimed by Italy. It was seized by Gabriel d'Annunzio, a flamboyant super-patriot who ruled it for 15 months before the Italian government got him out. Everyday his army of Black Shirts would parade in front of him & say in response to one another:

"For whom is the Future?" "The Army of Italy"
"For whom is the power & Glory?" "For us"

Mussolini admired d'Annunzio and even adopted his use of black shirts as the party's uniforms/gang colors and daggers, truncheons, and practice of over-dosing victims with castor oil in street fights.

In their first election for office in Milan in 1920 the Fascists lost miserably to the Socialists 180,000 to 4,000. While the Socialists celebrated at their victory party, a hand grenade flew in through the window, wounding several people. The next day the police searched Benito's office where they found all sorts of bombs and explosives. He was jailed and released only a day later.

Among other things, it seems Benito was a poor loser.

Playing Tag with Knives: Fascist Tactics

With no majority party to take control, Italy was beset with riots, factory takeovers, and 1880 strikes in 1920. Fascist gangs of thugs (squadristi) took to the streets, beating up socialists, communists, and union officials and force-feed them castor oil, a particularly nasty liquid commonly used to calm upset stomachs. As an extra added torture, they carried razors with which they would dry-shave half their victims' moustaches. For those readers who have never shaved their moustaches, suffice it to say that it hurts a lot.

Not It. In addition to starting riots against their enemies, the Fascists played a game I call "Not it". Just like the children's game of Tag where the last person to say "Not It" is It, so it goes in politics. A common political tactic is for one side to blame the other side for its own crimes and faults, because, whatever the truth of the matter, whoever gets blamed first is in a weakened position by right of having to defend themselves. Even if they justly counter-blame the other side, it looks like they're only copying the other side, making them look unoriginal and guilty, since the other side first has already put it into people's heads that the innocent side is guilty. Hitler and the Nazis would copy Mussolini in this and various other tactics.

The March on Rome (1922)

This is the sort of thing you can't make up. It's my Benito Mussolini March on Rome play set that I found in a hobby shop. It has no fewer than four Benito's (in case three of them get lost under the couch or are eaten by your dog). Given how lame this event was, I'm not sure what you do with this, but it could be a worthwhile challenge to kids' imaginations. There are also play sets to recreate mass rallies by Hitler, Lenin, and Mao.

By 1921, the Fascists had 2200 local chapters and 320,000 members. In Milan, they had won 125,000 votes and 35 seats in the Council of Deputies.

The Ras were local party bosses named after Ethiopian party chiefs. Many thought Benito too wishy-washy, wanting to please everyone all the time. For example, for some reason, Benito tried to ally with his foes, the Socialists. When the Ras protested, Benito resigned, thinking they would beg him to come back. When they didn't, he dumped his alliance with the Socialists to reclaim party leadership.

In 1922, when the Ras and 50,000 squadristi stormed the town hall in Ferrara, the government told Ferrara to comply with Fascist demands. sparked similar marches on Bologna, Ravenna, and Parma, and then plans to march on Rome and seize power. When Benito finally jumped on the bandwagon, he gave a speech with his typical bombast and bluster, declaring: "Either the government will be given to us or we will seize it by marching on Rome."

The March on Rome (10/24/1922) was a fairly lame event, being delayed by a lack of cars and buses for transport. Even though the army could have beaten the 14,000 fascists taking part, the premier and high-ranking politicians panicked and offered Benito a government post. Sensing their weakness, he spurned their offer, so the king let Benito form a new government. When Benito showed up in fashionable black pants and shirt and white spats, he told king: "Your majesty will excuse my appearance. I come from a battlefield." Where that battlefield was, no one could say, but it sounded nice for history.

The actual march on Rome materialized several days after Benito took power. It made a nice parade.

"I could have transformed this gray hall into an armed camp. I could have nailed up the doors." -- Benito's 1st address to Parliament

Peace with the Church

Ever since the incorporation of Rome into the Kingdom of Italy at the expense of the Papacy in 1871, relations between church and state had been strained. In 1929, Mussolini signed the Lateran Treaty by which the Papacy recognized the state of Italy in return for recognition of an independent Vatican state and the right to teach in schools. For Benito, this was a win-win solution, because it gained not only recognition of Italy from the Church, but an influential ally that could be very useful for indoctrinating the nation's youth.

Benito's Cult of Personality

Image was everything to Mussolini and his regime amounted to little else. However, the cult of personality that Benito developed provided the template for similar cults of twentieth century dictators like Hitler, Stalin, and Mao. The key for all of them was mass media. During the early twentieth century, in addition to posters and newspapers, that also meant a new type of technology, the loudspeaker, which allowed politicians to address huge numbers of people at a time, generating a certain mob mentality that could be whipped up into a frenzy, getting more people involved, further increasing the frenzy, and so on.

Mussolini's also made extensive use of posters, which had been vital to the propaganda efforts of the First World War. On the one hand, these would portray Benito as larger than life, while regular photo-ops simultaneously portrayed him as a man of the people: wrestling a lion cub in a zoo, in military uniform visiting a veterans hospital, or riding a horse (with the man leading the horse cropped out). The combined images of superhero and common man were both necessary in the age of mass media democratic politics.

As far as his personal image was concerned, Benito claimed to be a fitness fanatic as well as a sparing eater and drinker. He was a sharp dresser, having an outfit for every occasion. However, he shocked Italians by not shaving everyday, leaving a five o'clock shadow that made him look like a gangster, an image he probably cultivated intentionally for intimidation purposes. Similarly, he had an imposing office with his desk at the far end so visitors had to walk its entire twenty-meter length to talk to him. Hitler would do the same thing, with the addition of a huge window behind him to nearly blind visitors and make him appear as a much more ominous and shadowy figure.

Mussolini was also notorious womanizer, with no attractive woman supposedly being safe alone in a room with him. Even publicity of this sort was probably calculated to add to his image of virility.

Feet of Clay: Benito's Armed Forces

"Good blood doesn't lie."-- Italian recruiting poster

Nothing better illustrates the nature of Mussolini's Italy than the discrepancy between his claims about his military and the empty shell it really was. For example, Benito claimed he had an army of 6,000,000 men in 1934, 8,000,000 in 1936, and 12,000,000 in 1939. In reality, it was never more than 3,000,000

Likewise, he claimed Italy was producing 450 artillery pieces per month, when in reality, it was never more than 200 per month, only one-sixth Italy's production rate in World War I. Even more embarrassing to the dictator was the fact that Italy's best artillery in World War II were Austrian guns captured during World War I.

Tanks. Mussolini claimed he had three armored divisions with 25-ton tanks. In reality, his tanks were mostly 3.5 ton armored cars that were easily pierced by gunfire, and having no weapons larger than machine guns, poor visibility, and no radio, so infantry had to lead it, largely defeating its purpose. For parades, they would borrow armored cars from the police.

When presented with a list of medium tanks, Benito took a quick glance, and with his typical dramatic gesture, pointed to one and said: "Make this one. By the time they rolled off production lines in 1940, they were already obsolete. Nevertheless, Italy kept on making them to the end of the war. In 1945, even Mussolini's chief of staff admitted Italy had nothing that could seriously be called a tank.

Air Force. By 1935, Italians owned most international aviation records, so one might expect Mussolini's forces to excel in this area. He talked about blacking out the sun with the sheer numbers of his planes, which he claimed numbered 8530. As usual, the reality was far different. Italy's air minister lowered the claim to 3,000 planes, while naval sources admitted it was only 1,000.

In reality it was only 583 planes. To impress visiting dignitaries, it would fly from field to field to be counted in multiple reviews. While Benito claimed he was producing 500 planes a month, it never exceeded 150. Italy produced more planes in World War I.

Italy's aeronautical experimental station at Guidonia was hailed as a marvel. Typical of the Fascists' desire for flashy shows, it had nice buildings, but no automatic flying equipment,

gyroscopic instruments, high-octane petrol, anti-icing devices, retractable landing gear, or variable pitch propellers. Similarly, Mussolini's planes were also lacking in quality, being inferior to British planes in speed and equipment.

One of the more embarrassing aspects of Benito's rule was the excessive number of generals he had, largely because he cut divisions from three to two regiments to claim more divisions.

Mussolini, also had three spy services. On the surface that may sound impressive, but in reality it was worse than worthless. Instead of gathering intelligence for the safety of Italy, they spent their time arresting each other, planting false documents in each others' files, cutting out newspaper clippings, and smuggling goods for their officers and Benito's girl friends. Meanwhile, Italy didn't even have an agent in Malta, only 100 miles away.

134. ADOLF HITLER AND THE RISE OF NAZISM IN GERMANY (1919-39)

***"The driving force of the most important changes in this world have been found less in scientific knowledge animating the masses but rather in a fanaticism dominating them and in a hysteria which drives them forward."--
Adolph Hitler***

Introduction. The most ominous development after World War I and one of the primary causes of World War II was the rise of Adolph Hitler in Germany. The Treaty of Versailles helped lead to this in five ways. First, there was the common belief that Germany had been betrayed, since the Armistice had been signed before allied troops had reached German soil. Germans, looking for scapegoats, blamed bankers, Catholics, and especially the Jews. Second, the Treaty of Versailles angered the German people and destabilized Germany both economically and politically. Third, the Weimar Republic, which succeeded the Kaiser's monarchy, was moderate, but weak, and thus let matters get out of hand. Fourth, the German economy's over-dependence on American loans caused it to collapse with the Stock Market Crash in 1929. Finally, the Depression, especially with the renewed raising of tariffs, created tense international relations. All these provided the conditions for Hitler to seize power.

Adolph Hitler was born in 1889 in Braunau, Austria. His early ambition was to be an artist, but he failed to gain entrance into Vienna's main art academy. Drawing upon strong anti-Semitic sentiments already in Vienna, Hitler blamed the Jews for conspiring to keep him out. He got by as an artist for soap and deodorant ads, having few expenses, since he was neither married, drank alcohol, or smoked. In 1913, having failed to get into the Austrian army, he crossed into Germany. Then came World War I.

Hitler served in the German army with distinction, was wounded twice (once by poison gas) and decorated for bravery. Being a loner, he actually enjoyed the war and the comradeship of the army, since it gave him a sense of belonging. Therefore, he felt especially disappointed and betrayed when Germany surrendered in November 1918. The

Treaty of Versailles the next year merely added to this bitterness. Not surprisingly, he conveniently blamed the Jews for Germany's plight.

After the war, Hitler served as a reservist, spying on political parties to make sure they did not add to the chaos then besetting Germany. One such party was the National Socialist, or Nazi, Party. This right wing group attracted Hitler with its racist ideas about a master Aryan race and the so-called "inferior" races, such as the Slavs and especially the Jews who must be destroyed. Hitler became the Nazis' seventh member and soon afterwards its leader. He also found a new talent, speech making, which attracted large audiences and funds to the new party's treasury.

As disturbing as the Nazi ideas were, they were nothing new or original to European culture. Persecution and hatred of the Jews went back to the Middle Ages where they were often resented as moneylenders, accused of such things as the execution of Christ and conspiring with the Devil to cause the Black Death, and subjected to expulsion from their homelands and at times even massacres. Even such a revered figure as Martin Luther said the Jews should be deprived of their property and that:

"...their synagogues or schools be set on fire, that their houses be broken up and destroyed...and they be put under a roof or stable, like the Gypsies... in misery and captivity as they incessantly lament and complain to God about us.

The idea of an Aryan super-race was also rooted in German philosophy, in particular Freidrich Neitzsche, whose idea of a new superior type of human ("ubermensch") was easily taken out of context and narrowly applied by the Nazis to the German people:

"A daring and ruler race is building itself up...The aim should be to prepare a transvaluation of values for a particularly strong kind of man, most highly gifted in intellect & will. This man and the elite around him will become the 'lords of the earth'"--from The Will to Power

Ordinarily, such ideas would have little appeal in normal prosperous times. However, conditions in Germany after World War I were anything but normal or prosperous. Political strife rocked the country as extremists from both the right and left. Notably the Communists, fought for power. Another problem came as the government printed vast amounts of money to support a strike against occupying French troops trying to force Germany to pay its huge indemnity. However, Germany's inability to back up its currency led to a wildly uncontrolled cycle of inflation. As a result, a single turnip would cost 50 million marks and people literally burned money for fuel, carted it around in wheelbarrows, and shoveled it out of bank vaults.

Given these conditions, it is hardly surprising that many Germans were drawn to the idea of themselves as a super-race that had been treacherously betrayed by "inferior" enemies from within and without. Therefore membership in the Nazi party grew rapidly in the early 1920s, prompting Hitler to try to overthrow the government in 1923. His *Putsch*, as it was called, was a total disaster, but the resulting trial earned Hitler a good deal of publicity as a national hero defending German honor against domestic violence and foreign humiliation. While in prison for nine months, he wrote *Mein Kampf* ("My Struggle"), which outlined his political beliefs and strategies for seizing power.

While its racist ideas were just rehashed versions of older ideas, *Mein Kampf* did provide a blueprint for modern politics through the use of radio, posters, mass rallies, lies, and catchy slogans which appealed to the emotions without really telling anything of substance in order to manipulate the political process. Nazism was a negative philosophy that thrived on Germany's miseries. However, by the mid 1920's, the illusion of prosperity and the apparently fading hostility toward Germany caused Nazi membership to stagnate.

All that changed in the 1930's, as other two effects of World War I created conditions favoring the Nazis. For one thing, the Depression with its higher tariffs raised international tensions, which Hitler could exploit to gain popularity. Also, the war had created an unstable economy that was overly dependent on financial support from the United

States. Therefore, the stock market crash in 1929 dragged Germany down with the American economy. By 1932, six million Germans were unemployed, which played right into Hitler's hands. This time he would use the democratic process to gain power and then use that very democratic process to destroy itself.

The Nazis reacted to these conditions in two ways. First, Nazi thugs, known as Brownshirts in imitation of Mussolini's Blackshirts, started riots with opposing groups, especially Communists, while blaming them for the disorder, embarrassing the government for failing to keep order and portraying themselves as the defenders of the peace. Second, they bolstered their popularity with free food and festivals, making them look like nice concerned Germans, and by staging huge mass rallies to display their popular support.

In late 1932, rich German industrialists, prompted by fear of a Communist takeover, pressured the government to make Hitler chancellor (prime minister), hoping they could control him while he contained the Communists. Little did they suspect that this was just the beginning for Hitler.

From chancellor to dictator (1933-38). Once in power, Hitler worked to increase his own power and German national pride in three ways: destroy any possible rivals to his position, rearm Germany, and launch a campaign of violence against the Jews. In the months following his becoming chancellor, he skillfully used his government powers, propaganda, lies, and brute force to divide his enemies and then destroy them one by one. Needing a majority in the *Reichstag* (German parliament), Hitler immediately called for new elections, hoping his new position as chancellor would win the Nazis more seats. In order to scare people into supporting them, the Nazis burned the *Reichstag* building and blamed the Communists. The resulting hysteria allowed Hitler to suspend civil rights and arrest the Communist leaders, thus gaining the Nazis more seats in the *Reichstag*.

Now it was time to eliminate the *Reichstag* and the democratic process along with it. Hitler planned to do this by passing the Enabling Act, which would give him legislative and executive power for four years, plenty of time to get a stranglehold on power in Germany. With the Brownshirts outside

threatening violence, the law easily passed, giving Hitler the legal framework in which to establish a dictatorship.

In the following months, Hitler used a combination of threats to opposing leaders, alluring promises to their followers, and brute force to eliminate his enemies. One by one they fell: the Social Democrats (with a strong labor backing), the Catholic Center Party, and the German Nationalists (ultra-conservatives who were forced to merge with the Nazi Party). Next came the press and universities, institutions with many educated people who saw through Hitler's lies and might be able to mobilize public opinion against him. In each case, Hitler formed a comprehensive national association that all members of that profession were required to join if they were to keep working. Of course, Nazi officials headed these new organizations, which gradually strangled freedom of speech and thought in Germany.

With Germany firmly under his heel, Hitler moved to gain firm control of his own party. His main rival, Ernst Rohm, was the head of the powerful Brownshirts, the para-military gang of thugs the Nazis used for violence and intimidation. Many army officers and industrialists feared Hitler would replace the army with the Brownshirts, while Hitler himself feared Rohm's power. Therefore, he won the support of the army and industrialists while serving his own interests by having Rohm and his associates murdered in the so-called "Night of the Long Knives." (It is widely believed that Hitler himself pulled the trigger in Rohm's murder.) The Brownshirts were dissolved and replaced by the much more efficient and deadly black-shirted Storm Troopers, commonly known as the *Schutzstaffel* or SS. From now on they would be the main agents of the Nazi Terror.

In August, 1934, President Hindenburg, symbol of the old Prussian order with which Hitler had been careful to associate himself, died. To symbolize the dawn of a revolutionary new order and the 1000-year reign of the Third Reich, Hitler demanded a loyalty oath from the army, not to Germany, but to himself. From now on Germany was to be Hitler, and Hitler was to be Germany.

The growing darkness. Hitler's second goal was the rearmament of Germany. He did this

through a massive arms build-up (in direct defiance of the Treaty of Versailles) and public works projects (such as highways for moving armies from front to front). At least in the short run this did provide jobs and prosperity and restore pride in Germany. However, in order to fund all this, the Government budget grew seven times from 1932 to 1938, with 74% of that budget for the military. This put a growing strain on the German economy, which helped lead to German aggression and World War II.

Finally, Hitler attacked the Jews, whom he imagined had kept him out of art school and betrayed Germany in the war. His Nuremberg Laws in 1935 subjected Jews to an ever-growing number of restrictions and acts of violence. The climax of this stage of persecution was the *Kristallnacht*, or Crystal Night (11/9-10/38), named after the shattered windows of Jewish merchants' shops that were looted that night. Using an incident in Paris between a Jew and German diplomat, the Nazis instigated this wave of violence against Jews across Germany. Nazi-led gangs looted Jewish owned shops, brutally beat their owners, and then rounded them up for the growing number of concentration camps springing up in Germany.

Many Jews, including Albert Einstein, left Germany, costing it many of its brightest minds. The horror stories they took with them led to growing fears of Nazi aggression and eventually World War II. They also took with them talents that the Nazis could have used but claimed were part of a worldwide plot to pollute science and destroy civilization. Einstein's theory of Relativity was especially singled out by one Nazi writer as being:

"directed from beginning to end toward the goal of transforming the living-- that is the non-Jewish-- world of living essence, born from mother earth and bound up with blood, and bewitching it into spectral abstraction in which all individual differences of peoples and nations, and all inner limits of the races, are lost in unreality, and in which only an unsubstantial diversity of geometric dimensions survive which produces all events out of the compulsion of its godless subjection to laws."

Wilhelm Mueller, in his book, *Jewry and Science*, claimed the worldwide acclaim given to Einstein for his theories was really only rejoicing over "the approach of Jewish world rule which was to force down German manhood irrevocably and eternally to the level of the lifeless slave."

"...the Jew conspicuously lacks understanding for the truth...being in this respect in contrast to the Aryan research scientist with his careful and serious will to truth...Jewish physics is thus a phantom and a phenomenon of degeneration of fundamental German physics."-- Nazi, Prof. Philipp Lenard

From 1905 to 1931, ten German Jews won Nobel Prizes in science. Hitler would kill six million more.

Conclusion. Why did Germany go along with this madness? A combination of factors gives at least a partial answer. First, Hitler was a master of dividing and attacking his enemies one by one. He would win over people with tempting promises while eliminating their, leaving them helpless before him. He also effectively used lies and propaganda to deceive the public and turn them against helpless scapegoats, such as the Jews, making people relieved they were not under attack *at that time* and not seeing what was happening until it was too late to save themselves. Finally, Hitler's programs did restore national pride and relieve some of the Depression's misery. Little did they realize the price they and the world would have to pay for this temporary bit of comfort.

The Weimar Republic

Germany's defeat in the war and replacement of the Kaiser with the weak Weimar Republic led to one of the most turbulent, but also culturally vibrant periods in German history. The liberal Weimar Republic, which abolished censorship, also spawned radical experimentation in the arts and lifestyles in Germany in the 1920s.

In the apparent prosperity & free and easy culture of the 1920s, Berlin in particular became associated with decadent partying and disillusionment with the old culture. This was

reflected in Fritz Lang's epic science fiction film *Metropolis* (1927), a dystopic view of the year 2000 where an upper class elite of owners lives in elaborate skyscrapers while the oppressed working class labor underground.

American jazz was especially popular in Germany at that time, opening opportunities for many African-American musicians.

Unfortunately, this seemed to provoke racist reactions that Nazism would thrive on in the 1930s. Overall, Hitler and his followers would use the liberal culture of the Weimar era as a convenient target for their anger.

German versions of the Ziegfeld Follies revue in America showed the growing influence of American culture during the Weimar era, while the famous German film actress, Marlene Dietrich, a staunch anti-Nazi later moved to the U.S. to pursue a successful career there.

Bauhaus. (literally "building school",) was the best-known cultural movement associated with the Weimar Era, founded by Walter Gropius, although it wasn't originally concerned with architecture. The Bauhaus style, also known as the International Style, was partly a reaction against emotional Expressionism. Rather, it reflected the Arts and Crafts movement of the previous century. However, instead of rejecting technology, Bauhaus strived for a reconciliation of art and technology in daily objects so there would be no distinction between form and function. Or, more concisely as its motto from 1923 put it: "art and technology - a new unity".

These efforts to integrate art and mass production on a large scale led to buildings and objects distinguished by clean simple lines and the absence of ornamentation. Instead of just being museum pieces, such objects also served as prototypes for mass production of tea services, chess sets, vases, desk lamps, and so on.

Freikorps and the Spartacist Uprising

Capitalist fears and Bolshevik threats of a global communist revolution seemed to be coming true in 1919 when the German communists, (AKA Spartacists) tried to overthrow the Weimar government.

The Social Democrats leading the government had to rely on the army and free bands of veterans, known as the Freikorps, to crush the uprising. As a result, the army, although severely reduced in size by the Treaty of Versailles, had tremendous influence within Germany. The army, civil service, and judiciary were all overwhelmingly conservative, wanting a restoration of the monarchy. As much as they disliked the radical tactics and beliefs of the Nazis, they hated communists, socialists and the Weimar government even more.

Therefore, Nazi acts against the state, such as Hitler's attempted putsch in 1923, were often lightly punished, giving them a relatively free hand to riot against the communists. Different parties would later enlist many Freikorps members (above) as virtually private armies to attack other politicians and protect their own.

Young Hitler

Hitler's parents and upbringing may be part of the answer to what went wrong. His father was authoritarian and rough on his son, while his mother over-compensated by pampering him. With such mixed messages, no wonder he was so messed up.

Hitler's father, Alois, who was probably his mother's uncle, could have taken the name Schickelgruber from the other side of his family. This raises speculation on whether Adolf could have been a serious candidate in elections with a name like that.

Another factor influencing Hitler (and history) was his rejection from the Vienna art school because his art was too representational. Not that it was bad (as seen below), but it didn't suit the more abstract tastes in vogue the time. Needing someone (besides himself) to blame, he blamed his rejection on the Jews.

Like so many young men of his day, Hitler welcomed the coming of the First World War, supposedly even falling to his knees to thank God for the war. Because he was temporarily blinded in a gas attack toward the end of the war, Hitler refused to use gas against enemy troops in WWII. Of course, this didn't stop him from using poison gas (Xyklon-B) on Jews in his death camps.

By the time he had recovered from the gas attack, Germany had surrendered, leaving Hitler with the feeling of deep betrayal.

Hitler (far left) with his comrades during WWI

Hitler the Lady Killer: Der Fuhrer's Love Life

Left to right: Mitzi Reiter, Geli Raubel, Renate Mueller, and Unity Valkyrie Mitford

Hitler apparently had difficulty bonding with other people, especially women, only feeling comfortable if he could control them. However, he did have a number of love interests or were rumored to have committed suicide.

Mitzi Reiter was 16 in 1926 when the 37-year old Hitler courted her with promises of marriage and blond children (although neither of them was blond). However, his political career kept him from following through on these promises, so Mitzi, depressed by these rebuffs, unsuccessfully attempted suicide by hanging and later married an SS officer. Hitler's sister, Paula, claimed Mitzi was the one person who could have prevented Hitler from becoming a monster.

Hitler's next girlfriend, Geli Raubel, was his half-sister's daughter and 17 years old (nearly legal) when he courted her. He apparently stifled her freedom of movement to the point where Hitler's pistol killed her in 1931 after an argument over her plan to move to Vienna. Whether it was murder or suicide remains unknown. After this, Hitler's personality reportedly became much darker as he had trouble creating meaningful relationships with other people and had to kill them.

Renate Mueller was a popular and suitably Aryan German actress who rose to prominence when the anti-Nazi actress, Marlene Dietrich fled to Hollywood. Mueller was also reluctant to star in Nazi propaganda films and even rumored to be dating a Jew. In 1937, she reportedly had a disastrous one-night stand with Hitler who begged her to kick him so he could be aroused while writhing around on the floor.

Several days later, Renate fell, jumped or was pushed to her death from a hotel window after several Gestapo agents were seen entering her building. Hmm.

Unity Mitford was an English socialite who became obsessed with Hitler, moved to Munich where he lived, and worked her way into his inner circle in the mid 1930s. The fact that her middle name was Valkyrie also impressed Hitler, who called her a "perfect specimen of Aryan womanhood." Eva Braun was extremely jealous of Mitford and won Hitler's attentions back by attempting suicide.

When England declared war on Germany in 1939, Mitford was so upset that she shot herself in the head with a pistol Hitler had given her. She survived the attempt and returned to Britain, where she died in 1948 from complications caused by the bullet that had remained lodged in her skull. Rumor has it that Mitford had Hitler's love child after returning to Britain & gave it up for adoption.

Hitler's longest lasting relationship was with Eva Braun whom he started dating in 1931 when she was 19 (and he was 47). She attempted suicide twice in their early relationship and was his primary mistress until 1945, despite various habits Hitler disapproved of, namely smoking and sun bathing in the nude.

He kept her concealed from public view and scrutiny, typically sending her to her room during parties and other social occasions. Hitler's chauffeur called Eva Braun the "unhappiest woman in Germany" because she spent nearly all her time waiting for Hitler.

Eva was also Hitler's wife for 40 hours before committing suicide with him on their honeymoon in his bunker in Berlin as Russian troops were closing in. This time she was successful in killing herself, but she did have a lot of practice.

The Origins of Nazi Symbols and Ideas

Unfortunately, the history of ideas is often important for the way people misuse them rather than use them. This is especially true for the idea of the Aryan super-race, which was also largely rooted, in a completely twisted way, in the ideas of the German philosopher, Friedrich Nietzsche, idea of a new superior type of human ("ubermensch"):

"A daring ruler race is building itself up...The aim should be to prepare a transvaluation of values for a particularly strong kind of man, most highly gifted in intellect & will. This man and the elite around him will become the 'lords of the earth'" --from *The Will to Power*

Aryans was brought into vogue by the French racist, Joseph Gobineau, transforming it from a linguistic to a racial term, saying survival could only be ensured by racial purity, and that racial intermingling could only lead to cultural, moral, and political decline.

Urbemensch (superman) was a term used by the 19th century German philosopher, Friedrich Nietzsche who argued that some individuals must be free to transcend their time's moral constrictions. Nietzsche was talking about a moral and ethical transcendence rather than a physical one based on brute force and was a vigorous opponent of anti-Semitism and the vulgar worship of power spawned by the German military's forceful unification of Germany.

His "will to power" and "superman" were only meant to apply to ideas, not to politics, but his prose was easily taken out of context and reduced to slogans that contradicted his intentions. His sister, Elisabeth Forster, especially vulgarized and popularized the more elitist and brutal interpretations of his work, giving them a distinctly racist slant that Hitler narrowly applied to the German people.

Anti-Semite was a term coined in 1873 by William Marr in *The Victory of Jewdom over Germandom as Viewed from a Non-confessional Standpoint*. Racist feelings against the Jews went back to the Middle Ages, as seen in this picture from 1476 supposedly depicting the ritual murder of 6 Christian boys by the Jews. Even Martin Luther added fuel to the flames of anti-Semitism:

"...their synagogues or schools [should be] set on fire, that their houses be broken up and destroyed...and they be put under a roof or stable, like the Gypsies...in misery and captivity as they incessantly lament and complain to God about us."

The swastika's use by German nationalists goes back to Germany's unification in the 1800s. Coming from the Sanskrit root, svasti meaning "well being," the ancient Aryan svastikah originally represented life, good luck, strength, and power. It only came to have its negative connotations under the Nazis in the 1920s, who also reversed its direction. Its first use in the context made popular by the Nazis was probably by Lanz von Liebenfels, an Austrian Racist who flew a swastika flag over his castle in 1907.

Fuhrer as the term for the leader of the party was first used by Austrian anti-Semitic politician, Georg Ritter von Schonerer, and later by Hitler when describing the fuhrer principle, the idea that there are natural leaders and followers, and that the followers should give unquestioning obedience to their fuhrer. Schonerer also proposed renaming Christmas as Yulefest and instituting a new calendar dating to the Germanic Cimbri's victory over the Romans at Noreia in 118 B.C.E.

Racial Hygiene. Along those lines, the revolution in public health & hygiene led to concerns that modern advances in medicine favored the weak, leading to the conclusion that there was a need for selective breeding &/or elimination of the weak & mentally ill by means of chemical injections or electrocution.

In the early 20th century this influenced mainstream medicine, social work & criminology in seeing social deviants (prostitutes, drunks, etc.) as genetically tainted, leading to calls for forced sterilization even by liberals.

A poster advertising the huge cost of taking care of the mentally ill

The Classic Case of Hyperinflation

Children gaze at stacks of 1000-mark notes needed to equal the value of one dollar during Germany's hyperinflation.

In 1923, when Germany failed to make shipments of coal and iron to France, the French occupied the Ruhr to squeeze out the payments. When German workers went on strike, France brought in its own workers to run the mines. For once, German public opinion and the Weimar government were united in backing the strikers, against France.

Unfortunately, the Weimar government could only support the German strikers by printing money without substantial gold to back it up. This aggravated an already existing inflationary situation and triggered history's most famous example of hyperinflation that created some surreal situations for the German people:

- A 5,000 mark cup of coffee cost 8000 marks an hour later.
- A gramophone that cost 5 million marks at 10AM cost 12 million by 3PM.
- Bankers were literally shoveling money out of bank vaults.

- A turnip cost 50 million marks (but it was a really nice turnip).
- A meal for two at a restaurant cost 1.5 billion marks.
- Prices weren't posted since they changed so often.
- Interest on loans was 35% per day.
 - According to one story a woman with a wheelbarrow full of money to buy bread had to leave the line, asking another person to save her place and watch her stuff. When she came back, the money was still there but the wheelbarrow was gone.

Inflation didn't hurt everyone. For example, industries would borrow money to invest in machinery and repay the loans later with worthless inflated currency. By November 1923 the government was issuing 4000 quintillion marks per day. Eventually the value of the dollar to the mark, which before World War I was 4:1, skyrocketed to 4 trillion: 1.

Money became so worthless that people literally carted it out of banks in wheelbarrows and burned it to heat their homes.

The Beer Hall Putsch (11/8/1923)

The Beer Hall Putsch (11/8/1923) The turmoil from hyperinflation forced the government to call off resistance in the Ruhr, which angered many Germans, including Hitler. Therefore, on November 8, 1923, three days short of the fifth anniversary of the "betrayal" of the Armistice, Hitler burst into a Munich beer hall where local officials were meeting. He set up a machine gun and fired a revolver into the air, announcing that the revolution had begun, the hall was surrounded, and thousands of heavily armed men were marching to his aid.

This was all pure bluff, but it did get the venerated General Eric von Ludendorff, a dabbler in racism and politics and pictured below with Hitler, involved. The next day, Hitler and 3,000 followers marched on the ministry building in Munich. Opposing troops opened fire, killing sixteen and wounding several more. Hitler hit the deck and then fled. Ludendorff himself just marched right through the opposing lines.

Hitler turned his trial into a stage for Nazi propaganda, denouncing the Treaty of Versailles as treason, saying: "There can be no question of treason that aims to undo the betrayal of a country." Although found guilty, Hitler got off with a light sentence of five years (of which he only served nine months) thanks to sympathy from a generally conservative judiciary during the Weimar Republic.

Mein Kampf: Hitler on Modern Politics

Unfortunately, while *Mein Kampf* was a rambling, poorly written and barely readable pastiche of other people's ideas, it did provide the blueprint for much of modern mass democratic politics since the time of Hitler. Below are a few select passages that seem as timely today as they did in the 1930s.

"The driving force of the most important changes in this world had been found less in scientific knowledge animating the masses but rather in a fanaticism dominating them and in a hysteria which drives them forward."

"All effective propaganda has to limit itself to a very few points and use them like slogans...It has to confine itself to little to repeat this eternally."

"The masses do not understand unless they are made aware of their master. The cruder and more brutal your language, the larger the crowd who will be ready to listen to you."

"It would never come into their heads to fabricate colossal untruths and they would not believe that others could have the impudence to distort the truth so infamously."

Hitler's Cult of Personality

Politics as theater. While Mussolini may have created a template for the cult of personality, Hitler refined it and took it much further, largely because of technological advances in the decade between when the two dictators took power.

Much of Hitler's success came from mass rallies. The larger the crowd, the more one lost his individual identity and became easier to control. Hitler's annual party rallies at Nuremberg were textbook cases of how this was done, commanding crowds of up to one million people. Just the logistics of providing transportation, food, and toilet facilities for such numbers was a tribute to twentieth century technology.

But the real key to the experience was the public address system that made it possible for all those people to hear the fuhrer's message at the same time and chant back the appropriate responses as one being. Even people wise to Hitler's tricks and deceptive message found themselves drawn toward and wanting to lose themselves in that "vast bubbling cauldron" of humanity, as one witness put it. For those not privy to such psychological manipulation and how it could

control their behavior, it was much harder to resist.

The Cathedral of Light (above), if not the first special effect for dazzling a crowd, certainly set a new standard for the era. Very simply, it was a series of spotlights arranged around the crowd and shining straight up into the sky. When Albert Speer proposed this idea in 1936, the military objected on the grounds it would require nearly all the spotlights in Germany. Speer countered that such a profligate display would give the world the impression that Germany had many more spotlights than it really did. While meaningless in itself, it created a larger-than-life experience that Hollywood still tries to improve on with each new movie to bring in the crowds.

Bringing their god to Earth. Creating a cult of personality involves what seem to be two mutually exclusive goals. On the one hand, the leader should seem like a god who is larger than life and in complete control of the situation, thus making people feel safe and secure under his care. Hitler's mass rallies and images on posters largely achieved that.

At the same time, he should portray himself as a common man in touch with the people, sharing their simple tastes while laboring tirelessly for their safety and comfort. He should be someone that people would like to have a beer with, someone they feel equal to, but also need to worship. Thus Germans constantly saw images of Hitler having lunch with the boys, Hitler with farmers, Hitler with factory workers, Hitler with the ladies (while maintaining a discrete distance so German men wouldn't feel threatened), Hitler with children, Hitler with dogs, and so on. Sound familiar?

For parades, Hitler liked to put women in the front lines, deeming them more prone to swoon in his presence or at his touch. A woman who merely shook hands with or touched Hitler would be treated like a saint by her neighbors back home.

Get Them While They're Young: The Hitler Youth

Taking a cue from the Jesuits, Hitler realized perfectly that gaining the loyalty of children when they are most impressionable made it easier to keep their loyalty for life. In addition to pushing this message in the schools, there was also the Hitler Youth, which provided paramilitary training that promoted gang loyalty among Germany's boys and youth.

During World War II, no one had a reputation for being more fanatical or vicious than the Hitler Youth. Unlike regular army units, special SS units of Hitler Youth would take no prisoners in battle, and bomber crews shot down over Germany prayed the regular army would capture them instead of the Hitler Youth, who would torture and kill them.

A special place for the women (i.e., at home having babies). As with ancient Sparta, the role of women in Nazi society was to give birth to and raise strong children for the master race. After coming to power, the Nazis even set up special homes to care for young unmarried Aryan women whose task was to get pregnant and have Aryan children.

And to prepare them for motherhood, there was the League of German Maidens, the female

counterpart to the Hitler Youth. Like the Spartans, they engaged in athletic training to build strong bodies for bearing strong children.

Nazi Math. Following are two math problems from a Nazi textbook laced with racist propaganda to reinforce brainwashing in the schools.

1) “To keep a mentally ill person costs about 4 marks a day. There are 300,000 mentally ill people in care. How much do these people cost to keep in total? How many marriage loans of 1000 marks could be granted with this money?”

2) “A bomber aircraft on take-off carries 12 dozen bombs, each weighing 10 kilos. The aircraft takes off for Warsaw, the international center for Jewry. It bombs the town. On take-off with all bombs on board and a fuel tank containing 100 kilos of fuel, the aircraft weighs about 8 tons. When it returns from the crusade, there are still 23 kilos left. What is the weight of the aircraft when empty?”

The Politics of Violence

Communists, Social Democrats, and even pacifists (above) scrambled to match the Nazis’ media blitz of posters and other campaign tactics. However, they could never match the dynamic appeal the Nazis had to Germany’s youth.

A personal account of a riot in Germany. The following account of a riot that occurred when Communists went to break up a speech & rally

by Goring can be seen as typical of the political violence that beset Germany in the early 1930s:

“A terrifying melee followed. Blackjacks, brass knuckles, clubs, heavy buckled belts, glasses and bottles were the weapons used. Pieces of glass and chairs hurtled over the heads of the audience. Men from both sides broke off chair legs and used them as bludgeons. Women fainted in the crash and scream of battle. Already dozens of heads and faces were bleeding, clothes were torn as the fighters dodged about amid masses of terrified but helpless spectators...”

The psychological impact of a bloody riot on a bystander, such as this German girl, Melita Maschman, is somewhat surprising and disturbing:

“...At one point somebody standing suddenly leaped from the ranks of the marchers and struck a man who had been standing only a few paces away from us. Perhaps he had made a hostile remark. I saw him fall to the ground with blood streaming down his face and I heard him cry out. Our parents hurriedly drew us away from the scuffle, but they had not been able to stop us seeing the man bleeding. The image of him haunted me for days.”

“The horror it inspired in me was almost imperceptibly spiced with an intoxicating joy. ‘We want to die for the flag’, the torch-bearers had sung...I was overcome with a burning desire to belong to these people for whom it was a matter of death and life... I wanted to escape from my childish, narrow life and I wanted to attach myself to something that was great and fundamental.”

A uniform by any other color... When the State, in an effort to curb the gang-style violence in the streets, outlawed the SA from wearing their distinctive brown political uniforms, they wore white shirts.

Hardly blind justice. During the Weimar Republic, police typically favored, and even helped, the Nazis, especially against the socialists

and communists who drew support from the working class poor who lived in districts associated with crime. For example, a Nazi fired a gun at a Social Democrat, Otto Buchwitz, during a meeting, which precipitated a brawl that destroyed every table and chair in the place. Not only did authorities ignore Buchwitz 's pleas for help, they sentenced him to three months in jail for the brawl.

This, in turn, cost him his parliamentary immunity, leaving him open to more harassment. Therefore, each day he would be harassed with threatening songs and slogans by eight to ten Nazis on his way to work, another twenty during lunch, and as many as two hundred going home.

Farewell to Romanticism. In the violent atmosphere of post World War I politics, the Romanticists' female image of the nation gave way to aggressive masculine images of Germany, most of them stripped to the waist to emphasize their strength.

Farewell to Romanticism. In the violent atmosphere of post World War I politics, the Romanticists' female image of the nation gave way to aggressive masculine images of Germany, most of them stripped to the waist to emphasize their strength.

The Reichstag fire: a classic false flag event.

The fall guy for burning the Reichstag was a half-blind and mentally challenged Dutch communist, Martin van der Lubbe, who was passing through Germany on his way back from the Soviet Union. According to one version of

the story, several Nazis overheard him in a Berlin café talking about how he was going to burn the Reichstag. A few nights later, when the Reichstag did go up in flames, the first people on the scene were Nazis led by propaganda minister, Hermann Goring, who immediately found and apprehended van der Lubbe. Although van der Lubbe admitted to the crime (for which he was beheaded in 1934), the Reichstag had burned down too fast for one person to set the fire. That, plus the speed with which the Nazis exploited the incident to blame the Communists, points the finger at them as the most likely perpetrators of this act of arson.

Marinus van der Lubbe, the half-blind Dutch Communist whom the Nazis used as the fall guy to blame the Communists for the Reichstag fire. He admitted to the crime and was beheaded in January 1934.

The start of the concentration camps. Having rounded up the Communist leaders, Hitler put them away in what was the beginning of the concentration camp system. These camps were first set up just to hold all the extra prisoners that the jails were unable to accommodate. However, they soon would come under the jurisdiction of Heinrich Himmler and the SS, gradually evolving into the death camps associated with the Holocaust.

The Reichswehr (German Army Between the Wars)

The Treaty of Versailles limited the German army to 100,000 men, but set no limits on their pay. As a result, the Reichswehr (German army under the Weimar Republic) paid its soldiers six times what any other country at the time did. This attracted the best and brightest of Germany who had to pass rigorous mental and physical testing to get in. This, in effect, created an army of 100,000 training officers who would help

Hitler rearm Germany quickly when the time came.

The Treaty of Versailles also stipulated that German soldiers be trained in animal husbandry. While beekeeping may have had limited military uses, training in handling horses still had great value. When the German army invaded Russia in 1941, modern tank divisions may have spearheaded the invasion, but behind it were 750,000 horses pulling the massive supplies the army needed.

Not everything was as it seemed with the Reichswehr. Since Germany was prohibited from having tanks, heavy artillery, and an air force, soldiers practiced with wooden artillery and cardboard mockups of tanks (below) and by flying gliders. Therefore, when Hitler's rearmament began, German soldiers were already familiar with how to use the real weapons they now had.

Hitler's Olympics

The 1936 Olympics, which were held in Berlin, were seen by Hitler as an opportunity to show off the New Germany and its Aryan super race. However, even the Nazis realized that, for the sake of public image, they would have to tone down the worst sorts of public abuse of the Jews. Therefore, a public campaign was launched to get Germans to "lighten up" on the Jews. Anti-Semitic signs and posters were removed, although the CBS correspondent, William Shirer, reported a road sign saying, "Drive carefully! Sharp curve! Jews 75 miles an hour!" This "more humane" treatment of the Jews had Hitler worried that it might undermine German hatred of the Jews.

While the Germans won the most medals, the most famous aspect of the games was the African-American athlete, Jesse Owens, winning a record four gold medals in track and field. Having watched his "superior" Aryan athletes being shown up by a non-Aryan, Hitler claimed that it wasn't fair for Germans to have to compete against wild animals.

The 1936 games were the second to use the ritual lighting of the Olympic torch and the first to have an Olympic relay bring the flame from Olympia, Greece. They were also the first games to have live television coverage (below), broadcasting over seventy hours of live events to special viewing rooms in Berlin and Potsdam and a few private television sets. An estimated 150,000 people watched the Olympics this way, although German sets only had a resolution of 180 lines compared to British TV with 405 lines.

Hitler and the churches

Historically, religion, calling upon a higher authority, has often been the one source of opposition to tyranny. However, in Germany, there was a catch. Although illegal under the Weimar constitution, the state had largely subsidized the Catholic and Lutheran churches, making them somewhat dependent on the state. Therefore, Hitler used this funding to pressure the churches to abstain from opposing Nazi policies. In many cases, the churches became major supporters of Nazi policies.

The Lutheran press started referring to the Jews as the "natural enemies" of Christianity. The Catholic Church even agreed to an oath of loyalty similar to the Civil Constitution of the Clergy during the French Revolution: "Before God and on the Holy Gospels, I swear and promise 'as becomes a bishop' loyalty to the German Reich and to the state . . . and to cause the clergy of my diocese to honor it."

Some clergymen resisted Nazi, but most caved in to the pressure. After World War II, there was a major split within the Lutheran Church in Germany between those who had followed state directives and those who had not. Eventually the two sides were reconciled and peace was restored in the church.

Nazi Cars and Freeways

The Great Slug Bug Scam. The Volkswagen (literally “people’s car”) was supposedly Hitler’s brainstorm, the idea of making a cheap reliable car for all the German people. It was also one of the Nazis’ biggest scams. Workers could give part of each paycheck toward buying one of these neat little cars when they became available. The problem was Hitler used all the money to pay for a new navy and no Volkswagens rolled off the assembly lines until after WWII.

The Autobahn was a massive public works project that provided thousands of jobs and a nice superhighway for all those Volkswagens that were never made. Luckily it could also be used for moving tanks quickly in wartime. When Eisenhower saw it at the end of World War II, it would inspire him to create for our present interstate highway system.

Hitler and the Jews

Hitler reserved his most venomous attacks for the Jews, whom he imagined had kept him out of art school and betrayed Germany in the war. He started slowly, subjecting Jewish merchants to

boycotts to drive them out of business. From 1933 to April 1938 the number of Jewish owned businesses in Germany declined from 100,000 to 39,552. The number of Jewish owned retail businesses went from 55,000 to 9,000.

His Nuremberg Laws in 1935 subjected Jews to an ever-growing number of restrictions and acts of violence, depriving them of citizenship and the right of intermarriage, banning them from all but the most menial occupations, forcing them to wear a distinctive Star of David to mark them for public abuse, confiscating their property and forcing them to live in ever more crowded ghettos.

Right: A German woman and Jewish man are publicly humiliated for violating the Nazi law forbidding marriage or dating between Aryans and Jews.

Nazi Children’s Literature

Cover of the 1935 anti-Semitic children’s book, *The Poisonous Mushroom*,

In addition to the Hitler Youth, Nazis also took over the day-to-day education of Germany’s children from an early age. Following are pictures from Nazi children’s books designed to teach Aryan children to hate the Jews.

Left: A mother compares Jews to poisoned mushrooms that are often hard to tell from edible ones.

Right: "Money is the God of the Jews"

Stereotypes of Jews as dirty, sexual predators, and child molesters

"Ugly" Jewish children driven from school as the cute Aryan children mock them from the book, *Trust No Fox in its Green Meadow and No Jew on his oath*.

Kristallnacht (11/9-10/1938)

One of the most notorious acts of persecution was the Kristallnacht, or Crystal Night (11/9-10/38), named after the shattered windows of Jewish merchants' shops that were looted that night. Kristallnacht was triggered by the murder of Ernst Rath, a German civil servant in the German embassy in Paris, by 17-year old Herschel Grynszpan. His father, Zindier Grynszpan, had just sent him a letter telling how the German government had rounded up 18,000 Polish Jews, including children from the streets, hospital patients, young and old and herded

them onto trucks and trains and then dumped them across the Polish border with only 10 marks (about \$4) apiece.

Enraged by this, Herschel went to the German embassy with a pistol in order to kill the ambassador. Since the ambassador was not in, Grynszpan killed the desk clerk, Ernst von Rath.

Herschel Grynszpan and a Nazi caricature of him used to stir up the Kristallnacht riots

Hitler immediately promoted Rath (who, ironically, was under investigation for being a Jew), saying, "The SA should be allowed to have a fling." He had his propaganda minister, Joseph Goebbels, stir up public hysteria against the Jews. The pro-Nazi paper, *Der Sturmer*, showed a drawing of Rath on a cross like Jesus, with the Jewish Grynszpan beneath the cross, while the SS ordered a "spontaneous" pogrom across Germany without any police interference.

On November 9, 1938, the fifteenth anniversary of Hitler's Putsch where sixteen "martyrs" died, a large demonstration was held, with the crowd fired up and "present" for each martyr as his name was announced.

At 2 AM (November 10) the real violence started. Thousands of shops were looted or destroyed. Over 1,000 synagogues were burned, while firemen just stood by to protect German property. Likewise large crowds stood by and watched. The police merely directed traffic, although some arrested Jews to protect them from the mob. Tens of thousands of less lucky ones were thrown into concentration camps. The

violence would continue for several days, killing 236 and seriously injuring 600 more.

As a public humiliation, Jews were often forced to shave each others' beards. In the following months, Jews had to turn over any precious metals, radios, or weapons they owned, lost their drivers' licenses, had their pensions reduced, were settled in ghettos, and subjected to curfews.

Jews, not their insurance companies, had to pay for all the property damage, since all the destruction was supposedly their fault.

In a mockery of justice, twenty-four Brownshirts were convicted for murder and given a reprimand. Six more accused of rape were convicted and sentenced to ten years prison, not for rape, but for violating Nuremburg Laws against Aryans having sex with Jews.

Three days after Kristallnacht, there was a meeting of top Nazis to lay the foundations for what would be known as the Holocaust.

World protest, or the lack of it. Around this time, Joseph Goebbels announced, "If there is any country that believes it has not enough Jews, I shall gladly turn over to it all our Jews."

There were some takers, but the U.S. was not one of them, calling its ambassador home for consultation, but continuing trade with Germany. The U.S. had already been criticized for the way it turned a blind eye to Hitler's racist policies and attended the Berlin Olympics in 1936.

However, some countries, notably Britain, the Netherlands, and Belgium, admitted several thousand refugee children, the latter two countries trying to hide them in the midst of the general population. It was easier to identify Jewish boys than girls because the Jews practiced circumcision.

Some of the 14,000 German Jewish refugees resettled in Shanghai

While there was a movement in the U.S. to admit refugees, there was a stronger movement to prevent this by isolationists worried about the number of immigrants, America's racial purity, and getting involved in European affairs. Congress was backlogged with sixty anti-alien bills, one of which proposed to ban all immigrants for ten years. As late as December 1944, Americans believed the Nazis had only killed about 100,000 Jews. Thus there were no efforts to bomb the ovens of Dachau and Auschwitz, although the administration knew what they were being used for.

Between 1938 and 1945, only 250,000 Jewish refugees were let in to the U.S. while six million died in the Nazi death camps.

"Jewish physics". Many Jews, including Albert Einstein, left Germany, costing it many of its brightest minds. The horror stories they took with them led to growing fears of Nazi aggression and eventually World War II. They also took with them talents that the Nazis could have used but claimed were part of a worldwide plot to pollute science and destroy civilization. Einstein's theory of Relativity was especially singled out by one Nazi writer as being: *"directed from beginning to end toward the goal of transforming the living-- that is the non-Jewish-- world of living essence, born from mother earth and bound up with blood, and bewitching it into spectral abstraction in which all individual differences of peoples and nations, and all inner limits of the races, are lost in unreality, and in which only an unsubstantial diversity of geometric dimensions survive which produces all events out*

of the compulsion of its godless subjection to laws."

Wilhelm Mueller, in his book, *Jewry and Science*, claimed the worldwide acclaim given to Einstein for his theories was really only rejoicing over "the approach of Jewish world rule which was to force down German manhood irrevocably and eternally to the level of the lifeless slave."

"...the Jew conspicuously lacks understanding for the truth...being in this respect in contrast to the Aryan research scientist with his careful and serious will to truth...Jewish physics is thus a phantom and a phenomenon of degeneration of fundamental German physics."-- Nazi, Prof. Philipp Lenard

From 1905 to 1931, ten German Jews won Nobel Prizes in science. Hitler would kill six million more.

135. THE ROAD TO WORLD WAR II (1919-39)

Introduction. By far, the most destructive aftershock of World War I was World War II, coming a mere 20 years after the Treaty of Versailles. While the rise of the Nazis in Germany in the 1930's generally took center stage, events elsewhere, some of them as far away as East Asia, also contributed to the outbreak of war. Three main factors, all resulting from World War I, would lead to war: the Treaty of Versailles, the Great Depression, and the Russian Revolution.

France, Britain and the Treaty of Versailles. Along with leading to the rise of the Nazis, the Treaty of Versailles had quite different results on France's and Britain's relations with Germany and each other. Since they shared a long land border with Germany and had suffered a great deal in the war, the French were much more nervous about a resurgent Germany and wanted to keep its power limited. Therefore, in 1935, when Hitler announced that Germany would rearm (they had been doing so secretly for two years), France signed a series of defensive pacts with Germany's neighbors to contain any future aggression by Hitler. Among these pacts was one with the Soviet Union, which France saw as the primary counterweight to German power.

Britain, however, feared Stalin as much as it did Hitler, and signed a naval pact with Germany giving it the right to build a surface fleet 35% as big as Britain's and a submarine fleet as large as Britain's. While Britain apparently did not feel threatened by this, France did. Consequently, the two powers rarely cooperated effectively during the series of crises that occurred in the late 1930s, providing just the sort of disunity and lack of cooperation Hitler wanted.

Aggravating the situation was a sort of shell shock among the British and French caused by the horrible memories of World War I. Just as they had been too eager to go to war in 1914, now they were overly cautious and willing to appease aggressors in order to avoid a war. Unfortunately, dictators such as Hitler thrived on such weakness. Just as the lesson of 1914 was that too much aggression can lead to war, the lesson of 1939 would be that war

can just as easily result from the appeasement of aggression.

The Depression and the Far East (1931-41). The Depression also had unsettling effects outside of Germany. Among other things, it seriously hurt Japan, whose economy depended heavily upon trade to pay for resources and food for its burgeoning population. As tariffs went up and the Depression deepened, Japan grew desperate for resources. This desperation led to a military takeover of the government, somewhat reminiscent of the Fascist dictators in Europe. In 1931, the Japanese seized Manchuria from China on the flimsy pretext of setting up the "independent" state of Manchukuo under Japanese "protection." China protested to the League of Nations, but the League had no power of its own to act against aggression, especially if that aggression were half a planet away. Therefore, Japan kept Manchuria and a foothold in China.

Even before this, China was already deeply mired in its own problems. European and Japanese aggression in the late 1800's had helped lead to turmoil in Chinese society and government. In 1912, a revolution replaced the last Chinese emperor with a republic under the western educated Sun Yat Sen. However, China's experiment in democracy floundered, and, after Sun Yat Sen's death, Chinese politics disintegrated into a three-way struggle for power between the Nationalist government's leader, Chiang Kai-shek, various independent warlords in the countryside, and the Communists led by Mao Zedong.

The Japanese seizure of Manchuria presented the Chinese government with a dilemma: fight Japan right away or crush the Communists and warlords first and then face the Japanese with a united front. Chiang Kai Shek, being strongly anti-Communist, decided to unify China first. For several years he waged intensive warfare against the Communists whom he badly damaged, but failed to destroy. However, Chiang's generals, anxious to turn against Japan, forced him to ally with Mao against the common enemy. Japan, fearing a united China, told the Nationalists to join it against the Communists or it would take "all the steps necessary to assure peace." In July 1937, it "assured" that peace by invading China.

The Chinese army was no match for the more mechanized Japanese forces, which relentlessly and brutally swept across the eastern seaboard of China. Cities were bombed and strafed mercilessly, while their populations were massacred with uncontrolled ferocity. Reeling from these losses, the Chinese switched to a strategy of trading space for time by retreating into the vast interior of China. This drew the advancing Japanese forces further and further inland and stretched their lines to the limit. The war now settled down to a costly stalemate that burnt, bled, and bent China, but could not break it.

As a result, the Japanese decided to look elsewhere for easier conquests. In 1939, they briefly turned north against the Soviet Union. However, defeat at the hands of Soviet forces in a short but sharply fought conflict plus a surprise pact by Japan's ally, Hitler, with Stalin to carve up Poland, convinced Japan to go elsewhere. Therefore, it turned to easier and more lucrative conquests in South East Asia. This involved attacking the colonies of France, Britain, and Holland, all of who were too preoccupied with the war then raging in Europe to effectively stop Japan.

This also brought Japan face to face with the United States. When the United States threatened economic sanctions against the Japanese if they did not pull back, Japan launched a surprise attack on the American naval base at Pearl Harbor in the Hawaiian Islands (12/7/1941). From the American perspective, this was the beginning of the Second World War in the Pacific, although the Chinese and others saw it as starting in 1937 with the Japanese invasion of China. Either way, the war in Asia was on.

Ironically, Japan's decision to turn south rather than north may have saved the allied cause in World War II. If Hitler had kept his Japanese allies informed on his intentions to attack Russia in 1941, they could have tied down enough Soviet forces in the Far East to deny Stalin vital reinforcements that would be a significant factor in the ultimate Russian victory against Germany. And, of course, a German victory against Russia would have seriously altered the course of World War II and subsequent history.

The Russian Revolution and Soviet Union. That leaves Russia, the other big power that should have been opposed to the Fascists. Unfortunately,

relations with the Western powers were poisoned by bitterness over Allied intervention during the Russian Civil War and the deep ideological differences between capitalism and communism. As a result, there was no concerted action between Russia and the West against Fascist aggression. All these factors, the disunity between France and Britain, Russian hatred and distrust of the West, and the unchecked aggression of Japan in the East combined to expose the weakness and disunity of the former alliance against Germany.

The cycle of aggression and the road to war in the 1930's. As a result, the weakening of the old alliance triggered a vicious cycle of encouraging Fascist aggression which the Western democracies failed to react to, thus causing more aggression, and so on. This pattern was sadly played out several times in the 1930's before the West finally took its stand.

It started in 1935 when Hitler announced that Germany was going to rearm itself in defiance of the Treaty of Versailles. (Actually he had been secretly expanding German forces since 1933.) Since he justified this with the principle of national self-determination, Britain and France did nothing to stop him. This merely encouraged more aggressive actions.

Consequently, in 1935, Mussolini sent Italian forces into Ethiopia, using only the weakest of excuses to cover this blatant act of aggression. When the League of Nations threatened economic sanctions against Italy, Mussolini said a boycott on oil (which would have crippled his war machine) would mean war with the League's members. The League, without any real force to back it up, fell for this bluff. Britain wanted to stand up to Mussolini. However, France, still angry about Britain's naval pact with Germany and hoping to stay on good terms with Italy as a counterweight to growing German influence in Austria, refused to support Britain. As a result, Ethiopia fell as the world just stood by and watched.

Therefore, in 1936 Hitler defied the Treaty of Versailles again by moving German forces back into the Rhineland, the demilitarized part of Germany. This especially agitated France, who wanted British backing but received none. Since

German rearmament was just starting, the German generals leading the troops into the Rhineland were under secret orders to turn back if they met any French resistance. They met no such resistance. Once again, Hitler got his way.

The aggression continued when the dictators, including Stalin got the opportunity to intervene in the Spanish Civil War. In 1931, unrest had led to the overthrow of the corrupt monarchy still ruling Spain. At first, a fairly liberal and democratic government took power. But, without a strong middle class and economy, riots and turmoil resurfaced. In 1936, the Fascist Phalangists, led by General Franco, seized power and started the Spanish Civil War.

Any civil war is a terrible thing, but Germany, Italy, and the Soviet Union chose to intervene and make the war in Spain much worse. Hitler and Mussolini backed the Fascists, known as the Nationalists. Stalin threw his support behind the Republicans, also known as Loyalists, who had many socialists and communists in their ranks. The result was a disaster for Spain, as terrorists from both sides murdered civilians and leaders from the opposition, and the German air force practiced the new tactics of aerial bombardment on Spanish towns.

The most famous of these atrocities, immortalized by the Spanish painter, Picasso, was the bombing of the Spanish town of Guernica, where over one-third of its population of 7000 were killed or maimed just because they were in the way. While that was a mere fraction of the millions that would die from aerial raids in the Second World War, it shocked the world since it was documented on film and also because it symbolized a sinister new turn in modern warfare. In the end, the Fascists won again as the Western democracies just watched from the sidelines. The question was: how much further could Fascist aggression go unchallenged? Hitler seemed determined to find out.

Hitler, further encouraged in his contempt for the Western democracies, next moved on to an even bolder objective: the *Anschluss* (unification) of Austria with Germany. Hitler, himself being of Austrian birth, claimed the Austrians were Germans whose drive to achieve national self-determination was being stifled by being kept separate from the rest of Germany. Whether right or wrong, this logic

helped paralyze France and Britain into inaction once again. Therefore, Austria became part of Germany in 1938 whether the Austrians liked it or not.

The next target of Nazi aggression was the Sudetenland, a part of Czechoslovakia with a large German population along with much of the country's industry and defensive fortifications. Raising the cry of national self-determination once again, Hitler threatened war with anyone who got in his way. A conference between Britain, France, Italy, and Germany met at Munich where the Fascist dictators bullied and persuaded France and Britain to agree to the Nazi takeover of the Sudetenland. Convinced, or at least wanting to believe, that this was all Hitler wanted and that he also wanted peace, they gave in to him once more, without even consulting their Czech allies. They figured this was all Hitler wanted.

In March 1939, Hitler swallowed up the rest of Czechoslovakia without French or British resistance. This had two effects. First, France and Britain were finally realized Hitler would not stop on his own and were determined to stand up to him the next move he made. Unfortunately, at the same time, Stalin was convinced that France and Britain would do nothing to stop any further Nazi aggression in Eastern Europe. Therefore, he signed a pact with Hitler (August, 1939) that would carve up Poland between them.

On September 1, 1939, believing Britain and France would do nothing to stop him, Hitler invaded Poland. Two days later, France and Britain declared war on Germany. A mere twenty years after the end of the First World War, the Second World War had begun.

Never Again

In order to understand what went wrong in the 1930s, we must appreciate the collective psychological “shell shock” that World War I had left in its wake, especially on Britain and

France. Just as they had been too eager to go to war in 1914, now they were overly cautious and willing to appease aggressors in order to avoid a war.

Unfortunately, dictators like Hitler thrived on such weakness. Just as the events of 1914 had shown that too much aggression can lead to war, the events of 1939 would show that war can just as easily result from appeasement and giving in to aggression.

Below: Signing the Kellogg-Briand Pact in 1928 to renounce war. Eventually 63 countries, including Germany, Japan, and Italy, would sign this pact in the hope it would ensure peace.

It didn't work.

The Rise of Mao Zedong

With the communists was their future leader Mao Zedong, a man who, in terms of sheer numbers, was responsible for more deaths than anyone else in history: over 70,000,000 people.

Mao is popularly seen as one of the ideological leaders of communism. In fact he wasn't even a very good communist. According to other communists of the time: "He is extremely devious and sly, selfish, and full of megalomania. To his comrades, he orders them around, frightens them with charges of crimes, and victimizes them. He rarely holds discussions about Party matters...Whenever he expresses a view, everyone must agree, otherwise he uses the Party organization to clamp down on you, or invents some trumped-up theories to make life absolutely dreadful for you.... Mao always uses political accusations to strike at comrades. His customary method regarding cadres is to use

them as his personal tools. To sum up...not only is he not a revolutionary leader, he is not a ...Bolshevik."

He wasn't much of a team player either. Despite propaganda about the so-called "Autumn Harvest Uprising" led by Mao in 1927, no such uprising ever occurred. Instead, when Zhou En-lai led a mutiny of some 20,000 Communist soldiers in the Nationalist army, Mao talked 1,500 of them into joining his gang of bandits, terrorizing the populace in Hunan's Jinggang Mountains.

He was married four times. His first wife died young. She was lucky. He abandoned his second wife to the enemy who killed her. After mistreating and ignoring his third wife, he sent her to Russia, where she went insane while he married again. His fourth wife, Jiang Qing (AKA Madame Mao) was as much of a monster as he was, which made her useful for attacking his enemies before finally betraying her to his enemies to save his own life. Mao was also a notorious womanizer, having his men procure him an endless string of dates, most of whom he infected with venereal disease.

In 1931 most communist leaders wanted to march westward to link up with another Red force, but Mao wanted to march northeast and got his way. However, he took two-thirds of the army southeast to seize Zhanzhou where he seized books and money for his own personal treasure, hiding it from the party in a cave. In addition, he advertised the capture of Zhanzhou to impress Stalin, which it did. From this point on, Stalin would back Mao against other Chinese communist leaders. This was the real reason for Mao's eventual triumph.

When Chiang Kai-shek was advancing against Zhanzhou with overwhelming forces, party leaders told Mao to retire before his army was crushed. Again Mao disobeyed and stayed so long for his own personal reasons that, when he finally did leave, he needlessly lost thousands of communist troops from battle, heat and disease. Then, he demanded and got (with Stalin's backing) the top post in the army.

Later, he was sent to relieve two bases, but he soon quit fighting and the Nationalists took the bases. The other generals relieved him of command and wanted to expel him from the party, but Stalin vetoed that. In retaliation for being relieved of command, Mao left for his luxurious villa where he ran a competing headquarters, telling his followers to evacuate the front lines and not to fight the Nationalists.

Although told by Stalin to cooperate with Mao, the new party leader, Po Ku, did dismantle Mao's alternate chain of command and unify the party, leading to the first major victory against Chiang Kai-shek and the Nationalists in March 1933. Mao moved back to CCP (Chinese Communist Party) headquarters and, for the time being, was more cooperative with the other leaders, since Stalin insisted the CCP include Mao in its decisions.

Mao got revenge against Po Ku (far left on the right picture) by having him deleted from this photo, a childish prank he may have learned from Stalin.

In 1934, Chiang mobilized 500,000 men to annihilate the Reds. Po Ku recognized the danger and tried to get rid of Mao by declaring him "ill" and asking Moscow to let him send Mao there to recuperate, but Stalin refused. Therefore, Po Ku assigned Mao to the rear guard as a sacrifice, but Mao turned up at headquarters to ensure his escape. In a hypocritical gesture of generosity, he even turned his secret treasure over to the Party, since he couldn't take it with him. Thus began the Long March.

The myth of the Long March (1934-35). In order to understand the Long March, we need to understand the complex diplomatic situation of the time. Stalin's big fear was that Japan would conquer China and use its vast resources and manpower to attack him. Therefore he saw the

survival of Chiang's Nationalists, the main power in China at this time, as vital to his own survival. By the same token, good relations with and the survival of the CCP (Chinese Communist Party) were vital to Chiang for keeping Moscow's favor and support against Japan.

Therefore, instead of trying to destroy Mao's forces, which he easily could have done, Chiang opened a path for them to the north. Along the way they could terrorize and local landlords who would submit to him for protection. Chiang would even broadcast his army's movements openly so the Reds could avoid his forces and move along his chosen path.

This was part of a deal in which Stalin agreed to release Chiang's only son, Chiang Kuo, held hostage by Stalin since 1925. The significance of this hostage situation must be seen in light of the importance of sons in Chinese culture and the fact that Chiang had venereal disease, making him unable to have any more sons. However, claiming Chiang's son wanted to stay in Russia, Stalin didn't give him back yet. That way he could further blackmail Chiang.

General Shao Li-tzu, the Communist mole who delivered Chiang's son to Stalin in 1925, giving him leverage over Chiang's policies for years, most notably forcing him to let Mao's army pass unmolested during the Long March.

For nearly everyone else, it was the Long March, but for Mao it was the Long Ride. Even the posters show him in a commanding position on horseback, although photos show a much less dramatic pose. At least Mussolini had the sense to crop the horse's handler out of the picture. In reality, Mao usually rode in a litter, even in the

mountains where his litter bearers had to climb on their knees, scraping the skin off their bones. Not surprisingly, Mao was not well liked by his soldiers.

The most fabled event of the Long March, the crossing of the Dadu Bridge, is just that, a fable. According to Mao's version, a large Nationalist force was defending the opposite side of a gorge, with a narrow suspension bridge as the only way across. Even worse, Chiang's troops had removed most of the bridge's floor slats. Nothing daunted, a brave force of Communist commandoes managed to cross the bridge in the face of enemy fire, secure the other side of the gorge and ensure safe passage for the rest of their forces.

In fact, while posters commemorate the dramatic storming of the bridge by brave Communist commandos, there was no opposition to the crossing, and the bridge was completely intact. Even Mao's successor, Deng Xiaopeng, admitted in an interview in 1982 that the whole incident was made up.

The Long March was actually several marches by different Communist forces trying to link up in the North. Leading one force was a tough and ambitious general Chang Kuo-t'ao, whom Mao (in the midst of intrigue against the party leader, Po Ku) saw as another threat to his own power. Therefore, he felt he had to delay entering Sichuan until he had firm control of the CCP. Using his ally and stooge, Chou En-lai, Mao convinced the rest of the party leaders to ambush a strong Nationalist force tailing them from Sichuan.

However, this was a ruse where Mao deliberately led the PLA (People's Liberation Army) into a disastrous defeat at Tucheng while watching safely from a mountaintop. Ten percent of the PLA (4,000 men) was lost at Tucheng, but Mao used this defeat to convince CCP leaders they were too weak to enter Sichuan, thus buying

himself time to seize control of the Party and prepare to confront Chang Kuo-t'ao.

Thanks to Mao's strategy, the Reds retreated westward in disarray, plagued by cold, hunger and exhaustion. Finally, a consensus of the other generals voted to press into Sichuan, which Chiang had still left wide open. However, Mao, backed by his ally/stooge and new party head, Lo Fu, got them to turn back, dumping their sick and wounded in the snow where most of them died.

Still, instead of going into Sichuan, Mao led his army around in circles for two more months, progressively exhausting local food supplies with each subsequent visit. For Mao his strategy was a "tour de force". For the Communists it was a disaster.

Chiang, mystified by Mao's erratic strategy, redoubled his efforts to drive the Reds along the open path north into Sichuan while Mao kept trying to force his way south to avoid confronting Chang Kuo-t'ao and his powerful army. Chiang's air force bombed and strafed the PLA, forcing it to abandon its medical supplies and disband its medical corps. One woman even gave birth while running from one of these attacks.

Finally, in April 1935 Mao agreed to enter Sichuan. Not only was there no resistance there, Chiang even left caches of money and food to lure them in. When Mao stopped to besiege Huili, Chiang began bombing again to force them further north. By now Mao had lost 70,000 out of his 80,000 men, who had marched an extra 2,000 kilometers on lacerated feet, all to buy him time for his showdown with Chang Kuo-t'ao.

Mao Seizes control of the Party (1935). In June 1935, the armies of Mao and Chang Kuo-t'ao linked up in Shanxi in the North while Chiang gained control of the southwestern provinces. While Mao's policies had cost his army 70,000 out of 80,000 men, Chang Kuo-t'ao's army had grown from 20,000 to 80,000 and was in good shape and well equipped. However, Mao did have the party leaders Lo fu, Chou en Lai and

Po Ku allied with him in secret against Chang Kuo-t'ao. This was because they had supported Mao's strategy and thus would share either the blame or "credit" for the previous year's disasters, depending on who won the coming struggle for power and wrote the history books. Part of their strategy was political smearing of Chang Kuo-t'ao for "warlordism" and "political backwardness".

However, for complete victory, Mao needed to do two things:

- 1) Wreck Chang Kuo-t'ao's army; and
- 2) Win the race to the Soviet border to feed his story to Stalin and claim his support as head of the Communist party in China.

Mao accomplished both these in an especially devious way. The two leaders' armies took separate paths northward. Mao's path was actually much harder, hampering his army with swamps, fog, storms, quicksand poisonous mud and, at night, below-freezing temperatures. Many remembered these seven days as the worst part of the Long March.

After a week of this, Mao, backed by Party leaders, ordered Chang Kuo-t'ao to reverse direction and follow his path. Chang Kuo-t'ao retraced his steps south and followed Mao's route for two days. Then, seeing how ridiculous this was, he stopped to retrace his steps back to his original route. However, two reversals of direction and the time it wasted had put Mao in the lead in the race to the Soviet Border.

When Chang Kuo-t'ao ordered his officers in Mao's column to rejoin him, Mao spread the rumor that Chang Kuo-t'ao was trying to kill him. Duped by this rumor, Chang Kuo-t'ao's officers followed Mao in the race north. Being a good party member and unwilling to kill fellow communists, Chang Kuo-t'ao let them go. To gain further advantage, Mao even leaked the position of Chang Kuo-t'ao's larger army to Chiang so he could attack it. Mao won the race to the border, but with only 4,000 troops left. However, his strategy paid off as Stalin declared him the leader of the CCP (Chinese Communist Party).

Mao still felt he had to dispose of Chang Kuo-t'ao's army. Therefore, he sent it across 1500 kilometers of desert filled with hostile forces to collect a stash of Soviet weapons. Nearly all of Chang Kuo-t'ao's men died after Mao marched them back and forth with a stream of contradictory orders. Out of Chang Kuo-t'ao's 21,800 men, only 400 survived, whom Mao later had buried alive. Incredibly, Mao even managed to lay the blame on Chang Kuo-t'ao and have his own officers denounce him. And just to rub salt into the wound, Mao even had Kuo-tao's 12-year-old son cast as the Trotskyite villain in school play.

Chang Kuo-t'ao eventually defected to the Nationalists and died in Canada in 1979

Mao had one more potential rival to dispose of: Liu Chih-tan the moderate and popular leader of the local Communist party in Shanxi. Mao used Liu Chih-tan's moderate views to charge him as a "right winger". Liu Chih-tan, taken off guard and not wanting to split the party or defy its leader, submitted to Mao who "purged" Liu Chih-tan's followers with torture and executions, but let the popular leader go for now. Later Liu Chih-tan was killed while fighting Nationalist forces, although most likely one of Mao's men shot Liu Chih-tan in the back.

The abduction of Chiang Kai-shek (1936). Chang-Hsueh-liang (AKA the Young Marshall) was the most powerful warlord in Shanxi province. Although he had good relations with the Nationalist leader, Chiang Kai-Shek, he wanted to rule all China and offered to join Stalin and the CCP against Chiang. Mao favored such an alliance, but Stalin didn't trust him and strung him along.

When Nationalist forces in Shanxi heavily defeated Mao, Hsueh-liang, seeing this as a chance to help the CCP and get Moscow's favor, kidnapped Chiang. Mao knew Stalin, wanting all Chinese parties reconciled against Japan, would oppose this. Nonetheless, he led Hsueh to believe Stalin favored it, especially after Japan allied with Hitler in the Berlin-Tokyo Axis (1936).

Mao wanted Chiang executed, hoping to provoke war between Hsueh-liang and the Nationalists. However, Stalin condemned the act as helpful to Japan and even started suspecting Mao was a Trotskyite cooperating with Tokyo. When Stalin ordered Mao to get Chiang released, Mao pretended not to get the cable or that it was garbled, using the delay to send Chou En-lai to persuade Hsueh to kill Chiang. By this time Hsueh, realizing Mao's game and that he had to release Chiang, put himself in Chiang's custody under whose protection he lived until he moved to Canada where he finally died in 2001.

Meanwhile, Chiang agreed to a truce with the CCP if Stalin would return his son. In June 1937, Stalin made Mao recognize the Nationalist government and agree to cooperate with it against Japan. In return, Chiang gave the CCP land in Shanxi with Yen-an as its capital and paid for the support of 46,000 Red troops.

Almost overnight, the CCP's status had risen from that of mere bandits to that of a major opposition party.

Perpetuating the Mao Mythology

Edgar Snow with Mao

Another common myth is that Mao's Communists were the main group fighting the Japanese, allying with Chiang Kai-shek to create a common front against the invaders.

The blame for this perception mostly rests with an American author, Edgar Snow, and his book *Red Star Over China*, published in 1937. Snow was one of the few Westerners given access to Mao at this time. In fact he most likely was planted there by Chiang as part of the deal with Stalin to get his son released.

Snow, like many Westerners during the Depression had socialist sympathies and thus wanted to believe what Mao told him. His book

was based on heavily manipulated and edited interviews with Mao, whom he called "direct, frank, simple, undeviating". Consequently, Snow's book whitewashed Mao's reputation and won him widespread support in the West.

This would have serious repercussions on US policy once Civil War resumed after Japan was defeated in 1945.

Mao's real role in World War II. War forced Chiang to allow Mao his autonomy in exchange for help against Japan. Instead, Mao's strategy was to attack Nationalist forces instead of the Japanese and to follow in the wake of the Japanese advance to take over the countryside, since the Japanese only had enough forces to hold the cities. The CCP would also exploit Nationalist defeats by rounding up recruits from their beaten army.

Although Stalin pushed the CCP to fight the Japanese, the only major battle against Japan for years was an ambush of a Japanese convoy at Pingxingguan in 1937 that killed some 200 Japanese soldiers. And Lin Biao, who fought this engagement, was acting in defiance of Mao's orders.

An Alternate View on how World War II in Asia Began

In addition to the standard textbook version, there is a very different view of how war started between China and Japan. In their monumental biography, *Mao: The Unknown Story*, Jung Chang and Jon Halliday, using recently uncovered documents, describe how Stalin actually manufactured the war as a diversion for Japan as follows.

Once in control of Manchuria, Japan apparently did not want to expand war to all of China, which it saw would be a monumental task. Stalin, however, did want it expanded to divert Japan's attentions away from attacking him.

This was especially crucial in the event of war with Germany.

The key to Stalin's strategy was a Communist mole (agent), Zhang Zhi-Zhong (pictured above), who was also commander of the Nationalist garrisons protecting Shanghai and Nanjing in the south. Stalin had Zhang urge Chiang to attack a 1500 man Japanese force in southern China.

Chiang would only agree if Japan struck first. Therefore, Zhang manufactured an incident where he killed two Japanese soldiers and then their Chinese prisoner, making it look like the Japanese had killed the Chinese prisoner and that Zhang's men had retaliated. Japan, not wanting war in the South, tried to defuse the situation through diplomacy. However, Zhang kept pushing for war and attacked the Japanese by air (8/14) until Chiang told him to stop. Zhang then faked a press release that Japan had shelled Shanghai, bringing public opinion to his side and finally forcing Chiang to agree to all out war.

China's "Holocaust": The Rape of Nanjing (December 1937-February 1938)

In December 1937 Japanese forces took the city of Nanjing. What ensued there, one of the worst atrocities in history, is what one might call a "soldiers' riot". Normally, the culture of killing inherent in armies is restrained by military discipline to be used only against other armies. However, when the restraints of that discipline are relaxed, raw and uninhibited violence is unleashed, causing even normally civilized men to engage in unspeakable acts.

In December, 1937 that became Nanjing's story.

One of the most shocking examples of these atrocities was the contest between two officers, Sub-lieutenants Toshiaki Mukai and Takeshi

Noda, to see who could kill 100 Chinese first. When they couldn't agree on who had won, they extended the goal to 150 when they reached Nanjing in December 1937. Just as shocking, two Japanese papers, the Osaka Mainichi Shimbun and Tokyo Nichi Nichi Shimbun covered the contest as if it were a sporting event.

The two men were executed by the Chinese for war crimes in 1948.

It used to be we thought 30,000 people were massacred at Nanjing, a shocking figure in itself. But the research of Iris Chang, showed it was more on the scale of 300,000. Her book, *The Rape of Nanjing*, brought any number of Nanjing survivors out who told their stories to her. Apparently, the burden of dealing with all these personal stories was too much for Iris, for she took her own life at the height of publicity for her book.

The massacres at Nanjing were still taking lives 60 years later.

Nanjing wasn't the only city that suffered. Between 1939 and 1943 Chungking was bombed by the Japanese 268 times. The People pictured here were among thousands of victims of a stampede triggered by a lack of air in their shelter during a bombing raid.

“The Cossacks will rule Europe”: A nuanced view of Munich

Britain’s prime minister, Neville Chamberlain, holds up the famous “Peace of Paper” (or piece) that gave Hitler the Czech Sudetenland in return for “peace in our time” (Sept, 1938)

The Munich Agreement and the policy of appeasement associated with it have typically been viewed as the source of continued fascist aggression that eventually led to World War II. While there is some truth to this, there are other ways of assessing this event.

For one thing, some have argued that the extra year of peace gave Britain the time to build up its defenses, in particular its air force (RAF) and radar, to a point where it was able to successfully stave off the Germans in the Battle of Britain (1940-1). While Hitler was also building up his forces, Britain did it with a greater sense of urgency, allowing it to catch up somewhat with Germany. In fact, Hitler would not put the German economy on a full wartime footing until 1943, long after Britain had done the same.

We also have to appreciate the situation as it appeared to diplomats in September 1938. Certainly, Hitler was a menace and a nasty dictator, but many saw Stalin as a greater threat. After all, his armed forces were practically equal in size (although not quality) to all the combined armies of the rest of the world at the time. And even with the veil of secrecy he had drawn over the Soviet Union, people had some inkling of his atrocities, in particular his purges and the Terror Famine in the Ukraine that had killed 5 million people. By comparison, Hitler’s terror was minor league stuff. There were the Nuremberg Laws, but even Kristallnacht had

not happened yet and the start of the Holocaust was still three years in the future.

Therefore, it comes as no surprise that some leaders saw Stalin as the real threat and Hitler as the main bulwark against Stalinist aggression. If Hitler were to lose face at Munich, it could cause the downfall of his government and the destabilization of its army. Or, as one British officer put it: “The Cossacks will rule Europe.”

THE SPANISH REVOLUTION (1931-75)

From unification to revolution (1492-1931).

While the Spanish Civil War is the best known episode of the Spanish history in the twentieth century, it needs to be put into the context of Spain's broader history during that century and be seen as a long-term process of revolution that shares many features with other modern revolutions.

Spain's history as a unified nation goes back to the final conquest of Granada by Ferdinand of Aragon and Isabella of Castile. This itself was the product of the *Reconquista*, the centuries-long struggle, with strong religious overtones, against the Moors. Out of that struggle had emerged two powerful elements in Spanish society: the Church and nobles who were rich landowners. In the 1500s Spain was the main power in Europe, largely by right of its American colonies. However, a century of involvement in Europe's religious wars sapped its strength, and by the end of the Thirty Years War in 1648 it had fallen drastically in power and prestige. A half-century later, a new dynasty, the Bourbons, came to power. At first they tried to implement reforms similar to those of other Enlightenment rulers, by 1800 they were as corrupt as most any other monarchy of the time.

This didn't change over the next century, so that by 1900, Spain was still a backward and feudal society, with a powerful Church and landowning class, a mass of impoverished peasants, and a small but growing poor working class in the country's few industrial cities such as Barcelona, Madrid, and Bilbao.

Since Spain wasn't involved in World War I and therefore escaped its huge burdens of debt, it enjoyed a brief period of industrialization and economic growth, and the corrupt government was replaced by the dictatorship of Primo Rivera (1923-30). Unfortunately, Spain couldn't compete with the bigger European economies once they recovered from the war in the 1920s. The resulting economic decline led to Rivera's overthrow and the brief restoration of the king and a constitutional monarchy, much like the one set up in France in 1789.

Start of the Revolution (1930-36). However, that only lasted a year and, as in the French Revoluti

on, was replaced by a moderate and liberal republic in 1931. Unfortunately, as in most revolutions, the initial moderate regime could not take the drastic measures needed to solve the many and deep-seated problems that triggered the revolution in the first place.

Spain at this time was divided between several factions: separatist Catalans in the northeast and Basques in the north, the Anarchists who wanted no army or central government, the Republicans supported by liberals, intellectuals, and the lower middle class, the Socialists supported by the working class who wanted a centralized state controlling the industries, and the fascist Falangists, supported by the Church, the rich, and the army.

As typically happens at the start of a revolution, the moderate government was unable to keep people at either extreme happy and Spain started to destabilize. In 1933 a right wing coalition won the elections, but, because of their repressive policies and hunger, lost control to the Socialists and Republicans in the 1936 elections. As violence increased on both sides, Spanish troops led by the fascist General Francisco Franco crossed from Morocco to Spain to overthrow the government. The result was civil war.

The Spanish Civil War (1936-39) was a prolonged and confused affair, largely because, as in other revolutions, it attracted foreign intervention. Supporting the Republicans, who represented the legitimate elected government, was a wide range of factions, making it difficult to coordinate strategy: Catalan and Basque separatists, socialists, and anarchists, along with aid from the Soviet Union and various international brigades of volunteers from liberal democracies such as France, Britain, and the United States. The other side, known collectively as the Nationalists drew support from the army, the Church, and rich landowners, along with substantial military aid from fascist Italy and Germany.

It was a vicious war, with atrocities committed by both sides. The Republicans especially targeted and murdered priests and nuns, while the fascists murdered leftist leaders. However, it went much further than that, because Stalin, Hitler, and Mussolini all treated this as a testing ground for their new weapons and tactics. The most notorious

of these was aerial bombardment of civilians, such as that of Guernica in 1937, immortalized by Picasso's painting, *Guernica*. Unfortunately, this was but a mild foretaste of such tactics in World War II.

In the end, Fascist aid and unity proved more effective, as the Nationalists cut Madrid, Catalonia, and the Basques off from one another and gradually took over Spain, piece by piece. By 1939, Franco was in firm control of Spain, which he would keep under his harsh fascist rule until he died in 1975. However, right after his death the Spanish established a liberal constitutional monarchy under which Spain would stabilize and prosper in the following years.

The Spanish Civil War (1936-9)

At the start of the war, the Republicans outnumbered Franco's Nationalist forces, so he asked Germany and Italy for help. Germany sent 10,000 men, 200 tanks, 600 planes, and a number of their excellent anti-aircraft guns. Italy sent 40-50,000 men, 150 tanks, 660 planes, and 800 artillery, along with masses of machine guns and other supplies.

Therefore, Stalin helped the pro-socialist Republicans with 1000 planes, 900 tanks, 300 armored cars and 1500 artillery. Except for 300 planes that France sent, the Western democracies gave the Republicans nothing but sympathy. Overall, Russian armor at that time was heavier, better armed, faster, and all round better than its German and Italian counterparts. However, it was poorly used, leading to entire divisions of captured Russian armor in the Nationalist army by war's end.

The most help the Loyalists got from the West was from unsanctioned volunteer freedom brigades, such as the Abraham Lincoln Brigade from America. The authors Aldous Huxley and Ernest Hemingway served in this way. Hemingway's *For Whom the Bell Tolls* is a semi-

autobiographical novel of his experiences in the Spanish Civil War.

Both sides used the Leninist tactic of focusing on enemy's leaders and terrorizing their followers. Franco's rebels killed some 40,000 civilians, especially targeting any leftists, typically striking at night for greater terrorist effect. Using murder gangs called *checa* the Republicans killed an estimated 75,000 more. They especially targeted clergy, killing 20% of Spain's bishops, 12% of its monks, 13% of its priests, and 283 nuns. Bloody turmoil enveloped the country as churches were burned and priests, nuns, and Republican politicians were executed. Both sides were perpetrators and victims.

The Spanish Civil War was also a propaganda war. The Republicans in particular used the poster medium effectively as seen below:

Franco's more experienced forces advanced rapidly through southern Spain. However, they would have a harder time in the north because the people there were better armed, educated, and informed about the issues. Catalan and Basque separatists provided an especially tough obstacle.

As Franco's forces closed in on Madrid in 1936, its defense at first seemed hopeless, especially against the Nationalists' artillery. Then, just as the defense was beginning to crumble, International Brigades arrived among cries of "No pasarán! Pasaremos!" ("They shall not pass. We shall pass."). By November 9th, a third of the International Brigades' soldiers had been killed, but then more reinforcements arrived. Fighting was intense, with hand-to-hand battles for the possession of every room or floor of a building. By November 23rd, the Nationalists had about three-fourths of Madrid but could take no more. They then tried to cut off Madrid from the rest of Spain. However, after heavy casualties in

taking one town, they abandoned this plan. The people of Madrid had held out and wouldn't fall to the Fascists until 1939.

Republican militia use a damaged tank for cover while defending an approach to Madrid.

Among the more tragic aspects of this war was its use of Spain as a testing ground for new weapons and tactics. Most notable of these was aerial bombing of civilian targets by the German air force in Spain known as the Condor Legion. The most notorious such incident was the German bombing of Guernica, a town of 7000 with two small munitions factories and a bridge. It's main crime, however, was just that it got in the way. As one eyewitness put it, *"A group of women and children were lifted high into the air, maybe 20 ft. or so, and they started to break up. Legs, arms, heads, and bits and pieces flying everywhere."* Picasso protested Germany's brutal aerial bombardment of Spanish civilians in his painting Guernica (pictured above), one of the most powerful artistic statements of the 20th century.

Unfortunately this was only a mild foretaste of what civilians would have to endure in World War II.

The Republican cause finally collapsed in 1939 and Franco began a brutal fascist rule that would last until his death in 1975. The author and freedom fighter, George Orwell, summed up the situation upon returning to Britain in 1939: *"Here it was, still the England I had known in my childhood: the railway cuttings smothered in wild flowers, the deep meadows where the great shining*

horses browse and meditate... the men in bowler hats, the pigeons in Trafalgar Square, the red buses, the blue policemen-- all sleeping the deep deep sleep of England, from which I... fear that we shall never wake till we are jerked out of it by the roar of bombs."

His words would prove prophetic.

136. WORLD WAR II IN EUROPE (1939-45)

"What General Weygand called the Battle of France is over. I expect that the Battle of Britain is about to begin. Upon this battle depends the survival of Christian civilization. Upon it depends our own British life, and the long continuity of our institutions and our Empire. The whole fury and might of the enemy must very soon be turned on us. Hitler knows that he will have to break us in this Island or lose the war. If we can stand up to him, all Europe may be free and the life of the world may move forward into broad, sunlit uplands. But if we fail, then the whole world, including the United States, including all that we have known and cared for, will sink into the abyss of a new Dark Age made more sinister, and perhaps more protracted, by the light of perverted science. Let us therefore brace ourselves to our duties, and so bear ourselves that, if the British Empire and Commonwealth last for a thousand years, men will still say, "This was their finest hour." --Winston Churchill, British prime minister

*"If you're going through hell, keep going."--
Winston Churchill*

World War II was the single most destructive war in history, claiming over 60,000,000 lives and untold material damage. In contrast to 1914, most soldiers in 1939 had a better sense of the seriousness of modern war and marched off with grim resolve rather than enthusiasm. The war in Europe can be seen as happening in two phases: the German blitzkrieg (1939-41) and the allied response and counterattack (1942-45). Technological and tactical innovations were central to each phase and affected events on both the Eastern and Western fronts.

Blitzkrieg (1939-41). As in World War I, many generals at the start of World War II were planning to fight the last war rather than the next, hardly taking into account the changes in warfare over the last twenty years. France, in particular, operated with a World War I siege mentality, relying on a giant enclosed concrete trench, the Maginot Line, which covered much, but not all, of its border with Germany. However, the German generals had a very different perspective. Having lost the last war, they were more determined to find a new way to win the next one. In their minds, that way was *blitzkrieg* (lightning war).

Blitzkrieg was largely the brainchild of Heinz Guderian, a German tank expert who convinced Hitler that the future of warfare lay with tanks and airplanes, not immobile lines of trenches. Instead of spreading tanks along the front as infantry support, Guderian's idea was to amass his *panzer* (tank) divisions at strategic points and blast through that part of the line. The German airforce, the *Luftwaffe*, would bomb and strafe the enemy behind their lines, further demoralizing and disrupting them. Meanwhile, infantry would consolidate their hold on the gaps blown open by the *panzers*. This would force the enemy back to a new position that was already weakened and threatened by the *panzers* and *Luftwaffe* wreaking havoc in their rear.

Blitzkrieg did not do away with the continuous front, since the manpower and firepower needed to fill a continuous front were more available than ever. What it did accomplish was to make the continuous front mobile, thereby pulverizing everything in its path. As a result, the fighting was not confined to a narrow static front, as in World War I. Rather, it swept across all of Europe in a broad swathe of destruction. Also, Blitzkrieg was designed for attaining short decisive victories that would avoid the prolonged type of warfare that had worn Germany out in World War I. At first it took its enemies by surprise and allowed the Nazis to overrun their enemies in both Eastern and Western Europe very quickly.

In the East, the German blitzkrieg easily overran western Poland while Stalin took the rest. Then, while Hitler was pre-occupied with defeating France and Britain in the west, Stalin invaded Finland and took the Baltic republics of Latvia, Estonia, and Lithuania (lost since World War I) as well as part of Romania. These events, along with Hitler's long-standing hatred of Russia, prompted a planned invasion of Russia, which was delayed by having to help Mussolini in the Balkans and North Africa. When it did get going in June 1941, the German attack met with incredible success, quickly inflicting tremendous casualties and driving almost to the gates of Moscow. Only the onset of winter temporarily stopped the German advance and bought the Russians time to recover.

In the West, Hitler also met with startling success as the German army rapidly overran Denmark,

Norway, Belgium, Holland and France by June 1940. Not until they reached the English Channel did the Nazi advance halt and give Britain renewed life. The ensuing Battle of Britain was the first major battle ever decided primarily by air power, as the Luftwaffe first bombed British airfields and then concentrated on Britain's cities to clear the way for an invasion of Britain. However, the British grimly held on until Hitler abruptly broke off the raids to turn his attention to the invasion of Russia. Britain's war effort was also bolstered by increasing aid from the United States, which would join the war by the end of 1941. Thus, as 1942 dawned, Germany was faced with two new and formidable enemies: the United States and Soviet Union.

The allied response and counter-attack (1942-45).

However, the benefits reaped by the German blitzkrieg would be short-lived, largely because, while the Germans became complacent and overconfident from their early successes, the allies were urgently adapting to and modifying blitzkrieg to neutralize the German advantage. They did this in three ways. First, they adapted their economies completely to war production. While the Russians were moving entire industries east of the Urals out of Hitler's reach, the United States was building a massive military-industrial complex that by 1944 was more than twice as productive as all its enemies combined. By contrast, Hitler, not wanting to alienate the German industrialists, delayed putting Germany on a full wartime economy until 1943, by which time it was too late.

Secondly, the allies, especially the British and Americans, expanded the use of air power from mainly ground support for tanks and infantry, as the Germans used it, to building large long-range bombers for massive bombing of German cities. Finally, both sides modified their tank divisions by adding mobile assault guns and motorized infantry. This, plus the higher production levels the allies maintained, largely neutralized the German blitzkrieg, slowing it down to a war of attrition that heavily favored Germany's enemies on both fronts.

In the east, the Nazi offensive resumed in 1942 with the coming of spring, advancing eastward until the Russians made their stand in Stalingrad where the Germans found blitzkrieg was totally unsuited for the house to house fighting of urban warfare. The intense fighting there bogged down the German war

machine until the Russians could build their forces for a counter-attack that cut off and destroyed the entire German Sixth Army in February 1943. After that, Russian perseverance and industrial production, helped by supplies from the allies via the Arctic Ocean, slowly drove the Germans back across Eastern Europe.

On the Western Front, the allied effort, increasingly bolstered by American military and industrial might, also met with success, driving the Germans from North Africa and Sicily and invading Italy in 1943. The next year, drawing upon their experiences in Italy, the British and Americans used their overwhelming air and firepower to open a second major front in France.

All this time, the British and Americans had also been launching massive long-range bombing raids on German cities. They used this strategy since they had no major foothold on the continent from which to fight the German army directly until 1944. Although it is still argued whether the allied bombing raids did substantial damage to German war production, which had been largely decentralized away from its cities and the bombing raids, they certainly devastated Germany's cities, demoralized its population, diverted German air power away from the Russian front, and wore down German air defenses, thus giving the allies critical air superiority by the time they were ready to invade France and liberate Western Europe from the Nazis.

By the end of 1944, Germany's war effort was collapsing as American and British air raids devastated its cities from above and allied armies converged from east and west. Finally, in May 1945, Russian forces took Berlin, bringing an end to Hitler's regime and the war in Europe.

THE WAR IN DETAIL

Germany triumphant (1939-41). When the Germans invaded Poland in September 1939, their concept of Blitzkrieg, ran almost flawlessly. The *panzers* burst through gaping holes in the Polish lines while Stuka dive-bombers spread terror and destruction along the front and well behind it. Polish cavalry brigades launched valiant but hopeless assaults against Guderian's tanks, which mowed them down mercilessly. When Warsaw stubbornly fought the Germans to a standstill, the

Luftwaffe came in for round the clock bombing raids until the city finally succumbed.

Meanwhile, France and Britain had declared war on Germany two days after the invasion of Poland, but had done little except sit and wait in what was known as "sitzkrieg" or the Phony War. This gave Hitler the time and initiative to prepare and launch an attack at a time and place of his choosing. He first invaded Denmark and Norway, thus securing his iron ore supply and a long irregular coastline from which to launch submarine raids.

It was not until May 1940 that the showdown with France and Britain came. The Allies expected a repeat of the Schlieffen Plan where the Germans would sweep through the Low Countries into France. The final German plan took advantage of these expectations by launching a diversionary attack into Holland and Belgium that drew the Allied armies north to meet them. However, the real attack came through the supposedly impassable Ardennes Forest between Belgium in the north and the Maginot Line in the south along France's eastern border.

Once again, German plans went like clockwork. The Germans smashed through the lightly guarded French lines in the Ardennes. While the *Luftwaffe* wreaked havoc in the French rear, Guderian's tanks raced toward the sea to close the trap that would cut the Allied forces in the north off from the rest of their forces in the south.

Panic seized the French troops who were being relentlessly strafed by the *Luftwaffe* and pursued and even passed up by the *panzers* (who were in too much of a hurry to stop and take prisoners). Panic also seized Allied High Command, which was virtually paralyzed by this sudden turn of events. Even German Headquarters was uneasy about its plans going too well and wanted Guderian to stop to let his infantry catch up. But Guderian saw first hand the total chaos and panic that ruled the Allies and kept going. He reached the sea in ten days, having gone further than the German army had gone during the whole four years of World War I.

Meanwhile, Allied defensive lines in the north were collapsing around the seaport of Dunkirk. In a desperate bid to rescue their army, the British launched a most unlikely flotilla of military and

civilian craft: destroyers, tugboats, river barges, and even pleasure craft. Braving the dive-bombing Stukas and German shore artillery, they managed to get to and extricate most of the British and French forces pinned against the beach. Britain would live to fight another day.

The remaining French forces in the south formed a new battleline where they bravely fought on. But it was too little too late as Paris fell, and France finally surrendered in June 1940. The surrender was signed in Napoleon III's railroad car, the same car where the Allies forced the Germans to sign the Armistice in 1918. The Battle of France was over. The Battle of Britain was about to begin.

Britain's prime minister at that time was Winston Churchill, a leader of indomitable courage who gave the British spirit a defiant edge during these dark times. As in the past, the British realized that an invasion of Britain (codenamed Operation Sea Lion) required control of the sea. But for the first time in history, that also required control of the air. Therefore, the Battle of Britain was largely determined by air power. The first clashes came over the Channel, and the German pilots, who had more experience from fighting in Spain, Poland, and France, at first did quite well. Then the *Luftwaffe* started concentrating on knocking out the Royal Air Force (RAF) and its bases in order to clear the way for invasion.

In this phase the British had several advantages. First of all, the German fighter planes only had 20 minutes fighting time over Britain after allowing for fuel to get across the Channel and back. In contrast, British pilots had full tanks for fighting. Secondly, the fighting over Britain meant that only British pilots who were shot down and survived could be rescued to fight again, while surviving German pilots became prisoners. Third, the British had a new technology, radar, which let them spot German planes as they were being launched and concentrate their forces against them. Finally, the British had gotten hold of a copy of Enigma, the German decoding machine. This proved to be a decisive element throughout the war since the allies were often able to intercept and prepare for supposedly secret German plans.

This still did not make it easy. Although they suffered heavy losses, German pilots were good and

their superior numbers exacted a toll on the RAF through aerial fights and bombing raids on British airfields. Bit by bit, the RAF was being worn down by casualties, battle fatigue and damage to its airfields. Ironically, what saved the RAF and Britain was Hitler's decision to bomb British cities.

Initially, Hitler did not want to concentrate on Britain's cities. However, on August 24, some of his bombers lost their way and accidentally bombed London. Churchill retaliated by launching an air raid on Berlin, which infuriated Hitler and caused him to turn the *Luftwaffe* loose on London and other cities. This gave the RAF the break it needed to recover its strength.

Thus began the Blitz, nine months of daily bombing raids. At first the raids came by day. But the RAF, now under less pressure, was able to inflict heavy damage on the enemy. Therefore, the Germans soon limited their raids to nighttime when their planes were harder to spot. Since the British could do little against these raids, civilians huddled in their cellars or flocked to the subways for safety. Surprisingly enough, there was little panic. The Blitz became a way of life interwoven with the more normal activities carried on in the daytime. And so, night after night, month after month, the British grimly hung on against these assaults on their cities.

Things looked particularly bleak for Britain in the spring of 1941. In addition to air attacks on their cities, the British also had to contend with German U-boats preying on their shipping in the North Atlantic. They answered this threat to their lifeline by developing sonar to detect German submarines and better depth charges and convoys with naval escorts to combat them.

Meanwhile, the United States, although officially neutral, was becoming increasingly concerned about Britain's survival against the Nazis. President Roosevelt brought America closer to direct involvement through the Lend Lease Act, which provided vital aid to the British in their hour of need. By the end of 1941, Roosevelt's policies and the Japanese surprise attack on Pearl Harbor would bring the United States into the war. However, it was events further east that proved to be Hitler's ultimate undoing. On June 22, 1941, he invaded

Russia, thus ending the Blitz and giving Britain new life.

The Eastern Front (1939-1944). In the East, Stalin had taken his share of Poland according to his pact with Hitler, and then swallowed up the Baltic Republics of Latvia, Lithuania, and Estonia. Next he attacked Finland, which put up a spirited defense that held the vastly superior Soviet forces at bay for several months. In the end, the Finns were overwhelmed and forced to cede part of their land to Stalin.

Stalin's growing power in the East increasingly alarmed Hitler who had intended from the beginning to destroy Russia. Hitler set his attack for May 1941, but events elsewhere delayed his plans. Mussolini, sensing an opportunity for Italian glory, invaded both Yugoslavia and North Africa, got bogged down by stiff resistance, and called on Germany to bail him out. Hitler was furious, but he sent in troops who overran the Balkans, drove the British out of Crete with a daring paratroop operation, and then drove the British back toward Egypt in North Africa. The delay this caused in Hitler's preparations to invade Russia may have been the critical difference that allowed the Russian winter to stop the German advance on Moscow and eventually defeat the Nazis.

The invasion of Russia was probably Hitler's biggest mistake, although at first it did not seem that way. Much of his mistake was being overconfident from his recent victories and not preparing the sort of force the invasion of Russia would require. Stalin, still trusting in his pact with Hitler, refused to heed warnings of an impending German attack. When the attack, codenamed Operation Barbarossa, came, it hit a Soviet army whose officer corps was decimated by the recent purges and Stalin's insistence on personally authorizing all actions any of his generals took. As a result, Guderian's *blitzkrieg* inflicted staggering losses on the Russians and drove deep into the Soviet Union in the opening months. Then the Russian winter set in, stalling the German offensive just 20 miles from Moscow. German soldiers, unequipped and unprepared for these subzero conditions, suffered horribly while their equipment broke down. Meanwhile, the Russians launched offensives of their own that nearly destroyed much of the German forces.

The German offensive revived with the spring thaw in 1942. The Germans advanced against Leningrad in the north and Stalingrad in the south. The siege of Leningrad was a long drawn-out affair that lasted 900 days. Starvation, more than bullets exacted its toll, especially on civilians. Although as many as 1.5 million Russians died in the siege of Leningrad, the city stood held out.

If any battle was the turning point of the war, it was Stalingrad, an industrial city that Hitler saw as the key to Russia's oil fields in the south. After initial German successes that took 90% of the city, the fighting bogged down into desperate house-to-house and even room-to-room fighting. As the Russians bled the German army white in the rubble of Stalingrad, they were also building massive forces to the north and south. On November 19, 1942, they slammed into the flanks of the German army guarded by its Italian and Romanian allies, broke through, and met in a giant pincer movement behind the German army. The German army of some 250,000 men besieging Stalingrad was now itself surrounded and besieged.

Hitler refused to let the Germans break out and retreat, insisting that they continue the siege while he tried to airlift supplies to them. Therefore, while starvation, the Russian winter, and shelling took their toll, the fighting in the rubble continued. However, in February 1943, the Germans finally surrendered. Of the 90,000 Germans who survived to surrender at Stalingrad, only 5000 would make it home from Stalin's prison camps.

The Russian victory at Stalingrad provided the impetus to go on the offensive and drive the Germans out of Russia. Two things provided the Russians with the means to fight this war to the bitter end. First, and most important, was the revival of Russian industries, many of them moved beyond the Ural Mountains and out of reach of the *Luftwaffe*. Second, there was substantial material aid from the United States shipped north of Scandinavia, braving the hazards of both the Arctic Ocean and German U-boats. By war's end, these gave Stalin the means to build the most massive war machine in all history.

The Russian Front in World War II became renown for the intensity and the desperation of its fighting. This was especially true of the Battle of Kursk in

the summer of 1943, a German attempt to break through a strong salient in the Russian line and turn the tide back in Germany's favor. This battle involved over one million men, 5800 tanks and assault guns, 5000 planes, and 30,000 artillery pieces on both sides. After weeks of blasting away at each other, sometimes at pointblank range, the Russians had broken the German offensive.

If Stalingrad signaled the end of the German tide of conquests, Kursk signaled the beginning of the end of Hitler's Third Reich. Not that Germany was completely done for yet. The fighting on the Russian Front assumed epic proportions till the end of the war. Whereas Hitler committed 10 divisions to North Africa, he had 200 divisions on the Russian Front. Therefore, the fighting, destruction, and bloodshed escalated to horrific levels and continued unbroken until the bitter end.

The Western Front (1942-44). The tide was turning against Germany on other fronts as well, especially as American forces and material were being fed into the war. In North Africa, Allied forces under the British General, Montgomery decisively defeated German General Rommel and his Afrika Corps at El Alamein. Despite all of Rommel's efforts, the German war effort in North Africa faltered without adequate aid from home. By May 1943, the Germans had been cleared from North Africa.

The Allies then swept across Sicily and into Italy. German forces defending Italy used its rocky and mountainous terrain well and slowed down the Allies who referred to Italy as "tough old gut". The slowness of the Allied advance in Italy aggravated Stalin who pushed the British and Americans to open a new front to take the pressure off Russia. Much of the hostility between Russia and the West after the war came from Stalin's belief that his allies intentionally dragged their feet while Russia and Germany bled each other to death.

In fairness to the British and Americans, launching an amphibious assault on France's heavily defended coasts was a very dangerous and tricky operation. It required intense preparations and the build-up of massive forces that were not ready until 1944. Until that time, the British and American air forces were busy taking the war directly to the German heartland. As the war progressed, so did the intensity of aerial bombardments of German cities.

In some cases, as at Hamburg in 1943 and Dresden in 1945, the bombing was so intense that firestorms developed, whipping up 150 mile per hour winds and temperatures of 1800 degrees Fahrenheit. The destruction and death tolls from these raids were devastating to the German people. However, German war industries had largely been decentralized and spread out away from the heart of German cities. Therefore, they still managed to maintain production of weapons and war materials.

On D-Day, June 6, 1944, the British and Americans finally gave Stalin the second front he wanted by launching an amphibious assault on the beaches of Normandy, the largest such assault in history. It ran a tremendous risk, but was successful in establishing a foothold in France. In the following weeks, the Allies expanded that foothold and then broke out into the French countryside in July. In the following months, they triumphantly advanced through France, liberating Paris in August, and being poised for a final assault on Germany in 1945.

The end of the Third Reich (1944-45). By late 1944, the German position on both the Eastern and Western Fronts was steadily crumbling. On June 22, 1944, the Russians broke through the German line and surrounded 40 divisions known as Army Group Center. Eventually they destroyed or captured all but 12 of those divisions. In October, a similar offensive destroyed Germany's Army Group North. Germany's allies, Romania and Bulgaria, dropped out of the war and the Germans were forced to abandon the Balkans. By 1945 the Russians were driving through Poland against a German army that had only one tank for every three or four miles of front and was drafting old men and 14 year old boys to fill its ranks.

In one last desperate for a negotiated settlement from Britain and America and thus force Stalin to stop his advance, Hitler launched a surprise attack against American and British forces in the Ardennes in December 1944. The Germans were initially successful in this "Battle of the Bulge," but their offensive literally ran out of gas and men as the Allies regrouped and counterattacked. In early 1945, the Russians, Americans, and British invaded Germany from both east and west.

With invasions closing in from all sides and air raids tearing apart Germany's cities, only Hitler,

who was secluded in an underground bunker, failed to recognize the inevitable collapse of Germany and refused to surrender. In late April, Russian forces reached Berlin. What few German forces that remained put up a desperate resistance, and it took the Russians three days to take the city. Just as the Russians were closing in on his bunker, Hitler committed suicide. His body, probably cremated beyond recognition, was never found.

In his wake, Hitler left an unprecedented amount of death and destruction, including the brutal and bizarre murder of 6,000,000 Jews and millions of others in his death camps. He had intended his Third Reich to last 1000 years. It had lasted twelve.

Selling Blitzkrieg

In 1933, to convert the new chancellor, Adolf Hitler, to the doctrine of blitzkrieg, Guderian did a demonstration using cardboard mock-ups of tanks placed over cars (above) or pictures of tanks carried by soldiers to demonstrate how it worked. Hitler was delighted, and by 1939 Germany had six panzer divisions. Even then, the German army was no more mechanized than its enemies. It had fewer tanks than either France or Russia and still relied heavily on horses for transporting supplies. However, the revolutionary way Germany used its tanks and planes would give it amazingly quick victories in the war's early years over enemies who still spread their tanks out as infantry support.

One of Blitzkrieg's critical elements was communications. While German tanks had radio communications with one another, French tanks didn't. Even allied High Command still relied on motorcycle couriers (who were often killed by marauding German planes), for information from the front. By contrast Guderian's state-of-the-art mobile radio command center gave him much more precise information on the current situation.

Blitzkrieg Strikes: Poland (September 1939)

Stuka dive-bombers led the German air assault. From an infantryman's perspective, it looked like the Stuka was diving straight for him personally. To add to the terror they were equipped with sirens, an idea supposedly credited to Hitler.

The Pomorske brigade. According to one story, the Germans met the Pomorske brigade, cavalry wearing white gloves and lances with pennons flying proudly in the breeze. It was like a page out of a 19th century storybook. However, this was the 20th century and the German tanks didn't care about chivalry and glory. Within minutes they had reduced the Pomorske Brigade to a bloody heap of men and horses. As the Polish prisoners were being led into captivity, they rapped on the German tanks, having heard they were only made of cardboard and tin foil.

The Germans would use this incident as the basis for jokes about Polish stupidity. To be fair, many or most people have similar jokes about other ethnic groups. I won't go into detail, although one baffling example is that Mexicans apparently tell such jokes about Swedes. Suffice it to say that stupidity and cruelty seem to be qualities found in humans everywhere. Only the names are changed to oppress the innocent.

Chopin's music. Polish radio defiantly met Hitler's round-the-clock air raids by broadcasting the music of Chopin, people scavenged the carcasses of dead horses for meat. Finally, Chopin's music was silenced and the Poles surrendered.

Almost immediately, the Nazis started rounding up Polish Jews for abuse and, in some cases, methodical executions.

France Falls (1940)

Sitzkrieg. Although France and Britain had declared war two days after Hitler invaded Poland, they did little but wait for Hitler to attack. Each day they would fire a few shots

across the border, trade insults with the Germans, and see whose brass bands were louder. All the while, allied morale steadily dropped.

The Maginot Line. In fact, the allies expected a replay of the last war, where trenches and massed firepower would destroy any enemy offensives. The French even lined their eastern border with a giant concrete trench, the Maginot Line, complete with an underground railroad and sunlamps to give the French Poilus (soldiers) their vitamin D.

The German strategy: Schlieffen Plan or no Schlieffen Plan? Originally, the German strategy was a replay of the Schlieffen Plan, with the main attack coming through the Low Countries north of France. But a plane carrying the plans crashed in Belgium, leading to a guessing game of whether allies got the plans or not and if they had them, did they think the Germans knew they had them and would change the plans as one would expect. Or would they do a reverse psychology and carry them out. Or would they do a double reverse psychology... etc.?

In the end, Hitler satisfied allied expectations of a repeat of 1914 by attacking through Belgium and Holland on May 10, bombing their cities and using paratroops to secure strategic points. Rotterdam, Holland was especially hard hit, with 814 civilians killed in this new kind of war. However, this was merely a ruse to lure the British and French armies north to meet the invaders.

Having drawn the bulk of allied forces north, the Germans struck with their *real* offensive north of the unfinished Maginot Line through the Ardennes, a thickly forested area that French High Command had wrongly deemed

as impenetrable (although French war-games in 1937 had proven differently). Therefore it was only defended by poorly trained and equipped reservists who now had to face the full fury of the Wehrmacht's assault.

Having brought their panzers through the Ardennes, the Germans worked with mechanical precision. Infantry crossed the Meuse River under cover of German dive-bombers, which silenced any French guns defending the opposite shore. Having secured a foothold there, engineers built bridges over the river, allowing the German tanks to cross into France.

Race to the sea. Stukas strafed the roads to clear them for the quickly advancing Panzers. Germans shouted from their tanks to the French troops: "Drop your rifles and get the hell out of here-- we don't have time to take you prisoner." By May 16, the hole in the allied line was 60 miles wide.

"Civilians and French troops, their faces distorted with terror, lay huddled in the ditches, alongside hedges and in every hollow beside the road...Always the same picture, troops and civilians in wild flight down both sides of the road...a chaos of guns, tanks, and military vehicles of all kinds, inextricably entangled with horse drawn carts."-- Erwin Rommel, German tank commander

Getting the message. On the maps it looked like the Germans were over-extending their line. But the maps didn't show the total confusion in the French army or high command. For one thing, the French used motorcycle couriers, not radios or phones, leading to the nightmare scenario of couriers dodging marauding Stukas to report on positions, getting their orders, evading more Stukas to give the troops orders that were totally out of date by then. That's if the courier survived and got through.

Confusion, then panic and paralysis, seized allied command as its forces in the north rushed back to escape the trap. Generals

were sacked right and left. Even the top commander, age 67, was replaced by one who was 73.

Even the German high command couldn't believe their success was so swift and complete and was getting nervous about Guderian's tanks outrunning his infantry support, so they told him to stop. Guderian seeing the total chaos and lack of resistance among the French, got permission to "consolidate" his line, which he "consolidated" at the Atlantic coast, having reached the sea and cut off the main allied forces racing south from Belgium in only ten days.

Meanwhile in the south, French resistance collapsed as German tanks and planes seemed to be everywhere.

Surrender. Hitler insisted the French sign the surrender in the same railroad car where Germany had surrendered in 1918. He then had the car dynamited so the French could never use it against the Germans again. One last humiliation awaited the French: the German triumphal march through Paris, following the exact route of the French victory march in 1918, which had followed the route of the Prussian victory march in 1871.

Vichy France. However, the Germans only occupied northern France. The southern half, known as Vichy France, functioned as a satellite state expected to follow Nazi policies, including the arrest of Jews to be sent to the concentration camps. Anyone, Jew or Gentile, suspected of plotting against Hitler's regime faced immediate execution.

The French navy was a major concern Britain's prime minister, Winston Churchill. Although it was anchored in Vichy ports on the Mediterranean, the Germans clearly wanted it, since that, combined with their own fleet, would give them naval superiority over the British navy and the ability to force a crossing of the Channel to invade Britain. Despite French assurances that they would scuttle their fleet before the Germany got it,

Churchill became increasingly nervous as the Germans closed in. Finally, out of desperation, he ordered the British to destroy their French allies' fleet, in the process killing about 1500 French sailors. The French, claiming they would have scuttled their ships in time, were understandably bitter over this incident.

But Britain had survived to fight another day

Dunkirk

Not all the allied forces had been lost. Retreating British, French and Belgian forces had been trapped in a collapsing pocket along the Channel coast around Dunkirk. Although Hitler wouldn't risk his precious tanks in a final assault, his air force mercilessly pounded the allied troops cornered on the beaches.

The British launched one of the most unlikely rescue flotillas in history to save their imperiled troops. Pleasure craft, barges, paddle wheelers, almost anything that could float were gathered to run the gauntlet of German Stukas and save the allied troops. British ships were guided to Dunkirk at night by its burning fires and during the day by smoke from its burning oil tanks.

Many ships were lost, including an offshore hospital ship, which managed to escape damage until a Stuka dropped a bomb down the smokestack. For days, bodies from the hospital ship washed ashore. Initially, the British hoped to rescue 45,000 men. However, from May 26th to June 4th, they evacuated 338,226 men as German planes bombed British rescue ships and strafed the helpless troops on the beach. Still, not everyone made it. Besides thousands of their comrades, the British also left behind in France all their ground equipment and half their air force.

Britain Alone (August 1940-May 1941)

One tool, just invented in 1937, was radar that would give early warning of German air raids. Many of the women who ran these radar stations would die in German air raids. Behind the line of radar defenses another 30,000 volunteers served as aircraft spotters. At Fighter Command Headquarters reports of incoming raiders would be plotted on a map of Britain to give an overview of the strategic situation at that time. The British even prepared oil slicks to incinerate invading Germans which, when ignited with flares.

The workhorse of the German fighter force was the Messerschmitt 109. An excellent fighter plane, but with only 80 minutes worth of fuel, leaving it only 20 minutes of combat time over Britain. Many German planes, even after surviving combat over Britain, ran out of fuel on the return trip and went down in the Channel. Opposing the German planes were very fast British Hurricanes and Spitfires (pictured below). When asked if his air force needed anything, Hermann Goring, head of the German Luftwaffe replied "a squadron of Spitfires"

Enigma is the term for a number of machines for encrypting and decoding secret messages. The

most famous of these was the German military version. Between the wars, the Poles had made significant progress in deciphering its messages, and just before the German invasion of Poland, they passed these secrets to the French and British. This enabled the allies to decipher encoded German messages, giving them an edge that some historians think shortened the war by two years.

However, the allies had to be careful as to how much they exploited this advantage, since using it too much might tip off the Germans, causing them to create a new code. One of the most gut wrenching decisions of the war for Churchill was to refrain from warning Coventry about it being targeted for a major air raid November 14, 1940. As a result, it took a serious beating, including its Cathedral (below). Still, by sacrificing Coventry in order to win the war, Churchill might have saved a dozen Coventry's down the road.

Shelter from the storm. At first, the British government banned using subway stations as bomb shelters. However, mobs of people desperate for a place of refuge clamored at the gates until they were finally let in. An estimated 40% of London's population spent their nights in "the tubes" during the Blitz, as the period of German bombing raids was called. Others slept in department store basements or stayed at home, sealing their curtains to keep any light from leaking out and giving German bombers a target. Some even walked the streets during the raids for kicks.

During the Blitz, thousands of children were evacuated from Britain's cities and lodged in the country, often with complete strangers. Special weekend rates allowed many parents to visit their children briefly on Sundays.

UXBs. Another type of hazard was the large number of unexploded bombs (UXBs) that had to be carefully extricated and detonated. Especially difficult were parachute mines that got hung up in trees, making them hard to get to. Complicating matters further was the fact that some bombs were booby trapped with trigger fuses. By December 1941, there were 3000 UXBs waiting to be defused.

Finding London. Since Bombing by night doubled the margin of error for hitting a target to ten miles, The Germans used two radio beams to guide pilots to London, knowing they were over their target when the beams intersected. To combat this, the British set up counter-beams to confuse German pilots and throw them off target.

Finding the tee. For those who think today's golfers are obsessive about playing the game in any sorts of conditions, consider the temporary golf rules passed by the Richmond Golf Club of London in 1941 during the Blitz. These are real.

1. Players are asked to collect the bomb and shrapnel splinters to save these causing damage to the mowing machines.
2. In competitions, during gunfire or while bombs are falling, players may take shelter without penalty or ceasing play.
3. The positions of known delayed-action bombs are marked by red flags at a reasonable, but not guaranteed, safe distance therefrom.
4. Shrapnel and/or bomb splinters on the fairways, or in bunkers, within a club's length of a ball, may be moved without penalty, and no penalty shall be incurred if a ball is thereby caused to move accidentally.
5. A ball moved by enemy action may be replaced, or if lost or destroyed, a ball may be dropped not nearer the hole without penalty.
6. A ball lying in a crater may be lifted and dropped not nearer the hole, preserving the line to the hole, without penalty.
7. A player whose stroke is affected by the simultaneous explosion of a bomb may play another ball. Penalty: one stroke.

Britain also faced another problem: starvation, since it had to import half its food and many of its other vital resources, largely from the US. “Wolf packs” of German U-boats preyed upon Britain’s shipping, threatening to cut its vital lifeline. In October 1940, two eastbound convoys lost 33 of 79 ships to German U-boats. As late as March 1943 a wolf pack of 40 U-boats sank 23 of 92 ships in two other convoys.

But by then the tide was turning. Better detection technology (sonar), depth charges, aircraft carriers enabling surveillance planes to cover the whole Atlantic, and more escort ships dramatically reduced shipping losses. The allies sank 33 U-boats in May 1943 and 22 more in July, making the erstwhile hunters now the hunted. With the Atlantic sea-lanes now secure, the allies could build up their forces for an eventual invasion of Hitler’s Europe.

The last major raid of the Blitz came on the night of May 10-11, 1941. It was a “dirty raid” as the British called it, one using incendiary bombs. Due to Britain’s mild winters, water lines were close to the surface and thus easily burst by bombs. This forced firemen to run canvas hoses to the Thames River, but the hoses kept catching fire. To complicate firemen’s efforts further, smoke got into a subway station, causing panic-stricken crowds to come pouring out into the streets where the fires were raging and bombs still falling. German air raids would assault Britain’s cities sporadically throughout the war, but this was the last night of the Blitz as Hitler turned east for new conquests.

Barbarossa: Germany vs. Russia (1941)

A fatal delay? When Mussolini bungled campaigns in both the Balkans and against the British in North Africa, Hitler intervened, sweeping through

the Balkans, driving British forces from Greece, and seizing Crete with a daring paratroop drop. In North Africa, the Afrika Korps, under Erwin Rommel, known as the Desert Fox, drove the British back towards Egypt.

Hitler’s Southern flank was momentarily secure, but he claimed the delay, which he estimated at four or five weeks, was fatal to German plans. In fact, even without Mussolini’s “help”, the German invasion probably would have had to wait until June to start because of an unusually rainy spring.

Russia had around 20,000 tanks at the time of the German invasion. Guderian thought this was an overwhelming advantage for Stalin, but if he gave this figure to Hitler and asked him not to attack, Hitler would say he was exaggerating Russian strength. So, to make his argument seem more believable to Hitler, Guderian cut the estimate of Russian tanks in half to 10,000, which would still be triple the number of tanks the Germans had. Hitler still thought he was exaggerating and insisted the plan continue.

Hitler’s success in Russia depended on the speed and surprise of blitzkrieg, for which Russia’s flat open terrain was perfect. Stalin gave Hitler the element of surprise by not heeding numerous warnings of the impending attack. And when it came, he was so shaken he couldn’t function for several days, giving Hitler an even bigger jump on the Russians. Therefore, when the attack was launched on June 22, 1941, it hit with hurricane force. Guderian’s two panzer divisions in the center destroyed 30 Russian divisions & then moved on to destroy 12 more. In the south, one panzer division pinned down and destroyed 20 Russian divisions.

The German offensive was rapid too. Guderian’s divisions advanced 175 miles in only four days, while German motorized divisions at one point

covered 413 miles in three weeks. The efficiency of the German army's engineers was one reason for the rapid advance through Russia, even bridging rivers in the face of enemy fire. Still, since Hitler concentrated mechanization in a few elite panzer divisions, the rest of the Wehrmacht had to rely on horses for transporting equipment and supplies.

Especially hurting the Russians was Stalin's insistence on controlling every move his armies made. Fighter planes were strafed on the ground because he refused to let them be launched. Tanks sank in a swamp he ordered them to advance through. Millions of Russian soldiers were wounded, killed, or captured because Stalin refused to let them retreat to new positions. Germany's overwhelming offensive led to a million Russian casualties and 3.5 million prisoners in 1941, growing to 5.7 million by 1945. Most would not survive captivity, 2.8 million alone dying by 1942

Non-Russians, such as Ukrainians, at first welcomed the Germans as liberators from Stalin. A million of them enlisted to fight for Hitler before they found that, against all odds, he was even worse than Stalin. Five days after letting the Ukraine declare itself an independent state, Hitler broke it up into five territories under Germany or its allies. Then, declaring there was no Ukraine, he began a purge of the local population, starting with the Jews. Local militia raised by the Germans helped in executing local Jews. First, the Nazis would force their victims to dig mass graves in the frozen ground. Then a kicker would kick bodies into the ditch to make way for the next round of executions. The Nazis would soon expand these operations to include Soviet citizens in general since they too were non-Aryans.

Not surprisingly, Nazi rule led to a widespread resistance movement. Russian partisan bands, containing both men and women, sabotaged railroad tracks and bridges, waylaid supply convoys, and ambushed isolated German units. Any partisans caught were automatically executed, just stirring up more Russian anger.

As long as conditions were good, the Germans advanced rapidly. However, Russia's lack of good roads led to traffic jams in good weather and made

travel nearly impossible when the weather turned foul. It started with the autumn rains which left the Wehrmacht (German Army) literally stuck in the mud. But the Russian winter wasn't far behind, and the German army was woefully unprepared for it. Guns jammed, engines froze, and steam engines couldn't get up a head of steam. Worst of all, Hitler had neglected to supply his men with winter clothing.

Meanwhile, the Russians prepared to defend the gates of Moscow. Women built defensive works while men cleared German barbed wire and land mines to pave the way for the counter-attack to come. It came on December 6, 1941, the Russians throwing everything they had against the freezing Germans. Stalin even used "trampers" to run ahead to detonate land mines so his tanks would be safe.

Now it was the Germans' turn to surrender or retreat and freeze. Some German units were trapped in isolated pockets and survived on airdrops by the Luftwaffe until they could resume their offensive in the spring. This success would prove fatal a year later when Hitler thought he could repeat this type of operation on a much larger scale at Stalingrad.

A Tale of Two Cities: Leningrad and Stalingrad

Much of the war on the Russian Front hinged on two very different sieges, one at Leningrad and the other at Stalingrad. In the North, German forces settled down to besiege Leningrad (once again, present day St. Petersburg). The 900-day siege of Leningrad was not so much a battle as a prolonged agony for its inhabitants.

An estimated one million Russians died there, an average of 1100 every day for 900 days, mostly from starvation or disease brought on by malnutrition. That's nearly three times more than all the Americans who died in the entire war.

People ate stewed twigs and peat moss shavings, household pets, and shoe leather, along with fir bark, insects, wallpaper paste, and lab rats. Pine sawdust, moldy grain dredged from sunken barges, bone meal, and cottonseed processed to remove the poisons were added to the bread. There were 226 people arrested for cannibalism, while human flesh was sold in the markets.

People were so hungry they would keep relatives' deaths secret so they could still use their ration cards. Because they were so weak from hunger, it took up to an hour to walk up three flights of steps.

During the shelling, people learned to walk on the side of the street closest to the Germans, using the buildings on that side as shelter from the shelling. Boys would be sent to the rooftops to shovel unexploded bombs down into the street.

In the winter, when its ice could support the weight of supply trucks Lake Ladoga became "the road of life". Despite the cold, drivers kept their doors open in case their trucks broke through the ice. In the summer, food was grown anywhere to feed the starving city, including a cabbage patch planted in the plaza of St. Isaac's Cathedral.

As supplies were brought in to the city, children were evacuated. Thousands of them lost touch with their families. After the war, the most popular radio show in Russia was "I am looking for someone". Its sole purpose was to reunite families separated by the war.

The Russian Composer, Dmitry Shostakovich, conducted his Seventh Symphony in the summer of 1942. It was a major event in the siege of Leningrad, signifying Russian defiance of the Nazis still besieging the city. Russian artillery drew German fire to one part of the city so the symphony could be performed peacefully in

another part of town. Finally, in 1944, the Red Army broke the siege. Leningrad had survived.

Stalingrad (September 1942-January 1943)

If any battle was the turning point of the war, it was Stalingrad, an industrial city that Hitler saw as the key to Russia's oil fields in the south. After initial German successes that took 90% of the city, the fighting bogged down into desperate house-to-house and even room-to-room fighting. As the Russians bled the German army white in the rubble of Stalingrad, they were also building massive forces to the north and south. On November 19, 1942, they slammed into the flanks of the German army guarded by its Italian and Romanian allies, broke through, and met in a giant pincer movement behind the German army. The German army of some 250,000 men besieging Stalingrad was now itself surrounded and besieged.

Before trying to take Stalingrad, the Germans virtually destroyed it in a massive air attack, creating such intense fires that people 30 miles away could supposedly read a newspaper by them at night. Then the German army moved in, only to find that tanks were ill suited to the desperate house-to-house fighting of urban warfare. Stalingrad quickly degenerated into the most vicious and desperate urban fighting in history.

For the Germans it meant their tanks were nearly useless in the crowded rubble strewn city. It also meant fighting toe to toe with an enemy fanatically devoted to defending its homeland & knowing it had the Germans on even terms for once. For the Russians it meant having to get to and supply the city by crossing the Volga River in the face of enemy dive-bombers. Casualties were horrendous for both sides. One of four Russian soldiers sent across the Volga didn't even survive the crossing to make it to the fight.

Many of Stalingrad's defenders were untrained citizens who were sent into battle after being given a rifle and basic instructions within sound of the fighting. Factories even continued working during the fighting, one producing a submachine gun especially designed for the city's urban warfare. Still, even when reduced to a narrow 1500-meter perimeter backed up to the Volga River, the Russians grimly hung on. There were no battle lines here, only bombed out buildings that held a hundred bombed out rooms, each of them its own battlefield, sniper's post, or grave. No quarter was asked or given in this city.

As one German officer put it: *"Stalingrad is no longer a town. By day it is an enormous cloud of burning, blinding smoke; it is a vast furnace lit by the reflection of the flames. And when night arrives, one of those scorching, howling, bleeding nights, the dogs plunge into the Volga & swim desperately to gain the other bank. The nights of Stalingrad are a terror for them. Animals flee this hell; the hardest stones cannot bear it for long; only man endures..."*

By November 1942, the Germans controlled all but 10% of Stalingrad. Still the fighting went on. The Germans were losing the equivalent of an entire division every five days. For the Russians, it was even worse, losing 25% of its entire force in two days fighting. As if things weren't bad enough for the Germans, Hell was about to freeze over again as another Russian winter approached. Once the Volga was frozen solid, it provided a more convenient avenue for supplying the Russian soldiers desperately holding out in Stalingrad.

But for Russian Marshal Zhukov, Stalingrad was now the bait to trap the Germans. The real Russian offensive would drive through Germany's poorly armed and trained allies north and south of town and meet behind German lines, trapping the entire German 6th army. The Russians struck on November 19, 1942, catching Germany's Romanian and Italian allies completely unprepared. Four days later the two forces met, closing the trap on the Germans. It happened so fast the Russian

soldiers had to reenact the two forces meeting and celebrating for the cameras.

Trapped inside this pocket, known as the Cauldron, was the entire German 6th army, some 250,000 men. Hitler refused to let them break out, insisting they go on fighting for Stalingrad, now nothing more than a useless pile of rubble saying German reinforcements would rescue them and the Luftwaffe would airlift supplies to the beleaguered army. Therefore, while starvation, the Russian winter, and shelling took their toll, the fighting in the rubble continued. However, in February 1943, the Germans finally surrendered.

Katyushas (Little Kates) were Russian rocket launchers that would send a devastating amount of firepower raining down on German soldiers at one time. They were also known as Stalin's Organs for the unnerving high pitched humming sound they made when being fired.

Despite Goring's assurances to Hitler, airlifting supplies to an entire army was beyond the Luftwaffe's capabilities even under normal conditions. However, with Russian anti-aircraft fire & the Russian winter factored in, only 80 tons of supplies, one-tenth of what was needed, could get through each day. In addition, due to some bad planning or a twisted sense of humor, some of the supplies that did get through were shipments of pepper and condoms.

Gradually, the Red Army tightened the noose around the Cauldron, pounding the Germans with artillery fire from all directions, and taking one airfield after another. Meanwhile, at Hitler's insistence the fighting for Stalingrad went on. Finally, on January 31, 1943, despite his promotion to field marshal and Hitler's orders to keep fighting, General von Paulus surrendered the remnants of the 6th army, the same army that had marched in triumph through Paris only two and a half years before. Of the 91,000

Germans who surrendered, only 6,000 would make it home from Stalin's prison camps.

“What is life? Life is the nation. The individual must die anyway. Beyond the life of the individual is the nation.”—Hitler speech soon after the disaster at Stalingrad

The Aftermath of Stalingrad

Kursk & The End of Blitzkrieg

In July 1943, the Germans, desperate to regain the initiative, launched a huge offensive against the Russians who were waiting in heavily fortified positions at Kursk. The ensuing battle was probably the largest battle ever fought in history. When it was over, the Germans had lost 70,000 dead and 2950 tanks, almost their total tank force at the start of the battle. The Russians had suffered heavy losses as well, but Kursk was the last major German offensive against Russia.

Kursk was a hellish battle of attrition with no clear-cut winner or loser. With the addition of artillery and mobile assault guns to armored divisions, tanks no longer ruled warfare absolutely. The days of blitzkrieg were over, and with that, the days of the Third Reich were numbered. From now on, the Red Army would be on the offensive, slowly and tortuously driving the Germans back across Eastern and

Central Europe. The war was far from over, but the tide was turning, not just in Russia, but on other fronts was well.

Whirlwind: the air war (1942-45)

An American B-24 is hit by German ground fire Whirlwind: the air war (1942-45). Until they had built up the forces for invading Hitler's Europe, the only way the British and Americans could do any harm to the Germans was from the air. Therefore, they developed the tactics and planes for large-scale aerial bombardments of enemy positions. Strategic long-range bombing required large planes, not only capable of carrying large numbers of bombs long distances, but also defensive armament since they were slow and fighter escorts didn't have the range to protect them for the entire mission.

Because of their limited range, fighter squadrons had to stagger the way they provided fighter escorts for the heavier and slower bombers on their way to and back from Germany. The large numbers of bombers used for a mission made organizing the planes into formation a major task. To that end, an older, combat worn plane with bright markings would serve as a rallying point for each bomber squadron.

Two B-17's collide in bad weather. The large number of planes involved made this a frequent sort of accident.

The bombers' slowness made them highly vulnerable to fighter attacks and anti-aircraft fire. A loss of anything less than 10% of the planes involved in such a raid was considered a success. Aircrews suffered the highest casualty rate for any branch of service in the American

and British armed forces. The incredible stress of such missions made it necessary to relieve any crewmen of combat duty after 25 missions, although the average life expectancy of a crewman was 14 missions.

Flak from anti-aircraft guns, such as German 88's, could hit planes at an altitude of six miles, spotting them with radar.

“Foiling” the enemy.” On one air raid, the allies dropped 92,000,000 aluminum foil strips to “white out” German radar, since each foil strip showed up as a blip on the radar screen.

However, it was the cities and people in them that really suffered. Many raids would first use high explosive bombs to blow out windows and rooftops to create more airflow through buildings for the firebombs that would follow. If conditions were right, such as at Hamburg, Dresden, and Tokyo, a firestorm, usually associated with a nuclear blast, occurred. Such fires triggered tremendous winds that sucked in surrounding oxygen and burned until there was nothing flammable left.

In Dresden, many people believed a rumor of a secret deal between Hitler and Churchill where Germany wouldn't bomb Oxford and Britain wouldn't bomb Dresden. Although it was a beautiful old city with no real military value, the allies may have bombed it to give morale support to Stalin, since it was in eastern Germany.

Dresden after allied incendiary raids and the resulting firestorm

The Sinews of War: the War of Production

World War II was as much a war of production quotas as it was of inflicting damage and casualties on the enemy. To a large extent, victory went to whoever could produce the most tanks and planes.

Russia was heavily crippled by the opening months of fighting with Germany, losing much of its industrial and agricultural heartland. However, the Russians managed somehow to move some 1523 factories eastward beyond the Urals and get them running in a remarkably short time. Soviet wartime production constituted a virtual 2nd industrial revolution in Russia.

An ice-covered Soviet sub, used to protect allied convoys in the Arctic Sea, the only route open for supplying Russia.

In addition, the U.S. & Britain helped keep Russia afloat via the Arctic Sea with massive aid consisting of planes, 665,000 motor vehicles (mostly Dodge trucks), boots, 8 ounces of rations for every Russian soldier for the duration of the war, 3/4 of its copper consumption and most of its high grade oil for planes. The allies also gave Russia 2000 locomotives, 11,000 freight cars, and 540,000 tons rails, equal to more railroad track than Russia built between 1928-1939. British wartime aid to Russia nearly equaled its entire 1989 defense budget.

Germany's concept of Blitzkrieg was as much an economic as military strategy, being geared to the economic necessity for a short decisive war that would net Germany large supplies of coal, iron, oil, and food. Largely because of promises he had made to German industrialists, Hitler waited until 1943 to put Germany on a total war footing. In 1944, despite Germany's increasingly desperate situation, Hitler devoted only 40% of Germany's economy to the war, as opposed to Britain, which had dedicated 50% of its economy to the war for several years. However, added to that were the imports and forced labor of millions taken from occupied areas.

Therefore, German plane production went from 10,392 in 1940 to 40,953 in 1944. Germany never tried to match its enemies in quantity, but quality, especially putting out excellent tanks, machine guns, and submarines as well as pioneering the development of Jets, and the V1 and V2 missiles. Given a bit more time, these weapons might have turned the tide back in Germany's favor. However, allied bombing of German ammunition, explosives, & especially oil facilities kept Germany from using these new high-tech weapons to full effect.

The Me 262, the first jet fighter with a top speed of 559 miles per hour, was virtually untouchable by Allied planes. Given a bit more time, these weapons might have turned the tide back in Germany's favor.

Britain at this time only produced half its food & none of its oil or rubber, so that, by 1944, the US had to supply it with 28.7% of its military equipment & 29.1% of its food. Not that Britain wasn't doing its part. British war socialism" & Keynesian economics led to a 50% increase in industrial production in 1942 alone. Tank production rose from 969 tanks in 1939 to 8611 in 1942. During that same time, production of bombers, such as the Avro Lancasters (below) jumped from 758 to 7903.

While Britain's GDP rose 60%, consumer production dropped 56%. The war ate up 50% of Britain's GDP, one third of that just for its strategic bomber force. To pay for this, Britain sold most of its overseas holdings, which had deep repercussions for it after the war.

However, America was the huge success story in the war of production quotas. During the war the US budget jumped from \$13 billion to \$71 billion by 1944. America's Industrial production doubled during the war, giving it 65% of world industrial production by 1945. Average plant utilization went from 40 to 90 hours per week. Industrial output went from 29% of GDP in 1939 to 38% in 1944. Productivity per man (or, more properly, human) hour in the US was double that of Germany's and five times that of Japan.

The stereotype of the American housewife took a heavy blow during World War II as millions of women stepped up to fill the gaps in the labor force left by men going to war. The iconic image of Rosie the Riveter still frames our perceptions of American women during this era.

In 1942, American industrial production was greater than that of all three Axis powers combined. By 1944, it had doubled again. American "know how" reduced the 12-week repair of the carrier Yorktown to 2 days. It cut the time needed to build a "Liberty" cargo ship from 196 days to 10.3 hrs. WWII also raised Americans' standard of living so that Steinbeck's Okies of the 1930's had become middle class factory workers of the 1940's. In short, the war lifted the US out of the Depression.

"The war was a hell of a good time. Farmers in S. Dakota that I administered relief to, & gave them \$4/wk & bully beef to feed their families, when I came home they were worth a quarter of a million dollars...What was true there was true all over the United States...And the rest of the world was bleeding & in pain. But it's forgotten now. WWII? It's a war I would still go to." --Paul Edwards, New Deal Worker

The Beginning of the End: France (1944)

For some time, Stalin had pressured his Western allies to open a second front in order to relieve the pressure on Russia. He felt Russia was bearing the brunt of the fighting. Indeed, while Germany had 10 divisions committed to the North African front, it had 200 divisions in Russia. In fairness to the Western allies, an amphibious invasion of France was a daunting task that required tremendous amount of logistical planning as well as men and supplies. Between the only two suitable invasion spots, Calais or Normandy, the allies settled on Normandy, selecting five beaches for the assault.

Two-thirds of the bombing raids before D-Day were around Calais to make the Germans think that was where the invasion was coming. The allies fabricated and broadcast "news" about a fictional First US Army Group (FUSAG) to make the Germans think the Allied invasion would take place north of Calais, even lining the British coast opposite Calais with inflatable fake tanks (below). Helping the allies was the capture of Enigma, the German decoding machine, which allowed them to intercept German communiqués. When they intercepted messages referring to FUSAG, they knew the Germans had gone for the bait.

By D-Day the allies had an overwhelming advantage of 12,000 planes against 169 for the Germans. Before, crossing Germany would

normally take three days. After D-Day, because of the threat of allied attacks during the day, that same trip took eleven days.

Before D-Day, there was a raging argument between German generals Rommel and Runstedt over placement of their tanks in readiness for the allied invasion. Rommel wanted forward positions for the tanks in France so they could react quickly and drive the allies back into the sea before they could build a substantial force. Runstedt wanted them kept back in reserve. Hitler resolved it by dividing them between forward positions and reserve.

Bad weather delayed the invasion for a day, but when a slight break in the weather appeared, commanding general of the Allied forces, Dwight D. Eisenhower, took the risk of launching the invasion. Paratroops first landed behind German lines to begin the invasion. Their role was to seize key points and create confusion behind German lines as to where the invasion was coming. Except for Omaha Beach, (which is effectively portrayed with nightmarish detail in the opening scenes of the film *Saving Private Ryan*) the allied forces met much less resistance than they were prepared for and established footholds on all five beaches.

Now, having established a thin beachhead, they had to race to build up their forces before the Germans could amass enough forces in the area to drive them out. The Allies' overwhelming air superiority especially disrupted German efforts. So did artificial harbors called Mulberries that allowed the allies to bring in large volumes of heavy equipment (below) needed to break through the surrounding German lines.

Having secured a beachhead, the allies had to expand it and then break through the German lines. To do this, they had to fight through the Bocage, the region of Normandy with thick hedgerows that made each field a virtual German fortress that must be assaulted and cleared out individually. The fighting that followed D-Day was intense, especially for elite paratrooper units that were constantly called upon to lead the fighting in the Bocage (below).

Especially wearing on German soldiers was the continued bombardment they were subjected to by the Allies who had massive superiority in air and artillery power. Unfortunately, 60,000 French civilians, including children, were killed just for being in the wrong place at the wrong time during the liberation of Normandy.

In retaliation, Hitler launched V-1 and V-2 Rockets against Britain. The V-2s, fired from bases along the Belgian coast and carrying a ton of TNT at speeds of up to 1000 MPH, were virtually impossible to stop and killed more British than the Blitz did. At the end of the war, German scientists were working on a V-3 rocket able to reach the America, making it essentially the first intercontinental ballistic missile. Captured German scientists would play essential roles in the rocket and missile programs for both the U.S. and Russia during the Cold War.

A V-1 rocket goes down over London

An attempted assassination of Hitler in July 1944 sent the fuhrer even farther over the deep end of delusion and paranoia. As a result, he had many of his best generals, including Rommel, arrested and given the choice of execution or suicide. Many killed themselves.

The Fall of the Third Reich (December 1944-May 1945).

A Russian soldier raises the Soviet flag over the Reichstag. Stalin wanted this picture banned because close-ups of it showed two watches on the soldier's arm, indicating the Red Army had been looting.

In December 1944, with Germany on the verge of collapse, Hitler launched one last desperate attack through the Ardennes (where the Germans had broken through in the Battle of France in 1940), hoping it would convince the Allies to negotiate a peace with Germany. Although initially successful, it was too little too late as the Allies regrouped and eventually won the battle. This was the last offensive launched by the Third Reich. In March 1945, the Western allies crossed the Rhine. Now it was just a matter of time.

In the west, German soldiers were surrendering by the thousands. Some German officers, figuring the war was over anyway, would give soldiers their discharge papers as they passed through or near their hometowns. Thousands of German soldiers and civilians fled westward to escape Stalin's rule.

On March 19, 1945, Hitler ordered the total destruction of what was left of Germany to punish defeatists. Luckily, Albert Speer, who was charged with this mission, failed to carry it out. When he confessed this to Hitler a month later, the fuhrer was too preoccupied with his own impending death to show much interest.

On the Eastern front, events were considerably more brutal and destructive. In Warsaw the Poles were hoping to liberate themselves from Hitler before the Russians got there. However,

Stalin halted the Red Army to “regroup”, giving the SS time to brutally suppress the Poles. He then moved to take the city, but not before the SS had carried out Hitler’s orders to level it to the ground.

Some of the more desperate German resistance came from the Hitler Youth, the most fanatical and vicious of Germany’s defenders. Pilots shot down over Germany prayed they were found by the regular army instead of the Hitler Youth who would torture and execute them.

On April 25, 1945, American and Soviet troops met on a footbridge over the Elbe River, signifying the end was near. All that remained was the final assault on Berlin by eight Russian armies. Against this the Germans only had 75,000 defenders many of them old men and boys. During the last few months of his life, Hitler rarely showed his face above ground, staying isolated in his underground bunker and becoming increasingly deranged and delusional while the Third Reich came crashing down in ruins. German boys (below) were given *panzerfausts*, one-shot anti-tank weapons, with which to face Soviet tank columns. Soldiers with rifles were issued an average of 5 bullets each.

Berlin by this time was a city without power, public transportation, sanitation facilities, fuel for cooking, or anesthetics for the wounded. Corpses from the bombing were left unburied. For food, people would come out to carve up

horses killed by the bombing. Despite the hopelessness of their cause, the Germans, especially SS units with nothing left to lose, defended Berlin ferociously. They even blew out the water pipes in the subway tunnels to stop the Russians from using them, in the process drowning thousands of helpless civilians hiding there.

While the German army defended Berlin, SS squads would randomly seize civilians, charge them with defeatism or collaborating with the Bolsheviks, and execute them on the spot. In some cases, German soldiers would intervene by shooting the SS officers. In the final assault on the Reichstag (below) the Soviets fought their way up its steps, blasted open the doors with two mortars and plunged inside. Then followed savage room-to-room fighting with fanatical SS units who, knowing they could expect no mercy, held out to the last. The earsplitting crash of grenades & gunfire reverberated through the halls as rooms were won & lost over & over again in the desperate hand to hand fighting.

On April 30, 1945, the Red flag was raised over the Reichstag. Stalin’s insistence that his army took the Reichstag in time for the May Day celebration cost the Red Army dearly. Overall, the Russians lost 300,000 men in the Battle of Berlin, 10% of their numbers and the heaviest losses of any battle of that duration during the war. Meanwhile, Hitler married his longtime mistress, Eva Braun, and then they committed suicide in their bunker. The Germans officially surrendered to Russia and the Western allies on May 8, 1945. Although they had already surrendered to the Americans and British on May 7, the Russians, based on prior agreement with their allies, insisted it be redone to include them, an ominous sign of the Cold War already emerging between the erstwhile allies.

137. WORLD WAR II IN THE PACIFIC (1941-45)

"I am become Death, the destroyer of Worlds."—
Robert Oppenheimer, quoting the Hindu scripture,
The Bhagavadgita, upon witnessing the first atomic
bomb test in July 1945

We have already seen how the stalemate between Japan and China, Hitler's failure to keep Japan informed about his plans against Russia, and France and Britain being distracted by the outbreak of war in Europe caused Japan to turn south and threaten the European colonies in South-east Asia. The Japanese planned to consolidate their gains there by forming the Greater East Asia Co-prosperity Sphere, an organization of states that would provide Japan with raw materials as well as markets for its manufactured goods. All this seriously damaged the reputation of the West and set the stage for colonial revolts and independence after the war.

Up to this point, Japan was careful not to antagonize the United States, which then held the Philippines. However, in 1941 the United States, nearly as concerned about aggression in Asia as in Europe, cut off its oil shipments to Japan to persuade it to back off from invading Indonesia. The Japanese, desperate for oil, took the fatal step of attacking the United States' naval base at Pearl Harbor in the Hawaiian Islands (12/7/41). This did cripple American naval power in the Pacific for the time being, but it also brought into action an industrial giant that Japan would have a hard time matching blow for blow. Still, the opening months of 1942 saw a virtually unbroken string of Japanese successes, including the conquest of the Philippines.

However, in the long run, these victories would cause some serious problems for Japan. For one thing, the Japanese generals became overconfident of victory, which in June, 1942 helped set up a serious defeat at the hands of the American navy at Midway, a battle which proved to be the turning point of the war. Secondly, the Japanese advance caused American industrial production to intensify and create overwhelming numbers of ships and planes for the war in the Pacific. In fact, by 1944 American production was twice that of Japan, Germany, and Italy combined. Another major problem Japan had was that, although its empire covered nearly 1/10 of the globe, most of that was

water. This spread the Japanese army very thinly over a large number of islands. That in turn stretched the Japanese navy's resources to its limits as it tried to supply the army on the various islands.

As a result, everything started going wrong for Japan. First of all, the widespread nature of the Japanese Empire meant that American warships, especially submarines, could destroy most of the Japanese navy and shipping, thus isolating forces on the islands from each other and Japan. This in turn allowed the allies to concentrate their forces on each island separately and destroy the forces there in detail. Finally, the stepped up industrial production of the United States wore the Japanese down with its superior numbers and firepower. The Japanese fought ferociously, often to the last man, despite being supplied with no food or ammunition and sometimes having to fight with bamboo spears.

By 1944, the Allies had taken islands within bomber range of Japan and were launching devastating raids on Japanese cities. One raid over Tokyo in 1945 triggered a firestorm, much like the ones that hit Hamburg and Dresden, killing 200,000 Japanese civilians in its flames. Japanese houses, made of wood and paper, were much more susceptible to Allied incendiary bombs than European cities of brick and stone.

By the time the war in Europe was over, the Allies were preparing to invade a Japanese homeland whose 60 largest cities were 60% destroyed, whose fuel supplies were depleted, and whose railroads and industries were near collapse. However, an invasion of Japan was not a thought the Allies treasured, since some estimated Allied casualties would reach one million while Japanese casualties might reach 10-20 million.

Complicating this situation was the fact that Stalin had promised to enter the war against the Japanese 90 days after the conclusion of the war in Europe. That would put his entry into the war in early August. The United States, not wanting to give Stalin a chance to expand in Asia, needed to win the war quickly with as few casualties as possible. They found that way with a new weapon: the atomic bomb, which they had been developing through the Manhattan Project since 1942.

On August 6 and 9, 1945, the United States Air Force launched nuclear attacks on the Japanese cities of Hiroshima and Nagasaki respectively. The level of destruction and suffering was unprecedented and signaled a dangerous new era in history. Debates continue about whether the U.S. should have dropped these bombs. Some see it as a needless act of mass destruction launched against a country on the verge of collapse. However, to Americans still caught up in the fury of a world war, it was seen as a way to shorten the war and save American (and Japanese) lives. Whatever one's opinion, Hiroshima and Nagasaki provided a grim and frightening vision of what the future could hold for us. The direct result of the atomic attacks on Hiroshima and Nagasaki was that Japan soon surrendered on September 2, 1945. However, Asia was anything but calm as civil war in China would put the Communists in power there in 1949 and the Cold War between the United States and Russia was starting.

“A Day of Infamy”: Pearl Harbor

The USS Arizona goes down during the Japanese attack on Pearl Harbor

Aircraft carriers. The key to waging and winning a war in the Pacific was the aircraft carrier, a mobile air base that allowed its owners to extend their air power far beyond the range of aircraft alone. In 1922, a naval arms limitation treaty put caps on the relative sizes of navies of different powers, including those of the US and Japan. However, the aircraft carrier, barely more than a concept at this time, was omitted from the treaty. Japan exploited this loophole and, by the start of World War II, had the world's largest aircraft carrier fleet.

The Japanese made thorough preparations for the attack on Pearl Harbor.

Spy photos enabled them to construct a mock-up of Pearl Harbor with each

American ship in place so they could practice dry runs of the attack.

They developed special torpedoes for the shallow waters of the harbor.

To avoid detection, they practiced strict radio silence and took an indirect route across the north Pacific that had virtually no other ship traffic.

As a result, when they struck they had the complete element of surprise.

Helping the Japanese was the fact that Pearl Harbor had been on high alert for an attack for six months. Thus, by the time the Japanese attacked, American vigilance had slackened. In fact, American radar picked up the Japanese planes approaching Pearl Harbor, but thought they were American planes flying in from San Diego.

The Americans had even cracked the Japanese diplomatic code and intercepted the message to their ambassador instructing him to deliver the declaration of war as the attack was starting. Unfortunately, by the time the message was deciphered and a warning delivered to Pearl Harbor, the attack was already underway.

The *USS Oklahoma* keeled over, the sailors inside drowning before rescuers could get to them.

The USS Shaw explodes in dry-dock during the attack on Pearl Harbor

The attack on Pearl Harbor sank four American battleships and seriously damaged four more. In addition, 347 American planes were destroyed or damaged on the ground. Adding to the damage was the fact that the planes were bunched closely together to make them easier to guard on the

ground, but also making it easier to attack them from the air.

The aftermath of the attack on Pearl Harbor

One factor that would prove crucial to America's comeback was the fact that at the time the attack on Pearl Harbor came, the US carrier fleet was away on maneuvers and thus was unharmed. This has led to speculation that President Roosevelt intentionally allowed the attack on Pearl Harbor to take place so that the U.S. would enter the war. However, that begs the question of why not just be ready for the attack when it came. We would still be at war, but with more of our fleet intact.

"I shall run wild considerably for the first six months or a year but I have utterly no confidence for the second and third years."-- Japanese admiral Yamamoto

Dark Days (December 1941-June 1942).

The attack on Pearl Harbor did cripple American naval power in the Pacific for the time being, but it also brought into action an industrial giant that Japan would have a hard time matching blow for blow. Still, as the Japanese admiral Yamamoto predicted, the opening months of 1942 saw a virtually unbroken string of Japanese successes, including the conquest of the Philippines.

The Bataan Death March. In April 1942, the Japanese subjected 76,000 POWs, including 12,000 Americans, to a grueling 60-mile forced march known as the Bataan Death March (shown above). During this ordeal, the POWs were driven relentlessly in the blazing sun without food or water. Even prisoners stopping to go to the bathroom were immediately shot or bayoneted. Those still able to walk carried comrades too weak or sick to continue on their own. About 5,000 of the 12,000 Americans subjected to this atrocity died before reaching their destination. Overall, 40% of American POWs in Japanese camps died, compared to 1.2% in German camps.

The Japanese expected their own soldiers to fight to the death and had complete contempt for any soldiers, including their own, who surrendered. For example, my father, who served as a paratrooper in the Pacific, told me of three Japanese prisoners, an officer and two enlisted men, the latter having surrendered. The officer, having the same contempt for the Japanese soldiers who surrendered as for Americans who did likewise, brutalized the enlisted men to the point that they had to be separated.

Thirty seconds over Tokyo: the Doolittle Raid. On April 18, 1942, Jimmy Doolittle led a squadron of B-25 bombers to raid Tokyo and three other cities. Because the Americans had no bases close to Japan, the bombers had to launch from aircraft carriers. However, normally being too large to launch from carrier decks, they had to be stripped of any excess weight. Also, since they didn't have enough fuel to return to their ships and were too big to land on a carrier anyway, the pilots continued to China where they ditched the planes behind Chinese lines in the hope of being rescued by Nationalist forces. While the raid barely hurt Japan, it was a morale booster for the Americans, while it shocked the Japanese and helped prompt the offensive on Midway that would prove to be the war's turning point.

Turning of the Tide at Midway (6/ 4/1942)

AF. Crucial to the American victory at Midway was cracking the Japanese naval code. They knew the code name for the Japanese target was “AF” which they suspected was the American base on Midway Island, one of the few islands in the Central Pacific. Therefore, the Americans at Midway sent an un-coded message saying they were short of water. When the Japanese signaled that AF was short of water, the Americans knew Midway was the target and would be waiting in force. Thus, instead of attacking with an overwhelming advantage, the Japanese would be meeting a force of carriers and airplanes comparable to their own.

Americans working round the clock at the Pearl Harbor shipyard, cut the repair time for the *Yorktown* from 12 weeks to 48 hours to get it ready for the upcoming battle. Unfortunately, the *Yorktown* was sunk at Midway.

Life turns on a dime. On June 3, 1942, American planes spotted the Japanese fleet. The next day a fleet of American Flying Fortresses tried to bomb the Japanese fleet but failed. The Japanese then launched an attack on Midway beating intercepting fighters and seriously damaging the American base there.

The Japanese planes returned to their carriers to load torpedoes to attack the American fleet. However, since it still hadn’t been sighted, they started to exchange torpedoes for bombs to make another attack on Midway. Then a Japanese plane reported finding the U.S. fleet, so they started to switch back to torpedoes.

Meanwhile, Midway launched its planes against the Japanese fleet. Japanese Zeros (fighter planes), which were faster than the American planes at that time, destroyed one squadron of

American planes after another while their dive bombers were refueling and switching to torpedoes on the carrier decks below.

Then a minor miracle occurred.

One lone squadron of American bombers that had overshot the Japanese fleet came back and found it, hitting the carrier decks cluttered with bombs, torpedoes and high-octane fuel hoses.

The effects were devastating.

The torpedo stores of one Japanese carrier, *Akagi*, caught fire, forcing the crew to abandon ship.

Another carrier, the *Soryu*, was disabled by dive-bombers and sunk by a submarine the next day.

Similarly, the carrier *Kaga’s* aviation fuel caught fire and its crew also abandoned ship.

American dive-bombers later sank a fourth carrier, the *Hiryu*.

Meanwhile the pilot of a Japanese scout plane sighted the American carriers, *Hornet* and *Enterprise*. However, being tired and confused, he saw them again and mistook them for two new ships. The Japanese were alarmed because they thought U.S. had only three carriers in the Pacific (which they did) instead of four. Therefore, they withdrew, despite still having superiority in surface ships.

The USS Yorktown being torpedoed at Midway

The final tally: four Japanese carriers and one US carrier & destroyer sunk.

In 5 minutes, 10:25-10:30 AM, June 4, 1942, the war in the Pacific was reversed nearly one hundred eighty degrees.... almost six months to the day after Pearl Harbor and Yamamoto’s prediction.

Production Quotas and Internment Camps

B-17 bombers under construction at a Boeing plant in Seattle, Washington

The War of Production. As in the European theater of the war, the Pacific front was as much about production quotas as casualty counts. The common belief has been that the day after Pearl Harbor, American industries immediately kicked into high gear, producing tanks, planes, and bombs “like sausages” (a phrase used by the Russian leader Khrushchev during the Cold War). In fact, industrialists had urged, and gotten the green light from, President Roosevelt to start preparing the buildup for war eighteen months earlier as they watched Hitler’s Blitzkrieg storm across Europe. Therefore, when the Japanese attacked Pearl Harbor, America was already transforming its industries for making war materiel. Once again, the production figures are astounding.

In 1941, the United States and Japan each had six heavy aircraft carriers.

Between 1942 and 1944, Japan launched six more carriers.

Meanwhile, the U.S. launched 14 heavy carriers, 9 light carriers, and 66 escort carriers.

By 1945 the US had nearly 100 carriers.

During the war, Japan produced 62,795 planes, peaking at 2857 in June 1944.

From 1943 on, the US was producing 100,000 planes *each year*.

Internment camps for our own citizens. Fearing they might be spies for Japan, the U.S. government rounded up between 110,000 to 120,000 Japanese and American citizens of Japanese descent, keeping them in internment camps for the duration of the war. An estimated 62% of those interned were American citizens,

including people who were as little as one-eighth Japanese. Since Japan then occupied Korea, Korean-Americans were also interned. These actions were probably motivated more by racial prejudice against Japan than any real threat they posed, especially in California where 90% of Japanese immigrants to the U.S. had settled.

The main goal, to remove them one hundred miles from the West Coast, involved moving them first to temporary Civilian Assembly Centers, typically in horse tracks, and from there to internment camps with cheaply built barracks, no plumbing, and a surrounding barrier of barbed wire and armed guards. They were located in remote, desolate areas, such as Wyoming, where they were unprepared for winter, especially for those uprooted without a chance to pack, taking only the clothes on their backs. The government budgeted \$.45 per person daily for food. Many were Of course, being so far removed from home, they had no independent means for making a living.

Many of these people lost valuable property, either due to restrictions on what they could take with them, or from theft or vandalism while absent. Some farmers’ lands were tended by neighbors, but others had to sell their farms on short notice at huge losses. A few internees were even killed by sentries for wandering too close to the barbed wire perimeter.

On January 2, 1945 the exclusion order keeping the Japanese Americans interned, was rescinded. Freed internees received \$25 and a train ticket home to rebuild their lives. Some of them returned to Japan at a time when it was clearly losing the war. The last internment camp was closed in 1946. In 1988, the U.S. government apologized for its actions during the war.

To prove their loyalty, a number of Nisei (second generation Japanese Americans) from Hawaii enlisted, but were sent to the European theater instead of the Pacific theater where their linguistic skills would have been of great use. However, in Europe they proved their loyalty by becoming one of the most decorated units in the war, known as the “Purple Heart Battalion” for all the casualties they sustained.

Playing the Race Card: the Propaganda War

The Pacific War was also a propaganda war, with both sides playing the race card and exaggerating stereotypes of the other side. The Japanese saw Americans as lazy drunks and their own soldiers as heroically reclaiming Asia for the Asians while chopping off the tentacles of the American and British octopi portrayed as FDR and Churchill.

However, Japanese propaganda tended to be aimed against the allies more than to its own people, the intention being to demoralize them and sow dissension within their ranks. The poster on the left tries to exploit Indian dissatisfaction with British rule by showing a blinded Indian soldier fighting for his British overlord. The right-hand poster, aimed at the Australian public, plays on fears of American soldiers stealing Aussie women at home while the men fight and die in New Guinea.

An especially provocative poster aimed at the American public shows African-American men abusing white women while their men are away at war. Similarly, the Japanese would try to demoralize American soldiers with a radio show hosted by a woman (actually several women) known as Tokyo Rose, who would play the latest hits interspersed with suggestions of how the women back home were cheating on them with men who stayed home from the war. One of these women, Iva Toguri D'Aquino was an American citizen with the bad luck of visiting her aunt in Japan when Pearl Harbor was bombed. Stuck in Japan, she was one of the women known collectively as Tokyo Rose, he

real signon being Orphan Ann. After the war, she was tried and sentenced to ten years in prison for helping the Japanese. She was later offered a pardon.

American propaganda was no subtler in its racial stereotypes, portraying the Japanese as near-sighted, buck-toothed, and as stupid as Elmer Fudd, as in the 1944 cartoon, “Bugs Bunny Nips the Nips.” More often, they were shown as an evil threat, murdering helpless American prisoners or molesting American women.

More amazing still is the misinformation spread about the Japanese, especially compared to the Chinese as seen in this Life Magazine article and a popular cartoon of the time, Terry and the Pirates, which had a feature “How to Spot a Jap.” Among the more interesting “facts” were:

- The Japanese are shorter and hairier than the Chinese and typically have buck teeth. (The hairier aspect may be due to the fact that soldiers in combat often cannot shave regularly.)
- The Japanese cannot walk straight because their legs are joined directly to their chests, making them shuffle along. However, the clever ones can mimic normal walking to infiltrate civilian society.

It's amazing the allies won the war after being fed so much misinformation. One particularly fatal misconception was that the slanted eyes of the Japanese prevented them from being able to fly long distances, leading to the conclusion they couldn't even reach Pearl Harbor.

Island Hopping

Two Marines are hit by sniper fire while landing on Saipan

Never got word. Every so often after the war, Japanese soldiers abandoned and forgotten on various Pacific islands would wander out of the jungle, some still thinking the war was going on. The Japanese government would have to send officials to explain the war was over and convince these men to come home. As recently as 2009, two such veterans wandered out of the jungle in the Philippines, thinking the war was still going on.

Lopsided casualties. Thinking any substantial casualties inflicted on the Americans would cause them to give up on the war, the Japanese showed callous regard for their own soldiers lives, sometimes in suicidal “Banzai” charges that, along with massive air and sea bombardments, led to nearly colonial era casualty ratios:

- Guadalcanal (1942): 25,000 Japanese vs. 1592 Americans killed
- Tarawa (1943): 5,000 Japanese vs. 1,000 Americans; only 17 Japanese survived.
- Leyte (1944): 65,000 out of 70,000 Japanese killed vs. 3500 Americans
- Iwo Jima (1945): 18,000 Japanese killed vs. 4917 Americans, the closest casualty ratio of the war
- Okinawa (1945): 185,000 Japanese vs. 12,520 Americans

Left: Marines killed on Buna Beach in the South Pacific. This was one of the first such photos released showing the stark realities of war. **Right:** Japanese soldiers killed rushing a machine gun on Guadalcanal (November 1942)

At the battle of Kwajalein in 1944, the American air and sea bombardment was so destructive that someone said the island looked as if it had been picked up to 20,000 feet and then dropped. As a result, all 8500 Japanese were killed as opposed to only 373 Americans.

The Seabees were the naval engineering corps. On each island that took the allies closer to Japan, the Seabees would prepare a new airstrip for launching air raids against the Japanese.

Flamethrowers, although outlawed by the Geneva Convention, were used by the Americans, especially against Japanese soldiers holding out in caves. Sometimes they would fire the flames across the entrance of the cave to suck out the oxygen and suffocate the inhabitants.

Paratroops were one of any number of innovations in World War II. The idea was to drop them behind enemy lines to confuse the enemy and disrupt their communications and supply lines. The basic procedure was to drop them from a low altitude (c.500 feet), which would give them enough time for their chutes to open and stabilize before hitting the ground.

Unfortunately, in one drop of the 503rd Airborne on the Pacific island of Noemfoor, Army Air Corps forgot to factor in that the landing site was 200 feet above sea level. Thus many paratroopers’ chutes didn’t have time to open or stabilize before hitting the ground.

One of those paratroopers was my father, who may be in this picture. His chute hadn’t stabilized and he swung into a Japanese tank upon landing, permanently messing up his back.

The fact that I found this on an Australian war memorial site shows the close cooperation of American and Australian soldiers during the war, even fighting shoulder to shoulder in such places as New Guinea and Noemfoor. My father always spoke highly of the Australians who, he said, were grateful to the United States for coming to their aid as the Japanese closed in. Apparently, he knew what he was talking about, because Australia has been among America's staunchest allies ever since, even during the controversial Iraq War in the 2000s.

Kamikazes

Toward the end of the war, as its situation became increasingly desperate, Japan launched a series of planes as suicide bombers. They were called "kamikaze", meaning "divine wind" referring to a typhoon that wrecked a Mongol invasion fleet in 1282, thus saving Japan. However, for Americans, kamikaze became synonymous with suicide bomber. The American admiral Halsey said it was the only weapon he feared.

American aircraft carriers, with wooden flight decks suffered considerably more damage and casualties than did their British counterparts with steel decks. For example, 389 men were killed in the kamikaze attack on the *USS Bunker Hill* (below left), more than all the fatal casualties suffered on all six British carriers during the entire war. American ships also took much longer to repair, up to six months back at Pearl Harbor. By contrast, British ships were usually back in service within hours.

The *USS Bunker Hill* & *USS Formidable* are hit by kamikazes. Although the U.S. admits to 34 of its ships being sunk, none were aircraft carriers.

Estimates vary about how many ships the Kamikazes sank and damaged. The U.S. Air Force admits 34 ships were sunk and 368 others were damaged, along with 4,900 sailors killed and 4,800 wounded. It goes on to say that 14% of the Kamikazes reached their targets and that 8.5% of all ships hit by kamikazes sank. Japanese propaganda claimed they sank 81 ships and were responsible for 80% of American losses in the final phases of the war. Another independent source says that kamikazes sank 47 ships. Japan sacrificed 3,912 pilots in this effort, most of them young men, some only 17 years of age.

The very nature of kamikaze missions has led to conflicting views on how recruits were obtained. Patriotism and devotion to the emperor were certainly factors, but so were peer pressure and even coercion. One witness compared the pilots setting out to sheep in a slaughterhouse, trembling as they approached their planes. Some even had to be carried and pushed into their planes by ground crew.

Pilots could return from a mission if they experienced mechanical problems or couldn't find their targets. However, there was a stigma lasting for decades for kamikaze pilots who survived their missions, one pilot who returned nine times with his plane intact being executed.

The last kamikaze attack took place on August 15, 1945, six days after the nuclear attack on Nagasaki.

The Bomb

The Trinity Test (7/16/1945)

The bomb. On August 30, 1939, only two days before Hitler invaded Poland, an article explaining nuclear fission was published. As a result, Albert Einstein wrote a letter to President Roosevelt, urging him to develop an A-bomb before Hitler did. Thus, in a negative sense, Hitler was the father of the atomic bomb.

Luckily, Britain snatched the entire world supply, 185 kilograms, of heavy water, a key ingredient in developing the bomb, from Norway before Hitler conquered it in 1940. However, the Germans still held the Rjukan hydrogen plant near Telemark, Norway, which produced heavy water.

In 1943, after two planes carrying American paratroops assigned to destroy the plant crashed, a commando team of 12 Norwegians took on the job. They succeeded in destroying it and a large supply of heavy water. The Germans rebuilt the facility, so six months later, a raid by 140 bombers finished it off.

How close Hitler could have come to developing an atomic bomb if the plant hadn't been destroyed is anyone's guess.

At this point, Britain had the theoretical knowledge, while the U.S. had the industrial capacity to develop an A-bomb. Thus the Manhattan Project, as the program for developing the bomb was called, fused Britain's theoretical knowledge with American industrial capacity. It would cost an unprecedented \$2 billion to complete.

Los Alamos, New Mexico the main site for the development of the Manhattan Project

The Manhattan Project spawned all sorts of new technologies at various sites throughout the United States: the first fully automated factory, the first factory operated by remote control, and the first wholly sterile industrial process, to name a few. In essence, it compressed thirty years of scientific engineering into four. Los Alamos, the main site for its development was called "a Nobel Prize winners' concentration camp".

When the bomb was successfully tested at Alamogordo, New Mexico on July 16, 1945, Robert Oppenheimer was reminded of a passage from the Hindu epic, *The Bhagavad Gita*: " *I am become Death, the destroyer of Worlds.*"

Miles away, a blind girl saw the light of the bomb's heat flash.

At least one physicist had the theory that detonating a nuclear device would ignite the atmosphere and incinerate the earth. Luckily, he was wrong.

Why wasn't Germany first? Although Hitler saw nuclear physics as "Jewish physics", Germany had retained enough physicists to build a bomb. In fact, the Germans were ahead on the A-bomb until a crucial reactor exploded. Also, they didn't realize graphite could be used in the process, because a German scientist in love with a woman in Chicago intentionally misled Hitler on the subject. Another scientist, in order to keep Hitler from setting set an unrealistic deadline for the bomb's completion, waited to tell the *fuhrer* the possibility of a bomb until he got a sustained chain reaction. Thus he got no government support to speed up the process.

The decision to drop the bomb is still a matter of controversy. However, to Americans still caught up in the fury of a world war, it was seen as a way to shorten the war and save an estimated one million American lives. For Truman, who had just come to office upon Roosevelt's death in April and had virtually no prior knowledge of the Manhattan Project, there was no way he could justify the deaths of more Americans to their families if they knew he had a weapon that could quickly end the war. Besides, most people still thought of it as just a big bomb, not knowing of the more insidious effects of radiation and fallout. Also, as many Japanese that the bomb might kill, many argued that it saved millions more from a prolonged conventional invasion. Finally, there was one other factor to consider: Joseph Stalin.

If Hitler spurred development of the A-bomb, Stalin helped prompt its use. As the war in Europe was winding down, he had told President Roosevelt he would bring Russia into the war against Japan ninety days after the fall of Hitler. Germany surrendered on May 8, which would put Stalin's entrance into the war somewhere around August 8. Once the bomb had been successfully tested on July 16, there was incentive to get Japan to surrender before Stalin declared war so he could claim some of the spoils in East Asia.

Complicating matter was the fact that Japan had approached Stalin (who was still neutral) to see what terms the U.S. would offer. Stalin delayed sending this message, although the Americans had intercepted and deciphered it. In the end, it was decided there was too little time to demonstrate the bomb in a remote area of Japan,

Therefore, Truman decided to drop the bomb.

The decision of what cities to target depended on finding a place not already extensively damaged by previous bombing raids, thus allowing the bomb to demonstrate its full destructive power and scientists to accurately assess its real impact. Only a few Japanese cities, including Hiroshima and Nagasaki, met that criterion.

On August 6th 1945, the B-29 bomber, *Enola Gay* (named after pilot Paul Tibbets' mother) and two other B-29s equipped with recording instruments approached Hiroshima. Because radar only picked up three planes and Japanese defenses and fuel were depleted, no planes were sent to intercept the Americans and a raid alert was called off, leaving Hiroshima's people exposed to the bomb's full effects.

It took the bomb 43 seconds to drop to its pre-determined detonation altitude of 580 meters, by which time the American planes were eleven miles from the blast. Its effects were unprecedented, leaving total destruction over a one-mile radius and destroying 69% of the city's buildings.

For example the photo on top shows damage to the barracks 4200 feet from the center of the blast, while the one below shows what was left of the theater only 2500 feet away.

In addition to the blast, all the fires set off by the bomb's blast and intense heat combined to create a firestorm, a pillar of fire and terrific winds that sucked in surrounding debris and people, further stoking the fire and increasing its heat and the winds. The winds even ripped children from their mothers' arms into the flames.

An estimated 70,000-80,000 people (30% of the city's population) died immediately from the blast with an equal number being injured. That only tells part of the story. Personal accounts by survivors revealed a whole new level of human suffering from war. Heat from the initial blast caused people's skin to just peel off. All that remained of some people at ground zero were black shadows burned into the concrete.

Everywhere there were charred corpses and people horribly burned crying out for water. Some burn victims made it to water, only to die, being too weak to take a drink. The cisterns and river were choked with their bodies.

Since medical facilities were so close to the center of the blast area, 93% of the city's doctors and nurses had been killed. Thus medical care was minimal, with the wounded covered with maggots.

It took some time for Japanese authorities to restore contact with Hiroshima and absorb the magnitude of damage inflicted. Never before had they, or anyone seen a city so thoroughly demolished. Even more shocking was the fact that it only took one bomb to do it.

While the Japanese were still assessing what had just happened, Stalin entered the war, so a second atomic bomb was dropped on August 9. The initial target was Kokura, but cloud cover diverted the mission to Nagasaki. A minor raid on the city on August 1st had prompted an evacuation effort, mostly of children, that reduced casualties when the atomic bomb was dropped.

By the same token, a number of survivors from the Hiroshima blast had fled to Nagasaki and therefore suffered through a second nuclear attack. In addition, 11 allied POWs who happened to be in the cities were also killed in each blast.

The bomb that hit Nagasaki, nicknamed Fat Man, was a more efficient plutonium device that triggered a blast equal to 21 kilotons of TNT (compared to 12.5kt for the Hiroshima uranium bomb). It generated temperatures at ground zero of 7000°F and a blast wind of 624mph. Because of intervening hills, there was less damage to buildings, no firestorm, and fewer

deaths (an estimated 40,000 the first day. As with Hiroshima, thousands more died from wounds and burns in the following days.

Meanwhile, a new and unforeseen hazard descended on the two cities: radioactive fallout. The Japanese called it “Black rain” because its effects seemed to coincide with the charred ashes from the burning city falling back to the ground. Indeed it was caused by dust and ash being sucked into the mushroom cloud and irradiated before falling back to earth.

One couldn't see or taste or feel fallout, but once it got inside the body it basically burned it out from the inside. Many people got sick. A few died, and most recovered... for the short term. However, cancer rates over the years for Hiroshima and Nagasaki survivors were unusually high.

Luckily, at least by later thermonuclear standards, the Hiroshima and Nagasaki bombs were tiny with relatively small yields of fallout. But radioactive fallout may have been the most frightening aspect of this new weapon. The idea of demolishing entire cities, and even civilization in a matter of hours or days was bad enough. But the specter of a planet so poisoned in the aftermath that people couldn't survive and rebuild civilization made the idea of a third world war seem unthinkable.

As Albert Einstein put it, he didn't know how the next big war would be fought, but the one after that would be fought with sticks and stones.

Whatever one's opinion, Hiroshima and Nagasaki provided a grim and frightening vision of what the future could hold for us.

137B THE EVOLUTION OF THE STATE IN THE EARLY 20TH CENTURY (1900-45)

Easily lost in the dramatic events of the early twentieth century is another equally important story: the growth of the modern industrial state. Once again, the roots of this story lie in two events or processes starting in the 1700s and continuing through the 1800s: the French Revolution, which gave birth to modern nationalism, and the industrial revolution. One process quietly taking place in the 1800s was the development of increasingly sophisticated weapons that only the state could afford and could use to enforce its will if the need should arise. Also, in the course of the nineteenth century, nation states took over and funded public education, which as part of its mission promoted nationalism among its young. Unfortunately, the resulting nationalist rivalries spilled over into economic, diplomatic, and military tensions that led to World War I.

As the prolonged stalemate continued on the Western Front, the various combatant nations assumed increasing control over virtually all aspects of their respective societies: raw materials, scientific research, industrial production, manpower (with the draft) and womanpower (as women moved into the factories to carry out government contracts), and the media. World War I had two other far-reaching effects by 1930: the destabilization of Russia, which led to the Russian Revolution, and an unstable global economy that triggered the Great Depression.

In Russia, the ultimate victor was Joseph Stalin, who launched a ruthless campaign to make the Soviet Union a major industrial power by controlling all production on a national scale. While micro-management on this scale proved somewhat counter-productive, it did result in a highly centralized industrial state (probably in spite of Stalin) that many other nations at the time saw as a model for their own development.

The Great Depression also contributed to greater state control. As the world economy continued to plummet, there was a growing belief, articulated by John Maynard Keynes in particular, that only the nation state could solve something as big as the Depression. This played out in two different ways in the 1930s. Liberal democracies, especially

Britain and the United States, provided massive funding of public programs to get people back to work. After World War II, Western European countries would carry this idea further with the somewhat socialist notion that it was the state's responsibility to ensure the welfare of society as a whole. The United States, while also adopting more social programs, would more fiercely resist adopting the benign socialism of its European allies.

Fascist dictatorships, such as Germany, Italy, and Japan would apply Keynesian ideas in a very different and less benign way: namely the buildup of military forces that produced jobs, but only in the short run because tanks and other military hardware produce little of nothing of economic use. Therefore, military buildups in the long run produced aggression, which led to the Second World War.

In the 1930s, Stalin's purges and Hitler's persecution of the Jews gave the world a frightening look at how dangerous and malign the modern state could be to its own people in terms of surveillance, terror tactics, propaganda, and the use of brute force with its monopoly on new, even more powerful weapons. The result was World War II, which was fought by the Western democracies to stop the aggression of the totalitarian fascist regimes.

However, there were two potential problems. One was that the democracies had to ally with Stalin in order to beat Hitler, a situation that would carry over during the Cold War. The other problem was they had to mobilize all their resources and exert much the same control over societies as their fascist opponents were doing and to an even greater extent than they had in World War I. This created the danger (and possible temptation) that they could become as dictatorial and repressive as the regimes they were fighting. Since World War II, weapons and surveillance technologies have continued to grow at frantic rates, making the liberty versus security debate more relevant than ever.

A NEW BALANCE OF POWER AND COLD WAR (1945-1948)

"The Soviet Union never deserts its friends."- Soviet ambassador threatening intervention in Hungary

The aftermath of World War II. The human capacity for self-destruction had reached new heights in World War II, killing an estimated 60,000,000 people, 27,000,000 in the Soviet Union alone. Many, if not most, of those were civilians who just happened to be in the wrong place at the wrong time. Added to that were another 50,000,000 refugees (AKA Displaced Persons or DPs), people uprooted by the war and trying to find their ways home: Jews still being persecuted in the aftermath of the war, Germans driven from their homes as Germany's borders shrank to make room for Stalin's own expansion, and Soviets released from German prison camps only to be forced to return home as "traitors" to face Stalin's wrath. Refugees flocked to cities desperate for jobs, food, and shelter, only to find mountains of rubble. Hardly a city had escaped the roar of the bombs, with some, such as Stalingrad and Berlin, being 95% destroyed. No wonder one observer referred to Europe as "half graveyard and half junkyard."

Even two years after the war, Western Europe had made little apparent progress recovering from the war. Roads and bridges were still in disrepair; cities were still largely piles of rubble, and consumer production was only half of pre-war levels. Britain and France, the two main European powers who in the past might have led the way in reconstruction, were themselves severely weakened by the war's staggering cost and growing unrest in their colonies.

This produced a good deal of bitterness against the conservative governments that had blundered into the Depression and World War II and done little to restore things to normal after the war. Benefiting from these problems were the communists, who had led much of the partisan resistance to the Nazis and now were gaining popularity and votes.

The end of the war also led to two counterbalancing factors in the struggle ahead. One was that until 1949 the United States was the sole possessor of nuclear weapons. Partly by default due to the war's damage elsewhere and partly by right of its vast

resources and industrial strength, the United States in 1945 was by far the number one economic power in the world, controlling an estimated 60% of the world's industrial production.

While the U.S. was the only nation capable of stopping Stalin, the perceived protection of two oceans made America isolationist at heart. However, having been dragged into two world wars in quick succession, many Americans reluctantly recognized that they were an integral part of a larger world. The fact that a new, hopefully more effective international body, the United Nations, was headquartered in the United States also symbolized America's new role in world affairs.

The other counterbalancing factor was that, although severely damaged by the war, Russia also had the world's biggest army, and Stalin was determined to use it to guard against a repeat of the last four years. In the post-war years, Stalin rebuilt much of Soviet industry while ignoring the needs of his people. For example, by 1948, Stalingrad, which had lost 95% of its industries and population, had restored 60% of its population and 70% of its factories, but had rebuilt only 20% of its housing. As a result, many people resorted to living in makeshift dugouts along the Volga River, their only modern convenience being an electric line for a light bulb.

Two historical factors further added to post-war tensions. One was the ideological hostility between capitalism and communism, further fueled by Western attempts to overthrow the Bolsheviks during Russia's civil war. The other was the alarming growth of Stalin's power since the 1930s.

A new balance of power emerges (1945-48). When the allied armies met in triumph at the Elbe River in May 1945, all seemed to be smiles and comradeship. But with the common Nazi enemy gone, old animosities quickly resurfaced, causing the Western allies and Soviet Union to establish spheres of influence from which they would eye each other suspiciously during the next half-century. This led to a vicious cycle where Stalin's suspicions of the U.S. and his subsequent reactions would lead to American suspicions of Stalin and corresponding reactions, which would confirm Stalin's suspicions, and so on.

Given this vicious cycle, with roots going all the way back to 1917, and Stalin's paranoid personality, it didn't take much to intensify his suspicions. One early issue was the long time it took for the Western Allies to open a second front in Normandy, making Stalin suspect Britain and the U.S. were hoping his war against Germany would exhaust Russia so they could take over Europe.

An early indication of Stalin's intentions was how he handled the Potsdam conference in July 1945. This was the first conference between the Big Three (The U.S., Britain, and Russia) since Yalta and the end of the war in Europe. However, both the U.S. and Britain had seen changes of leadership: Harry Truman taking over in the U.S. after FDR's death in April and Clement Atlee replacing Winston Churchill as Britain's Prime Minister. Thus Stalin, seeing himself faced with two men inexperienced in foreign policy, decided to stall the proceedings until they had to go home. While accomplishing his goal of getting nothing decided and leaving him with a free hand in Eastern Europe, Potsdam started to turn American public opinion against Stalin.

This came into clearer focus in March 1946 when Churchill gave a speech at Fulton, Missouri describing how Stalin's actions, had brought an "Iron Curtain" down across Eastern Europe. Although Soviet control of this area was hardly complete yet, Churchill's speech further alerted the West to what was happening in Europe.

In reaction to Churchill's rhetoric, Stalin was even more determined to establish a buffer zone in Eastern Europe to forestall any future aggression from the West. His domination of Eastern Europe generally followed a fairly insidious but effective pattern. First the Red Army would liberate the country from the Germans. Then the Communists would form a coalition government with other parties while holding key government posts, in particular the ministry of the interior that controlled the police. Using propaganda, gangs of thugs much like the Fascists had used, and the threat of military force from the police and (if necessary) the Red Army, the Communists would gradually force their opponents from the government until only they remained.

As a result, by 1948 Poland, Czechoslovakia, Hungary, Bulgaria, and Romania, fell under Soviet

domination with Soviet troops occupying their territories. Only Yugoslavia, by quickly going Communist and making an outward show of obedience to Stalin, escaped Soviet occupation and kept some measure of independence.

Americans increasingly were feeling betrayed by their former ally: his stall tactics at Potsdam, his takeover of Eastern Europe, and his support of the Chinese communists in their civil war. In addition, Britain, exhausted by two world wars and seeing its empire rapidly come unraveled, announced it could no longer play the role of global policeman that it had largely fulfilled in the glory days of the British Empire. Thus a growing sense of global responsibility and fear of the spread of communism led the United States to step up and get actively involved in Western Europe.

Militarily, President Truman, in what was known as the Truman Doctrine, committed the United States to stop Communist aggression in Greece and Turkey. In Greece a bitter civil war had been raging since the end of World War II between communist guerrillas operating from mountain bases and government forces in the valleys. American military aid and advisors, along with remaining British involvement, managed to help the government forces stop the Communists and drive them out of Greece by 1949. However, Greece had suffered horribly in this civil war following right on the heels of World War II.

Meanwhile, for Turkey it was much the same story as before: Russia pressuring it to open the straits at Istanbul. However, some gunboat diplomacy (i.e., sending America's largest battleship, the USS Missouri, "just to pick up a dead diplomat's body") gave Stalin the message and he backed down. As a result, Turkey would remain strongly allied with the U.S. against the Soviet Union throughout the Cold War and even a member of NATO (North Atlantic Treaty Organization), although it has hardly any coastline on the Atlantic. Complicating this was America's alliance also with Greece, who had conflicting claims with Turkey on the island of Cyprus. Several crises over this island during the Cold War would put the U.S. in an awkward position.

America's economic response was known as the Marshall Plan, announced in 1948. Its basic premise was that communism thrived in economically backward or disrupted areas. Therefore, large amounts of foreign aid to revive Europe's economies would deprive the communists of the conditions on which they thrived, save Western Europe from communism, and provide the United States with stable trade partners and markets. Marshall Plan aid was offered to any country desiring it, including the Soviet Union. However, Stalin, not wanting to be dependant on the West, refused the aid, as did his obedient satellites in Eastern Europe, as much as they may have needed and wanted it.

However, Marshall Plan aid made a huge difference in Western Europe, especially France and Italy, which were in danger of Communist takeover by means of elections in 1948. When American aid was announced, French and Italian Communists made a final bid for power by disrupting their nations through strikes, riots, and even sabotage of public works such as railroads. In each case, the communists largely discredited themselves, while the more moderate democrats had the Marshall Plan aid to back them up and win over voters. As a result, Western Europe experienced a remarkable economic recovery after this.

The success of the Truman Doctrine and Marshall Plan encouraged the U.S. to pursue an expanded two-pronged strategy in its efforts to stop Soviet expansion across the globe. Militarily, the Eisenhower Doctrine, issued in the 1950's by President Eisenhower, announced the U.S. would follow a policy, known as *containment*, to stop communist aggression wherever it occurred. Early successes in this policy, namely the overthrow of Mohammed Mossadegh in Iran and Jacobo Arbenz in Guatemala in 1953, would encourage more intervention that would lead to the Cuban Crisis in and American involvement in Vietnam in the 1960s.

Economic aid would bear fruit with Japan in the 1950s much as it had with the Marshall Plan. However, the U.S. would give aid almost indiscriminately to any regime that would back it against Russia. Unfortunately, all too often these were corrupt, brutal, and unstable dictatorships, thinly masked as democracies just to get American aid. Once again, support for the shah in Iran and a

series of similar regimes in South Vietnam would serve as examples of the severe limits of this policy.

The Cold War begins (1948-55). By 1948, the United States and Soviet Union had established their spheres of influence in Western and Eastern Europe respectively. Unlike World War I when a definitive treaty emerged to determine a new balance of power, no such treaty emerged after World War II. This was because there was such a quick falling out between Stalin and the Western allies after the war. The fates of Western Europe and Eastern Europe had been determined without direct confrontation between the two superpowers. But, by 1948, when the two superpowers had established their spheres of influence, they started confronting each other in what is known as the Cold War.

In essence, the Cold War was a period of hostility and competition between the U.S. and Russia that always stopped short of direct war, mainly because their growing arsenals of nuclear weapons made such a war seem suicidal to both sides. Therefore, the Cold War played out as a series of crises resolved along two lines of development: either by non military means or by fighting by proxy (substitute) where one or both powers fought each other by supporting smaller allied states in regional wars. The Korean (1950-53), Vietnam (1954-75), Arab-Israeli (1973 and 1982), and Afghan (1979-89) wars were all examples of the superpowers exploiting regional conflicts to promote their own ends.

Crises resolved through non-military means actually ran a higher risk of erupting into all out war, since American and Soviet forces directly opposed one another. In such cases, each side would play a dangerous game, known as *brinkmanship*, trying to push the other side into a position that would make any further escalation of the crisis run the risk of full-scale nuclear war, thus forcing it to back down.

The initial stages of the Cold War would be played out in two widely separated theaters corresponding to the two main theaters of World War II: Europe and Asia.

The Yalta Conference (February, 1945)

The Big Three (l. to r., Churchill, Roosevelt, and Stalin).

Yalta was a meeting in February 1945 between the Big Three (Churchill of Britain, FDR of the United States, and Stalin of the Soviet Union) to discuss the postwar arrangements of Europe as the war was near its end. (At the time, Soviet forces were only 60 kilometers from Berlin.) Much like Woodrow Wilson at Versailles in 1919, illness impaired FDR's ability to negotiate effectively with Stalin. Two months later he would die. Ironically, the meeting was held in the Soviet Crimea because Stalin said his doctors insisted he wasn't healthy enough to travel to the proposed site in the Mediterranean. Also, Stalin had Churchill's and FDR's quarters bugged so he could listen in on their private discussions.

Churchill, who didn't trust Stalin, wanted to create a tightly worded document to which he could hold the Soviet leader and minimize aggression in Eastern Europe. By the same token, Stalin wanted a loosely worded agreement that he could interpret as he chose. FDR thought Stalin, who could pour on the charm when he needed to, could be reasoned with and resisted Churchill's pressure for a firmer agreement. That, plus FDR's illness and the preponderance of Soviet forces in Europe (outnumbering the Western allies three to one) gave Stalin the leverage he needed to get things his way.

They did eventually agree on three matters:

- Germany would be divided into four occupation zones: Soviet, American, British, and a French zone carved out of the American and British zones. Later, a "Committee on Dismemberment of Germany" would be set up to decide if Germany would ultimately be partitioned into several nations.

- Democratic elections were to be held in all liberated and former Axis countries, a provision Stalin followed only in name.
- Stalin would bring Russia into the war against Japan 90 days after the fall of Germany. FDR has been criticized for this since the atomic bomb would make unnecessary such a deal that later would give Stalin a foothold in East Asia. However, at this time, it wasn't clear when the bomb would be ready or if it would even work.

Germany Surrenders (May 8, 1945). Symbolic of growing tensions between the victorious allies was disagreement over the date of VE (victory in Europe) day. The Western allies had forgotten a pre-arranged copy of the surrender terms they had agreed on with Stalin. Therefore, a makeshift version was signed on May 7th. This led to a Soviet protest and a re-signing of the surrender the next day, thus creating two VE (Victory in Europe) days: May 7th and 8th, 1945.

Treaty ending the war in Europe. Also reflecting rising tensions between the victors was the fact that there was no treaty to end World War II in Europe as there had been with World War I. Besides the unconditional surrender and dissolution of the Third Reich Germany and the division of Germany into four separate occupation zones meant there was no recognized German government with whom to make such a treaty.

“Half graveyard and half junkyard”

Dresden after the war

In the cities of the victorious allies, thousands flooded the streets to celebrate victory and the end of the war. However, not everyone on the winning side felt like a winner:

"Above the muzzle of our window and from all the other cells of the Lubyanka [Prison] we too, former prisoners of war and former front line soldiers, watched the Moscow Heavens, patterned with fireworks and crisscrossed by the beams of search lights. That victory was not for us." -- Alex Solzhenitsyn on victory celebrations seen from his prison cell

The Western allies' losses were relatively small compared to those in Eastern Europe. Less than 1% of the populations of France, Britain, the U.S., and Canada died in the war, a total for them all of approximately 1.5 million. Around 400,000 Americans died in World War II. To put that into perspective, for every American that died, around 70 Soviets died, a total of between 27 million and 29 million people. Still, each of those soldiers died his own individual death, and each of their families was distraught by the loss of a loved one.

Yet, by another comparison, 4,221 Americans had died in Iraq by the end of 2008, just over 1% of the American death toll in World War II and 1/7000th the Soviet losses.

Germany lost 4.5 million soldiers and 2 million civilians, some 9% of its population.

- Some towns were left totally devoid of adult men.
- Treptow, a Berlin suburb had 1105 women age 19-21, but only 181 men that age.
- Two-thirds of all German men born in 1918 at the end of the First World War didn't survive the second one.
- While Britain devoted over half its GDP to the war effort, Germany had ransacked other countries' economies and workforces. By September, 1944, there were 7,487,000 foreigners in Germany, the vast majority of them there against their will. They made up 21% Germany's population.

Greece lost 7% of its population during the war, followed by a bloody and destructive civil war lasting to 1949.

Ten per cent of Yugoslavia's population died in the war, many of them from the German policy

of retaliating against partisan activities in a village by executing all of its males over age 15.

An estimated 27,000,000 Soviets died in the war, roughly 14% of its population.

- Of 800,000 Soviet citizens who joined the German army, 215,000 (26.8%) died.
- Out of 5.5 million Russian POWs, 60% died in German camps.
- Of 750,000 Soviets captured at Kiev in 1941, only 22,000 survived the war.
- After the war, there were 20 million more women than men in the Soviet Union.

Poland lost around 5.5 million, including 3 million Jews from the Holocaust, totaling over 16% of its population.

The Holocaust killed six million Jews, 60% of Europe's total Jewish population.

- Forty per cent of those released from concentration camps didn't survive their first weeks of freedom.

In Asia, China had lost 20 million people, and Japan 3.78 million.

Berlin, like Warsaw and Stalingrad, was virtually destroyed, and was a prime example of the war's destruction in Central and Eastern Europe.

- In the last 14 days of the war, it was hit by 40,000 tons of shells.
- Up to 95% of its center and 75% of its houses were destroyed.
- Wheeled transportation, including ambulance service no longer existed.
- It had almost no fuel, electricity, or communications, and no working industries.
- There were 3000 breaks in its water mains, leaving virtually no clean water or sanitary facilities. As a result, rats proliferated.
- There was hardly any police or fire protection.
- The dead lay unburied for months, creating a horrible stench
- People lived in basements and dugouts of rubble in a Stone Age-like existence. They were the lucky ones. Some had no shelter at all.
- Some people estimated it would take fifteen years to clear its rubble.

As one witness described Berlin:

"Wherever we looked we saw desolation.

The streets were piled high with debris which left in many places only a narrow one way passage between high mounds of rubble, and frequent detours had to be made where bridges and viaducts had been destroyed. The Germans seemed weak, cowed, and furtive and not yet recovered from the shock of the battle of Berlin. It was like a city of the dead."

Other cities hardly did any better.

- In Hamburg, devastated by a firestorm resulting from a massive raid in 1943, pre-fabricated huts built for GI's were the only decent shelters.
- Wiener Neustadt, near Vienna had only 18 houses and 860 of its previous population of 45,000 left.
- Sixty per cent of Japan's sixty largest cities were in ruins, being especially vulnerable to American air raids since so many of their buildings were made of wood. Americans had a hard time finding suitable targets for the atomic bomb, because so few cities were relatively intact by August 1945.

Famine and pestilence also loomed over "the lunar landscape of craters and rubble" that was Europe in 1945. For one thing, much farmland was ruined by flooding and scorched earth policies, while damage to roads and bridges left each area isolated, so even unscathed farmland was useless. In addition, lack of equipment and fertilizer led to lower crop yields and widespread hunger. To make matters worse, farmers wouldn't trade food they had for worthless cash. Finally, a drought in 1945 reduced Europe's agricultural production to 50% below normal. This led to strict rationing, many people receiving less than 900 calories a day.

In Holland, people were allotted fewer calories in a week than they should have had in a day.

There were 700,000 needy children in Czechoslovakia; half of them infected with Tuberculosis.

Cultural damage. Much of Europe's art and architecture were also ruined. In addition, high-ranking Nazis, such as Herman Goring, had plundered massive amounts of art, often stored in mine shafts that needed to be returned to their rightful owners. By the same token, the Soviets plundered much of Berlin's art treasures, such as the Trojan gold excavated by Heinrich Schliemann in the 1800s. Not until after the fall of communism in 1991 did Russia admit to having these priceless artifacts.

DPs (Displaced Persons)

Two Germans return from a Russian POW camp on one pair of legs.

Uprooted from their homes, an estimated 50 million displaced persons (aka, DPs) wandered across Europe, either dying from starvation, exposure, or attacks by hostile soldiers and civilians. Not wanted by the locals, the unfortunate émigrés were driven further on, attacked by bandits, robbed, raped, and murdered. In one case, several hundred Jewish children were loaded on a train to remove them from anti-Semitic attacks by people who, of all things, blamed the Jews for the war.

All too often, DPs and Jewish concentration camp inmates found themselves kept in old concentration camps, since there was nowhere else to put them. In some of these camps people continued dying at the rate of 1000 to 1500 a day, their bodies stacked like cordwood as in the days of the Third Reich.

German DPs. During the war, Hitler had expelled 750,000 Poles from Eastern Europe and replaced them with 500,000 Germans, a process that was reversed after the war when 8 million Germans were driven West to a Germany

seriously reduced in size by Stalin. Hitler's goal to include all Germans in one border had come true, but not as he had planned.

Of the 8 million Germans forcibly uprooted from Eastern Europe and driven to Germany, some 2 million died on the journey.

A German mother hurries ahead of the lone survivors of a group of some 150 refugees of a death march from Lodz looking for help for her sick baby. Unfortunately, the baby had died.

Rape. In addition, thousands of German women were raped, mainly by Russian soldiers in retribution for atrocities committed by the Nazis. There were 87,000 women in Vienna hospitals, and even more in Berlin, who reported being raped by Russian soldiers. However, since it was so humiliating to report such a crime, the real number of rape victims is estimated at several times that.

As a result, there were 150-200,000 "Russian babies" born in East Germany (1945-6). The number of illegal abortions performed and how many women died from them is unknown.

A German girl is led from a Berlin train station after being gang-raped by Polish youths who would regularly board trains to rob or rape German refugees fleeing Poland

Retribution. There were also angry recriminations against those who had

collaborated with the Germans, especially in France. French women, who had fraternized with German officers, had their heads publicly shaved and were driven through the streets of their towns to the taunts of their neighbors. Other collaborators were beaten by angry mobs or, in some cases, shot.

Soviet DPs. Even more tragic, Stalin wanted East Europeans, especially Russians, in Western Europe returned to him. Many of them had served in the German army, making up an estimated 10% of the Wehrmacht.

Thousands more were prisoners of the Germans, many of them wounded, but Stalin viewed them as traitors too. Nevertheless, the allies gave in to Stalin's demands and agreed to return any people from areas that had been part of USSR before 1939.

In one case, thousands of Cossacks who had served in the German army at Stalingrad had made their way with their families to Austria, an ideal area with its pastures and relatively plentiful supplies. Then came the shattering news they were to be handed over to Stalin. In desperation, some killed themselves and their families.

Overall some 5.5 million Soviet citizens were repatriated. According to one estimate:

- 20% were sentenced to death or 25 years hard labor (death).
- 15-20% were given shorter labor sentences from which one might survive.
- 10% were exiled to Siberia.
- 15% were sent to rebuild cities.
- 15-20% were allowed to return home.
- The remaining 15-25% escaped or died in transit.

Some accounts of DP's disembarking in USSR relate they were taken behind buildings, after which came the sound of machine gun fire.

Getting by in Postwar Germany

A train overloaded with Germans to make the trip to a Black Market.

Before the 1945 harvest, the average German's diet was 950 calories per day, less than half of what the average worker needed and one-third of the American diet. In Berlin it was 850 calories, leading to 4000 deaths each day. Broken water mains and sewers in Berlin led to outbreaks of cholera, killing two-thirds of all newborns.

In response, the allies. The U.S. and Britain in particular, had to import food to prevent mass starvation in Germany. West Germany was especially hurt since Stalin had the best German lands and 4,000,000 refugees had fled to the West.

Britain imported 1,000,000 tons of food and the U.S. brought in another 500,000 million tons. As a result, Britain had to ration food for its own people, something it hadn't had to do during the war.

Unfortunately, a grain shortage in America the next spring led to shipments being stopped, reducing the average single daily meal of watery soup to 400 calories, less than half of what some concentration camps had fed their inmates. People started collapsing on the job, while others dug through the garbage of GI's who were receiving 4200 calories a day.

The "\$65 question". In the early months of the occupation, things got steadily worse for the German people. Typhus spread among those too tired to clean lice. Tuberculosis in Hamburg increased five times. Children often went without breakfast or lunch, shoes or winter coats.

In contrast, occupation troops were very well off, which led to growing fraternization between

allied troops and the local population. All this in spite of the fact that fraternization was strictly forbidden, bringing a fine of \$65 (one month's pay) for offending GIs. This gave rise to the expression, "the \$65 question".

U.S. propaganda, such as this passage from the GI paper, *Stars and Stripes*, tried to scare GIs from fraternizing with the Germans: *"Don't get chummy with Jerry. In heart, body and spirit, every German is a Hitler...If in a German town you bow to a pretty girl or pet a blonde child, you bow to Hitler and his reign of blood."*

In time so much fraternization took place that the Allied authorities could do nothing about it. According to one German at the time, *"It is impossible to distinguish between good girls and bad girls in Germany. Even nice girls of good family, good education and family background have discovered their bodies afford the only real living."*

Moral standards have crashed to a new low level. At the present rate, in two months, I wonder if there will be a decent moral woman left."

Germany's "cigarette economy". Since the value of the old Deutsch Mark collapsed with the Third Reich, cigarettes served as the primary, though unofficial currency in post-war Germany. This was because there was a controlled supply through GI PXs, constant demand, convenient size, and an innate value since it could temporarily calm nerves and hunger.

The pay for two days' labor clearing rubble (the one job Germans could get then) was equal to the value of one cigarette. Many Germans hung around movie lobbies waiting for Allies to toss cigarette butts, 7 butts equaling one cigarette.

Few cigarettes were consumed by the original buyer. Even kids had their own stash for trading in the thriving black markets outside German cities. This was the only way many German citizens could survive, illegally trading family treasures to GI's for food and other necessities.

When trains started running, many people traveled to areas with food to trade.

Trains got such names as the Potato train, Calorie express, Vitamin train, Nicotine line, Fish Express (going out), and Silk Stocking Express (coming back). These trains were typically overloaded, with Germans even riding on the roof to make the trip to a Black Market.

Black market trading near Berlin

Black market prices were remarkably stable, even between different cities, given the lack of centralized regulation. Such regulation came largely from big time black market traders called *scheiber*. Below are some typical prices one would pay for various goods. Average monthly pay for a worker was about 150 marks.

5 marks = a little less than one cigarette = two day's labor clearing rubble
1 pound of meat = 3 bottles of wine OR 15 cigarettes OR 80 marks
1 pound of coffee = 500 marks
1 pound of butter = 250 marks
1 pound of bacon = 200 marks
1 pound sugar = 90 marks
1 pound flour = 30 marks
A 3 pound loaf of bread = 25 marks
A man's suit = 1,000 marks
A ladies' dress = 800 mark
1 bottle of schnapps = 200 marks
1 pair of nylons = 200 marks

A day at the market. Note that nearly all of these cost well over one month's wages. Therefore, survival in this economy required some shrewd trading, such as these deals carried on in one day by a somewhat astute German.

First he traded 320 marks for a pound of butter. He traded half of that for 50 cigarettes.

He then traded 40 cigarettes for a bottle of wine and a bottle of Schnapps.

Next he traded the Schnapps to a farmer for two pounds of butter.

He took one pound and traded it back to the original dealer for 320 marks.

Thus he got 1.5 pounds of butter, a bottle of wine, and 10 cigarettes for nothing except for some shrewd trading.

GI wheeler-dealers. Although, illegal, many American GIs took an active part in the black market trade as well. For example, a GI could buy 25 cartons of cigarettes for \$20 in the PX (store reserved for American GIs only). He could trade those for a Leica Camera, which sold in U.S. for \$600.

With that \$600 he could buy 750 cartons of cigarettes and trade them for 30 Leica cameras, which he could then sell in U.S. for \$18,000. With that money, he could move up to dealing in art and diamonds, buying one diamond for 2 kilos coffee and 50 cigarettes.

Stalin's occupation currency scam. Originally, the allies planned to pay all occupation armies in one occupation currency. However, the Russians balked at this until some U.S. official gave them a set of engraving plates and said just keep track of how much they print. Since Russian troops were as much as three years behind in pay, Stalin printed vast amounts of this money and used it to pay off his troops.

However, he refused to let his soldiers spend it in the Russian sector, so they went to the American sector, there they bought all sorts of souvenirs at outrageous prices, paying 3-4000 occupation marks for a fountain pen, 1000 marks for a Mickey Mouse watch, and much more for better watches. In July 1945, American troops were paid \$1 million in occupation marks, but sent back \$3 million. Overall Stalin's little scam cost the U.S. treasury \$250 million.

Belgium. Since its conquest and liberation had been quick, thus minimizing damage, and its government had spirited away its gold reserves to Britain, Belgium was the one country in Europe whose economy rapidly revived after the war. This drew foreigners across its borders to get food and supplies that were lacking in their own countries.

Seeking Justice at Nuremberg

Major surviving members of Hitler's regime stand trial at Nuremberg

On November 20, 1945 trials at Nuremberg opened to show the world the extent of Nazi crimes against Jews, Gypsies, Slavs, and prisoners of war. The trials lasted 216 days.

Key to the prosecution's case were photos taken by Nazi officials themselves and found by allies in their homes after the war. However, Stalin was nervous about the trials, fearing they might expose some of his war crimes in the process of investigating those of the Nazis (e.g., his massacre of an estimated 22,000 Poles in the Katyn Forest in 1940).

A total of 11 Nazis at Nuremberg were condemned and hanged for mass atrocities. Among those condemned were Joachim von Ribbentrop, Hitler's foreign minister, and Herman Goering, head of the Luftwaffe. Later trials of those involved in certain indictable occupations (business, security, officers, diplomats) would lead to some 20,000 Nazis being convicted over the next 20 years.

Strict measures were taken to prevent Nazi prisoners from committing suicide before facing justice. For example, prison stairways were ringed with steel mesh to prevent defendants from jumping to their deaths. Despite these precautions, several Nazis, such as Herman Goering, were able to smuggle in cyanide capsules, which killed them almost instantly and painlessly.

Complaints abounded that the most guilty and powerful had escaped to Italy and then used Papal relief funds, supposedly set aside for refugees fleeing from the Nazis, to escape to Syria, Egypt and South America.

While many big time Nazis escaped, others, such as teachers and civil servants who had been in the Nazi party, were denied jobs or forced to join rubble clearing crews and the like.

Simon Wiesenthal, the "Nazi Hunter." A survivor of 13 concentration camps and witness to countless atrocities, Wiesenthal tracked down hundreds of Nazi war criminals after the war and brought them to justice. He also ran a clearinghouse of information to help people find loved ones separated by the war. All this while holding down menial jobs to support his mission.

Japan's leaders faced war crimes trials of their own. Their leader, premier Hideki Tojo, attempted suicide in 1945 to avoid such trials. The attempt was a failure, and he was convicted and executed in 1947. Three other leaders were convicted and condemned the next year. Amazingly, they tried to appeal the verdict.

However, the emperor, Hirohito, was not tried or even ousted, the Americans realizing that his importance to Japanese culture as a figurehead was too valuable to waste. The Japanese revered authority so much that in places without a strong Western presence, such as French Indochina and Korea, Japanese soldiers were kept on by the war's victors, obeying orders from the victorious allies by way of the government back home.

When the Korean War broke out in 1950, the U.S. needed a strong stable base of operations in East Asia that Japan could provide. Much like the Marshall Plan in Europe, American money rebuilt the Japanese economy, making it a firm ally and trading partner. So invested was America in supporting Japan, it was even complicit in covering up the atrocities that took place at Nanjing in 1937. By the same token, the Japanese were relieved and grateful that we did not carry out similar atrocities on them.

Signing the U.N. Charter (June 26, 1945)

The failure of the League of Nations to secure international peace led to the creation of a new organization toward the end of World War II in the hopes of doing a better job. The charter for this new body, the United Nations, was signed in San Francisco, which was indicative of the leading role the United States was playing in the world. The original membership consisted of 51 nations, a number which has grown to 192.

The primary problem for the old League of Nations had been its lack of an executive body with powers of enforcing the general will. The U.N. attempted to rectify this with the Security Council of 15 members, five of them being permanent: the United States, Britain, France, the Soviet Union (replaced by the Russian Federation after the end of the Cold War) and Nationalist China (later replaced by Communist China). The five permanent members each can veto any action of the Security Council, unless they are directly involved in the dispute under discussion.

Probably the most decisive action taken by the U.N. was its restoration of Korea's borders in the Korean War (1950-3). While mainly a U.S. action, fourteen other nations also took part, all serving under the U.N. flag being presented to General MacArthur in the photo below.

Since then the United Nations has provided peace-keeping forces to separate combatants in wars and civil wars, its forces being supplied by neutral nations and distinguished by their baby blue helmets. Such forces are typically considered neutral non-combatants, so firing on them is considered a serious breach of international law.

While not that successful in stopping wars, the U.N. has served as a medium for negotiating ceasefires for existing ones and discussing crises before they erupt into war, such as the Cuban Missile Crisis in 1962. It has also provided economic assistance, famine relief, and medical aid to undeveloped parts of the world.

Reparations and "Ethnic Cleansing"

German reparations. Stalin wanted reparations (both material and forced labor) from Germany, much like what the Western allies had gotten from Germany after World War I. However, the loosely worded Yalta agreement only provided for a reparations council to be located in Russia. Stalin took this as a green light to dismantle entire German factories (above) and transport them and captured Germans (including civilians) back to Russia. Unfortunately, the factories mostly remained dismantled and rusting in Russian railroad yards.

Stalin wasn't the only one involved in dismantling German factories after the War. British workers here dismantle machinery from a Krupp factory to be shipped back home. However, Britain put an end to this practice, seeing the moral implications of profiting from German war industries and the economic cost of having to carry a German economy crippled by such reparations.

Stalin already had an estimated 2.3 million German prisoners of war he could use for forced labor, but that wasn't enough. So he forcibly transferred nearly 300,000 ethnic German

civilians to the Soviet Union as well. These included 100,000 deported from Romania, around 30,000 from Yugoslavia, and 165,000 from previously German territories now annexed by Poland.

There were two categories of these civilians: those taken from Eastern Europe (“mobilized internees”) and those taken from Germany (“arrested internees”), the latter category getting much worse treatment. An estimated 19% of the “mobilized internees” died in captivity compared to 39% of the “arrested internees”. Since their forced labor was deemed inefficient, proceedings for repatriation back to Germany began in 1946.

Other examples of “ethnic cleansing” in post-war Europe included:

- When 100,000 Croats fleeing Tito’s Yugoslavia were forcibly returned by Britain, Tito had at least 40,000 of them executed.
- Pogroms against the Jews in Poland caused 63,387 to migrate to Germany.
- Bulgaria forcibly moved 160,000 ethnic Turks to Turkey.
- Hungary traded 120,000 Slovaks to Czechoslovakia for an equal number of Hungarians.
- Similar exchanges took place between Poland and Lithuania and between the Soviet Union and Czechoslovakia.
- Some 400,000 Yugoslavs moved north to replace 600,000 Germans and Italians
- In June 1945 Czechs started to move 3 million Germans from Sudetenland. An estimated 267,000 died on way to Germany.
- The German proportion of the population in Bohemia and Moravia dropped from 29% (1930) down to 1.8% (1950)
- Poland, which was 68% Polish in 1938, was overwhelmingly Polish by 1946
- Before 1938 Czechoslovakia was 68% Czech and Slovak. By 1950 it was almost exclusively Czech and Slovak.
- After the war, 623,000 Germans were expelled from Hungary, 786,000 from Romania, 500,000 from Yugoslavia, and 1.3 million from Poland.
- Overall 13 million Germans fled to W. Germany where they were eventually resettled and integrated into society and the economy.

The Potsdam Conference officially allowed these forcible movements of Germans, but after it was mostly done.

Besides Poland and a few other minor exceptions, borders remained pretty much unchanged from before the war. Therefore, the aftermath of World War II left most states, except for the Soviet Union and Yugoslavia, ethnically homogeneous.

The Potsdam Conference (July 1945)

The new Western leaders, Clement Atlee of Britain and Harry Truman of the United States, meet Stalin at the Potsdam Conference in July, 1945. Behind the smiles, all was not well, though.

The Potsdam Conference was the first conference of the Big Three since the fall of Germany. A lot had changed, including the players. Churchill had been replaced in post-war elections as prime minister of Britain by the Labor leader, Clement Atlee. Meanwhile, FDR had died in April and been succeeded by his vice-president, Harry Truman, who had not been kept up to date on affairs (including the Manhattan Project). Thus Stalin faced two men largely inexperienced in foreign policy that he planned to take advantage of.

His main strategy was to stall for time, knowing Atlee and Truman would have to return home fairly soon. To that end the Russians insisted that all speeches be translated into English, Russian, and French in order to drag out the proceedings. They also kept strange hours, rising late in the morning for a long and leisurely breakfast. By the time the meetings started, it was almost time for everyone else to have lunch, which created further delays. The Soviet stall tactics worked, keeping anything substantial

from getting resolved, and sending the Western allies home with a sourer attitude toward Stalin.

During the conference, the Trinity Test successfully tested the first atomic bomb. When Truman informed Stalin that the U.S. had a new weapon of unprecedented destructive power, Stalin barely reacted, saying he hoped the U.S. would use it (i.e., against Japan who was still fighting). Stalin's nonchalant reaction was probably because, thanks to espionage, he probably knew as much or more about the bomb than Truman did.

“Red is the new brown”: Stalin’s Takeover of Eastern Europe

The single most divisive issue leading to the Cold War was Stalin's takeover of Central and Eastern Europe in the years after World War II. From the Western point of view, this was a betrayal by an erstwhile ally. For Stalin, it was a necessary measure in light of the West's previous hostility to communist Russia. Underscoring this fear was Hitler's surprise attack in 1941 that had cost the Soviet Union untold physical damage and 27 million lives.

For all intents and purposes, Red tactics (street violence, intimidation, murder, etc.) were identical to those of the Brownshirts in the 1930s. The only real difference was that in Nazi Germany, the hot button name to label an enemy with was “communist.” In post-war Europe it was “fascist”. Thus the expression: *“Red is the new brown.”*

The fate of Poland was an especially bitter case for Britain, since it was for Poland's sake that it had declared war on Germany in 1939. Some 200,000 Polish expatriates served under British command, mainly in North Africa, and

Churchill felt especially committed to a free and independent Poland.

Stalin had other ideas. His first move was a significant readjustment of borders, moving the Soviet border some 200 miles west and compensating Poland by expanding its western border by a similar amount at Germany's expense. This involved the mass deportation of thousands of Poles from lands now annexed by the Soviet Union to the newly constituted Poland. That, in turn, created a chain reaction driving several million Germans westward from newly Polish territory to a diminished Germany.

Churchill had actually agreed to Stalin's annexation of Polish territory (based on, of all things, the Nazi-Soviet Pact of 1939) and even the forcible transfer of ethnic Poles. When informed that they could not return to their homes (which were now part of the Soviet Union), thirty men of the independent Polish army committed suicide.

With the border adjusted to his satisfaction, Stalin turned to Poland's internal politics. During the war Stalin had supported the communist Lublin Committee as Poland's legitimate government, while Britain supported a more democratic Polish government in exile. The communists became increasingly abusive toward any non-communists and delayed the first postwar elections while they intimidated, jailed and even murdered members of the opposition. They also disqualified non-communist candidates in 10 out of 52 districts (affecting about a quarter of the population) and on Election Day marched office and factory workers to the polls.

When somehow the Communists won a landslide victory, the opposition leader, Stanislaw Mikolajczyk, resigned his post in protest. This cost him his parliamentary immunity and he had to flee the country for his life in a high-speed car chase. Strong protests from the U.S. and Britain came to nothing and Poland would endure over forty years of communist rule and Soviet dominance.

The Communist Party slogan was:
"Independence - Peace – Welfare"

The Poles found ways to express their national pride even under Stalinist rule. One involved the 18th century, the Italian artist, Canaletto, who did a series of urban landscapes of Warsaw. After the war and the methodical destruction of Warsaw, the Poles used these paintings as blueprints for rebuilding their city to assert their nationalist spirit. Similarly, Polish membership in the Catholic Church was a means of showing some defiance of Communist rule.

Canaletto's painting of Miodowa Street in Warsaw.

Czechoslovakia and the "Third Defenestration of Prague". Czechoslovakia's demise was also quite upsetting to the West since, before the war it had been a model Central European democracy with a successful industrialization policy and a large efficient army. Its betrayal by the West to Hitler at Munich in 1938 had done nothing to increase the Czechs' trust of the West, but they still aspired to build a successful capitalist democracy in 1945.

After Soviet and American troops withdrew in 1946, the Czechs held elections in which the communists were just one of several parties in the government, although holding nearly half the cabinet posts and the all-important ministry of the interior which controlled the police, there being no other Czech military organization after the Nazi occupation. Still, Czechoslovakia seemed to be settling into a stable non-Soviet pattern by following Stalin in foreign policy while exercising more independence in domestic affairs...until the Marshall Plan was announced.

Czech attendance of European talks about Marshall plan aid without first asking Moscow infuriated Stalin and aroused his suspicions about Czech loyalty, never a good thing. Stalin

first "convinced" the communist Czech premier Gottwald to have Czechoslovakia withdraw from taking part in the plan, which it did.

But once aroused, Stalin's suspicions were not so easily calmed, especially when an opinion poll showed a projected loss of 25% of the Communist vote in upcoming elections due to economic problems and food shortages arising from a famine in 1947. So, along with giving the Czechs 600,000 tons of Soviet grain (which his own people could not afford to lose), Stalin directed the Czech interior minister to replace non-Communist police chiefs with Communists.

When protests broke out, armed communist bands rioted and raised the threat of a coup, while a former Soviet ambassador showed up and warned the Czechs that the Soviet Union might have to "safeguard Czechoslovakia's Independence", adding: "*The Soviet Union never deserts her friends.*"

With Czech participation in the Marshall Plan effectively vetoed, most of the non-communist cabinet members of the Czech government resigned, hoping to force a new election. When the non-communist minister resigned, hoping the crisis would force new elections before the communists got too powerful, the communists responded by stirring up strikes and riots, which forced the ailing president Benes to ask them to form a government, thus inaugurating forty years of Soviet rule.

In defiance of the communist regime, the foreign minister, Jan Masuryk, a popular Czech patriot, refused to resign his post. A month later (March 10, 1948), he was found dead several stories beneath his bathroom window. While communists claimed he committed suicide, several subsequent investigations concluded Soviet agents most likely pushed him.

This has been called the "Third Defenestration of Prague". (The first was in 1419 when radical Hussites threw fifteen town councilors to their deaths out of a town hall window, triggering the religious struggle known as the Hussite Wars. The second, and most famous, occurred in 1618 when angry Protestants threw two imperial

ministers out a castle window in Prague, thus starting the Thirty Years War.) The result of this “Third Defenestration” was the tightening of communist rule in Czechoslovakia.

Mourners line the street for the funeral of Jan Masaryk.

Back in the U.S. this sequence of events shocked Congress so much that it voted an initial \$5.3 billion for the Marshall Plan.

Hungary. During the 1930s, Hungary had increasingly close trade, and then diplomatic, relations with Fascist Germany and Italy. It also benefited territorially from Hitler’s land grabs in 1938-9. Therefore it was pretty much forced to join Axis forces in the war, helping with the invasions of Yugoslavia and Russia. As the war turned against Germany, Hungary first tried secretly negotiating with Britain and the U.S., but Hitler discovered this plot and German forces occupied the country in 1944. Again, as Soviet forces were approaching, the Hungarians tried negotiating, this time with Stalin, but Hitler forced the regent to negate the truce by kidnapping his son. He then deposed the regent and established a fascist government that lasted until the Soviets drove the Germans out in 1945.

Elections in 1945 delivered 57% of the vote to the Smallholders Party and only 17% to the Communists. However, pressure by the communists backed by the threat of Soviet intervention kept the Smallholders from forming a government. Instead a temporary coalition government was formed with the Communists just one of four parties, but the one controlling the ministry of the interior and thus the security police.

Soon, the Communists were setting up “People's Courts” across Hungary to eliminate influential people likely to oppose them. They commonly accused them of *fascism*, a highly charged word in light of recent history, but used indiscriminately by the communists to label anyone who wasn’t one of them.

They also accused the premier of espionage and kidnapped his 5-year old son to force him out of office and the country. Meanwhile, gangs of communist thugs attacked members of the Hungarian Freedom party in the streets until it disbanded. Bit by bit, through a series of purges, government reorganizations, and rigged elections, the Communists solidified their control, denying the vote to anyone condemned for “crimes against democracy”.

By 1948 all but the Communist Party had been disbanded. In 1949, the People’s Republic of Hungary was declared as a “country of the workers and peasants” where “every authority is held by the working people”. The hated communist regime would rule Hungary until its overthrow in 1989.

Bulgaria. During the war, Bulgaria had joined Germany against Britain and the U.S., but maintained neutrality with the Soviet Union. In 1944, as the war was turning against Germany, the Bulgarians formed a new government hostile to Germany, and put out peace feelers to Britain and the U.S., with whom it was still at war, hoping this would prevent intervention by Stalin and the Red Army.

It didn’t work. Even though Bulgaria had been careful to keep the peace with Stalin, he declared war nonetheless. This prompted the formation of a new government with Communists as a major part of the coalition. From there it followed the familiar pattern of purges, trials, street violence, etc.

As elections approached, the Communists demanded that all parties join their Fatherland Front. As a result, they won 60% of the legislative seats, allowing them to gradually pressure any non-Communists out of the government or just arrest and eliminate them.

In 1948, they declared the Peoples Republic of Bulgaria, which would last, like most other East Bloc communist regimes, until the sudden collapse of communism in 1989.

Rumania. Like many of its neighbors during the war, Romania was coerced into joining Hitler and took part in the invasion of Russia in 1941. However, in 1943, Romania unsuccessfully tried secret negotiations with the U.S. and Britain. The next year, King Michael, with support from the communists, replaced the pro-fascist government with the monarchy, withdrew from the Axis alliance, and declared a ceasefire with Russian forces.

When the Red Army entered Rumania, Stalin ordered the king to put the communists in power or be overthrown. Over American and British protests, the communists tightened the noose, promising free elections, but only letting Communist Party members vote. Thus they got 80% of the vote, the king abdicated, and in 1948, the People's Republic of Rumania was declared. Under Nicolae Ceausescu, (ruled 1965-89), Rumania was one of the more hardcore communists states along the lines of Stalinism. Ceausescu promoted his own cult of personality, and even had one for his wife.

Unlike the fall of most other communist regimes in 1989, Ceausescu's fall was a violent revolution that ended with his trial and execution.

Marshall Tito and Yugoslavia. Marshal Josip Broz Tito (above) was the tough communist leader of the Yugoslav resistance that liberated Yugoslavia before the Red army could get there. Without the Red Army's presence, Stalin had to allow Tito more freedom than he did other East Bloc leaders. However, because Tito followed a different, less strict model of socialism, even

taking aid from America, Stalin kicked him out of Cominform, the Communist international organization. That didn't seem to bother Tito in the least, who ruled Yugoslavia with an iron fist until his death in 1980. After that and the demise of the Soviet Union in 1991, the Balkans would descend into chaos for the better part of a decade.

The Buck Stops with Truman

Harry Truman holds up the copy of the Chicago Tribune that jumped the gun in wrongly predicting the outcome of the 1948 presidential election.

"He doesn't have enough sense to pour sand in a rat hole."

—Harry Truman

Harry Truman was the last president to serve without a college degree (although he attended law college for two years after being rejected from West Point for poor eyesight, and was an avid reader of history). His father was a farmer, which accounted for both his strong work ethic and unassuming manner, something critics compared unfavorably to his more sophisticated predecessor, FDR. Another formative experience was his service in World War I, which brought out his leadership qualities. (Initially rejected by the army for his poor eyesight, he reportedly memorized the eye chart to gain admission.)

Truman was also a man of his convictions. When a friend and political ally tinged with scandal died, he was the only politician to show up at the funeral, simply saying he had always been his friend.

After a moderately successful career in the Senate, including an incredible comeback in the 1940 election, Truman was chosen as FDR's running mate in 1944. He served as vice

president for only 82 days before FDR died and he became president.

Truman had virtually no contact with FDR during his brief vice-presidency, and was kept uninformed on major initiatives, including the existence of the Manhattan Project to develop the atomic bomb. His inexperience combined with his simple homespun manner and lack of college degree led to low expectations of him as president.

"The buck stops here."—Harry Truman.

In fact, Truman developed into one of America's most capable presidents. Central to this was his willingness to make tough decisions, no matter how unpopular they may be. He alienated labor by cracking down on a national railway strike after the war, made the decision to drop the atomic bomb (a popular move at the time), but withstood pressure to use it during the Korean War, seeing that nuclear weapons had made the Cold War a very different game from previous diplomacy. He recognized Israel as a nation, desegregated the military, and fired the popular General MacArthur, all very controversial moves from which he would not back down.

Thus at times, he suffered from the lowest popularity ratings in American history. By the same token, the success and wisdom of his decisions at other times gave him some of the highest presidential ratings in our history.

"If you can't stand the heat, you better get out of the kitchen."—Harry Truman.

Truman quickly came to the decision to resist Stalinist aggression after the war. In a meeting with Molotov, the formidable Soviet foreign minister, Truman basically read him the riot act, telling him the Soviets had better behave better from now on. When Molotov replied he had never been spoken to like that before, Truman shot back, "Carry out your agreements and you won't get talked to like that." While it didn't solve U.S.-Soviet relations, it let Stalin know that Truman wouldn't be intimidated.

I wonder what Harry Truman would do if he were a live today.—Popular joke about Truman's low chances of reelection in 1948.

In 1948, after sixteen years of Democratic presidents, the Republicans seemed poised to reclaim the White House. No one gave Harry Truman much of a chance at reelection, especially with the looming threat of communism abroad and a still faltering economy at home. No one much but Harry Truman, that is.

He did it in typical Truman style: with hard work and grit. He launched a massive train tour, called the "Whistle Stop Tour", across the nation and took his case directly to the American people, while his opponent, Tom Dewey, remained somewhat complacent about and aloof from campaigning. The result was the most stunning upset in American political history that is still held as the gold standard of political comebacks.

The Greek Civil War (1946-49)

Almost immediately after liberation by the British from a brutal Nazi occupation, in 1944, Greece became embroiled in a civil war between the communists, who had led much of the resistance, and the unpopular monarchy restored by the British.

Until American advisors took over, Greek government troops only maintained a static defense that let the enemy strike where and when they wanted. As a result, the Communists overran most of the countryside, establishing their own government, courts, and even phone system.

Starting in 1947, with the Truman Doctrine, American advisors took over training and directing government forces. Switching from the government's passive defensive strategy, they took the offensive, dividing Greece into nine sectors and sweeping through them one at a time. Yugoslavia had provided the most support to the communists, while Stalin, who had promised to stay out of Greece, kept his word,

leaving the communists to their fate. Thus, by 1949, they had cleared out communist forces.

Both communist guerillas and government troops would kill peasants just for talking to the other side, leaving them caught in the middle with nowhere to turn. In addition, they stole 1.3 million sheep and goats and 100,000 cattle and horses. This drove 700,000 peasants to flee to the bigger towns, leaving much of the countryside empty.

Women mourn men and boys killed by Communist guerillas just for talking to American military advisors. In addition to murder, the rebels stole 1.3 million sheep & goats and 100,000 cattle and horses. They even kidnapped an estimated 30,000 children to raise as Communists.

As usual, children were often the victims worst hit by the war. Although the Red Cross was able to evacuate a number of orphans to Rhodes, most others weren't so lucky. During the war, communist forces also kidnapped an estimated 30,000 children to Bulgaria to raise as communists.

The Marshall Plan (1948-52)

Don't fight the problem, gentlemen. Solve it." --George C. Marshall, or "General Marshall" as he insisted even the president call him. Truman's secretary of state, called the "organizer of victory" for his staff work during WWII, pushed the Marshall Plan to revive Western Europe's economies and save it from going communist

America's economic response was known as the Marshall Plan (1948). Its basic premise was that Communism thrived in economically backward or disrupted areas. Therefore, large amounts of foreign aid to revive Europe's economies would deprive the Communists of the conditions on which they thrived, save Western Europe from Communism, and provide the United States with stable trade partners and markets. Marshall Plan aid was offered to any country desiring it, including the Soviet Union. Stalin, not wanting to be dependent on the West, refused the aid, as did his satellites in Eastern Europe (after some of Stalin's "gentle" persuasion).

It was a trip to Moscow that convinced Marshall that Stalin was waiting for European economies to collapse so communism could take over. Reinforcing this belief was a gaffe made by ailing President Roosevelt in 1945, promising to have all U.S. troops out of Europe in three years. After a stop in Germany, where he saw how postwar chaos still persisted, he was convinced aid must be given to Europe to revive its economies and save it from going communist.

With Europe still in such bad shape Marshall outlined a proposed plan for aid to Europe in a speech at Harvard (6/4/1947). Emphasizing the urgency of the situation, he said, "The patient is sinking whilst the doctors deliberate." His plan was a hard sell for the still largely isolationist American public and Congress, but it passed,

eventually supplying \$13.1 billion worth of aid to Europe.

Marshall Plan Aid was open to all European countries, which raised the question of whether Stalin would accept it or let his satellites do so. After all, he had accepted massive Lend-Lease aid during the war. However, he saw too many strings attached, namely letting Americans travel freely in the Soviet Union distributing aid but also seeing how badly the Soviet Union had been damaged during the war.

For forty years, Western experts estimated Soviet losses in the war at around 20 million lives, a staggering figure in itself and one that Soviet officials didn't deny. Not until 1985 did Mikhail Gorbachev announce the figure as 27 million. Some scholars since then have pushed it further up to 29 million.

Overall, sixteen nations participated in the Marshall Plan and received U.S. aid: Austria, Belgium, Denmark, France, Great Britain, Greece, Iceland, Ireland, Italy, Luxembourg, Holland, Norway, Portugal, Sweden, Switzerland, and Turkey, plus the three allied occupation zones of West Germany. On Stalin's orders, no communist bloc countries participated, reinforcing the perception that the Marshall Plan was political in nature and aimed against the Soviet Union.

Between 1948 and 1952, the U.S. spent \$13.7 billion on Marshall Plan Aid (roughly equal to \$130 billion in 2000). Only 20% of that came as loans, the rest being in grants of food, industrial machinery, etc. The Marshall Plan encouraged Europeans to buy American goods and was criticized as merely a ploy to expand American markets. Indeed it did solve the dilemma of reviving markets for American goods, but one might say the U.S. did well by doing good, since it saved Western Europe's economies as well as its own.

A street in Hamburg, Germany before and after reconstruction using US aid

Among supplies sent to Britain was sugar, which was one of the items rationed after the war, making those restrictions especially unpopular. The prime minister even carried his own bowl of sugar to meetings as a show of solidarity with the rest of the public and the sacrifices they were making.

Left to right: eggs sent to Europe, a hydroelectric dam in Austria built with Marshall Plan aid, and Italian motorcycles, a sign of Europe's recovery.

Among the more interesting aspects of Marshall Plan aid were the 7,500 Missouri mules (below) the US sent to help revive Greece's livestock after its costly civil war. These mules, twice the size of Greek mules, were also stubborn and cantankerous, but proved very useful once the Greek farmers learned how to handle them.

Marshall Plan aid made a huge difference in Western Europe, especially France and Italy which were in danger of Communist takeover. When American aid was announced, French and Italian Communists made a final bid for power by disrupting their nations through strikes, riots, and even sabotage of public works such as railroads. In each case, the Communists largely discredited themselves, while the more moderate democrats had the Marshall Plan aid to back them up and win over voters. As a result, Western Europe experienced a remarkable economic recovery after this.

Postwar Politics in France and Italy

In response, the Church issued this poster with a picture of Garibaldi and the questions of whether the communists were truly democratic. When the poster was flipped over, it transformed the picture of Garibaldi into the dictator Stalin.

Having “saved” Eastern bloc from the Marshall Plan and American influence, Stalin still hoped to bring parts of Western Europe, especially France and Italy, under his influence, since there was still widespread discontent with the capitalist leaders who so far had failed to revive Western Europe from the war. The key to Stalin’s success or failure lay with the general elections in France and Italy. If communists could win those elections, American and British influence in Europe overall would likely collapse.

Having little to offer those countries in a positive way, Stalin had the communists do whatever they could to disrupt public order with strikes and riots and to discredit the ruling government, much like Hitler and the Nazis had done in the 1930s. Postwar politics were particularly wild and chaotic in France and Italy. Communists in both countries had led much of the resistance against the Germans, making them a popular and powerful political force after the war.

In addition, both countries’ economies were in shambles. In France, prices were inflated fourteen times of what they had been in 1938, electrical production was only half of what it had been, and coal production was only one-fifth. Hunger stalked the land, especially in the cities where 75% of the population was malnourished.

After the war, the provisional government declared by the Free French in Algiers continued as France’s government. The conservative war hero, Charles De Gaulle, served as head of state until resigning when the Communists gained

nearly a third of the seats in the legislature in the 1945 elections. However, the Socialists kept the Communists, from gaining full control of the government. At first, the Communists worked within the system and cooperated with the Socialists to push through more socialist oriented reforms, but finally split with them.

In 1947, with the announcement of the Marshall Plan, Stalin urged French communists to disrupt the economy with strikes and riots. A massive general strike that fall succeeded in disrupting food and coal supplies and transportation, while Communists physically seized control of the legislative Assembly, held it overnight, and had to be forcibly evicted.

Strikers derailed up to five trains a day through sabotage, sixteen people being killed in one such incident. Meanwhile, all across France, pitched battles raged between strikers and police, making some wonder if France was slipping into civil war.

In response, the government got emergency powers, called up 80,000 troops to replace striking workers, and, most effectively, threatened to cut social security benefits to strikers. Gradually, strikers returned to work and the strikes collapsed.

One factor undermining the French communists was a changing public perception of them and Maurice Thorez, their leader. In 1939, as World War II was starting, Thorez had deserted the French army and spent the war in exile with Stalin rather than fight Germany, which at first had been an ally of communist Russia. Thorez’ actions became more acceptable after 1941 when Russia became an ally against Germany. In 1945 he returned to France, regained popularity, and even held the post of vice premier before the Communists split with the Socialists. However, Stalin’s increasingly hostile actions against the West after the war damaged the reputation of the French communists in general and Thorez in particular.

Thorez didn’t help matters with his remark that the French communists would do nothing to stop Soviet troops if they came into France to save communism there. This cost the Communists a

good deal of support, since most of the French were French nationalists first and loyal to a particular party second. If Thorez had read his history more carefully, he would have recalled the French had pretty much invented nationalism back in 1789 and weren't about to give it up to a dictator like Stalin.

In the end, a growing perception of the French communists as being too tightly associated with Stalin, their split with the Socialists, and the lure of American Marshall Plan aid helped defeat the French communists' violent bid for power. While still a factor in French politics, they would never again have the support they commanded right after the war.

Some of the rioting, largely stirred up by French Communists to disrupt the 1948 elections. When strikers derailed a train, killing 20 people, public opinion turned sharply against the Communists.

Eventually, Charles De Gaulle would return to power and oversee the birth of a new constitution, the Fifth Republic, with a stronger executive. In the 1960s, he would steer France on a course that was more independent from the U.S., even developing France's own nuclear bomb. Some people saw De Gaulle as an anachronism, confusing himself with Joan of Arc in his belief in France as a world power.

Postwar Italy, heavily damaged by the war, was another battleground between capitalism and communism. Agricultural production was half of its pre-war level, while 80% of its industrial production had been destroyed, along with most of its inland transportation, and much of its merchant marine. Three million people were homeless; 2 million unemployed, and uncounted millions underfed, in particular lots of war orphans. Both inflation and banditry were rampant, and separatist groups in Sicily and

Calabria were trying to break away as independent states.

Italy, like France, saw turmoil throughout the country in 1947. Communist workers occupied factories, wrecked offices, and openly battled the police and Fascist action squads in the streets, using caches of weapons hidden since the war. In the countryside, thousands of peasants seized the lands of the rich. Meanwhile, even in the National Assembly, 200 delegates battled on the floor.

As in France, Italian communists commanded a lot of support that threatened to give them control of the government. Thus the 1948 elections in Italy were a bitterly contested campaign between the conservative (and U.S. backed) Christian Democrats led by Alcide de Gasperi and the Communists led by Palmiro Togliatti.

The Catholic Church was particularly scared of communism, since it was an atheistic creed. The pope excommunicated Communist Party members, while priests denounced the "cosmic sin" of communism from the pulpits.

One group this had an effect on was women, who were voting for the first time and were especially influenced by their priests. Communists' girlfriends were even more affected, since excommunication meant they couldn't get married in the eyes of the church or have a church wedding with a white gown and all the other trappings.

In the U.S., celebrities such as Frank Sinatra, urged Italian-Americans to write their relatives back home encouraging them to vote against the communists. However, even more important than popular singers in exerting American influence was the newly formed CIA.

The vexing question was whether the U.S. had the right to interfere in other countries' affairs. The answer seemed to lie in the National Security Act (1947), giving the government the right to act against any threat to national security. By the Truman administration's reckoning, a communist victory in Italy's elections would constitute such a threat. While

CIA involvement in the Italian election was less than subtle, agents going around handing out cash from suitcases to Christian Democrat politicians, it was the basis for all subsequent covert operations by the CIA in other countries.

Another widespread tactic was using posters to frighten voters away from supporting the communists. Rome and other cities seemed to be papered over with such posters, which were generally anything but subtle. The Church was heavily involved in this propaganda campaign, funding the issue of over 300 different posters to scare people away from the communists. Italian communists liked to use images of the popular national hero, Giuseppe Garibaldi, to imply he would have supported their party. In response, the Church issued a poster (top) with a picture of Garibaldi and the question of whether the communists were truly democratic. When the poster was flipped over, it transformed the picture of Garibaldi into the dictator Stalin.

Political posters from the 1948 elections in Italy. The caption for the one on the right reads: “Attention! Communism needs a boot.”

Meanwhile, strikes and violence continued across Italy. A right wing politician was shot in his own home, and two bombs were thrown into a crowd at a communist rally.

Probably the most influential factor was the promise of Marshall Plan Aid, but only if the communists were defeated. Along those lines, Christian Democrats spread the rumor that Stalin was sending lots of grain to relieve starvation in Italy. In fact, he wasn't sending grain, so that when it never showed up, people called him and the communists a bunch of liars.

In the end, these various tactics and American money and aid worked, giving the Christian Democrats and their leader, Alcide de Gasperi, a landslide victory, thus keeping Italy in the Western camp during the emerging Cold War.

The Long Road to the Computer (1642-1947)

The IBM Automatic Sequence Controlled Calculator after installation at Harvard University in 1944. It was 51 feet long, weighed 5 tons, and had 750,000 parts. On the right side were card readers, a cardpunch, paper tape readers, and typewriters. It took 1/3 second for an addition problem and 1 second for a multiplication problem.

The history of mechanical calculators, forefathers of the computer, goes back to 1642 when Blaise Pascal created an adding machine, the Pascaline (below) that automatically carried digits from one position to the next. It had several dials that could be turned with a stylus. Underlying gears turned as each digit was dialed in, the cumulative total displayed in a window above the "keyboard". However, Pascalenes remained little more than curiosity pieces in private parlors until the debut of Thomas De Colmar's Arithmometer in 1820. Able to add, subtract, multiply, and divide, it was the first commercially successful calculator, being the model for calculators into the 1900s.

Babbage's Difference Machine. The Englishman Charles Babbage (26 December 1791 – 18 October 1871) was obsessed with using the steam engine to power a device that would calculate navigational, celestial, and mathematical tables. From 1822 to 1849 he worked on the design for

his *Difference Machine*, which could do four functions (add, subtract, multiply, and divide). He even got a grant from the British government, probably the first government grant for researching computers. Although he never built one, he is often considered the father of the computer. In 1991, to mark the bicentennial of Babbage's birth, a working Difference Machine was built. To prove that it was feasible to build such a machine in the 19th century, the project used only the technology available then.

The Jacquard Loom (1825). In 1728, a new weaving device, the Falcon's loom used the Frenchman Basile Bouchon's invention of perforated paper rolls, the holes operating as binary on/off switches to determine if a particular color thread was used in that row of fabric. A century later Joseph-Marie Jacquard invented an automatic loom (above right) using punched cards to control the patterns in the fabrics in a similar way. Despite worker riots against the replacement of people by these machines, virtually all industrial looms were using this system by 1900. Not only that, it was being applied to other industrial uses, such as riveting patterns on the large steel ships bringing millions of immigrants to America. Just in time, someone found another use for this concept.

The Hollerith machine (1890). The 1890 US census provided the impetus for another step toward inventing the computer. Because of the huge influx of immigrants, people figured the 1890 census wouldn't be finished before the 1900 census came around. To the rescue came the Hollerith machine. Using punch cards like those designed for Jacquard Looms, census takers would punch out chads on the appropriate places for numbers of family members, males, females, etc. Back at the census bureau, secretaries placed the card in an electronic machine with contact points for each space on the card. When the lever was lowered, only tabs for places with missing chads would complete the electronic circuit by touching the electrified plate underneath the card. This would automatically register the appropriate number on a counter. Like the Jacquard loom, this was using a basic

binary, on-off, concept that is still central to computer design.

In 1930, Vannevar Bush at MIT built a large-scale differential analyzer with the additional capabilities of integration and differentiation (left and below). Funded by the Rockefeller Foundation, it was perhaps the largest computational device in the world at that time

The Z-1 machine (1938). Another pioneer in the field was Konrad Zuse who, working in his parents' living room between 1935 and 1938, built the Z-1 machine, a relay computer, using binary arithmetic. During World War II he applied to the German government for funding, but the Nazis thought its development would last longer than the war. After the war he constructed the Z-4 machine at the University of Zurich and founded a computer company that was later absorbed by Siemens Corporation. As pioneering as Zuse's work was, it was little known outside of a few people and had no real impact on the development of computers.

The Electronic Numerical Integrator And Computer (ENIAC) (above) was the first general-purpose electronic digital computer and the forefather of today's all-electronic digital computers. It was 150 feet wide with 20 banks of flashing lights and about 300 times faster at addition than the IBM Automatic Sequence Controlled Calculator. Built between 1943 and 1945 by two University of Pennsylvania professors, John Mauchly and J. Presper Eckert for the war department, its purpose was to create a machine to replace all the women (known as "computers") employed by the army to calculate the complex firing artillery tables.

To program a modern computer, you type out a program with statements like:
Circumference = 3.14 * diameter.

To reprogram the ENIAC you had to rearrange the patch cords settings on some of its 3000 switches.

Vacuum Tubes. Relaying the signals in ENIAC was a vast array of 19,000 vacuum tubes. In the mid 1800s a German, Heinrich Geissler (1814-79) carried out experiments with vacuum tubes and found that a current passed through an enclosed gas tube, which contained a partial vacuum and one of a series of gases, would produce a brightly colored glow. He found that different gases, such as hydrogen, oxygen, and nitrogen, produced different colors. His devices were known as Geissler Tubes.

In 1878, the Englishman, Sir William Crookes (1832-1919), expanded on Geissler's research and found that an electrically charged cathode in a tube (left) would produce streams of what he called "cathode rays." This would also help lead to the invention of television in 1927.

But that's another story.

Unfortunately, vacuum tubes used a lot of energy, and produced a lot of heat, causing them to burn out quickly. If one vacuum tube on the ENIAC went bad, technicians had to search through its 19,000 vacuum tubes until finding the problem. This didn't make computer design and usage very efficient.

The Transistor (1947). In 1947, William Shockley, John Bardeen, and Walter Brattain invented the "transfer resistance" device (above), AKA the transistor, which would revolutionize the computer and give it the reliability that could not be achieved with vacuum tubes. The key innovation was a valve

that let a weak signal control a much larger flow much as a faucet controls the flow of water.

This was a much more elegant solution to the needs of electronics, being small and using much less power than the vacuum tube. Since it used so little power, it also produced hardly any heat, thus giving it a longer life than a vacuum tube. The transistor dramatically expanded the possibilities for further computer development.

Since ENIAC and other early computers, such as ILLIAC, JOHNNIAC, and MANIAC (*Mathematical Analyzer, Numerical Integrator, and Computer* or *Mathematical Analyzer, Numerator, Integrator, and Computer*), were so huge, future computers were envisioned to grow in size with their capabilities. A prime example was the villainous computer HAL (the letters IBM moved back one position each in the alphabet) from the 1968 movie "2001: A Space Odyssey" (below). To turn it off, one would have to go inside of it. Of course, the real trend for computers, as in other areas of technology, has been progressive miniaturization.

The First Computer Bug. In 1945 the first computer bug was discovered: a moth that was beaten to death in the jaws of a computer relay. Technicians reported they "debugged" the computer, giving rise to today's common terminology. The moth now resides in the Smithsonian.

The Frontiers of Postwar Consumer Technology

Balancing the fears caused by the emerging Cold War was the anticipation of a new age of technological wonders that would revolutionize our lives. Consumers didn't have to wait long, as almost immediately, an abundance of new consumer products appeared to make life easier and more fun.

(Nearly) instant photography: the Polaroid camera (1947). In 1947 Polaroid announced the invention of the one-step camera (above) and started marketing it the next year. Early models could develop a picture in one minute, with instant development finally available in 1979. Such a camera ideally suited a society on the move that increasingly demanded instant results. Although the pictures were not professional quality, they suited the average American family wanting to capture a moment and not wanting to wait a week or two to review it.

Prelude to MacDonal'd's: the Automat. Introduced in Philadelphia in 1902, the automat became a quick and popular form of urban dining during the first half of the twentieth century.

Diners would insert a number of coins into a slot next to a window showing the desired item. They could then lift the window, which operated on a hinge, and remove their food, which was a cold dish such as a sandwich or pie. In many automats, customers could also buy hot food

served cafeteria style from steam tables in the back.

Despite what the name suggests, automats required a large staff for preparing the food in the kitchen and replacing sold items. They reached the peak of their popularity in the 1940s and 50s, but faded from the scene with the advent of the suburbs, increased reliance on the automobile, and drive-in fast food restaurants, such as MacDonal'd's.

The automatic washing machine. During the twentieth century, the days of pounding laundry on rocks by the local stream or river finally ended for most housewives in the Western world.

Although the electric washing machine had been around since 1904 and was fairly common by 1930, it had to go through several developmental changes before becoming the automatic washer we are familiar with.

One major feature was the spin washer, first introduced in the 1930s. Previously, water had to be wrung out with a separate manual (and later power) wringer. By 1940, there were washing machines in 60% of America's 25 million households. In 1947 General Electric introduced what we would recognize as the first modern automatic top-loading washer. By 1953 sales of automatic washing machines had surpassed those of wringer washers.

There's no way to quantify the impact of the washing machine on personal hygiene and health. Similarly, the reduction in the drudgery of washing clothes by hand and the resulting freedom it provided women has even been compared to modern birth control in its impact on the Women's Liberation movement in the 1970s.

The LP or long-playing record (1948). One of the prime features in the history of technology is miniaturization: packing new technology into smaller and more portable forms. Such was the case with the replacement of the 78-rpm with the 33 $\frac{1}{3}$ -rpm record, also known as the LP or Long Playing record.

Although first introduced by RCA in 1931, production halted after two years, largely because of the Great Depression. Columbia resumed development of the LP in 1941, but World War II delayed its introduction to the market until 1948. While the older 78 rpm format could only hold four minutes of material, the 33 $\frac{1}{3}$ rpm record typically held 30 to 45 minutes over two sides of a disc. This proved especially appealing to classical music fans who didn't have to switch records several times in the course of a symphony. In the picture above, a man stands holding a stack of LPs that hold as much music as the stack of 78s next to him.

Some record turntables came equipped with record-changers (introduced in the 1920s), which could automatically play an entire stack of records, double albums often had sides 1 and 2 backed with sides 4 and 3 respectively, so listeners could listen to two sides of the album without having to turn over the record.

Forty years later, another revolution would take place: the CD, which could hold 78 minutes of music on its one side compared to the 30-45 minutes of the LP. And it did this on a disc less than half the size of the LP.

It would take half as long, twenty years, for the next dramatic advance, the digital music revolution, to take place where a pocket-sized device could hold an entire music collection and made it completely portable—all without consuming any plastic discs.

Fun and Fashion in the Forties

Swing dancing was especially popular in the 1920s, 30s, and 40s and was associated with jazz music of the times. Just as jazz had African and African-American roots, so did much of Swing dancing, although some dances, notably the Balboa, originated in the Anglo-American community.

One of the most popular dances to come out of the African-American community in Harlem, the Lindy, served as the basis for numerous variations that evolved into other swing dances.

The term jitterbug, which is popularly associated with a particular dance, actually referred to swing dancers themselves. It was supposedly coined by bandleader, Cab Calloway, who said the dancers on the floor looked like a bunch of jitterbugs.

Postwar fashions. The austerity of wartime carried over into the late 1940s as it took time for most economies to recover and make clothes and fabrics available and affordable. Thus skirts and dresses tended to be shorter and tighter to conserve on cloth.

Adding to this trend was the influx of women into the workforce during the war. Skirts and dresses had to be more comfortable and practical for women in office jobs, while Rosie the Riveter wore totally functional dungarees in the factory.

Although not a fashion statement at first, teenage girls (AKA Bobbysoxers, above) continued this trend into the 1950s, making jeans and slacks only become more prominent as part of a woman's wardrobe over the decades as society has become less formal.

Postwar austerity applied to food as well, which was rationed even more strictly in Britain, as it exported grain to keep Germany from starving. As a result, people were generally fitter and trimmer, which clothing styles also reflected.

Not surprisingly, when economies recovered and fabrics became more readily available in the late 1940s, dresses became longer and fuller, a trend that continued into the 1950s.

One fashion accessory that has disappeared as a must for both ladies and gentlemen is the hat. There was a time in Western culture where a woman's hair was kept from public view much as it still is in traditional Muslim society. Even as women's hair became more visible in high society, modesty still demanded ladies wear a hat. As a result, hat styles changed as regularly as dress styles, the fashion capital for both being Paris. Below are the *spring* hats for 1944.

Growing informality in society saw the demise of hats, both men's and women's, in the 1960s. Apparently, after that, no one seems to have cared how they appeared to the rest of society.

139. THE EVOLUTION OF MODERN WAR & ANATOMY OF COLD WAR CRISES

Introduction. By 1948, the United States and Soviet Union had established their respective spheres of influence in Western and Eastern Europe. However, unlike World War I when a definitive treaty emerged to determine a new balance of power, no such treaty emerged after World War II because of the quick falling out between Stalin and the Western allies. So far, the post-war settlement had been determined without direct conflict between the two superpowers. But, by 1948, when the two superpowers had established their spheres of influence, they started confronting each other in what is known as the Cold War.

The Cold War crises always stopped short of direct war between the two sides because their growing nuclear arsenals made such a war potentially suicidal to both sides. Already by 1945 two world wars in quick succession had shown the spiraling destructive potential of modern technology. At first, it took a while for both sides to realize nuclear weapons were much more than just big conventional bombs.

Even when that lesson sank in with the realization that nuclear war was played by a different set of rules, it still was not clear just what those rules were; but it was clear we could not risk such a conflict. Before the twentieth century, diplomats could use the threat of war as one tool in their efforts to resolve a crisis. However, with the nature of war so radically different, the rules of diplomacy also had to change drastically. The question was how. To the diplomats and leaders who had gone through two previous world wars, the answer largely lay in analyzing what had gone wrong in 1914 and 1939.

The road to total war (1789-1945). Many times throughout history people during wars had exercised little or no restraint in killing each other. Therefore, war, as horrible as it was, had never seriously threatened the very existence of our species. In the twentieth century it did.

The root of the problem lay in two things: the spirit of nationalism born during the French Revolution and the mismatch between the slow rate of change in cultural attitudes toward war compared to the

accelerating pace of technological change triggered by the industrial revolution. The first of these, nationalism, made universal conscription possible, drawing upon the whole population of France and producing huge armies of loyal, at times enthusiastic, and relatively cheap recruits. Universal conscription dramatically changed the scale of warfare, but that, combined with the industrial revolution, would change everything about war.

By 1914, industrialization had spawned revolutions in communications, transportation, and warfare. In communications, the telegraph and telephone drastically cut the time of communications between governments. That alone might have been manageable, except that, with the telegraph used in conjunction with railroads, armies could mobilize much more quickly, giving diplomats hardly any time to reflect on their situations and negotiate a settlement. As a result, the various powers' provocative behavior in 1914, especially Russia's mobilization (an act once accepted as a legitimate diplomatic strategy) spun out of control into war.

Industrialization also triggered dramatic population growth while mechanized production freed a much larger percentage of that population from farming and factory work for the armies. By 1914, combining those huge armies with the mechanized firepower of weapons such as the machine gun, poison gas, and more powerful artillery gave industrial nations the recipe for a level of carnage and destruction hitherto undreamt of. Not only that, but after the initial battles ending with the First Battle of the Marne, the two sides' armies spread out in an attempt to outflank one another. However, since both sides had millions of men, each with many times the firepower of their ancestors, they were able to fill in a solid line of trenches from the mountains to the Sea. The continuous front had been born, but because the technology of defense was more effective than that of offense, neither army could go around or through the other. Not that they didn't try. They did and with tragic results. Thus the continuous front was also a static front with material damage mainly limited to a narrow strip of land. That would change in the next war.

Between the wars, diplomats, in their efforts to prevent another such disaster, focused on, and tried

to avoid the provocative diplomacy of 1914. Unfortunately, they went too far in their efforts to keep the peace in the 1930s, constantly meeting Hitler's aggression with appeasement. This only encouraged more aggression while Hitler built up his power. Therefore, the Second World War broke out only twenty years after the end of the First.

By 1939, industrialization had further expanded populations and the armies they could fill, while it also supplied those armies with even more destructive weapons. Two of these in particular, the tank and airplane, which had just made their debut in the previous war, now came into their own. Tanks, rather than eliminating the continuous front, just made it mobile, thus spreading the swathe of destruction from a limited static front to one that engulfed all off Europe. Airplanes exacerbated this effect, especially with long-range strategic bombing that now made cities and their civilian populations behind the battle lines primary targets.

Unfortunately, if the Second World War seemed to spawn another quantum leap in the destructive capability of modern technology, the entry of a weapon of even more devastating power heralded the end of that era and the start of a whole new era in the history of human warfare: the atomic bomb. Even more ominous was the development of thermonuclear, or hydrogen, bombs just seven years later using a fusion reaction to generate an explosion that dwarfed that of the of the Hiroshima bomb's fission reaction in much the same way that it had dwarfed conventional bombs. Whereas a simple chemical reaction was the basis of warfare in the age of gunpowder (c.1500-1945), the key to the Atomic Age was a much more complicated chain reaction taking place inside the nucleus of the atom, something so small we still didn't have microscopes powerful enough to see it. But we could unleash, if not control, its destructive force. Now the very survival of civilization was on the line, and a way had to be found to avert a clash between the two nuclear superpowers, the United States and Soviet Union.

New rules for a new game. Therefore, the Cold War assumed the form of a series of crises that were resolved along two lines of development: either by non military means or by fighting by proxy (substitute) where one or both powers fought each other indirectly by supporting smaller allied states

in regional wars. The Korean (1950-53), Vietnam (1954-75), Arab-Israeli (1948, 1956, 1967, 1973, and 1982), and Afghan (1979-89) wars were all examples of the superpowers exploiting regional conflicts to promote their own ends.

Crises involving the Americans and Russians in a direct confrontation ran a higher risk of erupting into all out war. Therefore, each side would carefully assess the seriousness and strategic value of the crisis to its own and the other side to calculate how far it could go without starting World War III. This assessment would be based largely on three factors. First was the strategic value (in terms of location and/or resources) of the target country at the center of the crisis. For example, any crisis over the oil-rich Middle East would have serious implications. So would a crisis over any strategic choke points such as the Suez and Panama Canals or Turkey's control of the Hellespont threatening Russia's access from the Black Sea to the Mediterranean.

The second and third factors were which superpower's sphere of influence the target country occupied and the diplomatic ties it had with each side. These would usually, but not always, belong to the same power, giving that power a decisive "home field" advantage in the crisis. However, crises where diplomatic ties did not correspond to the sphere of influence tended to run the highest risk of escalating into war because it wasn't clear who held the all-important home field advantage.

Two examples of such a situation were the Berlin Blockade in 1948-9 and the Cuban Missile Crisis in 1962. In the former crisis, West Berlin had strong diplomatic ties with the West but was located in the middle of Soviet controlled East Germany. The Cuban Missile Crisis saw just the opposite situation, with Cuba in the United States' traditional sphere of influence, but having strong diplomatic ties with the Soviets. In each case it was unclear who had more at stake and was willing to go farther in defense of what it believed to be its "home turf". This was where the chances of miscalculation and the risk of war ran the highest.

Having assessed the risks in a crisis, each side needed to pursue a strategy between being too aggressive and too weak, such as those which led to World Wars I and II respectively. This needed to

meet three criteria. First, it must show strength and resolve without being too provocative. Second, playing a dangerous game known as *brinkmanship*, it should push the other side into a position that would make any further escalation of the crisis run the risk of war, thus forcing it to back down. For example, during the Berlin Blockade, the United States and Britain airlifted supplies into West Berlin rather than crashing the land blockade Stalin had set up. This avoided committing an act of aggression that might lead to war and it forced Stalin into the position of either letting the planes through or actively shooting them down, which would also lead to war.

Finally, the strategy in a crisis should provide the opposition a face-saving way to back down without feeling publicly humiliated. The United Nations could play a valuable role here as mediator to defuse the crisis. So could secret diplomatic deals between the two powers, such as the secret agreement by the U. S. to remove its missiles from Turkey if Russia would publicly agree to take its missiles out of Cuba in return for a public commitment that the U.S. would not invade Cuba. Recognizing the value of such secret “back channels”, the two powers installed a “hot line” after the Cuban Missile Crisis, thus providing direct communications with one another during any future crises.

It is important to note that these were not hard and fast rules that were ever written down in a handbook so both sides knew exactly how to deal with one another. Rather they were vague principles that evolved through trial and error as the two sides struggled to find a way to deal with the new sort of world nuclear weapons had created. However poorly articulated these principle were, during the most dangerous half-century of human history to that point they helped the United States and Soviet Union break the pattern of resolving differences through total war. In the process, they avoided nuclear Armageddon and provided some glimmer of hope that the human species might survive its technological adolescence.

THE EARLY COLD WAR (1948-53)

The Cold War in Europe (1948-55). The first Cold War crisis was over Germany, which was divided between Soviet and Western spheres of influence in 1945. France, Britain, and the United States held the Western two-thirds of Germany, while Russia held the eastern third. At first this division was meant to be temporary with a permanent settlement to be hammered out in the future. But Stalin and the Western allies were soon at odds over the fate of Germany. Stalin wanted it to be Communist and the Western allies wanted it to be Capitalist and democratic.

In 1948, the United States and its allies made several moves that led to a crisis: the formation of a military and economic alliance that was aimed against a resurgent Germany but which Stalin thought was against him, the Marshall Plan to stop the spread of Communism, the unification of the three western sectors into what would become West Germany, and the introduction of a new currency to stabilize the German economy. Stalin kept this new currency out of his sector and tried to introduce his own currency into the West. The allies responded by keeping his currency out of the West. Stalin, sensing a resurgent West German economy and fearing that this might threaten his dominance in East Germany and Eastern Europe, raised the stakes in what is known as the Berlin Crisis.

Berlin, which itself lay deep inside East Germany, was divided between the allies in much the same way as the rest of Germany. The Western allies had access to West Berlin through three land corridors and three air corridors. Therefore, West Berlin was quite vulnerable to Soviet pressure, and that is where Stalin struck.

On June 24, Stalin started cutting off utilities and the flow of traffic and supplies along the three land corridors leading into West Berlin. This presented the Western Allies with a difficult choice. If they abandoned West Berlin to its fate and let Stalin have his way, it would encourage more aggression that might lead to war just as a similar sort of appeasement had done in 1939. By the same token, crashing the Soviet blockade could lead to war just as similar acts of aggression had done in 1914.

The Allied solution was tedious but ingenious: an airlift of supplies into West Berlin. This would supply West Berlin while using three-dimensional air space that could not be blockaded. It was a classic case of brinkmanship, since stopping the airlift would require shooting down American and British planes, which might provoke a war. Since the United States had the Atomic bomb and he did not (at least until the following year), Stalin did not want to risk a war with the United States. Therefore, he let the planes go, hoping the British and Americans would get tired of this costly operation. They did not. For nearly eleven months, they kept up the round-the-clock flights that were only 30 seconds apart, taking in supplies and taking out some 50,000 sick, elderly, and very young people. Besides food and medical supplies, they also took in cars, heavy machinery, and even Clarence the Camel, a defiant symbol to Stalin that the Western Allies could bring anything they wanted into West Berlin.

Each succeeding day of the airlift embarrassed Stalin with proof of the West's technical ability to pull off such a feat. After eleven months, he lifted the blockade. The Berlin airlift had saved West Berlin. It had involved 276,926 flights that brought in 1,592,287 tons of supplies at the cost of 24 air crashes and 79 lives. The importance of the Berlin Crisis was that it stopped further Stalinist aggression in Europe. The same month that the blockade was lifted (May, 1949), West Germany was formed as a parliamentary democracy.

The Berlin crisis prompted two rival alliances led respectively by the United States and Soviet Union. In 1949 the North Atlantic Treaty Organization (NATO) was formed between the United States, Britain, France, Belgium, the Netherlands, Luxembourg, Greece (1952), and Turkey (1952). It was mainly a defensive alliance to stop Soviet aggression by hemming it in to the west and south. In 1954, the NATO allies, in need of manpower and firepower to combat the Soviets, allowed West Germany to rearm itself and admitted it to NATO. Outside of the United States, the West German army became the biggest and best-trained army in NATO.

A similar alliance, the South East Asia Treaty Organization (SEATO) was formed in 1954 between the United States, Britain, France,

Pakistan, Australia, New Zealand, Thailand, and the Philippines to contain the Soviets and Communists to the south and east. A third alliance, the Mideast Treaty Organization (1955) completed the ring of hostile powers on Russia's borders to the south. These alliances proved to be less stable and reliable than NATO, but they did ring the Soviet Union with unfriendly alliances, which alarmed its leaders.

In response to this threat, Russia formed the Warsaw Pact in 1955 with its satellite states in Eastern Europe: East Germany, Czechoslovakia, Romania, Hungary, Bulgaria, and Albania. Making this threat much more potent was the fact that the Soviets now had nuclear weapons of their own. In the following years, Britain, France, China, and India would join the "nuclear club" and all but India would develop their own nuclear arsenals.

Therefore, by the mid 1950's, distinct battle lines had been drawn in Central Europe. Armies which people expected to be demobilized and sent home in 1945 remained in place for nearly a half century, draining their countries' economies, turning Central Europe into an armed camp, and presenting the constant threat of war, which this time would probably be accompanied by a devastating nuclear exchange. Whole generations grew up under the ominous cloud of this atomic umbrella, acutely aware that the next war might well be the last for the human race.

The struggle widens: East Asia (1945-53). World War II had been a truly global war, especially involving Europe's colonial empires in Asia. By the mid twentieth century, the areas outside of Europe loomed much larger in importance as they shook off Europe's grip and started developing on their own economically and politically. Japan had led the way since the late 1800's, and its early success against the European colonial powers inspired others in Asia to challenge European supremacy as well.

One such country was China, whose civil war between the Communists led by Mao Zedong and the Nationalists led by Chiang Kai-shek had been interrupted by World War II. That civil war resumed right after Japan's defeat. Although the Nationalists started out with more men and resources, the Communists had Soviet help, both in the form of weapons and high ranking Nationalist officers who were actually Stalin's moles and

repeatedly betrayed Chiang Kai-shek's. By 1949, the Communists emerged victorious, and the West found itself confronted by another Communist power that was heavily backed by the Soviet Union. The ensuing clash between Communist East and Capitalist West came in a third country: Korea.

The victorious Americans and Soviets partitioned Korea, which had been occupied by Japan since the early part of the century, after the war at the thirty-eighth parallel. Soviet dominated North Korea became Communist, while American backed South Korea was capitalist and democratic, at least in form. In 1950, North Korean forces invaded South Korea and overran most of it.

This crisis brought to the forefront the fledgling United Nations, founded in 1945 in the recurring hope that such an international organization could help defuse conflicts and safeguard the peace. The members of its main executive body, the Security Council, each had the power to veto any proposed actions. As luck would have it, when the Security Council met to discuss the Korean crisis, the Soviets boycotted its meeting. This allowed the United States to pass a resolution calling for an international force to stop the North Koreans.

The bulk of this force consisted of American troops led by General Douglas MacArthur. With the United Nations forces barely hanging on to a toehold in the south, MacArthur landed an amphibious invasion behind North Korean lines and drove them back north. When the U.N. forces advanced dangerously close to the Chinese border in the North, Chinese forces entered North Korea and drove them back south. What ensued was a long bloody stalemate that ended with a ceasefire at the original border, the thirty-eighth parallel. The Korean War had two major results. For one thing, it contained the spread of Communism, but at the cost of a divided Korea and the loss of millions of lives and untold material damage.

It also affected Japan where the United States was worried about the further spread of Communism and Soviet power into East Asia. Feeling that poor and unstable conditions created the ideal conditions for the spread of communism, the United States decided to provide Japan with economic aid to help it revive. As a result, Japan's prosperity and stability rapidly recovered, making it a strong ally

and trading partner for the United States. However, by the 1980's, Japan' was seriously challenging American dominance of world trade.

A growing climate of fear. In the 1950s, Soviet possession of the atomic bomb, the emergence of an aggressive and hostile Communist China, American support for South Korea and Japan, and the development of thermonuclear weapons by the United States in 1952 and the Soviet Union only a year later all served to create a climate of growing fear and paranoia on both sides. Stalin's behavior inside the Soviet Union did nothing to allay those fears. During World War II, he had to lighten up a bit on his repression and terror in order to encourage his people to fight the Fascists. After the war, however, he re-established his terrorist regime, instituting a new round of purges against talented subordinates who had emerged during the war and he saw as threats to his regime. This, in turn triggered a wave of paranoia and recriminations in the United States about the ubiquitous communist threat, feeding into the dark days of Joe McCarthy's hearings and J. Edgar Hoover's use of the FBI in his secretive campaign against suspected Communist traitors.

Even after Stalin's death and the discrediting of McCarthy, the new Soviet leadership found it difficult to dismantle the whole Stalinist system without risking the entire fabric of Soviet power coming unraveled. Therefore, the legacy of paranoia persisted on both sides for decades, fed by and feeding into growing stockpiles of nuclear weapons, not just in the United States and Soviet Union, but also in Britain, France, and China as they all joined the "nuclear club" and developed their own nuclear arsenals. The world was still a very dangerous place, and seemingly more dangerous with each passing day.

The Berlin Airlift (1948-49)

West Berliners watch an American C-54 coming in for a landing during the Airlift

The Yalta agreement provided the U.S., Britain, and France each with its own sector of Berlin, dividing it up much as Germany overall had been divided. The problem was that Berlin was deep inside the Soviet controlled sector of Germany, with the Western allies having three narrow land and air corridors through which to supply their part of the city.

Map showing the division of Germany into different sectors and the three air corridors accessible to West Berlin across East German air space

In 1947, when Britain and the U.S. made moves to combine their sectors into one sector known as Bizonia, Stalin started shutting off one road or another for a time, or discontinuing water service due to "technical difficulties". The next year, the allies convinced France to join in combining their sectors into one West German territory and started to replace the old German Reichsmark currency with a new Western German Deutschemark, allowing West Berliners to exchange 60 old marks for 40 new ones. At the same time they imported 20 million cigarettes to stabilize the economy, which started to revive.

Alarmed by these moves, Stalin introduced his own East German mark. East Germans quickly realized the superior strength of the West German economy, trading seven or eight of their own marks for one West German mark.

In June 1948, when the Western allies refused to allow the East German currency into their sector, Stalin blockaded the land corridors they needed to supply West Berlin. He figured the West's only options were either to crash the blockade, which would likely lead to war, or give up West Berlin, which, being so deep inside East Germany, was nearly impossible to defend.

However, the British and Americans saw another option: to airlift supplies into the besieged city. Since Stalin couldn't build a wall 30,000 feet high to blockade the air corridors to stop this, he could only stop the planes by shooting them down, which would lead to war, an unacceptable option since the U.S. was the sole nuclear power at the time.

"Why shouldn't it [airlift] work, they dropped so many bombs on Berlin, they should be able to drop potatoes." --Berlin woman talking about the plan to airlift supplies into West Berlin during the Soviet blockade.

However, safely landing potatoes was a much more daunting task than dropping bombs, because Berlin's population of 2,000,000 needed 12,000 tons of supplies each day and only had 36 days of food and 45 days of coal stockpiled. Many Berliners were still collecting scrap wood for fuel from bombed out buildings. Therefore, Stalin figured the West had neither the capability nor will to carry out such a task.

He was wrong on both counts.

This was especially true after President Truman's astounding reelection in November 1948 freed him from some of the political pressures by various groups trying to influence his handling of the Berlin Crisis. Still, it was a daunting task.

The allies worked around the clock, 24/7, even by the light of jeep headlights if necessary. Transport flights on the 275-mile route between Berlin and Frankfurt Planes landed at 30-45 second intervals, so if a pilot missed his approach to Berlin, he had to return to West Germany.

The U.S. Air Force was training 100 crews a month in Montana to fly within the three 20-mile wide corridors between Berlin and the West. The air control rooms at West Berlin airports were also frantically busy, as they had to coordinate flights to accommodate one landing every 30-45 seconds.

Transporting coal (left) was a particular problem because coal dust would get in the engine. To combat this, pilots flew with the cargo doors open so the coal dust would get sucked out the back.

At the other end, West Berliners transferred cargo from supply planes. Turnaround time from landing through unloading to taking off again for West Germany was 30 minutes. German Workers could eventually empty a plane in 7 minutes.

Over time the allies got increasingly better at supplying the city. While the Americans added more and bigger planes to their fleet, Berliners helped the French build a third airfield in their sector at Tegel. Since the Soviets refused to remove a control tower obstructing the runway's approach, the French blew it up. When an angry Soviet general demanded to know how they could do such a thing., the French General Jean Ganeval answered, "With dynamite, my dear colleague."

On September 18th, the allies delivered 7000 tons of supplies. By spring, 1949 they had increased that to 8000 tons a day. On Sunday April 15, 1949, during what they called the Easter Parade, they delivered 13,000 tons, finally passing the 12,000-ton threshold.

Aiding the allies' were an especially mild winter and West Berliners' efforts to use every available bit of space to grow food, although they also grew tobacco as remnants of the cigarette economy carried on. To reduce food needs, some 50,000 people were also evacuated from West Berlin.

While life was hard in West Berlin during the blockade, one factor making it a bit more livable was that passage between the two sectors was open. An estimated 10% of West Berliners survived by buying supplies in the eastern sector. Soviet propaganda and photos played this up, trying to convince people the airlift was a failure by showing hungry children and little girls from West Berlin having to shop in East Berlin.

Electricity was another matter, because Stalin had stripped power plants in the western sector of their generators before the allies had moved in. This forced Western authorities to ration power to West Berlin in four-hour intervals on a rotating basis. Thus, a family might get power from midnight to 4AM one day, from 4-8AM the next day, and so on. As a result, movies were played in the middle of the night and concerts by candlelight. Loudspeakers mounted on trucks would broadcast the news. Dentists' wives even generated power with bicycle generators.

Also complicating matters were unusual amounts of fog in November and December and Soviet efforts to sabotage the operation by *buzzing* (flying dangerously close to) their planes and trying to blind pilots with search-lights.

All things considered, there were remarkably few accidents. Thirty-one Americans lost their lives in 17 crashes, while 40 British crewmen died in 8 crashes. Berliners mourned the deaths of those airmen as their own, even though they had been dropping a very different sort of load on the city just a few years before. Allied pilots became new heroes to the West Berliners and even inspired Berlin children to play like they were airlift pilots.

One American pilot, Gail Halverson, gained fame and the nickname the “Candy bomber” by dropping pieces of candy attached to little parachutes to Berlin children. This even had an impact on the hobby industry back in the States, marketing modeling kits of the C-54 “Candy Bomber” flown by Gail Halverson. During the 50th anniversary celebration of the Berlin Airlift

in 2009, Halverson returned to reenact the candy drops he made so famous.

Just to show Stalin they could airlift anything they wanted, the allies brought a baby camel named Clarence into Berlin. Other things flown in included cars, giant replacement wheels for C47s, and heavy construction equipment. When vital construction equipment proved too big and heavy to bring in one piece, a Brazilian engineer came up with a technique for dismantling the machinery, bringing the individual parts to Berlin, and reassembling them there.

Whether because of Clarence the Camel, the airlift, or the West’s counter-blockade cutting coal and steel to East Germany, Stalin finally gave up on the blockade in May 1949 and let supplies into Berlin. As the sign on the first truck into the city announced, West Berlin was still alive. However, the issue of West Berlin existing as a haven of freedom in the midst of the Soviet bloc would remain an issue throughout the Cold War.

The Forgotten War: Korea (1950-53)

In September 1945 American occupation troops landed under General John Hodge. He ignored local Korean parties and instead relied, incredibly, on over 500,000 Japanese troops and tens of thousands of Japanese bureaucrats to run the country, which deeply offended the South Koreans. The Japanese were eventually replaced, so the US needed Koreans to help, but were unwilling to include communists, who were numerous. Instead, they relied on professionals, especially ones educated in the U.S. or by American missionaries, while ignoring how unpopular or corrupt they might be.

The American-supported leader of South Korea was the contentious Syngman Rhee. Rhee was American-educated (the first Korean to get a degree at an American university) and had spent most of the period of Japan's occupation of Korea (1910-45) in the U.S. While he had connections in America, he had no real support base in Korea. However, until the North Korean invasion, American officials didn't really care, not seeing any value in Korea and ignoring Korean feelings to the point of even using Japanese troops to keep control in 1945. Rhee's stubbornness would prove a major stumbling block in future negotiations at Panmunjon.

Kim Il Sung, the popular communist leader of North Korea, had opposed the Japanese during the war and worked with the Soviets, who put him in charge of North Korea after the war. Following the pattern of Lenin and Stalin, he broke up great estates and gave them to peasants, initially without collectivization. He also ruthlessly suppressed any opposition, causing many non-communists to flee to the South. His regime and that of his son, Kim Jung Il, would prove to be among the most brutal and repressive dictatorships during the Cold War.

Kim Il Sung constantly sought Stalin's permission and support to invade the South. When Mao and the communists finally seized control of China in October 1949, Stalin gave the green light as part of a three-way deal. Stalin would supply China and North Korea with arms, while China and North Korea supplied the bodies and blood to tie down and wear out U.S. forces and resources.

By spring, 1950, large numbers of Soviet tanks, planes, artillery, and machine guns had been delivered to North Korea and were amassing on the border. Despite reports of a buildup, MacArthur and his

staff in Tokyo ignored the signs, and then panicked when the invasion started.

On June 25, seven divisions led by big T-34 tanks, arguably the best tanks to fight in World War II, struck across the border, completely surprising the South Korean army and quickly driving it into full retreat. Three days later, they took the South Korean capital, Seoul. In order to slow the communist advance the South Koreans blew up bridges in the invaders' path, in one case killing thousands of refugees as well.

This crisis brought to the forefront the fledgling United Nations, founded in 1945 in the recurring hope that such an international organization could help defuse conflicts and safeguard the peace. The permanent members of its main executive body, the Security Council, each had the power to veto any proposed actions. As luck would have it, when the Security Council met to discuss the Korean crisis, the Soviets were boycotting the meeting in protest over Taiwan, instead of Mainland China, getting the Chinese seat on the Security Council. Russia's absence allowed the United States to pass a resolution calling for an international force to stop the North Koreans.

The first forces sent to help South Korea were Americans from the occupation force in Japan. Unfortunately, by 1950, thanks to the soft life in Japan, they had lost all combat readiness, in terms of both training and equipment. They also had no respect for the North Koreans they were about to face, thinking they would just run away as soon as the Americans landed.

They were wrong.

Instead, the Americans, who fought as well as could be expected, were outgunned and outclassed by the North Koreans every step of the way. Among other things, they had no weapons that could stop the enemy's T-34 tanks. By

September, American and South Korean forces, along with hundreds of thousands of refugees, were barely hanging on to a toehold around the port city of Pusan in the extreme south of the peninsula. Only American bombing of North Korean supply lines had any effect in slowing down their advance.

On September 15, UN forces led by MacArthur struck back. Instead of hitting the North Koreans head-on, MacArthur, despite tricky tides and beaches, sparse information on enemy defenses, and contrary advice by subordinates, engineered a risky amphibious landing 150 miles behind North Korean lines at Inchon. Luckily, it was a success, which forced the North Koreans into a headlong retreat northward to avoid getting trapped between the armies of UN forces. After heavy resistance in which 50,000 civilians were killed, Seoul was recaptured (9/25). Two weeks later, MacArthur crossed the 38th parallel into North Korean territory, taking its capital, Pyongyang (10/19), the only communist capital to fall during the Cold War.

Stalin, not wanting to get directly involved against the United States, pushed China to support North Korea. Therefore, China, by way of the Indian ambassador in Beijing, started warning the U.S. to stop its advance, which was rapidly approaching the Chinese border at the Yalu River. MacArthur wouldn't listen.

Meanwhile, Truman, worried about China intervening, met with MacArthur at Wake Island (below). The general assured Truman that his continuing advance through N. Korea carried no risk of Chinese intervention. MacArthur even snubbed the president's invitation to lunch. But with mid-term elections coming up, Truman had to be nice to the highly popular general, even describing their meeting as the most satisfying of his career.

Six weeks after this meeting, despite MacArthur's confident assertions, massive Chinese intervention was driving UN forces in headlong retreat. It started as a warning shot. On October 25, as UN forces were driving toward the Yalu River, Chinese forces suddenly struck in two ferocious and devastating attacks on forward units of the UN army. UN forces didn't even realize they were Chinese until they found that some prisoners they took were unable to understand Korean. Then, as suddenly as they had attacked, they were gone, with no trace of the Chinese army to be found.

Rather than take this warning seriously, MacArthur continued his advance northward toward China, sure that he could easily sweep aside any Chinese forces that dared challenge him. So overconfident was he that he split his forces going north and sent what he considered spare ammunition back to Japan. As far as he was concerned, he had won the war and the troops would be home by Christmas.

On November 26, right after Thanksgiving, 300,000 Chinese troops drastically changed MacArthur's Christmas plans. The Chinese general, Peng Dehuai, compensated for his army's lack of modern equipment with effective infiltration tactics away from the roads and enemy detection. As a result, MacArthur and UN forces, who were tied down to wheeled vehicles and the roads that could carry them, were caught completely off-guard. (Peng would later be rewarded for his service to China by being executed as a traitor to Communism during Mao's Cultural Revolution.)

Being assaulted from the surrounding hills, UN forces soon found themselves engulfed in successive human waves. Typically, they would mow down wave after wave until they were out

of ammunition and were either overrun or had to retreat, leaving their wounded behind.

A napalm bomb hits Chinese positions blocking the breakout from Chosin Reservoir as marines prepare to move on. Despite their hardships and desperate position, the marines fought their way out, making this one of the most celebrated exploits in the history of the Corps.

*“It was enough to make your hair stand on end...When the bugles died away we heard a voice through a megaphone and then the blast of a police whistle. I was plenty scared, but who wasn't? I couldn't believe my eyes when I saw them in the moonlight. It was like the snow coming to life, and they were shouting and shaking their fists--just raising hell...The Chinese didn't come at us by fire and maneuver...they came in a rush like a pack of wild dogs. Even though I was ready it was a terrible shock.”--
Martin Russ, *Breakout**

Making this especially bad was the fact that it was happening in the midst of the Korean winter, so that frostbite claimed more victims than combat did. An army that just days before thought it had won the war was now in full retreat, trying to use a scorched earth policy to slow down the enemy. Caught in the middle were thousands of Korean civilians, many of whom were killed in the crossfire or even blatantly massacred.

On December 6, the communists retook Pyongyang.

On January 4, 1951, Seoul fell for the third time in six months.

Despite their hardships and desperate position, the marines fought their way out, destroying several Chinese divisions in some of the most celebrated engagements in the Corps' history. Making this even more remarkable was the Marines' custom of not leaving any of their own behind.

Meanwhile, MacArthur openly advocated invading China and using the Atomic bomb. Truman, seeing this would be a whole new kind of war if nuclear weapons were added to the equation, realized the foolhardiness of such an action. Finally, on April 10, 1951 he relieved MacArthur of his command. It was one of the most controversial and divisive acts of Truman's presidency, but he refused to back down, asserting the principle of civilian control of policy.

In January, Truman had put General Matthew Ridgeway in charge of the fighting in Korea, an inspired choice, who instilled the UN forces with new fighting spirit. By January, 1951, they had stopped the Chinese offensive and were counterattacking in February. By late March they had recaptured Seoul and reestablished their line at the 38th parallel, the original border before the war started. In late April, they met and repulsed another Chinese offensive.

Stalemate (1951-53). By now the front was stabilizing along the 38th Parallel where a prolonged war of stalemate would develop, with neither side able to dislodge the other with conventional weapons or willing to use nuclear weapons and risk a Third World War. Instead, the fighting reverted to a style of trench warfare more reminiscent of World War I. On the one side the huge numbers of Chinese soldiers entrenched in the hillsides held up any UN advances, while overstretched supply lines going back to China and American artillery and air superiority hampered any Chinese offensives.

By July, 1951 the Korean War had turned into a stalemate characterized by trench-lines much as in World War I.

Instead, fighting took the form of small night patrols where casualties were counted in single digits instead of the thousands. However, over time all those single digits add up.

The Air War. Air combat largely centered over an area known as Mig Alley. Russian-made Mig-15 jets, flown by Chinese, North Korean, and Russian pilots, briefly gave Communists the edge in the air war, because of their swept-back wing design, which made them more maneuverable. The Korean War was the only time during the Cold War that Americans and Russians directly fought each other. Although the Americans knew they were facing Russian pilots, they chose not to publicize it, since that might increase tensions with Russia.

Flying a jet in combat created a whole new set of problems as well as possibilities for pilots in the Korean War, since the higher speeds demanded a much higher turning radius and quicker reflexes than with slower propeller driven planes. By 2000 computers and more sophisticated weapons systems would take over much of the task of flying in combat, to the extent that totally unmanned drones would perform some missions.

Napalm hits a N. Korean railroad yard during Operation Strangle. Such direct hits were rare for high-speed jets dropping

“dumb bombs” while flying through smoke and flak.

Operation Strangle was an effort to destroy communist supply lines. However, the campaign ultimately failed because the static battle-lines and lower intensity fighting reduced the Communists’ supply needs, while hitting specific targets with “dumb” bombs at such high speeds was extremely difficult. Also, roads and bridges were easier to repair than expensive jets lost in such raids. UN forces lost 330 planes during this operation.

Therefore, UN forces turned their attention against North Korea’s industrial base, infrastructure, and cities. American bombing raids against the four largest hydroelectric power plants in North Korea reportedly cut power throughout country. By the end of the war, saturation bombing by American B-29 bombers, besides destroying North Korea’s cities, may have killed over one million North Korean civilians. With most of its industries and cities in ruins, the survivors fled to the countryside.

North Korean civilians huddle in a shelter that also serves as their makeshift home, since, their real home was destroyed by aerial bombing.

The strategy worked in that Kim Il Sung did ask Stalin to agree to a ceasefire. However, the war was costing Stalin virtually nothing compared to what America was spending, and he was impervious to the suffering of the Korean people. So the war dragged on.

Peace talks started in 1951 at Panmunjon, but dragged on for two years, since Stalin was only interested in looking like he was interested in peace. Besides being confrontational and provocative, the Communist negotiators also arranged for their UN counterparts to be seated

in lower chairs so they would feel more intimidated.

One issue was treatment of prisoners. Initially, the North Koreans had been in charge of prisoners, but because of their brutal treatment one-third of all UN prisoners died the first winter from starvation, dysentery, and mistreatment. Therefore, the Chinese took over, providing more humane treatment, but also subjecting their prisoners to lengthy propaganda lectures and brainwashing sessions. Another sticking point was that North Korea claimed it held only 3,000 prisoners, while the UN claimed it was 11,000.

On the other hand, the UN claimed that up to half of the North Koreans taken prisoner wanted to stay in the democratic South rather than go home. Communists claimed the UN was making that figure up and wanted all the prisoners back.

End of the war. In 1952, Dwight D. Eisenhower, America's top commander in World War II, was elected president, largely on the pledge that he would end the war in Korea. Even more decisive was the death of Stalin in March 1953, removing the major stumbling block to peace. In May, Eisenhower threatened to bomb Beijing with nuclear weapons, while bombing North Korean dams led to disastrous flooding. After heavy fighting and losses in June, the new Soviet leadership, wanting to focus on matters at home, agreed to a ceasefire in July, 1953.

In the prisoner exchange, 12,000 UN troops were traded for 50,000 communists, although two-thirds of the Chinese prisoners supposedly wanted to defect to Taiwan. Some hardcore Communist prisoners tore off their UN-issued clothes and crossed the border naked.

Losses in the war were heavy:

- The U.S. lost 54,000 killed and 100,000 wounded.
- Other UN forces lost 3,000 killed and 12,000 wounded.
- South Korea lost 415,00 killed and had 5 million refugees.
- North Korea lost an estimated 1 million killed

- China lost an estimated 250-500,000 killed.

The Korean War is often called the Forgotten War, because it didn't get the heavy coverage of previous wars or the media coverage of the Vietnam War a decade later. This was largely because it was so soon after World War II and Americans weren't ready for the emotional involvement required by such a war. Besides, the Korean War was not a declared war, but rather a "police action", making it even harder for the American public to get involved. Therefore, it had very little newspaper coverage. The best one could get was a daily column on page 2 of the *New York Times*.

Highlighting the forgotten aspect of this war is the fact that it wasn't until 1995, forty-two years after the ceasefire ending the war, that a national memorial was finally dedicated to its veterans in Washington D.C.

McCarthyism (1950-54)

"This is the most unheard of thing I've ever heard of."--Joe McCarthy.

No episode in American political history better teaches us how fear and paranoia can take over a society than the episode of Senator Joe McCarthy from Wisconsin. He enlisted in the marines as an intelligence officer during World War II, thinking that being a marine would help his career. He called himself "Tail-gunner Joe" claiming to fly 32 missions (when it was actually just one) to qualify for a Distinguished Flying Cross. In his capacity as an intelligence officer,

he forged a letter of commendation from his commanding officer and countersigned by Admiral Nimitz, and claimed that an injury was a combat wound when it actually occurred during an initiation ceremony while crossing the equator for the first time.

He resigned his commission in April 1945, five months before the end of the war, and ran for the Senate the next year. He attacked his opponent for war profiteering (although he made nearly as much in investments during the War as did his opponent) and for not enlisting for the War, although his opponent was 46 when Pearl Harbor was bombed.

His first three years as a senator were unremarkable, until he lobbied to commute the death sentences of a group of SS officers convicted of massacring American prisoners, claiming, without substantiation, the Army had tortured them to get confessions. Soon after that, the Senate press corps voted him "the worst U.S. senator" currently in office.

At this point, growing fear about communism generated by recent events (the fall of China to the communists, Stalin's takeover of Eastern Europe and getting the atomic bomb, the Alger Hiss case, and Klaus Fuchs' confession to espionage for the Soviets), gave McCarthy the cause he could latch onto for popularity.

His meteoric rise to prominence started February 9, 1950 with a speech to the Ohio County Women's Club lunch in Wheeling West Virginia, where he announced, almost casually as a throwaway line, that he had list of 205 Communists in the state department controlling foreign policy. Later in Denver, when asked to produce the list, he claimed he left it in his other suit, which he left on the plane. The next day the Denver Post ran a photo of McCarthy with the caption "Left Commie List in Other Bag". However, what seemed to start as a joke, turned very bad very quickly.

Much of McCarthy's problem was an obsession to please others and be the center of attention. While merciless in persecuting innocent people,

he loved to socialize and drink with reporters after hours, treating them like old buddies that he was letting in on his secrets. He was also an extremely heavy drinker, which added to the disreputable nature of his exploits, but no one seems to have called him on that. (His secret for keeping liquor down was to eat a stick of butter.)

The Washington press corps, ever eager for a story, played into McCarthy's hands, and he exploited this ruthlessly to keep himself in the limelight. Realizing when reporters' had to meet deadlines, he would announce bombshells right before those deadlines so the press didn't have time to check his facts. And fact checking was a major loophole hardly anyone bothered to address for nearly four years. For example, one person on McCarthy's lists was Howard Shipley, a Harvard "astrologer". A reporter followed up on this and did find Harlow Shapley, a Harvard astronomer. Although Shapley had no overt political activities, he remained one of the primary targets of McCarthy's early investigations. He especially liked to make charges in smaller towns where AP reporters would pick it up and use it without checking their facts.

More often, it was nearly impossible to pin him down to any sort of specifics.

- The number on his list of communists in the state department went quickly from 205 (or 57 depending on which part of the Wheeling Speech one heard) to 57 again during a speech in Salt Lake City to 81 during a five-hour speech in the Senate.
- When reporters in a bar (after a lot of drinks) asked McCarthy to clarify whether the people on his list were communists, communist sympathizers, or what, McCarthy conveniently couldn't find the list again and then accused the reporters of stealing it.
- Once in Madison, when McCarthy claimed there were commies on the newspaper staff, a reporter challenged him to name one. McCarthy went silent, so the reporter persisted until McCarthy said "I'm not going to answer that question if we sit here all day." The reporters sat through fifteen minutes of silence until McCarthy got up and left the room.

McCarthy, who claimed to be Catholic, had strong support from American Catholics (representing about 20% of the U.S. population), who normally voted Democratic but saw him as one of their own and also opposed communism. Among his supporters was Joseph Kennedy Sr., an avid anti-communist. McCarthy was a frequent guest of the Kennedys, dated two of Joseph's daughters, was godfather to Robert Kennedy's first child, and had Robert on his staff for six months before they had a falling out. John F. Kennedy, although a Democrat, never publicly criticized McCarthy, who reciprocated by refusing to campaign for Kennedy's Republican opponent. It is widely believed Joseph Kennedy's support for McCarthy was meant to pave the way for the Catholic presidency of his son, John.

After the Wheeling speech, McCarthy moved aggressively in the Senate to attack people in the State Department he claimed were communists. The numbers on his list moved from the original 205 to 57 (during a speech in Salt Lake City) to 81 during a five-hour speech in the Senate. In response to his charges, hearings by a subcommittee of the U.S. Senate Committee on foreign Relations, known as the Tydings Committee, were called. Being mostly Democrats, its final report called McCarthy's charges a "fraud and a hoax," saying the result of his actions was to "*confuse and divide the American people [...] to a degree far beyond the hopes of the Communists themselves.*" The Republican response by William E. Jenner called the Tydings report "*the most brazen whitewash of treasonable conspiracy in our history.*" American politics was definitely becoming meaner and more partisan, as seen by the fact that three separate votes in the Senate on whether to accept the Tydings Report broke down along strict party lines. Meanwhile, press coverage of McCarthy was gaining him popularity and a national following.

Although not taken too seriously or given much respect at first, McCarthy campaigned ruthlessly for other Republicans in the mid-term congressional elections in 1950. He especially

helped smear Millard Tydings, the Democratic chair of the Tydings Committee, even going so far as to doctor a composite photo to make it look like Tydings was in intimate conversation with a Communist Party leader. A later investigation of this election by a Senate subcommittee recommended that such tactics be grounds for expulsion from the Senate. However, in every case, the candidates McCarthy campaigned for won their elections, thus vaulting him to a position of very high status in the Senate.

Redbaiting Republican style in the 1950 elections. With McCarthyism, the Republicans, long out of office since 1932, had found their issue. In addition to Nixon's classic red-baiting of his opponent in California, there was:

- George Smathers in Florida: "Joe [Stalin] likes him and he likes Joe"
- John Foster Dulles in NY: "I know he is no Communist, but I also know that the Communists are in his corner and that he and not I will get the 500,000 Communist votes that last year went to Henry Wallace in this state."
- When Truman fired McArthur, Bill Jenner of Indiana charged: "this country is in the hands of a secret inner coterie which is directed by Agents of the Soviet Union."
- Senator Wherey of Nebraska referred to Vietnam as "Indigo China"

Richard Nixon viewing microfilm found in a pumpkin patch that helped him secure the conviction of Alger Hiss and launch his political career as a hardline anti-communist.

Not surprisingly, McCarthy didn't get along with President Truman, whom he accused of being soft on communism. He was especially rough on John C. Marshall (the author of the

Marshall Plan which earned him the Nobel Peace Prize in 1953), charging in a book he published in 1951, *America's Retreat From Victory: The Story Of George Catlett Marshall*, that Marshall was directly responsible for losing China to the communists. He even went so far as to accuse Marshall of being part of "*a conspiracy so immense and an infamy so black as to dwarf any previous venture in the history of man.*"

When Truman fired General MacArthur, McCarthy accused the president's advisors of getting their boss drunk to make that decision, adding that he should be impeached. Truman returned the love, calling McCarthy "*the best asset the Kremlin has*" and comparing the senator's actions to shooting American soldiers in the back during a hot war.

McCarthy's relations with President Eisenhower were better, only because Ike chose not to directly confront him, although he privately detested the senator. Ike was especially criticized for not coming to the defense of his friend and mentor, John C. Marshall. When McCarthy started attacking Eisenhower for being soft on communism during the first year of his presidency, the president's advisors urged him to confront the senator, but he refused, saying he would not "*get down in the gutter with that guy.*" As a result, McCarthy continued and intensified his witch-hunts.

Not only did the 1952 election get McCarthy re-elected, it also gave the Republicans control of the presidency and both houses of Congress. However, leading Republicans, such as Robert Taft were concerned about putting McCarthy where he could do little harm to the country and the party's reputation. So they made him chairman of the Senate Committee on Government Operations, what was supposed to be a somewhat innocuous position, the real power till then being with the Internal Security Subcommittee. However, the mandate of this committee was flexible enough to allow McCarthy to extend its operations to pursue alleged communists in the government. This was where he carried on some of his most notorious work, helped as chief counsel by the almost equally infamous Roy Cohn.

McCarthy (left) with Roy Cohn

His first targets were personnel in the Voice of America, which broadcast news from the American point of view to the Iron Curtain. Using questions laced with his typical innuendoes and false accusations of communist slanted broadcasts, McCarthy wrecked morale in the VOA and may have contributed to one of its engineers' suicide. Next the subcommittee went after the overseas library program of the International Information Agency, forcing it to delete any books McCarthy deemed tinged with any communist influence. Some libraries even burned the newly censored books.

The beginning of the end. The first sign of things coming unraveled for McCarthy was the controversy over his appointment of J. B. Matthews as staff director of the subcommittee. When it was learned that Matthews, an ardent anti-communist, had claimed that Protestant clergy comprised the largest single group supporting communists in America, there was a huge outcry of protest along with demands that McCarthy dismiss Matthews. McCarthy caved in and accepted Matthews' resignation.

In autumn 1953, McCarthy went after the U.S. Army. After failing to come up with any dirt on the Army Signal Corps, he focused on an army dentist with left-wing tendencies, Irving Peress, and why he had been rapidly promoted to Major, although it was according to the provisions of the Doctor Draft Law for which McCarthy himself had voted. When Peress refused to answer McCarthy's questions, citing the Fifth Amendment, the senator told the Army to court-martial him. However, Peress had applied for and immediately gotten an honorable discharge, thus saving him from court-martial. McCarthy then summoned the general who had

granted the discharge, Brigadier General Ralph W. Zwicker, who, under advice from counsel, refused to answer the subcommittee's questions or kept changing his story. McCarthy's response was that Zwicker was "not fit to wear that uniform." Unfortunately for the senator, his comment about Zwicker, a World War II hero, backfired, as he was flooded with outrage from veterans, the press, and even President Eisenhower. Under pressure from leading Republicans, the Secretary of the Army, Robert Stevens, gave in to McCarthy's demands for cooperation. McCarthy, not able to leave well enough alone, gloated that Stevens "could not have given in more abjectly if he had got down on his knees." Not only did this sit badly with the public, it also caused the Army, with support from Eisenhower, to retaliate.

The Army-McCarthy hearings lasted 36 days in 1954 and were broadcast live on television to an estimated 20 million viewers. Instead of attacking the senator directly for his political activities, they investigated the alleged pressure by McCarthy and Cohn for favorable treatment of one of the senator's aides, G. David Schine. Although Cohn was found guilty of the charges, McCarthy was not. However, where the Army had failed, television had done the job, because extensive exposure of the senator on TV and in the press convinced many that he was nothing more than a reckless and dishonest bully.

Central to this was the exchange on June 9 between McCarthy and Joseph Welch, the Army's chief legal representative, when Welch challenged Cohn to provide the list of 130 alleged communists and subversives in defense plants. Instead, McCarthy started attacking one of Welch's employees. Welch shot back the famous words: "*Let us not assassinate this lad further, Senator. You've done enough. Have you no sense of decency, sir, at long last? Have you left no sense of decency?*" When McCarthy resumed his attack, Welch cut him off and demanded the chairman call the next witness, the gallery erupted into applause and recess was called.

Three months before this, Edward R. Murrow (below), host of CBS News' *See It Now*, took on

the senator in one of the great moments in journalistic history. After showing clips of the senator in his own words, Murrow concluded: "*This is no time for men who oppose Senator McCarthy's methods to keep silent, or for those who approve. We can deny our heritage and our history, but we cannot escape responsibility for the result. There is no way for a citizen of a republic to abdicate his responsibilities. As a nation we have come into our full inheritance at a tender age. We proclaim ourselves, as indeed we are, the defenders of freedom, wherever it continues to exist in the world, but we cannot defend freedom abroad by deserting it at home. The actions of the junior Senator from Wisconsin have caused alarm and dismay amongst our allies abroad, and given considerable comfort to our enemies. And whose fault is that? Not really his. He didn't create this situation of fear; he merely exploited it -- and rather successfully. Cassius was right. 'The fault, dear Brutus, is not in our stars, but in ourselves.'*"

After this, it was all downhill for McCarthy, as public support for him melted away. On December 2, 1954 the Senate voted 67 to 22 to condemn the senator for his contempt of Senate rules, turning his subcommittee into a "lynch party", that it had tended to bring dishonor and disrepute to the Senate, and to "*obstruct the constitutional processes of the Senate, and to impair its dignity.*" McCarthy kept his senate seat for two and half more years, but his political career was over, as Senate colleagues avoided him and were noticeably absent during his speeches. His drinking got progressively heavier until he died May 2nd, 1957 at the age of 48, from hepatitis most likely aggravated by alcoholism.

The effects of McCarthyism on America were wide and deep. In addition to people whose careers were directly ruined and their families and friends who were stigmatized by association, the majority of Americans were left with an abiding fear that continued to permeate

American culture until the 1960s and, to an extent, to the end of the Cold War. People with left-wing views went underground or were marginalized, while others who might have had a view on politics that deviated even slightly from the mainstream felt it best to keep their opinions to themselves.

Below: Several examples of how the fear of communism permeated popular culture during the early Cold War.

FC.140A DECOLONIZATION IN SE ASIA AFTER WORLD WAR II

Introduction. World War II marked the beginning of the end of the West's colonial empires. While the colonies in Africa would not generally gain their independence until after 1960, those in South and Southeast Asia started gaining their freedom in the aftermath of the war. This was largely because Japan had stripped away those colonies in the opening phases of the war, thus discrediting the West and destroying the myth of its invincibility. Even though the European powers restored their rule in 1945, they were too exhausted from the recent war effort to effectively resist the growing agitation for independence.

The colonies also benefited from both widespread indifference to and support for their movements for several reasons. For one thing, the Soviet Union supported independence movements even when led by nationalist and capitalist elements, seeing them as a step toward socialism, which they could then work for after independence. Secondly, the U.S., with its dominant economic position in the world, supported decolonization in order to gain free access to markets previously run by colonial powers. However, it opposed radical nationalists who wanted to control their own economies. Finally, Europeans, disillusioned and worn out by war, only wanted recovery at home and cared little about their colonies. There were four major independence movements after the war: Malaysia, Indochina, Indonesia, and the Philippines. In the first two of these, the newly established communist regime in China would play an active role.

Malaysia. In June 1948 a communist-led uprising by guerrillas who had fought the Japanese broke out. About forty per cent of Malaysia's population was made up of middle and working class ethnic Chinese. Therefore, Britain resettled many of them in an effort to isolate them from communist influence and pressure. Thus, while Malaysia did win its independence in 1957, rich businessmen who supported and protected British economic interests led the new nation.

Indochina had been a French colony since 1867. Soon after the French re-established their rule, they

faced an insurgency led by the Vietminh. This was a communist group who had fought the Japanese during the past war, thus giving them credibility with and support from the populace at large. After 1949 they also had help from communist China. On the other side, France drew economic support from the U.S., especially after the Korean War broke out in 1950. After a long drawn-out struggle (1946-54) and a major defeat at Dien Bien Phu, France granted Indochina its independence. Three new nations emerged from this: Vietnam, Laos, and Cambodia. Since Vietnam was especially divided between communist and anti-communist elements, it was divided between North and South at the 17th parallel until internationally monitored elections could take place in 1956. However, fear of a communist victory led the U.S. to block these elections and back a repressive, but anti-communist, regime in the South. As a result war broke out between the two parts of Vietnam, each supported by outside powers, thus prolonging the agony and destruction of the country for another thirty years.

Indonesia. The aftermath of World War II saw a three-way struggle emerge between the communists, the Dutch and Nationalists led by Kusno Sosrodihardjo (AKA Sukarno). The U.S., worried about a communist takeover, threatened to cut off Marshall Plan aid to the Dutch unless they gave up Indonesia. The Dutch succumbed to this pressure, and in 1949 Sukarno took power backed by pro-US factory & plantation owners. He would rule with mixed success until being ousted in 1967 by General Suharto.

The Philippines had been an American colony since the Spanish-American War in 1898. Much like in other Southeast Asian colonies, Japanese victories against colonial powers, this time the Americans, inspired an insurgency in the Philippines led by the communist Hukbalahap, a group who had fought Japanese occupation during the war. On July 4, 1946, the United States granted independence to the Philippines, favoring a liberal party run by landlords and the urban rich who favored American economic interests. The Hukbalahaps continued their revolt until they were crushed in 1952 by the new Philippine with the help of US military advisors.

Postcolonial American policy in Southeast Asia.

While the U.S. typically favored independence for the European colonies, it was particularly concerned about communist influence in these new nations. In 1955, it formed the Southeast Asian Treaty Organization (SEATO) with Thailand, Pakistan, the Philippines, Australia, New Zealand, Britain and France. From its headquarters were located in Bangkok, Thailand, it was modeled after NATO as a military alliance designed to stop the spread of communism through a policy of containment. SEATO was dissolved on June 30, 1977 in the aftermath of communist victories in Vietnam and other parts of Southeast Asia.

FC.140B INDIA SINCE WORLD WAR II

Introduction: The foundations of modern India during British rule (1858-1947). While most Indians viewed British rule (AKA Raj) as a negative experience, it did prepare India for the modern world in a couple ways. For one thing, the British did build industries and the most extensive railroad system in Asia by 1900. For example, the Tata Iron Works was the largest iron foundry in the world and that firm continues to be a major factor in India's economy today. One other thing the British did was establish a nationwide school system and bureaucracy, both operating in English. This had two benefits. First of all, it unified India by using one common administrative language for a country split up by some 700 languages and dialects. A more long-range benefit has been that thousands of jobs, many requiring some education (i.e., on line tech support), have been outsourced to India since English is the predominant second language across the globe. (For the American market, Indians have to learn the American dialect of English.

Independence, partitioning, and Kashmir. In order to prevent civil strife between Muslims and Hindus, Britain's grant of independence to India in 1947 involved its partition into the Hindu nation of India and the Muslim nation of Pakistan. It could be that this prevented more violence between the two groups, but it wasn't without its problems, the most outstanding of which was control of Kashmir, an area stuck between India, Pakistan, and China. Which in 1947 was 77% Muslim. Hari Singh, Kashmir's reigning monarch under British auspices during the Raj, could choose to join India, Pakistan, or remain independent. Pakistan expected him to join Pakistan. However, when he remained uncommitted, Pakistan sent irregular forces into Kashmir to bully Singh into submission. Instead, he joined India, which sent in troops to clear out the Pakistani guerillas. The UN was called into mediate the dispute, and it decreed a plebiscite (popular vote) would decide the issue. However, the plebiscite was never held, leaving India in control of half the region and most of its population. Pakistan had a sparsely populated third, while, to confuse matters more, China controlled the rest and claimed more.

Two conflicts broke out over Kashmir between India and Pakistan in 1965 and 1999, neither becoming an all-out war nor deciding anything. When India discovered that China had built a military road from Tibet to Kashmir, hostilities briefly broke out between those two countries. More important to China than the disputed border was the fact that, after China crushed the Tibetan revolt in 1959, India had given refuge the Dalai Lama, Tibet's spiritual leader. The Sino-Indian conflict, fought in October 1962 at the same time as the Cuban Missile crisis, ended with China overrunning Indian positions, then declaring a cease-fire and pulling back to the original border, apparently feeling it had made its point to India about interfering in Tibetan affairs.

India and the Cold War. Since its independence in 1947, India has functioned as the world's largest democracy (in terms of population). Therefore, one might expect it to align with the United States during the Cold War. However, things were not quite so simple. Since America's primary concern was containing Soviet expansion, it focused more on supporting India's neighbor and nemesis, Pakistan, even though it has generally been ruled by military dictators. Therefore, the Soviets, who typically supported any former colonies to weaken the West, courted an alliance with India. This put India in the awkward role of playing both ends against the middle, where it would accept aid from Russia, which the U.S., alarmed India might go communist, would give aid to India, which led to more aid from Russia and so on. The end result was that India stayed non-aligned while receiving aid from both super-powers.

The Nuclear issue. In the 1960s, India developed and tested a nuclear bomb. However, it chose not to develop a nuclear arsenal, probably realizing how that could destabilize the region. However, in 1998 Pakistan became the first Muslim nation to develop its own nuclear bomb and, when it did start building up an arsenal, India followed suit. As both sides' arsenals increased, so did the danger of a nuclear holocaust if the two sides went to war. Luckily, both sides recognized threat of MAD (Mutually Assured Destruction) and start negotiating. While tensions persist, especially after the terrorist bombing of a hotel in Mumbai in 2009, the fact that

the two nations are still talking offers hope of a peaceful resolution of their problems.

Globalization and India since the 1990s.

Throughout the Cold War, India remained in the ranks of what were referred to as under-developed countries, being poverty stricken and having a spiraling population from its high birth rate. Since the 1990s that has been changing rapidly, with India becoming one of the high tech centers of the world. As stated previously, much of the foundations for this were its infrastructure of factories, railroads, and English speaking schools. Another important factor has been the ongoing cycle of the spread of industrialization through outsourcing of jobs to places with cheaper labor.

Unfortunately, like China, India has seen uneven development with islands of high tech prosperity awash in a sea of poverty, leading to two problems that exacerbate each other. First of all, India's rapidly skyrocketing population (estimated at nearly 1.2 billion in 2009) makes it much harder to supply its people with the bare minimum of a standard of living. Secondly, the rapidly expanding middle class is consuming resources at a much higher rate than the rest of the country. As such consumption in India and China expands and competes with other developed nations for resources, the human race and planet face a rapidly looming crisis as those resources become scarcer.

141. MISSED OPPORTUNITIES: THE AFTERMATH OF STALIN (1953-56)

Introduction. The death of Joseph Stalin in 1953 marked the end of an era for both the Soviet Union and the world, although no one was sure just what it meant for the future. For many Soviets, the end of Stalin's brutal dictatorship also meant the end of stability. They wondered who would watch over and defend the Soviet Union now that his strong hand had been removed. To others, it meant an opportunity to dismantle at least some, if not all, the repressive aspects of Stalinist rule. People in Eastern Europe watched anxiously for signs they could gain more liberties, if not outright freedom, from Soviet rule. For the West, it was also an anxious time. Would the new regime in Moscow continue Stalin's hostility to the West or would it open a new regime of peace and cooperation? Unfortunately, when the dust finally settled by the end of 1956, little would seem to have changed within the Soviet empire or in its relations with the West. Not that people, especially Nikita Khrushchev, wouldn't try to change things. However, the Stalinist legacy of three decades of repression and paranoia would prove to be too strong to be dismantled within such a short time. To a large extent, it was a period of missed opportunities that faced heavy odds of those opportunities blossoming into a new era of peace and stability.

Mixed signals. Since Stalin had not designated a successor, no single figure emerged in the immediate aftermath of his death. Instead a moderate coalition, led by Georgi Malenkov, took over in the Kremlin that did not even institute a major purge of its enemies. Other hopeful signs followed. Peace talks in Korea resumed only two weeks after Stalin's death and produced a ceasefire by July. Leaders in the Kremlin were even considering the idea of a reunified, but neutral Germany. Along these lines, they summoned to Moscow the East German leader, Ulbricht, a dictator cut in the Stalinist mode, to encourage him to relax his harsh rule. However, this ultimately triggered a more ominous chain reaction of events.

In June 1953, East German workers, sensing more relaxed control from Moscow, demonstrated against Ulbricht, whose response to the message from the Kremlin had been to impose even harsher work

quotas on his people. When the East German government did nothing to respond to these demonstrations, the protests turned political, threatening to overthrow Ulbricht and communist rule in East Germany. Eventually, Beria, the former head of Stalin's secret police, ordered in Soviet forces and crushed the protests.

However, the Kremlin's initial indecision during this crisis encouraged similar riots and strikes in Czechoslovakia, Hungary, Romania, and even Siberia. Many Soviet leaders saw these as attempts by the United States to upset communist rule in Eastern Europe. This generated a backlash against the government's recent moderate policies as well as a fiercer power struggle within the Kremlin. Beria, saw this as his opportunity to seize power, but was defeated and executed. This was the only notable execution to take place in the aftermath of Stalin's death. The fact that its victim, Beria, represented more than anyone the old Stalinist legacy was a sign that times had indeed changed.

Unfortunately, two things would prevent the United States from picking up on these cues. One was the recent Red Scare of the McCarthy era that still heavily affected American politics. The administration of the new president, Dwight D. Eisenhower, who had courted McCarthy's support during the 1952 election campaign, was split over how to treat these new developments. Even more worrying to the Soviets was West Germany's admission into NATO in 1954 and the decision to let it rearm the next year. This was done largely to relieve the strain the Korean War had put on American Military resources. Seeing West Germany as a reliable democracy and ally now, the U.S. decided to use that country's resources to bolster the Western alliance. However, a rearmed and hostile German state was the last thing Russians wanted to see so soon after World War II. Therefore, they responded by forming their own military alliance, the Warsaw Pact in 1955. Thus the future of U.S.-Soviet relations seemed cloudier than ever.

Nikita Khrushchev. By 1955, a new leader, Nikita Khrushchev, had emerged from the power struggle inside the Kremlin. Khrushchev himself seemed to epitomize the mixed signals being sent to the West in the 1950s. He came from a poor working class background and had joined the Bolshevik

Revolution in 1917. As political commissar at Stalingrad, he had seen firsthand the destruction World War II had wreaked upon the Russian people and understood as well as anyone the even greater destructive power of nuclear weapons. He firmly believed communism was the best way to create better lives for the people. Unlike Stalin and Malenkov, he had a very personable style, going out to meet the people and generating genuine popular support. He prompted more consumer industries, freedom of the arts, better pensions, and freed thousands of political prisoners from Stalin's gulags. Trying to project "Socialism with a human face," he even opened the Kremlin to visitors and children's parties.

However, Khrushchev had also been a loyal follower of Stalin, helping carry out many of his harsh policies. Therefore, to many people, especially in the West, he only represented a continuation of Stalinist rule. In addition, Khrushchev had a somewhat volatile and unpredictable personality, seeming to be waving the olive branch of peace one minute and his saber the next. This made it difficult for the West to know which Khrushchev it was dealing with at any given time. Contributing to Khrushchev's unpredictability was the conflict between his own genuine desire to improve the lives of the Soviet people and the need to look tough in his dealings with the West in order to satisfy the hard-liners within the Kremlin. In the end, his attempts to follow both of these seemingly irreconcilable policies would lead to his overthrow from power in 1964.

Initially Khrushchev did two things to show a more moderate and reasonable regime was in charge. In 1955, he withdrew Soviet troops from Austria (which had been occupied like Germany since 1945) on the stipulation that it maintain a neutral position between East and West. The next year, in a six-hour speech to a closed session of a Congress of the Communist party, he took an even bolder step by exposing Stalin's purges as frauds and denouncing Stalin himself as a pathological criminal. When news of this speech leaked out, the common people welcomed it as a sign of more relaxed times to come. However, many communist leaders in the Kremlin and Eastern Europe worried about where this would lead. Those worries soon proved to be justified.

Unrest and crisis in Eastern Europe. Khrushchev's speech excited new hopes in the West, which continuously broadcast the text of his speech over Radio Free Europe, its main medium of propaganda to Soviet satellite countries. Naturally, this stirred up hopes of freedom from Soviet rule across Eastern Europe. Poland was the first country to react, as its workers' demands for economic reforms grew into demands for political reforms. At first, Khrushchev moved Soviet forces toward Warsaw, threatening to crush the movement. Then, he seemed to do an about face (especially when compared to how Stalin would have acted) and agreed to give the Poles more freedom as long as they stayed loyal to the Warsaw Pact. This was hardly the end of it, though.

Later that month (October, 1956), student demonstrations erupted across Hungary in support of the Poles. When the Hungarian secret police shot several demonstrators, workers joined the students. Soviet troops sealed off Budapest and fierce fighting ensued. A popular leader, Imre Nagy, was restored to power. His government called for amnesty for the demonstrators along with more liberal political and economic reforms while still assuring the Soviet Union of Hungary's loyalty. Khrushchev withdrew his troops (many of whom were fraternizing with the Hungarians) from Budapest, but moved more forces close to Hungary's borders. This only caused demonstrations to spread to the countryside while more and more Hungarian troops joined the demonstrators, taking their weapons with them. Then on November 1st, Nagy repudiated the Warsaw Pact and declared Hungary's neutrality. Meanwhile, Radio Free Europe kept hopes and tensions at fever pitch by promising support to the rebels.

However, as luck would have it, another crisis, this time over the Suez Canal, had erupted with fighting between Israel and Egypt. With the United States thus distracted, the Kremlin seized the opportunity to move fifteen divisions, including 4000 tanks (which are hard to fraternize with) against Budapest. Even without help from the United States, which probably would not have risked war with Russia over Hungary anyway, the rebels held on for three weeks, even fighting Soviet tanks with homemade bombs called Molotov cocktails. Some 700 Soviet soldiers and 3-4000 Hungarians died in

the fighting before Budapest was brought back under control. Nagy was ousted from power and executed along with 300 other rebel leaders. Another 35,000 Hungarians were arrested, while 200,000 more fled to the West.

The Hungarian uprising of 1956 showed how far Khrushchev and the Kremlin would let reforms progress within the Soviet Empire before cracking down. Unfortunately, the West took this as a sign that nothing had changed since Stalin's death and maintained a hostile posture against Khrushchev, and he responded accordingly. Therefore, an opportunity to ease tensions between the superpowers backfired, causing the Cold War to heat up even more in the years to come.

Was Stalin murdered?

One theory, based on the testimony of one of Stalin's guards, Pyotr Lozgachev, suggests that Stalin may have been the victim of foul play. According to Lozgachev, on the night of February 28th/March 1st the guards in charge of Stalin's security were told to go to bed, an unusual order for a man as paranoid as the Soviet leader. However, the order didn't come directly from Stalin, but his main guard, Khrustalev.

When they got up the next morning, there was no sign of Stalin, nor was there for the whole day. However, no one had the nerve to disturb him. Then a light went on about 6:30PM, but still no sign of Stalin. Finally about 10 o'clock they got the nerve to go in to check on him and found him mumbling something like "Dz dz".

It took Beria and the other Politburo members several hours to show up, and they didn't summon a doctor until the next day (March 2nd). Stalin managed to hang on and finally died 9:30PM on March 5th. He was quickly embalmed and laid in state, where thousands came to view

him. According to some versions, hundreds of people were killed in the crush to see him.

The tardiness of the politburo members in showing up when notified aroused the suspicion of historian, Edvard Radzinski, leading to the theory that Khrustalev, working with one of the politburo members, most likely Lavrenty Beria, injected Stalin with poison. Molotov, in his memoirs, claims that Beria told him "I took him out," while Khrushchev wrote that after the stroke, Beria went about "spewing hatred against [Stalin] and mocking him" until the stricken leader showed signs of consciousness. Then Beria fell to his knees and kissed Stalin's hand until he lost consciousness again, at which Beria stood up and spat.

In 2003 a joint group of Russian and American historians announced that Stalin had ingested warafin, a powerful but tasteless rat poison that predisposes the victim to cerebral hemorrhage (stroke).

Khrushchev Zingers

The essence of Khrushchev's personality, a down-to-earth peasant common sense, shows as much through his sayings as his political actions:

"Support by United States rulers is rather in the nature of the support that the rope gives to a hanged man."

"When you are skinning your customers, you should leave some skin on to heal, so that you can skin them again."

"Whether you like it or not, history is on our side. We will bury you!"

“I once said, "We will bury you," and I got into trouble with it. Of course we will not bury you with a shovel. Your own working class will bury you.”

“If you cannot catch a bird of paradise, better take a wet hen. “

“If you start throwing hedgehogs under me, I shall throw a couple of porcupines under you.”

“Don't you have a machine that puts food into the mouth and pushes it down?” (said sarcastically about all the automated kitchen gadgets Americans had.)

“Economics is a subject that does not greatly respect one's wishes.”

“Bombs do not choose. They will hit everything.”

“Do you think when two representatives holding diametrically opposing views get together and shake hands, the contradictions between our systems will simply melt away? What kind of a daydream is that?”

“Call it what you will, incentives are what get people to work harder.”

“Politicians are the same all over. They promise to build bridges even when there are no rivers.”

POSTWAR CONFORMITY AND THE SEEDS OF DISSENT IN THE 1950s

Pressures to conform. World War II gave Americans an unprecedented era of affluence, technological growth, leisure, and opportunities for education and research. Out of this came four new factors pressuring people to conform, and especially to spend more to keep the consumer economy growing: modern advertising, television, credit cards, and babies.

Advertising had grown in tandem with the industrial consumer economies that emerged in the nineteenth century. As production of goods grew, so did the need to find consumers to buy those goods. After World War II, this need grew dramatically in the United States which, having suffered little material damage from the war, had 60% of the world's industrial capacity and needed to convince people to buy those goods. Complicating this was the traditional thrift-oriented mentality of most people, especially reinforced by the hard times of the recent Depression. In addition, there was little to qualitatively distinguish one brand of product from another.

Therefore advertising agencies hired psychologists who used modern psychological techniques to influence people to subconsciously prefer their products over the virtually identical products of their competition. One of the big pioneers in this field was Rosser Reeves, best known for his Anacin commercials that, in order to get people to buy his headache medicine, showed annoying animated images of a throbbing brain full of lightning bolts and pounding hammers. People hated these commercials, but they also bought lots of Anacin. Other commercials attacked people's subconscious fears and insecurities to make them believe their products, such as a brand new car, would solve their problems. Vance Packard exposed these tricks in his book, *The Hidden Persuaders*, but people still kept buying.

Adding a whole new dimension to these advertising techniques was television, which mesmerized people with dynamic moving images designed to sell them the sponsors' products. Television was the perfect advertising tool for reaching a visually oriented species such as humans whose eyes take in 90% of the information they get from the world

around them. Reinforcing these messages were shows that typically showed affluent families with the very sorts of products the sponsors wanted viewers to buy.

Unfortunately, buying all this cost more money than people had saved in cash. So along came the credit card, making it easier for people to get that new car or washing machine now and worry later about paying for it (along with added interest charges). Credit cards did indeed encourage consumer spending. Unfortunately, millions of families also found out how easy it was to lose track of their spending and fall heavily into debt.

Finally, there was the post-war baby boom and their parents' desire to provide their children with a better life than they had during the Depression. In the consumer society of the 1950s, people equated this with buying lots of toys and other things for their children. And that could only be good for business. These new opportunities and pressures affected people's attitudes toward two things: conformity and sex.

Conformity and deformity. Both men and women experienced growing frustration with pressures to conform. However, they experienced them in different ways. After the war, millions of men seemed to move seamlessly from the regimentation and conformity of the armed forces to that of the factories and corporations that were rapidly growing with the American economy. However, although corporate regimentation seemed familiar enough to these men, the lack of excitement and sense of purpose they had known during the war was gone. Replacing it was a dull routine of either assembly line work or paperwork, meetings, and kow-towing to the boss. Reflecting this lack of purpose was a profusion of adventure magazines that tried to recapture the excitement of the war years. Also reflecting it was Sloan Wilson's *The Man in the Grey Flannel Suit* (1955), a book detailing the frustrations of being trapped in the corporate rat race by day, only to return every evening to a house in the suburbs that was increasingly less a home and more a burdensome means of keeping up with the Joneses. Its characters, Tom and Betsy Rath were fictional, but the lives they portrayed were all too real to growing numbers of Americans in the 1950s.

For women much of the problem started with an acute post-war housing shortage that developed when millions of veterans came home, got married, and started families. The solution to this problem was a brand new phenomenon: the suburbs. The suburbs were largely the invention of William J. Levitt who applied Henry Ford's mass production techniques for cars to building homes. He broke home construction into 27 separate steps, each one being handled by a separate team specializing in that step. By 1948, Levitt's crews were completing 36 houses a day. Each house sat on a lot of 60 by 100 feet and had two bedrooms a bathroom, a 12 by 16 foot living room, and a kitchen. They had no basements, because concrete slabs were much easier and faster to lay down. The first Levittown, as this Long Island community was called, had 17,000 such houses with 82,000 residents.

Mass-produced Levittowns solved the acute post-war housing shortage, but they also created a whole new problem for women: a growing sense of isolation. Since the men generally took the family car on their long daily commutes between home and work (another source of stress), their wives were stranded miles away from the families and friends they had grown up with in the city. Instead of apartment buildings shared by a number of families, there were now separate family homes, oftentimes separated from one another by hedges or fences. The meaningful relationships and mutual support women had previously relied on were now replaced by a growing sense of desperate isolation from the rest of the world. This malaise was given a name, Housewife Syndrome, and a cure, large doses of anti-depressants to medicate women into passive acceptance of their fates. For both men and women, alcohol consumption also increased dramatically in order to dull the pain.

One woman who had bought into the suburban dream and seen it go sour was Betty Friedan. Coming to a gradual realization that millions of other women shared her malaise, she wrote a book that took her five years to research and write. That book, *The Feminine Mystique* (1963), would become the handbook for the feminist movement that would emerge in the late 1960s.

Things we don't talk about was the general attitude of society toward sex before the 1950s. Underwear was referred to as unmentionables and

talk about sex reverted to discussing birds and bees. Enter Alfred Kinsey, a mild straight-laced professor at Indiana University with a passion for collecting things, especially information. In the 1940s Kinsey launched a monumental study that culminated in 1947 with the publication of *Sexual Behavior in the Human Male*, an 804 page, three-pound book that quickly became a bestseller. Kinsey's book showed that pre-marital sex, extra-marital sex, homosexuality, and other practices typically labeled deviant behavior were more prevalent and normal for men than previously assumed. Naturally, such findings triggered heavy criticism and moral outrage from parts of a society still deeply rooted in its Protestant heritage. Not surprisingly, Kinsey's next book, *Sexuality in the Human Female* (1953), sparked an even more violent backlash, since it was about our mothers, sisters, daughters, and wives who were supposed to be pure and basically asexual. More devastating to Kinsey was The Rockefeller Foundation's decision to cut funding for his research. Kinsey's reaction was to overwork himself in further pursuit of his research until he died of heart failure in 1956. But the cat was out of the bag.

Kinsey's work encouraged more open attitudes toward sex. Much of this was healthy, but there were some results of questionable value. Most notable among these was Hugh Hefner's *Playboy* magazine, which showcased glossy airbrushed photos of beautiful women who evoked images of the wholesome girl next door except that they happened to be missing their clothes. Hefner, himself from a strict Methodist background, espoused a philosophy of promiscuous sex divorced from any emotional commitments. All this was slickly wrapped in a package laced with product placement type articles/ads for the latest accessories for the successful playboy: cars, stereos, clothes, etc. There were also serious articles and interviews that Hefner's customers could conveniently claim they bought the magazine for. The cumulative effect of this approach was to give pornography a pseudo respectability that made it and sex part of the mainstream culture.

Meanwhile a very different sort of quest was being realized: the birth control pill. The driving force behind the pill was Margaret Sanger. For decades she had been crusading to get access to birth control for women suffering in poverty from the burden of

too many children. Sanger, an incredibly persistent woman, had been jailed several times just for providing information about birth control. In the 1950s, she joined forces with John “Goody” Pincus, whose career had suffered for his dedication to research on hormones and fertilization. Their efforts bore fruit and the birth control pill came on the market in 1960. However, the Pill, as it was called, had far-reaching and unforeseen effects. While it did relieve many women of the burden of unwanted children, it also made sex seem safer for women by removing the fear of pregnancy. Just as *Playboy* led a movement to bring sex out in the open for men, the Pill made sex less scary and more desirable for women. Together, Kinsey’s and Sanger’s work, Hefner’s magazine, and Pincus’ pill would help lead to the sexual revolution of the 1960s.

Conclusion: toward a decade of dissent. The 1950s are typically viewed as a placid and comfortable decade. More properly it was a transitional era seeing revolutionary changes in the home, the workplace and attitudes toward sex. Add to this the start of the Civil Rights Movement and an emerging counter-culture centered on the Beats and Rock and Roll, and one can see the seeds of dissent in the years to come.

The Transistor Radio Revolution

The first commercially available transistor radio, Texas Instruments' Regency TR-1, marketed in 1954. However, since American industries were focused on the development of color TV, the Japanese were able to take over the market for transistor radios and, from there come to dominate the electronics industry overall.

In addition to the computer, the transistor created a revolution in miniaturizing consumer electronics, notably the transistor radio. Although invented in 1947, it took some time for the electronics industry to embrace it for a number of reasons.

One was the bottom line. As with any new technology, production is expensive until further research and development have created a cheap way to mass-produce it. At this point companies weren't ready to make that commitment, especially as they were pouring their resources into developing what they saw as the next big technology: color TV, which made its debut in 1954. The transistor's durability also threatened the profit margin of companies in a completely different, but significant way: revenues from repairing and replacing vacuum tubes that constantly burned out.

Secondly, since until now the radio had been a large heavy device, the average family could only afford one. One advantage of this was that it did encourage more togetherness, as the whole family would listen to it together. Postwar sociologists were constantly warning about how personal devices were further fragmenting the nuclear family. The transistor radio was the poster child for such a message, being small, portable, and eventually cheap (its initial price a relatively pricey \$49.95).

In addition, the “common wisdom” was that no one would want to listen to the tinny quality of sound coming from such a pocket-sized device. However, the common wisdom didn't account for the tastes of teenagers, who preferred the tinny sound of their own rock n' roll music to the fuller sound of whatever their parents listened to.

Thus the transistor radio spearheaded two revolutions at once. There was the consumer revolution that allowed everyone to listen privately to his or her chosen program, even in the midst of a crowd, much like people do with cell phones today. And there was the youth counter-culture ushered in with rock n' roll. In 1955, the year after the introduction of the transistor radio, Bill Haley's “Rock Around the Clock” became rock n' roll's first number one hit, followed next year by rock's first superstar: Elvis Presley.

No, those aren't cell phones that are pressed against their ears, but transistor radios, the mobile device of the 1950s

Turning Japanese. Ironically, the real beneficiaries of the transistor revolution were the Japanese, in particular a company called TOTSUKO, bought the rights to manufacture transistor radios, which cheap Japanese labor allowed them to do much more cheaply than American companies. As with anything, timing was crucial. Since the war, anything bearing a label saying "Made in Japan" was considered second rate. Reinforcing this was anti-Japanese sentiment left over from the war. However, by the late 1950s, a new generation of consumers, not so affected by such sentiments, was coming of age with money in their pockets. In addition, American companies, with one exception, Regency, had still not caught on to the potential of transistor radios.

In 1956, TOTSUKO (renamed Sony so Americans could pronounce it) introduced its first transistor radios. By 1965 the Japanese had captured 94% of the American market, making the transistor radio the first electronics product to be overwhelmed by foreign competition. More would follow as Sony's dependable little transistor radios would make "Made in Japan" a byword for first rate quality. In the years to follow, Japanese stereos, cameras, TVs, and eventually cars would also flood American markets, much to the chagrin of their American counterparts.

A Decade of Technological Revolutions

In addition to TV and the transistor radio, the 1950s witnessed technological revolutions on a number of fronts. Here are some of the highlights. Because there were so many, they have been broken down year by year.

1950

- Zenith offers the "lazy bones" remote control that plugs into the TV.
- Antihistamines are first widely used.
- Bell Labs & Western Electric invent the telephone answering machine.

1951

- Univac 1 the first commercial computer is produced.
- The Atomic Energy Commission produces its first electricity from atomic energy.
- Super glue is invented.
- Videotape recorder (VTR) invented by Charles Ginsburg
- J. Andre-Thomas invents first heart-lung machine, making possible advanced life support during open heart surgery
- The first built-in flashbulbs for still cameras are introduced.

1952

- First "Hydraglide" (AKA power steering) introduced by Chrysler
- Mr Potato Head patented; later the first toy advertised on network TV
- First patent for the bar code issued to Joseph Woodland and Bernard Silver
- Sony introduces the first pocket-sized transistor radio

1953

- Radial tires are invented.
- Invention of first musical synthesizer.
- DNA's Double Helix of is discovered by Francis

Crick and James Watson.

- Jonas Salk announces vaccine for polio.
- First color TV broadcasting.
- Saran Wrap created by Dow Chemical.

1954

- The first color TV broadcast was the Tournament of Roses Parade on January 1, 1954 to 21 stations.
- The first nonstick pan is produced.
- Chaplin, Fuller and Pearson invent the solar cell.
- Harvard physicians perform the first successful kidney transplant, the patient surviving for seven more years.

1955

- Optic fiber is invented.
- The first wireless remote, Zenith's "Flashmatic" is invented.
- Gregory Pincus develops the first oral contraceptive.
- Microwave ovens are first marketed by Tappan, costing \$1300. The original version invented in 1947 (below), was 5.5 feet tall and weighed 750 pounds. One blogger reminisced about how he and his brother used to aim the opened microwave at an egg and explode it. That may explain why they have a safety device that only allows operating a microwave when closed.

1956

- Scotchgard™ Protector is first marketed.
- "Mistake Out" (AKA Liquid Paper) is invented. Basically it was a white enamel applied with a tiny brush to cover typographical errors. Until the 1980s when computer word processing would start to replace typewriters, this was the primary way one would correct minor typing errors. Major ones would require starting that page all over.
- The first computer hard disk is invented.

- Christopher Cockerell invents the hovercraft.
- The Neutrino, an atomic particle without an electrical charge is discovered at Los Alamos Laboratories.
- Anti-protons are detected in the atmosphere.
- The first commercial videotape recorder is introduced for industrial applications, revolutionizing how TV programming is produced and stored. It would be nearly 30 years before affordable home VCRs would be widely available.

1957

- The computer language Fortran is invented.
- George de Mestral of Switzerland patents Velcro.
- "AA" size batteries are introduced by Eveready.

1958

- The modem is invented.
- The laser is invented by Gordon Gould.
- Jack Kilby and Robert Noyce invent the integrated circuit
- First commercial use of stereophonic recordings with two channels of sound. Future attempts to improve on this, notably Quadrophonic sound, would meet with little or no success until the 1980s with CDs and digital recording.
- Rich Knerr and Arthur "Spud" Melin, founders of Wham-O market the Hula Hoop, based on bamboo hoops reportedly twirled around the waist in Australian PE classes.
- A Boeing 707 jet makes the first non-stop trans-Atlantic passenger flight.

1959

- Wilson Greatbatch invents the internal pacemaker.
- The snowmobile is patented as the "Ski Dog", a typographical error of Ski Doo that its inventor, Joseph-Armand Bombardier, decided to keep.
- Jan 2- The Soviets launch Lunik I which reaches escape velocity from the earth's gravity and a speed of 25,000 miles per hour. It flies past the moon, making it the first manmade satellite of the sun.

Electron Frontiers: The Birth of TV

Howdy Doody watches himself and Buffalo Bob on TV

If one thing came to define American culture in the 1950s, it was television. In 1941, there were 8,000 TVs in the U.S., half of them in New York City. In 1949, there were still only 3,602,872 sets in the U.S., but a year later that number had nearly tripled to 9,734,872. By 1959, it had reached 67,145,000.

As TV set sales skyrocketed, people seemed mesmerized and willing to watch anything: Roller Derby, wrestling, harness racing, amateur shows, really bad B movies, anything. One TV executive suggested that people would even watch a show with nothing more than a hand constantly rolling dice. In fact, the obsession with watching anything through a screen-like window affected other consumer products by adding windows: ovens, clothes driers, electric skillets, and even houses with picture windows.

Children's programming. One early captive audience was young Baby-boomers, the original TV generation. The first major show in this genre was *Howdy Doody*, a circus/western themed show, which ran from 1947 to 1960. Its title character was a marionette with 48 freckles (one for each state in the union until 1959). It had a live audience of children known as the Peanut Gallery.

In 1949, NBC decided the original Doody (below) looked too immature and needed a makeover. The result was the more familiar Doody (top). Unfortunately, the original creator of Doody stormed out of the studio in protest right before going live, so NBC explained the puppet's absence as the result of getting plastic surgery.

When its host/puppet master, Buffalo Bob Smith, had to take a break due to a heart attack, the show promoters told its young viewers he was just taking a vacation at Pioneer Village. A parody of Howdy Doody in the 1980s was a character on *Pee Wee's Playhouse* named Randy. Despite their physical similarities, Randy was as evil and mischievous as Howdy was nice.

Another bit of trivia: Ron Howard (aka Opie on *The Andy Griffith Show*) got his start in show business by winning a Howdy Doody look-alike contest in Milwaukee.

Possibly the best-known and best-loved children's show of early TV was *Captain Kangaroo*, which ran from 1955-84. Bob Keeshan (who got his start as Clarabell the Clown on *Howdy Doody*) played the title role as the grandfatherly Captain who interacted with other people and puppets, such as Mr. Moose and the mischievous Bunny Rabbit, the original low talker, whose main goal in life was to trick the Captain out of his carrots.

The classic after-school show was the *Mickey Mouse Club*, also premiering in 1955. In addition to cartoons, song-and-dance numbers by the kids in the cast (AKA the Mouseketeers), and serials that starred the kids and dealt with everyday challenges, the adult host Jimmy Dodds provided moral leadership with homilies that became known as Doddisms.

For local after-school programming, one mainstay was 1930s vintage episodes of the *Three Stooges*, which glorified physical violence for comic effect. After each 20-minute episode of such unrelenting violence, some adult would come out and warn kids not to try the brutal stunts that Moe pulled on Curly and Larry each episode. Then, he'd show us another one to drive home the point.

Local stations also made extensive use of puppets, since they are cheap and rarely forget their lines. In Chicago, that puppet was Garfield Goose, some stupid goose puppet who thought he was king of the United States. Key to the program was Frazier Thomas, who thought he was the goose's prime minister and had the uncanny ability to interpret the senseless clacking of Garfield in order to carry on meaningful conversations with the goose. Another character was Romberg Rabbit, who was also a low talker. Frazier could talk with him too.

Even children get bored with a grown man talking for an entire hour to a puppet, so much of the time was filled in with such things as old cartoons and 1940s vintage grade-B serial westerns, with a “new” episode running each day. How many kids could follow their convoluted plot lines from day to day, or even cared, isn't clear. But we'd watch anything if it was on the tube back then.

Violence against cats. Saturday mornings were particularly special for children's programming, because that's when cartoons ruled the airwaves and first provided parents with an electronic baby-sitter so they could sleep in. Premier among these shows was Mighty Mouse, a super-mouse that beat up countless cats, Tom and Jerry, a more down-to-earth version of Mighty Mouse where the mouse still always beat the cat, and Sylvester and Tweety Bird, where it was a tiny baby bird that beat the cat. The main rule of thumb was that small herbivores always beat large carnivores, whether it was a roadrunner

against a coyote (a wily one at that) or a rabbit against a bald-headed human with a speech impediment. A great parody of this genre of cartoons was Itchy and Scratchy on *The Simpsons*.

TV situation comedies (AKA sit-coms), still a mainstay of TV programming, go back to the early 1950s. As with other new technologies, people tended to think first of applying older uses and forms to them before seeing their wider possibilities. Among the pioneers of the TV sit-com was the *Burns and Allen Show*, starring the older vaudeville act of George Burns and Gracie Allen.

Their earliest shows combined elements of sit-com with vaudeville. George would come out and do an onstage monologue. Then there would be the bare elements of a comedy play with onstage props that George might use for sight gags such as walking around the prop for a wall instead of using its door. Then another monologue followed by a singing act, and then the rest of the play.

Commercials took the form of product placements that worked their way into the dialogue. (“Would you like some Carnation Evaporated Milk with your coffee? It's the milk made from contented cows.”)

The number one sit-com of the 1950s was *I Love Lucy* starring Lucille Ball (above) who, as the stage-struck housewife of a popular nightclub entertainer, was always coming up with zany schemes either to get on stage or carry off some other ridiculous scam. My theory is that Juliet's crazy faked suicide caper in *Romeo and Juliet* was the inspiration for *I Love Lucy*, except that Lucy was funnier...and smart enough to survive her own stupid capers.

Game shows were a relatively cheap type of show to produce that also proved extremely popular in the 1950s. Some of the more popular shows then were:

- *What's My Line* where celebrity panelists tried to guess contestants' occupations.

Salvador Dali was a contestant once. No one guessed his occupation.

- *You Bet Your Life* with Groucho Marx

- *Who Do You Trust?* Where celebrity panelists tried to figure out which of three

contestants was the real person described at the beginning of that round.

- *The Price is Right*, still a mainstay of daytime game shows, premiered in 1956

- *Twenty-one* a high stakes quiz show that was the center of a major scandal for

feeding a contestant answers over several weeks to build viewer interest.

- *Queen For a Day* where the woman with the most pathetic sob story, as judged by

the audience applause-o-meter, got her wish, a crown, and a dozen roses.

Westerns were probably the most popular type of TV drama in the 1950s. Like World War II, it was easy to tell the good guys from the bad guys by the colors of their hats (black or white).

There were around 120 TV Westerns, some of the most popular being Roy Rogers, The Lone Ranger, Hopalong Cassidy, Gunsmoke, Wagon Train, and Have Gun Will Travel.

Roy Rogers, largely appealed to kids, since it had several non-human characters: Trigger and Buttermilk (horses), Bullet the Wonder Dog, and

Nellie Belle the Jeep. Similar to this was *Fury* and *My Friend Flicka* (shows starring horses) and *Rin Tin Tin* and *Lassie* (with dogs in the leading roles).

As TV producers caught on that women liked westerns too, they started casting hot looking leading men who might occasionally go bare-chested to thrill the ladies. Westerns thrived into the 1960s, but faded in popularity, a combination of wearing out their welcome and not adapting to the moral confusion and controversy of the times.

The Twilight Zone was a science fiction/fantasy anthology series that aired from 1959-64. It was a hard sell for its creator and narrator, Rod Serling, a highly respected writer of TV drama at the time, because science fiction wasn't considered serious material.

In fact Serling's vision was very serious. In the still repressive political climate of the 1950s, anything of a political nature was kept out of TV drama. Using the science fiction's otherworldly and seemingly innocuous settings, Serling crafted highly pointed political and social allegories and parables without directly stepping on anyone's toes. Thus in episodes such as "The Monsters Are Due on Maple Street" and "The Shelter" he was able to tackle such issues as mass hysteria, the dehumanizing aspects of modern society, McCarthyism, and nuclear war and just claim they were stories about human nature (which they were) and not about any one person or group in particular (which was sometimes more debatable).

The Twilight Zone was a valuable cultural landmark and means to get Americans, in particular impressionable Baby-boomers on the verge of adolescence, to think seriously and freely about contemporary issues.

A typical episode was “The Obsolete Man”, which takes place in a future totalitarian state where a man, named Wordsworth, is condemned for being obsolete on two counts: being a librarian (and literate) and believing in God. For his method of execution, he asks to choose a personal assassin, the head of state known only as the Chancellor, to whom he may disclose his preferred method of death. He also requests that his execution be televised for the whole nation to see.

When the Chancellor arrives, Wordsworth reveals he has locked the door, and chosen to die by means of a bomb hidden in the room and set to go off in 45 minutes. He also explains the regime will lose face if it tries to rescue the Chancellor with the nation watching on TV. As time winds down, Wordsworth calmly awaits death by reading Psalm 23 from the Bible while the Chancellor grows increasingly panicky, begging Wordsworth to let him go “in the name of God.” Repeating that phrase, Wordsworth releases him just before the bomb explodes, while he dies calmly.

In the final scene, the Chancellor, who has lost face and his position, is declared obsolete and condemned to death.

Color TV. The first color TV broadcast was the Tournament of Roses Parade carried to 21 stations on January 1, 1954. At the time, there were only 200 experimental color sets able to view it. By March there were 370 stations broadcasting in color, with 202 more ready to start. In April, RCA started selling color sets at \$1,000 each (half the price of a car). One year later, it had sold only 5,000 sets. But color was clearly the wave of the future

Crabgrass Frontiers: the Birth of the Suburbs

"We are not builders. We are manufacturers." --Bill Levitt

Before the suburbs there were the “urbs”. By 1920, America had become an urban nation where more than half its people lived in communities of 2500 or more. Many of them lived in urban tenements nostalgically recalled in many of Norman Rockwell’s paintings. Photos of ethnic festivals also suggest a greater sense of community still existed in urban neighborhoods that the following half-century would largely dissolve. This was also before any urbanites had anywhere else they could live that was easily accessible to work. And it was before there were enough cars to take them between the two relatively distant places.

With the Depression still fresh in many people’s minds and postwar prosperity just starting, middle class America was poor by today’s standards. However, there was much less perception of a social distinction about being poor, since almost everyone was in the same predicament. This was largely reflected in the popular TV sitcom from the mid 1950s, *The Honeymooners*, about two families living in a sparsely furnished tenement apartment. While struggling financially, they had aspirations of upward mobility that their audience could relate to.

But there were problems, in particular with housing. As early as 1944, people foresaw the coming housing shortage when millions of veterans would return home to start families delayed by the war. Many of these new couples lived with their parents. Others found themselves crowded into substandard housing,

even old army barracks, often having to share housing with several other couples. Things only got more crowded and tense when millions of noisy babies with irregular sleep patterns started showing up in what was referred to as the baby boom.

Into the breach stepped Bill Levitt. A housing contractor before the war, he served in the Pacific with the Naval engineering corps popularly known as the Seabees. With each island American forces would take bringing them closer to Japan, the Seabees would build air bases from which to launch raids against Japanese cities. The Seabees were very efficient in doing their job, including quickly constructing pre-fabricated housing known as Quonset huts.

Inspired by the Seabees and Henry Ford's assembly line process, Levitt decided to apply the same techniques to building houses. His first project, Levittown, was on a Long Island potato farm he bought, cleared and subdivided into individual lots.

Rather than hiring expensive skilled workers who built one house at a time, he broke down the process of building a house into 27 stages, each done by a separate crew that focused on that one aspect of the project and then moving on to the next house. That way Levitt could create a virtual assembly line of house-building modeled after Henry Ford's assembly line. He could also use cheap unskilled workers who only had to learn one narrow aspect of house building.

Best of all, it kept prices down.

First, one crew would lay the slab on a lot, then move to the next lot to lay that slab, then the next one and the next one, etc.

Levitt-slabs just waiting for someone make them a home

Levitt was the first large-scale builder to construct houses on radiantly heated cement slabs. By foregoing a dugout basement, Levitt estimated he saved consumers \$1,000 per dwelling. The practice caught on. By 1952, 25% of all new houses were constructed on slab. Another money-saving omission was the front porch, where neighbors traditionally socialize with one another.

Building materials, from siding to nails, were delivered in perfectly calibrated house-sized amounts to each house site. Workers needed to do no measuring or cutting. Interchangeable, standardized parts also cut costs.

A building crews tanding on a slab with all the materials need for building a Levitt house

Once the first concrete slab was set, the next crew would frame the house, and then the next house, and the next, and the next, etc.

Then a third crew would work its way down lot-by-lot attaching the outer walls.

After that came the siding crew, and then the roofing crew.

Inside another crew installed the plumbing while an electrical crew did the wiring.

After that came crews that put in the insulation, the drywall, and the mudding.

Then came the painting crew, the flooring crew, and the crew that installed the appliances. All Levitt houses featured modern kitchens complete with electric range, refrigerator and other built-in accessories designed to take the labor out of housekeeping.

To reduce his dependence on middlemen, Levitt bought his own lumber stands in California and Oregon, invested in a lumber mill, and established a centrally located warehouse in Levittown. To increase efficiency, pre-cut lumber was bundled "combat loaded," with pieces arranged from top to bottom according to the sequence of when they would be needed.

While many supplies were shipped in, some materials were made on site. A cement hopper and gravel pit set up in one subdivision produced concrete for house slabs. After construction was completed, Levitt flooded the pit to create a community lake.

Originally, Levitt only built two variations of Cape Cod houses. This made it easier and cheaper for his crews to work quickly. Once the project was in full production, Levitt was finishing 36 houses a day.

Before the war, it would take him a year to complete that many homes.

Levitt sacrificed individuality and custom design for low-cost efficiency. Still, his later Pennsylvania development, also known as Levittown, featured six house models, each in several different styles and model years. The ranch house model, called the Levittowner, cost \$10,900, payments being \$67 a month. To create a sense of variety, Levitt would put houses at different angles on their lots, put different models of houses on adjacent lots, and paint them different colors. He boasted he had created "the least monotonous mass housing group in the country."

As prosperity increased in the 1950s and families grew, Levitt and other developers started offering ranch-style houses that included an attic, which could be finished into an extra bedroom. Later models would include such refinements as enclosed garages instead of open carports.

As with everything else, landscaping was standardized so that each lot received the same allotment of shade trees, fruit trees, evergreens

and perennials and flowering shrubs. The final plan called for more than 400,000 plantings at a cost of \$8,000,000.

Levitt supplied homeowners with detailed instructions on the care of lawn, plants and shrubbery. The assumption was that most new homeowners—as lifelong city dwellers—would have been unfamiliar with even the most basic aspects of horticulture. While small by rural standards, Levittown's 7000 square foot lots seemed spacious to city dwellers. Levitt figured most homeowners would be unwilling to maintain lots any larger than that.

Lawns offered homeowners an opportunity to individualize their homes. In some cases this led to "grass widows syndrome", the feeling by housewives of being ignored by husbands who spent all their spare time tending their lawns and gardens. At least grass widows' husbands were at home, as opposed to a later more severe condition called "golf widows".

Consistent with mid-century architectural design, Levitt incorporated windows and natural light wherever possible. Later models featured full-length or floor-to-ceiling picture windows, in front and back, segmented into standard multiples. This also fit in with the growing popularity of TV, where people loved looking through anything that resembled a TV screen, including ovens, clothes driers, and electric skillets. Most models featured large, sliding glass doors that opened on to an outdoor terrace that could be finished into a livable, even enclosed, patio space.

To cut costs and add flexibility, Levitt replaced conventional, solid-wood closet doors with Japanese manufactured bamboo screens. Like all of his materials, Levitt ordered the bamboo screens in bulk—1,750,000 square feet of them in his initial order. "The Japanese will learn what it means to be touched by Levitt," *Fortune Magazine* quipped.

While most of Levitt's cost cutting measures held up, some did not. His tarpaper composition sewer pipe saved money in the short run but

proved unstable. Homeowners often were forced to pay thousands of dollars to install new, copper lines—generally after Levitt's five-year warranty had expired.

Levittown as a Community. The basic planning unit for Levittown was the master block (below), a roughly mile-square area that encompassed three to five variously sized neighborhoods, also known as "sections." Each section contained on average between 300 and 500 houses. Although the goal of Levittown was to house people, and lots of them, by arranging his houses around neighborhoods drawn to human scale, Levitt hoped to create a small-town feel.

In addition to houses, Levittown's master plan called for swimming pools, baseball fields, churches, schools, and shopping centers. Levitt believed new homeowners preferred a full-service community with "built-in" features—just like its houses.

Elementary schools were to be nestled inside each master block so that, in Levitt's words, "no child will have to walk more than one half mile to school or cross any major road." He donated the land for both schools and churches.

Levitt's plan also included Olympic-sized swimming pools, Little League baseball fields, neighborhood parks, and a multi-purpose community building. An avid baseball fan, Levitt even built a regulation, major-league field in the hopes of luring a minor league team to Levittown.

By building a few large, centralized shopping centers, Levitt hoped to avoid the problems associated with haphazardly placed and often unsightly commercial strips. Levittown's main shopping center was not only large—at the time,

the biggest shopping center east of the Mississippi—but also meticulously landscaped.

During Levittown, Pa.'s first year, the company sold an average of 1600 houses a month. During a typical closing, it was not uncommon to see 40 to 50 buyers settling simultaneously on their new homes. This was indicative of a corresponding real estate boom across America.

Levitt took a lot of criticism for the three Levittowns he built and the multitude of imitations they inspired in cities across the nation: "*Suburbia is becoming the most important single market in the country. It is the suburbanite who starts the mass fashions—for children, ... dungarees, vodka martinis, outdoor barbecues, functional furniture, [and] picture windows ... All suburbs are not alike, but they are more alike than they are different.*" --William H. Whyte, author of the 1956 best seller, *The Organization Man*

"It is a one-class community on a great scale, too congested for effective variety and too spread out for social relationships...Mechanically, it is admirably done. Socially, the design is backward." --Lewis Mumford, 1952

"What would you call the places our homeowners left to move out here? We give them something better and something they can pay for." —Bill Levitt's response

In fairness to Levitt, he did try to create self-contained communities each with its own recreation facilities, shopping, schools, and churches within a square mile block. Unfortunately, other developers were not quite so conscientious, packing as many houses as possible into a small space to maximize profits. Unfortunately, this was at the expense of all the amenities that Bill Levitt had built into Levittown to make it a community rather than just a cluster of houses.

From 1950 to 1960, 20 million people moved from the cities to the suburbs. In terms of sheer numbers, this outstripped the fabled Westward migration of the 1800s many times over.

Except this was neither an *urban* migration, where living space was very limited and had to be maximized by building upward, nor a *rural* migration, where people had to occupy more space in order to farm. Rather, it was a *suburban* migration, where people took as much land as they could afford, not as much as they needed. As prosperity expanded in the coming decades, so did the size of houses, even as the size of families shrank. Suburban sprawl took over more and more farmland. In terms of space it also separated families further from one another, creating a greater psychological divide between them as well.

That and various other factors (the demise of the front porch, air conditioning which isolated people in their homes, fences and hedges that marked distinct boundaries between different families' property, and the increased mobility of society which cut into family meals and allowed families to move more often to follow corporate jobs) would all have unfortunate effects on the fabric of modern society.

On the Road: The Interstate Highway System (b.1956)

A stretch of interstate around Los Angeles

The affluence of the 1950s made it so the average American family could buy at least one car, making the US a nation on the move. However, all those extra cars needed more roads on which to drive, as the old two-lane highway system was quickly proving inadequate to handle all the new traffic.

In the early 1900s few roads were paved outside of the cities. Oftentimes, unpaved shoulders bordered ditches with steep drop-offs that could prove fatal. Road atlases consisted of written

directions, sometimes with a picture of a fork in the road.

In 1919, Lt. Dwight D. Eisenhower took part in the US army's first transcontinental motor convoy from Washington DC to San Francisco. Largely because of inadequate roads, it took 62 days, as vehicles got stuck in mud and sand and equipment crashed through wooden bridges. It was an experience that stuck in Ike's mind.

In 1939, the US bureau of Public Roads, probably influenced by the success of Hitler's Autobahn, recommended a transcontinental highway system of 26,700 miles. At the end of World War II, Eisenhower saw the Autobahn first hand, which just reinforced his ideas about the benefits of an interstate system to both commerce and defense.

A major hazard of two lane highways was passing slower vehicles, especially semis, on hilly or curved stretches of road where one could not see oncoming traffic. As cars backed up behind the slower semis, frustration would build and drivers would often take unnecessary risks in passing them, sometimes with fatal results.

In 1939, the US bureau of Public Roads, probably influenced by the success of Hitler's Autobahn, recommended a transcontinental highway system of 26,700 miles. By 1935, the government had built an early prototype of the interstate system with limited access in Massachusetts. During World War II, Eisenhower also saw the benefits of the Autobahn to both commerce and defense.

A typical stretch of highway before the interstates. Unpaved shoulders often bordered ditches with steep drop-offs that could prove fatal.

While Congress passed several bills to establish an interstate system, it never funded such a project. Finally, in 1956, with Eisenhower's prompting, Congress passed the Interstate Highways Act to remedy this situation. Also known as the Dwight D. Eisenhower System of Interstate and Defense Highways, it was possibly the most ambitious public works project since the Roman Empire.

The defense aspect of the interstates was to move tanks and other military vehicles rapidly across the nation. The new superhighways were also supposed to serve as emergency landing strips for air force planes.

Illinois was the site of the first comprehensive research project to build test pavements that could withstand the rigorous conditions interstates would have to endure. The site, which met requirements for temperature, frost penetration and soil conditions that were typical of most of the country, was built between 1956 and 1958 and consisted of six test loops west of Ottawa on the site of the current I-80.

Bulldozers lined up to build an interstate in 1960

Since 1956, it is estimated that interstates, which represent 3% of the nation's highways but carry 24% of its traffic, have saved 234,000 lives by providing:

- At least 2 lanes going in each direction to eliminate dangerous passing of other vehicles on dangerous curves and hills in the face of oncoming traffic along two-lane highways.
- Gentler curves and paved shoulders
- Median barriers & rumble strips to warn drivers they are leaving the road.

Each year the nation's interstates save an estimated \$30 billion in safety, time, fuel and consumer costs along with 9.7 billions of gasoline. They also save the average American 70 hours travel time per year, 20 billion hours for the nation as a whole.

On the down side, a certain romance and nostalgia about America's two-lane highways was lost with the interstates and their sanitized views of America. It's hard to imagine Jack Kerouac's *On the Road* as *On the Interstate*.

Also, from 1956 to 2006, the number of vehicles on national roads has grown from 65 million to 237 million, an increase of 263%, while our population has grown 75%. Miles traveled per year has increased 373% to three trillion. Traffic is increasing eight times faster than the miles of new road being built.

As of 2011, major repairs and maintenance were needed on existing roads.

- Five percent of interstate bridges were rated structurally deficient and another 16% as functionally obsolete.
- Likewise, 17% of the roads were in poor or mediocre condition and another 16% in only fair condition.

Unfortunately, only 49% of the funds needed for these repairs were being allocated. The collapse of the I-35 bridge near Minneapolis in 2007 (below) was a grim reminder of this need.

Birth of a (fast food) nation

As America became a nation on the move, it was only natural it would want and develop a diet as quick as its lifestyle. And nothing has fulfilled that need and defined that lifestyle since 1945 more than McDonalds.

In the 1930s, with the Northeastern shoe and textile industries closing down, two brothers, Dick and Maurice MacDonald, pulled up stakes and moved to the “promised land”, California. First, they opened a movie theater, which failed. Then they started a hot dog stand near a racetrack in 1937, which did all right during the racing season.

In 1940, they got a \$5000 loan from the Bank of America and opened a new stand in San Bernardino, a blue-collar town of about 100,000 people. This did reasonably well, bringing in \$40,000 a year.

However, it was nothing special, having 25 menu items (including Barbeque ribs and beef and pork sandwiches) that slowed service to an average wait of twenty minutes. Having 20 carhops didn't help, since their high school friends and boyfriends tended to hang around, filling the parking lot and probably reducing business.

Therefore, in October 1948 they closed down for several months and totally retooled their operation with a number of time and money-saving innovations.

- Seeing 80% of their business was burgers, they fired the carhops & cut the menu to 9 items.
- They replaced their three-foot long cast iron grill with two six-foot long stainless steel grills that held heat better than cast iron and were easier to clean.
- Plates and silverware, which tended to disappear anyway, were replaced by paper

bags, wrappers and cups, which also allowed them to get rid of the dishwasher.

- The size of the burgers was reduced from 1/8 to 1/10 pound.
- They got rid of messy condiment stations & added two pickles, ketchup, mustard, & onion to each burger.
- They adapted a machine that made peppermint patties to mechanically making burger patties.
- They also discouraged custom made orders since they led to big delays.

On December 12 they reopened, their restaurant sporting a sign with a chef called Speedy and the motto: “MCDONALD'S FAMOUS HAMBURGERS BUY E'M BY THE BAG”. And next to that in even larger letters: “15 CENTS”.

At first, business fell off as teens (who had just used their restaurant as a hangout) and the fired carhops heckled them. But in time working class people found that, for the first time, they could take their whole families out for a reasonably cheap meal. Adding to the family appeal were glass windows so kids could watch the cooks working. In a sense, McDonalds was mass-producing food like Detroit mass-produced cars and Bill Levitt mass-produced houses, handling a customer every fifteen seconds, with crowds lined up halfway to the curb.

Gross annual receipts in 1951 were \$277,000, and by the mid 1950s the restaurant was earning a profit of \$100,000. The McDonald brothers were deluged with requests about how they did it, and were generous in sharing their secrets. As business grew, so did pressure to open franchises. They sold their first franchise for \$1,000 to a gas retailer in Phoenix who surprised them by wanting to use the McDonalds name. The Carnation Company even wanted to turn them into a national franchise. However, the

McDonald brothers, having made more money than they'd ever dreamed of, were content with what they had and didn't want to get tied down to the endless headaches going national would bring them.

By 1954, the McDonald brothers had issued nine franchises. To handle their growing business, they kept buying more multi-mixers for making milk shakes from Ray Kroc, a man who was as driven to succeed as they were content with what they had. Soon Kroc was managing the franchise end of McDonalds, whose customer base he saw as families. When scouting out new locations, he would count schools and church steeples rather than measure traffic patterns, seeing those as the best predictors of success. And where he saw more and more steeples and schools was in the emerging phenomenon of the suburbs. Along those lines, he wouldn't hire women, thinking they were only there to flirt, and that would drive off the family business.

Besides being a workaholic, Ray Kroc was a control freak, obsessed with control of every aspect of McDonalds franchises. He demanded absolute cleanliness in his restaurants and employees (including no facial hair) and absolute standardization in his product. He would even pick up garbage and hose down his own parking lot.

Kroc's goal was for any customer at any McDonalds anywhere to be able to expect the same standardized quality of hamburger: 1.6 ounces of commercial grade beef with no more than 20% fat (when the industry standard was 33%), one-quarter ounce of chopped onion, one tablespoon of ketchup, one teaspoon of mustard, and a single pickle one inch in diameter.

Such rigid standardization demanded complete (nearly 24/7) dedication and conformity by his franchisees. The irony was that he wanted franchisees who were individualistic enough to put their life savings on the line, yet willing to conform to his rules. He felt he could more readily find people with such values in the Midwest, and, since he lived in suburban Chicago, he opened his first stand in Des Plaines,

Illinois in 1955. One problem he discovered was the McDonald brothers had licensed McDonald's rights to that part of Illinois to someone else. So to open his store, he first had to buy out the other contract for \$25,000, putting him even deeper into debt.

Once it was open, Kroc was a totally hands-on manager, in both running his stand and overseeing those of his franchisees. Therefore, the company grew slowly, with Kroc granting only one franchise besides his own in 1955. In 1956 he sold twelve. In 1957 there were forty McDonalds. From there it grew to 79 (1958), then 145 (1959), and then 228 (1960).

By 1961, people were identifying McDonalds more with Ray Kroc than the McDonalds brothers who still owned the name and were running their original store in San Bernardino. Kroc, who thought they were lazy and ambitious, wanted to buy them out, which he did, agreeing to their price of \$2.7 million. That was a hefty sum at the time, but Kroc thought it was a bargain with the chain growing by 100 stores a year.

Still bitter against the McDonalds brothers, he forced them to take their name of their restaurant (which they renamed Big M) and opened a competing McDonalds only a block away. Once when asked what he thought about competition, Ray Kroc answered: "If they were drowning to death I'd put the hose in their mouth."

Ray Kroc's intense competitive spirit would pay off. By 1989, McDonalds, for better or worse, had revolutionized how America and the world eat, owning over 20,000 restaurants worldwide.

In 1963, McDonalds replaced its icon, Speedy, with a clown. The original Ronald McDonald was portrayed by famous weatherman & TV personality, Willard Scott.

"...the reason Japanese people are so short and have yellow skins is because they have eaten nothing but fish and rice for two thousand years...if we eat McDonald's hamburgers and potatoes for a thousand years we will become taller, our skin become white and our hair blonde"-- Japanese President, Den Fujita, upon opening of the first Japanese McDonalds in 1971.

Kids Stay Free at Holiday Inn

In 1951, Kemmons Wilson, a very successful contractor from Memphis Tennessee, took his family on vacation to Washington DC. This was back in the days before super-highways when long lines of cars could be backed up for miles trying to pass slow moving semis on hilly and winding roads. Therefore, a family usually could travel only about 300 miles a day, and then had to look for lodging.

Unfortunately, there were no industry standards of cleanliness, and motels could be located far from any decent place to eat. Sometimes you might stumble onto something charming. Other times you might find a rattrap with no better prospects in sight. The motel below would be considered nice back then.

While the basic rate of \$8-10 a room was decent, families were charged an extra \$2 for each child. Thus the rate for a family with 5 children (not a lot back then) would be around \$20 (which was a lot back then).

Wilson decided he would open his own motels with consistent standards of cleanliness and a policy of not charging extra for children. In 1952, he opened his first Holiday Inn in Memphis.

Four years later, as if to help Wilson, Congress would pass a \$76 billion federal highway plan, putting millions of Americans on the road and in need of lodging every night.

Wilson's chain would grow to 1500 motels across the nation. Besides assuring consistent quality of accommodations to travelers across the nation, Holiday Inn was the first to offer the public a "Kids Stay Free" policy, in-room phone and TV, and free ice. These are amenities that we may take for granted today, but we owe them to the vision of Kemmons Wilson.

A Decade of Fads

One sign of an affluent (and some might say decadent) society is fads temporary movements typically having little of substantive value but being popular just because they entertain. While previous decades, in particular the 1920s, had fads, the 1950s, being the most affluent decade in history to that time, were especially loaded with corresponding fads.

Davy Crockett: the first merchandising spinoff empire. "Davy. Davy Crockett. King of the wild

frontier.” At least that’s what the song told us and we bought it, along with 100 million dollars worth of raccoon caps, cap-guns, wrist watches, books, moccasins, lunch boxes and all manner of merchandise.

Interestingly, there were only five episodes about Davy Crockett which aired as part of *The Wonderful World of Disney* in 1954 and 1955, but it was enough to trigger TV’s first merchandising mania, something that’s taken for granted with any blockbuster action movie or TV show. In fact, now they create a product and then movies and TV shows to advertise them.

Fess Parker portrayed both Davy Crockett and later Daniel Boone in an actual TV series, something which may have caused a permanent blurring of the two real life men into one entity (Davy Boone, Daniel Crockett?) and forever making their individual accomplishments less distinct to history students.

Like most fads, Davy Crockett and the coonskin cap faded from the scene more quickly than they had appeared, leaving a lot of people stuck with worthless coonskin hats...unless they saved them and tried to sell them as collectibles fifty years later.

In 1960, Davy would have a brief revival and go out a second time (or third if you count the real battle in 1836) in one final blaze of glory, this time portrayed by John Wayne in the movie, *The Alamo*.

Hula hoops were one of the biggest fads of all time. Its promoters, if not actual inventors, were Richard Knerr and Arthur "Spud" Melin, founders of Wham-O. In 1957, they heard a visiting Australian casually mention that PE classes in his home country had children twirl bamboo hoops around their waists for exercise.

Inspired by this factoid and the recent invention by Phillips Petroleum of a lightweight and durable plastic, Knerr and Melin created and marketed a device they called the “Hula hoop” because its users seemed to be doing the Hawaiian Hula. In two months, Wham-O sold 25

million hula hoops and another 100 million internationally in the following months. At its peak of popularity, they were manufacturing 20,000 hoops a day.

Not that all nations thought this fad was a good idea. The Japanese banned Hula Hoops thinking they might lead to inappropriate behavior. The Soviet condemned them (with some justification, as an example of the "emptiness of American culture". By 1960, Hula Hoops were lying next to coonskin hats in millions of attics, although Hawaii did attain statehood in 1959. Whether this was because of or in spite of the Hula Hoop is a matter of debate. Meanwhile, Knerr and Melin were marketing another hot idea: the frisbee.

The saucers have landed and they're ours. In 1957, a plastic flying saucer toy was first marketed by Rich Knerr and Arthur "Spud" Melin, founders of Wham-O and later creators of the Hula Hoop. The Frisbee’s history goes back to the popularity of tossing tin pie tins manufactured by The Frisbee Baking Co. of Bridgeport, Connecticut. Yale students would warn innocent bystanders of errant incoming pie tins by shouting “Frisbie”. In 1948, two World War II veterans improved on this by making them out of plastic. Their efforts to market the toy as the “Flyin’ Saucer” and “Pluto Platter” met with little success until Knerr and Melin noticed it, bought the rights to it, and marketed it as the Frisbee.

Poodle Mania! Each decade seems to favor certain colors, fashions, and even dogs. And in the Fifties the dog of choice was the poodle, which brought with it a lot of cultural baggage, such as poodle skirts, ceramic poodles, plastic poodles, pink poodles, decorative poodles, storage poodles, and even wastecan poodles. As if that wasn't enough, you could even look like a poodle with the poodle haircut especially popularized by Lucille Ball.

Much of this we could blame on World War II and Japan. After the war, we were touchy about the Japanese manufacturing anything that could possibly be used for making war. So they made

lots of poodles, all of them bearing the label "Made in Occupied Japan." To some Americans it seemed that the war had never ended, but just entered a new phase. To a large degree, they were right.

Chlorophyll. Green vegetables are good for you, so that means the green chlorophyll in them must be good for you and eliminate bad smells to boot. At least that was the common belief in the 1950s, so they added chlorophyll to every kind of product imaginable: toothpaste, shoe inserts, deodorants, and even chewing gum.

Whatever its merits, chlorophyll products sold well until "The Journal of the American Medical Association" had to ruin everything by pointing out one brutal fact: goats, who graze and live on chlorophyll, still have bad breath. After that, chlorophyll sales plummeted.

Cramming (AKA Telephone Cramming or Telephone Box Squash). Along with those crazy horns that make other soccer fans go deaf, we can thank South Africa for the sport of trying to cram as many people as possible into a phone booth (maybe to escape the sound of those horns). As a competition sport, cramming soon spread England and in 1959 to California. It became especially popular across college campuses as each one tried to set a new record. Since phone booths were so small, there wasn't room to fit very many rules:

- 1) The booth must still contain a phone (presumably working).
- 2) The door could be left open and only half of a person must be inside the booth to be counted.
- 3) The booth must be upright.
- 4) British rules required a team member to be able to either receive or place a call. I assume that placing a call earned you more points than receiving one, and that making a long distance call directly added even more. International calls would be the best. I don't know if reaching a wrong number counted. Luckily, this rule did not apply anywhere else.

The world record appropriately was claimed by the South Africans who fit 25 people inside one booth. The English, who had wider booths only

made it to 19, but they had to actually use the phone. A Canadian group made it to 40 but their booth was on its side and so they were disqualified (see rule 3). The American record went to a group at St. Mary's College in Moraga, California, who managed to cram 22 people into a booth.

As far as I can tell, this was a men-only sport, since this was before Title IX. Besides, this was the Fifties, and cramming would have been very unladylike back then. Not to mention the complications created by those huge flouncy skirts, heavily reinforced brassieres, and all the red lipstick in use back then.

Having destroyed an unknown number of phone booths, people tried Cramming into other helpless objects. VW Beetle cramming in particular enjoyed a brief heyday. (I don't know if British rules required someone to drive the car.) However, like all good fads, this one ended rather quickly and with mercifully few deaths.

**For those not in the know or under age 30, telephone booths were places where one could pay a dime to use a phone to call someone who hopefully was in the same place as their phone, since all phones were connected to walls. This made talking on the phone while driving extremely difficult. And don't even think about texting.*

"Housewife Syndrome"

An ad for the anti-depressant, Milton, which was prescribed for millions of women suffering from "Housewife Syndrome".

A major factor driving women's behavior in the Fifties was the misperception that the war had created a significant imbalance of eligible women compared to men. (In some countries, notably Russia, this was the case.) Women's magazines

added to these fears (and their profits) by playing up this belief, pressuring women to conform to a more feminine and ladylike styles and behaviors in order to catch and keep a husband.

This meant discouraging women from pursuing higher education or independent careers out of fear that would scare off a man. Thus the ideal woman in many people's minds should act, if not stupid, at least a bit clueless about anything besides babies and housework, and should never ever show herself smarter or more athletic than a man. This must have made for some very boring marriages.

For example, consider the following article, *The Good Wife's Guide*," from *Housekeeping Monthly* (May 13,1955).

"Have dinner ready. Plan ahead, even the night before, to have a delicious meal ready on time for his return. This is a way of letting him know that you have been thinking about him and are concerned about his needs. Most men are hungry when they come home and the prospect of a good meal (especially his favorite dish) is part of the warm welcome needed.

"Prepare yourself. Take 15 minutes to rest so you'll be refreshed when he arrives. Touch up your make-up, put a ribbon in your hair and be fresh-looking. He has just been with a lot of work-weary people.

"Be a little gay and a little more interesting for him. His boring day may need a lift and one of your duties is to provide it.

"Clear away the clutter. Make one last trip through the main part of the house just before your husband arrives. Run a dustcloth over the tables.

"Over the cooler months of the year you should prepare and light a fire for him to unwind by. Your husband will feel he has reached a haven of rest and order, and it will give you a lift too. After all, catering

for his comfort will provide you with immense personal satisfaction.

"Minimize all noise. At the time of his arrival, eliminate all noise of the washer, dryer or vacuum. Encourage the children to be quiet.

"Be happy to see him. Greet him with a warm smile and show sincerity in your desire to please him.

Listen to him. You may have a dozen important things to tell him, but the moment of his arrival is not the time. Let him talk first - remember, his topics of conversation are more important than yours.

"Make the evening his. Never complain if he comes home late or goes out to dinner or other places of entertainment without you. Instead, try to understand his world of strain and pressure and his very real need to be at home and relax.

"Your goal: To try and make sure your home is a place of peace, order, and tranquility where your husband can renew himself in body and spirit.

"Don't greet him with complaints and problems.

"Make him comfortable. Have him lean back in a comfortable chair or have him lie down in the bedroom. Have a cool or warm drink ready for him.

"Arrange his pillow and offer to take off his shoes. Speak in a low, soothing and pleasant voice.

"Don't ask him questions about his actions or question his judgment or integrity. Remember, he is the master of the house and as such will always exercise his will with fairness and truthfulness. You have no right to question him.

"A good wife always knows her place."

Of course, the role of a housewife, as described above, typically meant being stuck at home with the kids and isolated out in the suburbs away from old friends and family with whom to socialize and on whom they could rely for support. Adding to their isolation was the fact that most families had only one car, and the husband took that to work. Therefore, many women, feeling trapped and unfulfilled in their lives, became depressed. Although not a specific disease, this was diagnosed as a malady known as “Housewife Syndrome”.

One woman who recognized this, although she didn’t have that name for it, was Betty Friedan, whose book, *The Feminine Mystique* (1963), would help launch the Women’s Liberation Movement.

Fifties Fashions

As prosperity and the supply of fabric expanded after the war, so did women’s dresses, with hemlines usually stopping at or just below the knee. For women and girls, the most popular style was the full dress or skirt known as the swing style. Other typical features to accentuate a feminine look were bows and wide (AKA “Peter Pan”) collars to soften the neckline. To create that full Fifties look, women and girls wore petticoats, which were often starched with a mixture of sugar and water to keep the full look.

Another popular style for women was the tighter pencil style designed to show off a woman’s “figure eight” or “hourglass” shape. This was considered too provocative for teenagers. Gloves and high heels were also a must for any lady going out in public.

Except on TV shows, housewives didn’t wear high heels and pearls while cleaning the house. However, they did typically wear simple dresses for cooking and household chores. Women’s magazines also encouraged them to dress up for when their husbands returned from a hard day at the office, so maybe a lot of men and TV producers did believe that housewives actually wore pearls and high heels while doing laundry and changing diapers. And women were supposed to be the dumb ones.

To maintain that perfect figure, the corset made a comeback in the form of the girdle. The good news was that steel and whalebone were mercifully replaced by modern artificial fabrics such as spandex. The bad news was that women still had to wear their girdles, oftentimes all day, no matter how hot it might be in an era when air conditioning was relatively rare. Similarly, bras were heavily reinforced to provide extra support (and heat). However, they probably provided good protection in a knife fight.

Casual pants and shorts, as the term implies, were generally worn for casual occasions, such as picnics and barbecues, but were considered inappropriate for most other social occasions. Shorts went to just above the knees and were also high-waisted to cover the belly button in case a lady wore a halter top. Even the bikini (named after the atoll of South Pacific islands that were the sites of several A-bomb tests by the U.S.) was extremely modest by today’s standards, again covering the belly button with a high waist. Young women wore jeans (still called dungarees), but mainly in the home. The sloppy look of the 1940s bobbysoxers was a thing of the past in the 1950s. Girls, in particular, were kept on a tight leash in terms of what they wore outside the home.

The Men in the Gray Flannel Suits. For men, the military conformity of the war largely carried over into the quasi-military corporate conformity of the 1950s...except the uniform now was the dark (blue, brown, or charcoal) suit and tie with a white button down shirt. Even teenagers might wear ties to school, but with a cardigan sweater instead of a suit coat. The “officers” (i.e., athletes) would wear their letter sweaters to denote their rank in the hierarchy.

Military conformity in the workplace without the excitement of war was reflected in Sloan Wilson’s *The Man in the Grey Flannel Suit* (1955), a book detailing the frustrations of being trapped in the corporate rat race by day, only to return every evening to a house in the suburbs that was increasingly less a home and more a burdensome means of keeping up with the Joneses. Its characters, Tom and Betsy Rath were fictional, but the lives they portrayed were all too real to growing numbers of Americans in the 1950s.

Hats were a must for men in the 1950s, and no man was considered properly dressed if he went out without his hat. Hats, like suits, were conservative: black, gray, or brown with a medium brim and a dark colored hatband.

At home men could be a bit more casual, even wearing pink shirts and ties, the unofficial color of the 1950s. There was even a semi-sloppy look of leaving the shirt tail out. TV westerns also had their impact on men’s shirts, although they generally did not wear coonskin hats even around the home with their sons.

Point of etiquette. It was considered impolite for a man not to remove his hat when indoors.

Social Security in the 1950s and 1960s: Going Steady

*Wouldn't it be nice if we were older
Then we wouldn't have to wait so long
And wouldn't it be nice to live together
In the kind of world where we belong
You know its gonna make it that much better
When we can say goodnight and stay
together*

*Wouldn't it be nice if we could wake up
In the morning when the day is new
And after having spent the day together
Hold each other close the whole night
through
Happy times together we've been spending
I wish that every kiss was never ending
Wouldn't it be nice
Wouldn't it be nice by the Beach Boys
(1966)*

Going steady was serious business in the 1950s and 60s, being sort of a “term limit” marriage, where neither could date some one else and each had to know where the other one was at all times. (Keep in mind, this was before cell phones.) While going steady, a boy had to call his girl a certain number of times a week and take her out a certain number of times, based on local (high school) custom, but usually ranging from two to seven. Each had a standing date for special events, and the girl would even save up and help budget “their” money for those occasions.

To advertise their quasi-married status, a couple might exchange friendship rings worn on the third finger of the left hand. Other signs of “steadiness” would be for the boy to give the girl

his class ring or letter sweater. Couples in rural Iowa wore matching corduroy “steady jackets”. Teen girls in the 50s were advised to wear “puppy love” anklets to advertise their current status: on the left leg if they were going steady, on the right if they were available. (Or was it the other way around.) In fact, since status changed so quickly and boys might forget the code, there were anklets that actually said, “Going steady” on one side and “Ready, willing, and waiting” on the other.

Saving Lives with Shaving Cream: Burma Shave Signs (1925-63)

Without DVD players, satellite radio, iPods, or cell phones to distract and entertain them while driving on winding and hilly two-lane highways, one of the most creative ways to keep drivers alert and safe were Burma Shave (shaving cream) signs, a campaign that graced America’s highways from 1925 to 1963, by which time the interstates and television had made it obsolete.

Each set consisted of six signs posted 100 feet apart that gradually unveiled a clever four or five-line poem and then the Burma Shave logo. Some poems extolled the virtues of their shaving cream, while others extolled the even more important virtues of safe driving on highways that were much more treacherous than today’s four-lane straightaway interstates. There are no reliable figures on how many cans of shaving cream the Burma Shave campaign sold, or how many lives it saved by making drivers think twice about doing something foolish.

THE BEATS, ROCK & ROLL AND THE COUNTER-CULTURE CYCLE (c.1950-)

*“I saw the best minds of my generation destroyed
by madness, starving hysterical naked,
dragging themselves through the negro streets at
dawn looking for an angry fix;
Angel-headed hipsters burning for the ancient
heavenly connection
to the starry dynamo in the machinery of night.”* —
From “Howl” by Allen Ginsberg

Introduction: the age of pop culture. Different eras typically see one art form dominating the expression of that time’s culture, such as painting during the Renaissance and late 1800s or classical music during the 1700s. During the 1950s and 1960s it was music. One of the defining aspects of twentieth century civilization overall was popular culture which through the mass media of movies, radio, recorded music and television involved a much larger section of the general population as participants, both active and passive. Starting with silent movies around 1900, pop culture grew in popularity as it branched out into radio in the 1920s and talking movies in the 1930s. The dramatic growth of prosperity and new media after World War II saw an equally dramatic growth in popular culture, in particular with the birth of the musical phenomenon known as rock ‘n roll.

In fact there has always been pop culture, commonly referred to before the twentieth century as folk culture, the difference being that pop culture has access to and makes use of mass media. Mass media has also homogenized pop culture where a much larger part of the population is singing the same songs and seeing the same movies. Previously, popular folk songs, such as “Ring around the Rosie”, would have nearly as many local variations as there were local populations singing them. There was just no way to reach everyone with the same version of a song at the same time.

African-American roots. One distinction between high culture and pop culture is that the latter more readily includes the culture of the poor and downtrodden. In post-war America much of that culture was African-American. The roots of African-American music lie back in their African

heritage, which merged with Christianity and evolved into gospel music during the period of slavery and continued after the Civil War. While the gospel music tradition has continued to the present day (e.g., Whitney Houston’s background), it also morphed into two other forms: jazz in urban areas and blues in the countryside.

Jazz and the Beats. A major factor influencing jazz in the postwar era was the rapid pace of urban life. Jazz greats like Charlie Parker would take traditionally slow tunes and speed them up with extra notes in between to create whole new pieces of music that reflected urban culture’s fast pace. Since cities have traditionally been more open to new ideas and art forms, these jazz musicians attracted a largely white audience. A group of these people came to be known as the Beats, referring to that feeling people get, especially late at night, when they are beat, tired, and open to new experiences. One of the Beats, Jack Kerouac, wrote a stream-of-consciousness novel on one long roll of paper, using the written word in an effort to simulate the musical pace and rhythm of jazz. That novel, *On the Road*, captured the spirit of the younger postwar generation that was vaguely dissatisfied with mainstream culture and was looking for something new and more meaningful. Its title and basic plot line also reflected the increasing mobility of American society in its search for meaning in life.

Allen Ginsberg’s poem, “Howl”, written in 1955, made heavy use of *parataxis*, a technique, which juxtaposes two starkly dissimilar images or fragments without any clear connection, forcing readers to make their own personal connections. In fact, much of what seems to be purely random names in “Howl” were very personal specific references to people and events in his own life. For example, his repeated use of Moloch, the Canaanite fire god, to symbolize American culture is a reference to the factory in Fritz Lang’s film, *Metropolis* as well as to the impersonal materialism of American culture. “Howl” and its use of parataxis has had a profound impact on both poetry and music lyrics ever since.

The blues, Elvis, and the birth of rock ‘n roll. Meanwhile, another, more rural, genre of African-

American music was taking form and gaining wider acceptance: the blues. In the early twentieth century, artists from the rural Mississippi Delta, such as Robert Johnson, drew upon African-American field work songs and spirituals to popularize a new kind of guitar-based music among Black listeners. As the century progressed, the blues gained growing attention among white listeners, in particular Alan Lomax, whose recordings of a number of blues artists in the 1930s are our primary record of much of history of this music.

After World War II, African-American music, known then as race music, as becoming increasingly visible, largely thanks to a highly popular white disc jockey in Memphis, Dewey Phillips, who played a free-form mixture of country, blues, and rhythm and blues on his show, thus exposing a growing white audience to a variety of black artists. Therefore, Memphis was ready for a crossover artist when in 1954 Phillips first played “That’s all right” by Elvis Presley. The song gained enormous popularity among white audiences even before they found out he was white. Elvis, who grew up in Tupelo, Mississippi, was himself influenced by a mixture of white country and black blues music, successfully blending them in a style that came to be called rock ‘n roll.

Thanks to Dewey Phillips and Sun Records owner, Sam Phillips, the popularity of Elvis and rock ‘n roll skyrocketed across the South and then the entire nation. Wherever Elvis performed, hordes of hysterical fans, mostly girls, nearly drowned out his music with their screaming. This opened the door for other black artists, such as Chuck Berry and Little Richard, as well as white performers who imitated this style, to rise to stardom and further popularize this new kind of music. As one song put it, “I don’t care what people say, rock ‘n roll is here to stay.”

Evolution of the Youth Culture. Throughout the vast majority of our species’ existence, all ages of society have been mixed together day to day, although work and most social activities were typically divided along gender lines. All that changed with the industrial revolution in two ways. For one thing, the increasingly technical nature of

society led to greater affluence and the growth of public education. Whereas before, children and adolescents would work with the adults in the fields or factories, public education was now separating them from the rest of society by putting them together in classrooms. Although adults were still in charge, young people were increasingly influencing each other in their shared cultural values. And just as the younger generation was being separated from adults, women’s suffrage was bringing the genders closer together, mixing them more and more in the workplace and the classroom. Thus a virtual youth subculture was starting to form.

The role of postwar prosperity. The popularity of rock & roll was also the result of other historical forces converging on America in the 1950s. At the root of this was America’s position after the war as a global economic and political superpower. By the 1950s this had translated into unprecedented prosperity and new technologies, especially mass media, in particular television that millions of Americans were able to buy. As usual such developments had unforeseen results, in particular with teenagers.

By the 1950s, American teenagers working part-time jobs after school were making more money than the average family during the Depression twenty years earlier. Since their parents generally paid the bills, this meant teens had unprecedented amounts of money, which they could spend just on themselves. One cheap and seemingly innocuous new product they bought was the portable record player. Whereas, before a family might have one large record player that sat in the living room and was controlled by the parents, now teens could play their own records in the privacy of their bedrooms, free from their parents’ censorship. At the same time, record companies along with radio and TV stations, recognizing teenagers as a huge affluent new market, catered to their tastes, even if they were somewhat rebellious and their parents disapproved. The result was global awareness and popularity of both the Beat culture and rock ‘n roll.

The pop culture cycle. Of course, there was backlash from adults and mainstream America against these strange new cultural forms. As a result, the media typically would incorporate the more “acceptable” aspects of this new “youth

culture” while rejecting and/or parodying its more radical aspects. Thus when Elvis Presley appeared on Ed Sullivan’s popular variety program, the cameras showed him only from the waist up because of his gyrations when he performed. Similarly, there were endless parodies of Elvis, including those of small children imitating his style. Treatment of the Beat culture was more hostile, portraying them as violent rebels who were undermining the morals of our youth. The media even coined a new word for them, beatniks, combining beat with the Russian satellite Sputnik, because they were “way out there.” One popular TV sitcom, *Dobie Gillis*, had a totally clueless (but harmless) stereotype of a beatnik named Maynard G. Krebs. At first, this diluted portrayal of the youth culture would increase its popularity as it exposed more people to it. That in turn would invite more homogenized stereotyping of the youth culture, and so on.

However, this process had its limits. Eventually, the youth culture would become so diluted and mainstream, it would lose its appeal to teenagers, thus reducing media profits. However, a new, revitalized, and more radical, expression of the youth culture would emerge. Once again, the media would stereotype and parody this new movement and also incorporate its safer elements, making it more popular with mainstream culture until it also lost its appeal. This would happen with the “hippies” in the 1960s, Punk and New Wave in the late 1970s, and Hip Hop in the 2000s.

Creating the Youth Culture

The “bobby soxers” of the late 1940s who cultivated a sloppy image of rolled up jeans and loose-fitting clothes were a precursor to the screaming hordes of fans chasing after Elvis in the 1950s and the Beatles in the

1960s. In the 1940s the object of their adulation was Frank Sinatra.

With rock n’ roll came the beginnings of the generation gap, its first battlefield being the family radio or hi-fi and the first battle being whose music got played on it. The result was often an uneasy truce, with either parents or their teenagers buying them transistor radios and portable record players (another invention of the 1950s), which their owners took to the “forbidden cities” of their bedrooms where they could listen to their subversive music and plot the next stage of the “revolution.”

And to many adults rock & roll was a revolutionary threat to the status quo. Senator Estes Kefauver headed the Subcommittee on Juvenile Delinquency where witnesses testified to the direct links between rock & roll and juvenile crime, while one psychiatrist referred to it as a “communicable disease.” Much of the fear about this music was based in racial prejudice, since its roots were African American blues, jazz, and gospel. Critics called it the “Negro’s Revenge” and went on how its voodoo dancing and tom toms had white girls “squealing and drooling over negroidal crooners.”

Nor were critics completely off the mark about the social effects of rock & roll. Between 1955 and 1963, which were also key years in the Civil Rights movement, the number of top ten hits by black artists increased by fifty per cent. All that extra exposure to African American music must have had its effects on teenagers’ views on race. After all, it’s a lot harder to hate people when you’re dancing to their music.

“Fifties speak”. Even more than the Flappers of the 1920s, the youth culture of the 1950s generated what seemed to adults to be a whole new alien language occasionally laced with some English to provide a minimum level of communication between generations. While the phenomenon itself was nothing new, the numbers of young people using it was unprecedented. In the 1960s, as the Baby-boomers reached adolescence, the numbers

would mushroom and help create what would be termed the Generation Gap.

Below are some select terms and phrases in case you ever get caught in a time warp and find yourself in the 1950s. Some have remained part of daily speech to the present day. Most haven't.

| | |
|--------------------------------------|--|
| <i>Actor</i> | <i>Show-off</i> |
| <i>Agitate the Gravel</i> | To leave (hot-rodders) |
| <i>Ankle-biter</i> | A child |
| <i>Ape (used with go) really mad</i> | to explode or be |
| <i>Are you writing a book?</i> | You're asking too many questions |
| <i>Back seat bingo</i> | Necking in a car |
| <i>Bad news</i> | Depressing person |
| <i>Bash</i> | Great party |
| <i>Big Daddy</i> | An older person |
| <i>Big tickle</i> | Really funny |
| <i>Blast</i> | A good time |
| <i>Blow off</i> | To defeat in a race |
| <i>Boss</i> | Great |
| <i>Bread</i> | Money |
| <i>Burn rubber</i> | Accelerate hard & fast (hot-rodders) |
| <i>Cast an eyeball</i> | To look |
| <i>Cat</i> | A hip person (Beats) |
| <i>Chariot</i> | Car (Beats) |
| <i>Chrome-plated</i> | Dressed up |
| <i>Circled</i> | Married |
| <i>Clutched</i> | Rejected |
| <i>Cranked</i> | Excited (Beats) |
| <i>Cream</i> | To badly damage) |
| <i>Cube</i> | A normal person |
| <i>Cut the gas</i> | Be quiet! |
| <i>Cut out</i> | Leave |
| <i>Daddy-O</i> | Term of address (Beats) |
| <i>D.D.T.</i> | Drop Dead Twice → Respond: What, and look like you? |
| <i>Deuce</i> | A 1932 Ford (hot-rodders) |
| <i>Dibs</i> | A claim |
| <i>Dolly</i> | Cute girl |
| <i>Don't have a cow</i> | Don't get so excited (hot-rodders) A |
| <i>Drag</i> | short car race; (Beats) A bore |

“Spendagers” was what one critic dubbed the teenagers of the 1950s, and for good reason. In 1956, *Scholastic* magazine disclosed that 13 million American teens were earning \$7 billion a year, averaging \$10.35 per teen each week, more money from part-time after-school jobs than the average family had made during the Great Depression twenty years earlier. And most of that was discretionary income, making teens a major factor in the consumer market. As the bulk of Baby boomers became consumers in the 1960s, these numbers would rise dramatically, giving rise to a consumer-oriented youth culture that refused to die even as Baby Boomers grew older (although many would refuse to grow up).

It was the combination of lots of teens with money to spend and mass market advertising that created a new phenomenon: the youth culture. Rarely, if ever, has the elusive promise of eternal youth and immediate gratification so dominated cultural values at the expense of age and experience.

You're in the Pepsi Generation (gap)

Various companies, such as Pepsi, cashed in on the emerging youth culture and market by packaging their products in ways that were both appealing to teen-agers and squeaky clean enough so as not to offend parents and make them worry that drinking Pepsi would turn their children into beatniks.

Looking at Pepsi ads from the 1950s to the 1960s, one sees an emerging re-definition of young, which happened to coincide with an increasingly younger consumer market. The people portraying a youthful image in the 1950s are definitely adults, youthful and active, but some with what might be hints of grey in their hair. These are also people who are successful, being able to afford ski trips and fancy clothes. So Pepsi should fit in with their affluent lifestyles. As late as 1962, the models, while youthful, have crows' feet around their eyes along with the motto: "for those who think young."

By 1965, millions of Baby-boomers have reached or are approaching their teen years and collectively have enough money to buy a lot of Pepsis. As a result, the new slogan (seen at top) is "Come alive! You're in the Pepsi generation!" The models are teenagers, not with expensive clothes or ski equipment, but having the freedom to go to the beach and enough change to buy a Pepsi. Besides their numbers, they're also too young to (legally) buy alcohol, which is a major competitor for the adult market. Making Pepsi more appealing, both beer and Pepsi came in bottles.

America's beat is the world's beat

World beat is a term that could first be ascribed to rock & roll, because American teens weren't the only ones affected by its infectious "voodoo" rhythms. Teens in Europe were also caught up with this new music that they could identify as belonging to their generation. However, in Europe there was the added barrier of state-controlled radio which severely limited or

banned rock & roll from the airwaves. If rock's association with African Americans made it something of an outlaw music in the U.S., being totally banned made it more so, and therefore even more enticing as forbidden fruit.

Along came Allen Crawford, a London record producer who in 1964 started illegally broadcasting rock music from an off-shore ship, the *Caroline*, to British teens hungry for the latest hits, all this at a time when the Beatles and British Invasion bands were at the height of their frenzied popularity. Crawford's broadcasts didn't stop at British shores either. Dutch teens picked it up, inspiring their own pirate radio broadcast from the North Sea. So dominant were British and American rock becoming by then that Dutch DJs broadcast only songs sung in English and mixed their own banter with English phrases.

World culture was being born with the first generation totally plugged into the mass media. French authorities trying to stop it passed a law requiring at least 40% of the music broadcast on the radio must be of French origin. Even in Russia, teens hungry for American and British rock would pick it up on Radio Free America (which Soviet authorities tried to jam), record it, and somehow burn illegal copies using X-ray plates (below).

142B. THE EVOLUTION OF THE SUPERMARKET (c.1900-1960)

"When I saw those shelves crammed with hundreds, thousands of cans, cartons and goods of every possible sort, I felt quite frankly sick with despair for the Soviet people." --Russian president, Boris Yeltsin describing his first visit to a Houston supermarket

From credit to cash-and-carry. It's easy to take for granted supermarkets as the way we shop for food. However, the supermarket is both a product of the industrial revolution and a vehicle for change in our daily lives. Out of industrialization came four effects that started us down the long road to the supermarkets: vastly improved agriculture, a higher standard of living and the urbanization that came with it, the transportation revolution (both railroads and automobiles), and mass media.

Previously, shoppers had to go on a nearly daily basis to a variety of specialty stores (butcher shops, produce markets, dairies, and bakeries) for their groceries. Besides being time consuming, such a system was also expensive.

By the early twentieth century, railroads were bringing vastly increased crop yields to distant urban markets so that by 1920 over half of America's population was living in towns with populations of 2500 or more. This profoundly affected the consumer market. Previously, when the economy was primarily agricultural and a farmer got only one harvest and payoff per year, he would have to pay for any supplies he needed with credit. The local storekeeper would keep a running tab and the farmer would pay it off when the next harvest came in. However, by the 1920s when most of the population was living in towns and cities, people earned weekly paychecks and could pay for whatever they bought with cash.

In 1917, a man named Clarence Saunders opened Piggly Wiggly, the first cash-and-carry grocery store. In addition to paying with cash instead of credit, it was set up in a revolutionary new way. Previously, much of the store's inventory was on shelves behind a main counter along with a person who would fetch whatever items the shopper

needed. The merchandise in Piggly Wiggly, however, was on shelves in aisles winding through the store. Customers would get the items themselves and pay for them at the counter. This had several advantages. First it was faster for the customers who no longer had to wait in line for someone else to get their groceries for them. This, in turn, made it possible to handle a larger number of customers in a given amount of time, thus increasing the volume of sales. In addition, it reduced labor costs since customers were doing most of the work. The combination of higher volume and lower labor costs meant Piggly Wiggly could charge cheaper prices, thus making it popular with customers. Eventually, there were some 3000 Piggly Wiggly's across the nation, not to mention thousands of other cash-and-carry stores.

The birth of the supermarket. In 1930 the success of the cash-and-carry stores inspired a branch manager for Kroger Grocery & Bakery Co., Michael Cullen, to open King Kullen, the first large scale supermarket in Queens, N.Y. With the slogans "the world's greatest price wrecker," and "Pile it high; sell it cheap," King Kullen provided all a shopper's grocery needs under one roof, thus saving consumers time while featuring lower prices because of its high volume. It took advantage of two other products of the industrial revolution: the automobile, which created a much more mobile and geographically widespread population of consumers, and mass media advertising in newspapers which could reach that far-flung population of shoppers. Keeping prices even lower was King Kullen's remote location from the center of town, which required lower rents while providing shoppers with parking spaces for their cars. By his death in 1936, Cullen had seventeen such markets across the Northeast. Meanwhile, another former Kroger employee, William Albers, had opened Albers Super Market in Cincinnati, the first store to use the word "supermarket." By 1939, there were 4,982 supermarkets operating across the nation. As early as 1932, the food industry accounted for the second largest advertising budget in magazines.

Other innovations led to greater profits for the supermarkets and savings for consumers. Refrigeration and frozen foods allowed longer shelf life for products, thus reducing waste and expense.

They also meant shoppers could buy larger amounts of food at one time and store it, thus saving time and money on extra trips to the store. Another invention was the shopping cart, basically a basket with a handle and four wheels, which allowed shoppers to carry (and buy) larger volumes of food at one time. The one limiting feature of the shopping cart, the amount of space it took up in storage, was solved by the invention of the nesting shopping cart where unused carts fit inside one another.

Supermarkets created a whole new dynamic in food marketing. Instead of going through a wholesaler to get their products on the shelves, food manufacturers went directly to the supermarkets. Competition for shelf space further reduced prices. More sophisticated ways of selling foods also evolved. One was pre-packaging by the manufacturers who used more colorful eye-catching labels and wrappers to attract the buyer. Stores used bright lights and soothing music to make shopping an exciting and enjoyable experience. Strategies of product placement, such as putting boxes of sugary cereals advertised by cartoon characters on lower shelves where children could reach them, replaced random arrangement of products. The advent of television in the 1950s merely added to an impressive arsenal of marketing techniques.

By 1960, supermarkets were selling 70% of the nation's groceries. In 1930 the average share a family's budget for food was 21%. By 2009 it was down to 6%, creating more discretionary income for consumer luxuries, family homes, and education, the hallmarks of the middle class.

Today, the supermarket has given us year round produce and bar codes, but also gets blamed for obesity in America and global warming. In short, it has transformed and become an integral part of our lives.

A SHORT HISTORY OF MODERN ADVERTISING SINCE 1945

“I like Ike.”—1952 political slogan
“Winston tastes good like cigarette should.”
—Cigarette ad

Introduction: from producers to consumers. One of the most significant turning points in human history came in the 19th century when industrialization started turning Western Civilization from a producer to a consumer oriented society. In other words, whereas before the main concern was to produce enough to satisfy everyone’s needs, now the concern was getting people to buy and consume everything being made through mass production. Advertising, mainly print media until the 1900s, had been evolving more or less in step with ever-increasing production rates.

However, both production and advertising took a dramatic turn as a result of World War II, which created two very different situations in the U.S. and the rest of the world. For Americans, the recent conflict had brought them out of the Depression, as millions of workers had found jobs thanks to government contracts for producing tanks, planes, and other munitions for the war effort. Conversely, the war had impoverished the rest of the world, including our primary trading partners in Western Europe, and left them in no position to buy the consumer goods our factories were retooling to produce now that government contracts for military goods were drying up. In addition, Americans still clung to a traditional Puritan thrift ethic that discouraged unnecessary consumption. American businessmen feared a return of the Depression if they couldn’t sell their products. Adding to individual companies’ fears was the fact that there was no real difference between their products and those of their competitors.

For Western Europe, the solution was the Marshall Plan in 1947 to pump money into foreign economies. In addition to creating markets for American goods, it would also stabilize our allies politically against communism as the Cold War was developing. Similarly, the U.S. helped rebuild Japan’s economy to create a stable trading partner,

ally, and base in East Asia for stopping Soviet and Chinese expansion.

Madison Avenue takes off. In the U.S., companies and Madison Avenue (where ad agencies were clustered in New York City) were enlisting the help of psychologists to find out what makes people buy what they do. The results were surprising, if not a bit disturbing. In one study, hidden cameras measured the rate of eye blinks by shoppers, the theory being the rate would increase from excitement over all the products on the shelves. In fact, their eye blink rates dropped to an almost catatonic state, as if they were in a trance. Not until they were at the cash register watching the bill climb did their eye blink rates dramatically increase.

Another thing surveys showed was that consumers, who swore by a particular brand of product, often could not distinguish their “favorite” brands from those of competitors when all external packaging and other identifying marks had been removed. Furthermore, they found that people were buying on the basis of subconscious fears, prejudices, and even unconscious feelings. Delving deeper into this, psychologists hired by ad agencies identified three basic needs in consumers’ psyches that they could exploit: conformity, oral gratification, and security.

Armed with this information, advertisers started employing non-rational techniques, such as using bright colors and logos to sell the illusion of satisfying these hidden needs. They settled on several areas of approach by which to win consumers, six of which are discussed below with select examples. Of course, some of the examples could fall into two or more categories.

1) *Sex appeal* is probably the most widely used approach to selling products, even when those products have no rational connection to sex. But, a whole new industry was emerging, or reinventing itself on the basis of non-rational strategies. Therefore, cigarettes and fountain pens, with their long sleek phallic imagery, were ideal products for boosting a man’s self-image of attractiveness. Similarly, men’s adventure magazines and beer all were presented as reinforcing men’s feelings of masculinity. One of the biggest mistakes Coors

Beer ever made was trying to market beer to women. Although they quickly withdrew the campaign, their image as a manly beer probably still hasn't recovered.

Cars as symbols of power and sexuality in the 1950s were a classic example of form leading function. Previously, cars had been seen mainly as practical and functional, although a few cars, such as Dusenbergs in the 1930s, had been exceptions to this rule. Then along came Harley Earl, who started designing cars for General Motors with size and style being the main selling points instead of reliability and economy. The iconic hallmark of American cars in the 1950s was the tailfin, which seemed to get larger (and more threatening) every year. (There were even rumors of people being impaled on them.) Big American cars became one of the ultimate status symbols, and remain so in some countries, notably China where Buicks are still popular. Madison Avenue also pushed the idea that a man should buy a new car every two years to renew his sense of manhood.

Advertisers also used sex appeal to target women, but the more conservative nature of advertising in the 1950s limited what Madison Avenue could show mainly to makeup and hair-care products. One campaign that did push the limits was the Maidenform Bra ads, which showed women dreaming they were in various locales that were either exotic (e.g., ancient Egypt) or unlikely (e.g., construction sites) wearing nothing above their waists except their Maidenform Bras. Over the years, as standards for what was deemed appropriate for public advertising loosened, women were increasingly used to sell sexy clothes to other women and hamburgers to men.

2) *Reassurance of worth.* This was an area where women were especially targeted, since after the War they had typically become stay-at-home housewives, many of them in new suburban homes. Therefore, advertisers pitched the line that a woman's value was measured by the quality of her housework, especially cleaning. Daytime TV was bombarded with ads for dish detergents, laundry detergents, and various other cleaning chemicals. Daytime dramas came to be called soap operas since companies selling such products sponsored

them. A typical commercial would be a mini-drama with two women: one whose house or laundry was spotlessly clean and another who was depressed because her work didn't measure up until the first woman would enlighten her about the brand of cleaning chemical she was using. The last scene would show the second woman, having used the superior product, euphorically showing off her clean laundry or house. And they lived happily ever after.

3) *Creative outlets.* One phenomenon of the 1950s, popularly known as Housewife Syndrome, referred to the depression of housewives feeling bored and unfulfilled with the day-to-day drudgery of housework. Manufacturers and Madison Avenue came up with lines of pre-packaged food products that were simple and easy, but also designed to appeal to women as a creative outlet, just like the great chefs of Europe. When a line of instant cake mixes where the cook only added water failed, researchers figured out that adding just water wasn't creative enough and modified their product so women could add an egg and a cup of milk. Now housewives could feel just like the great chefs of Europe.

4) *Emotional security.* One of the more outrageous advertising campaigns took place in 1921 when the advertisers for Listerine Mouthwash (which had previously been sold as a floor cleaner and cure for gonorrhoea) invented a condition dubbed halitosis (bad breath), making millions of consumers insecure about something nearly everyone had up to that point in history and few people worried about. Since then, advertisers have constantly played upon, built up, and even created insecurities in consumers about something they have but no one else does (such as body odor, dandruff, and even "housitosis") or about something everyone else has but they don't (e.g., the latest fashions, toys, or electronic device). Emotional security especially relies on social acceptance, so ads show the consumer enjoying their product is with a group of people also enjoying it. Beer ads especially do this, typically showing a bunch of men together after a day at work or winning a big game (reassurance of worth) and enjoying a beer together as their reward.

5) *That warm and fuzzy feeling.* This includes all the commercials that use darling little children and puppies to sell us such things as cars and furniture. It's also used to induce nostalgic feelings of the good old days (e.g., lemonade) and family reunions (e.g., wine and biscuits).

6) *Immortality.* This especially includes commercials for financial and insurance companies that make us feel we can take care of our families even after we die.

Pushing ethical standards. While such tactics sparked discussions about ethical standards, their apparent success led to even more questionable practices, largely driven by the fear that once everyone had bought a certain product there would be no reason to buy any more. Out of this came something called planned obsolescence, where products either became outdated or broke down after a relatively short time, thus inducing the consumer to buy a "new and improved" version of the product. Possibly the most dangerous examples of this practice came from the American auto industry in the late 1960s when it started producing cars that proved increasingly unreliable. Behind this was a certain complacency about the dominance of American cars in the marketplace. However, in the 1970s cheaper, more reliable, and fuel-efficient foreign cars, especially from Japan, started taking larger and larger shares of world automobile markets. By the time American companies started improving the quality of their cars again, they had lost their dominant position in the world.

Another controversial practice was subliminal advertising. These were ads hidden from consumers' conscious awareness so they could only notice them subconsciously or unconsciously. One popular charge concerned movies, which run at twenty-four frames per second, too fast for the human brain to consciously notice individual frames. Periodically hidden inside one of these frames was an ad for popcorn, soda, or candy, the theory being that, after viewing several of these frames over several minutes would feel hungry or thirsty and go to the concession stand for food or drink. Later research indicated subliminal advertising had little or no effect.

The television age. Modern advertising really came into its own in the 1950s with television, which proved itself an especially powerful medium for several reasons. Central to its influence is the fact that we are a visually oriented species that gets 90% of its information through the eyes. As a result, it is much harder for us to ignore a TV than a radio. Of course, we can turn it off, but we're not programmed to shut out visual stimuli, so, all too often, the TV stays on. Once it has our attention it can incessantly repeat a message until it sinks in. Compounding this is the fact that it comes into people's homes where they can't escape its message, unless they turn it off--which they generally don't do.

Possibly most unsettling is how TV captures the imagination and attention of children, who are especially impressionable and easy to influence, thus making them lifelong customers. McDonalds has been particularly successful in this regard. After catering to a whole generation of baby-boomers from childhood through adolescence, it realized that America's increased affluence might make more upscale restaurants appealing to those same customers as adults. Thus, in the late 1960s, it created a clown (Ronald McDonald) and Happy meals with toys included. Consequently, the children of baby-boomers would pester their parents (who tended to indulge their kids) to go to McDonalds and other fast food restaurants with similar sales pitches to kids. Since the 1950s, advertising has become both more sophisticated as technology has advanced and more explicit, as standards of what is appropriate for TV have loosened.

The Evolution of TV Advertising

At first, ad agencies saw TV as just an extension of radio and treated TV ads as radio ads, just with pictures. Therefore, on July 1, 1941, when the first TV commercial aired on WNBT (NBC)

in NYC for Bulova, the camera focused on a watch and said “It’s three o’clock, Bulova Watch time.” This was already a standard ad on radio, just without the picture.

The ad agency, Biow Company, charged Bulova \$9 for the ad: \$5 for TV time & \$4 for “station charges.

Just like the Internet in the 1990s, no one knew how much of a future TV would have. Who would buy TVs with nothing to watch and who would broadcast shows without anyone owning TVs? The first big market for TVs was taverns because sports events would pack in customers. Therefore, beer, cigarettes, cars & Gillette razors were the main sponsors.

Because of limited resources and no prior experience in the medium to draw upon, early TV advertising was largely done as cheap cartoons or live demos. In June 1946, Gillette & NBC televised the Joe Louis-Billy Conn fight. Louis won. So did Gillette with an audience of 150,000. In 1947, Ford & Gillette sponsored the first game of the World Series, making Gillette’s Sharpie, (an animated parrot) and jingle (“Look sharp, be sharp”) fixtures on TV for years.

Live demos were another early mainstay of TV commercials: band aids staying stuck to boiling eggs; a Remington razor shaving a peach; the Timex torture tests (“It takes a licking and keeps on ticking”), and dropping an RCA radio from a 12’ ladder.

Of course, live demos had their pitfalls. For example, June Graham demoing a frost-free freezer couldn’t get the easy open button to work. So she shifted emphasis to another feature with the camera zooming in on her face while a stagehand off camera opened the freezer. Then the camera zoomed out to show a smiling woman next to an open freezer door. Another product that didn’t work right was the early pop-top for beer cans, requiring some deft camera work to cut away until the problem was fixed.

In another commercial in 1959, the woman demonstrating a Frigidaire delivered her lines flawlessly until the end of the ad when she yelled “Help! I can’t move!” because the microphone wired to her bra had short-circuited when she touched the Frigidaire.

Until the 1950s “respectable” advertising was still a print medium that still put a premium on the written word. Therefore, it was difficult to sell the scions of an older generation of print-driven advertising executives on the possibilities of TV advertising with its dynamic moving images that captured potential customers’ attention whether they liked it or not. However, in 1957 Chevrolet gave a man named Kensinger Jones a shot at using this new approach, setting him up with a huge budget of \$1 million that would soon grow to \$90 million.

At the time, Chevrolet and its parent corporation, General Motors, were on top of the world, producing nearly half the cars sold globally at the time. GM even willingly allowed the then nearly bankrupt Ford Motor Corporation to steal some of their top executives, fearing that if it controlled any more of the automobile market they would be subject to government anti-monopoly actions. Therefore, Chevy felt safe in trying a new approach to advertising, an attitude that was quickly dying in its approach to producing cars.

For his TV ads, Jones brought in an experimental filmmaker, Gerry Schnitzer, whose approach was to let the camera tell the story with minimal narrative. For example, one short film had a postman approaching a hopscotch board on a sidewalk and, when no one was looking, playing a secret game of hopscotch.

Schnitzer's first commercial for GM showed a wholesome clean-cut teenager rushing out the door to the prom as his family watches. The boy approaches his jalopy, the older icon of the youth car culture, patched together with various parts and made functional by hours and hours of tinkering. As he's about to get in, he notices a new Chevy convertible (with the top down).

For the first time words are spoken, not dialogue however, but a soothing male voiceover announcing: *"If it's happened once, it's happened a thousand times."*

The boy looks back and forth between the Chevy and his family, who are clearly in on the surprise. Then Dad reaches in his pocket, pulls out a set of keys and hands them to the boy, who runs to the new car, then back to the jalopy to retrieve his nearly forgotten corsage and almost as a farewell to a by-gone age.

Only after he picks up his equally wholesome date, does the voiceover return to deliver the message as if we haven't gotten it: *"What a gal! What a night! What a car! The new Chevrolet!"*

That ad, along with other Schnitzer ad/films with little or no dialogue and minimal narration (such as a driverless Chevy astounding style-conscious Parisians as it moves effortlessly through the streets of Paris and a Chevy sitting on top of a mountain as an airline pilot exclaims: "My God, there's a car on that rock"), signaled as much as anything, the birth of modern advertising in television. Ads with extensive dialogues or voiceover narratives would still comprise much, if not the bulk of TV advertising, but the cutting edge of TV ads would hearken back to Gerry Schnitzer's work.

In 1971, TV commercials went from 60 to 30 seconds due to higher costs. One casualty was live demos because 30-second demos are nearly impossible to do.

Rosser Reeves Sells Pain Relief and a President

The 1952 presidential election pitted the seasoned Democratic politician, Adlai Stevenson, against General Dwight D. Eisenhower, a man with virtually no experience in politics (unless one counts how he handled the egos of other generals like Montgomery and Patton in World War II). Ike was no public speaker like Stevenson was, so the Republicans brought Rosser Reeves of the Ted Bates ad agency, to handle his campaign.

More than anyone, Reeves understood the power of the new medium of television. He called his approach Unique Selling Proposition (USP). It had three basic rules:

1. An ad must make a single and simple pitch to the consumer.
2. This pitch should be one the competition can't make, or at least hasn't made yet
3. The pitch has to be so overwhelmingly powerful and convincing that potential consumers can't help but think that it is absolutely true.

In that vein, Reeves was responsible for numerous memorable slogans:

Wonder Bread helps build strong bodies in eight ways.

M&M's melt in your mouth, not in your hands.

Colgate cleans your breath while it cleans your teeth.

How do you spell relief? R-O-L-A-I-D-S.

Only Viceroy gives you 20,000 filter traps in every filter.

Certs breath mints with a magic drop of retsyn.

Reeves would be responsible for some of the most successful, and irritating, ads in TV history, most notably the "Hammer in the Head" commercial for Anacin (1952) that showed a

head wracked with three different types of animated pain (top). Then an authoritative sounding announcer would inform us that Anacin delivers relief from pain “*fast, Fast, FAST.*” It also would provide “*Fast relief from headaches, neuritis, and neuralgia,*” not that anyone in the audience had heard of neuritis and neuralgia. But they sounded bad, so you sure didn’t want to get it.

Another claim was that “*Three out of four doctors recommend the ingredients in Anacin,*” although it says three out of doctors recommended Anacin itself. In fact, it turned out he most prominent ingredient in Anacin after aspirin was a large dose of caffeine.

In fact, a consumer poll found that viewers hated the Anacin ad. But it seemed to sell a lot of Anacin and the campaign ran for over a decade.

Eisenhower answers America. This was the approach the Eisenhower camp got when it hired Rosser Reeves to run its campaign. In a series called “Eisenhower answers America” Reeves created 29 TV spots based around three themes: the cost of living, corruption in government, and the war in Korea. In each spot an average citizen would ask a question and Ike would answer it. Such as:

Man: “*General, the Democrats tell me I never had it so good.*”

Eisenhower: “*Can that be true when America is billions in debt, when prices have doubled, when taxes break our backs, and we are still fighting in Korea. It’s tragic...and it’s time for a change.*”

That’s what the viewer saw, something seemingly straightforward. However, it was large smoke and mirrors in how it was constructed. First, Reeves would have Ike read a series of answers, looking down to his right as if directly addressing a citizen until the last several seconds when he would turn to directly address the camera (i.e., the viewer). Then Reeves would find some average-looking citizens who would ask a question while looking up to their right.

After that, Reeves would match different questions with answers and splice the clips together to make it look like Ike was having a personal dialogue with each person.

Ike hated the phony nature of the ads and the fact that he wasn’t even allowed to wear his glasses to read the cue cards. (Supposedly they made him look too old.) However, the ads seemed to work, being run in a media blitz in certain battleground states in the last three weeks of the campaign. Naturally, Democrats called foul at this new technique, but to no avail. A new age in politics had been born. No longer was it public speaking to a crowd that mattered most. Now it was the apparent one-on-one eye contact between the politician and each individual viewer via the TV screen that could reach literally millions of individuals simultaneously.

FC.142D A SHORT HISTORY OF THE AMERICAN AUTO INDUSTRY TO c.2010

The Oil Century. Just as one could call the twentieth century (especially after 1945) the American Century, one could also call it the Oil Century. In 1949, coal accounted for two-thirds of the world's energy. By 1972 two-thirds of global energy came from oil, and most of that was burned in cars, and most of those cars were made in America.

Until the early 1900s, automobiles were individually made and limited to a small market able to afford such luxuries. Then, along came Henry Ford with the revolutionary new concept, the assembly line, which mass produced cars cheaply so that a lot more people could afford to buy them. The boxy Model T had no frills and, as Henry Ford would quip, came in any color a customer liked, as long as it was black.

What made cars so dynamic a part of the economy was the fact that workers' wages were high enough and cars were cheap enough that a much larger part of the population could afford the cars and other products they were making. The true consumer society had been born, and inhabiting it was a new type of person that one historian dubbed "Hydrocarbon Man."

Form over function. For the first half of the century, the basic formula for success had been to make good affordable cars with no frills and people would buy them. Even during the dark days of the Depression, that formula held true for maintaining what few auto sales took place. After the war and fifteen years of deprivation, however, people had more money to spend and were ready for something new and exciting.

Making this possible was Charles Kettering's invention of the high-compression engine using high-octane fuel in 1947. This could have led Detroit in two directions as far as producing cars was concerned: smaller fuel efficient cars, or much bigger cars that could carry extra features, weight, and status. Detroit went for Big. The ultimate winner would be a small foreign car derisively called the Bug.

However, just as the auto industry was moving forward in its advertising, it was moving backward in the quality of its product. This was largely the work of two men, General Motors' CEO Alfred P. Sloan, and his chief designer, Harley Earl. As Sloan saw it, smaller cars meant smaller profits, since it cost nearly as much in parts and labor to build a small car as a big one.

In this new age of affluence and abundance, Sloan saw the automobile less as a functional device and more as a status symbol representing one's current place as he moved up in the social hierarchy. For GM the hierarchy went from the basic Chevy for working class people and young couples just starting out up through the Buicks and the Oldsmobile and finally to the Cadillac as the ultimate sign that one had arrived at the top of society.

However, Sloan wanted customers to change cars on an even more regular basis than they changed status. To accomplish this, he had to make customers dissatisfied with the cars they currently owned. And to accomplish that, GM had to change each model of car every year in enough ways to distinguish it from last year's older "out of date" model. The term for this approach was "planned obsolescence."

Heralding these changes would be a massive advertising campaign to get the public excited for next year's new models coming out in the fall. As a result, the unveiling of next year's models became a major media event, at first with traveling auto shows, and later with TV advertising.

However, it was impractical and expensive to significantly improve a car in terms of engineering each year. Besides, such changes would usually be hidden under the hood, thus making them much less exciting and harder to sell. It was much cheaper to make cosmetic changes in the car, changing the shape or size of the body each year and adding more shiny chrome and larger tail fins to give the misleading impression of being more streamlined and futuristic.

The problem was that function was increasingly taking a back seat to form. In some cases, the changes in such things as body design actually compromised performance and safety. Among

other things, as American cars became progressively gaudier and heavier, fuel efficiency dropped. However, at a time when America was virtually self-sufficient in oil and gas was cheap, that didn't seem to matter. Twenty years later it would.

The Bug. By the late 1950s, the American auto industry was so far on top of the rest of the world that it lost sight of what had made it great. Sales were still skyrocketing, and so were stocks on Wall Street. Unfortunately, auto executives became obsessed with how the stock market was doing and ignored the quality of the cars they were producing. And, at first, there was no necessary correlation between the two. More specifically, there was a lag rate between when the quality of the autos started falling and the time it took for the consumers to catch on. Masking, and partly adding to, this decline in quality were the flashy, but unnecessary, new features (e.g., chrome and tailfins) that were being added each year to make last year's model seem obsolete.

In the meantime, both Western Europe and the U.S. were seeing a new emerging market of consumers wanting or only able to afford basic no-frills automobiles. In Western Europe, this was the result of the economic recovery starting with the Marshall Plan. In the U.S., it was the emergence of a relatively affluent blue collar middle class making decent wages in American factories and able to buy their own homes and cars.

There were increasing calls for Detroit to meet this new demand, but the thinking among the executives was that big expensive cars made bigger profits than small cars and that producing small cars would cut into big-car sales and profits. Therefore, American auto makers dragged their feet in producing a car for this market and left the door open for small efficient foreign cars to sneak in and steal American and global markets. It started with a small inconspicuous German car: the Volkswagen Beetle.

The idea of the Beetle went all the way back to the 1930s, when the German auto maker, Ferdinand Porsche, had a dream of making a cheap efficient version of Henry Ford's Model T for the German public. Hitler initially bought into this idea, but diverted money set aside from workers' paychecks toward buying such a car to building his navy.

Thus the Beetle never got off the ground until after the War, when a visionary German businessman, Heinz Nordhoff, bought the then derelict auto plant and started bringing Porsche's dream to life.

It was a success in Europe, but in order to modernize production to make his cars more competitive in the marketplace, Nordhoff needed hard cash, and that meant he needed to crack the U.S. market. Complicating that was the fact that the Beetle was made in Germany, which still didn't sit so well in many Americans' minds just a decade after the war. His initial effort in 1949 to market the Beetle through a Dutch salesman, Ben Pon, met with failure. What did work, starting next year, was a gradual word-of-mouth campaign about the reliability and low cost of the car. It began with a handful of GIs coming back from service in Germany with Beetles they had bought there. By 1956, the Beetle had won so many customers that it merited a review in *Popular Mechanics*:

"The Volkswagen sells because it is, more than anything else, an honest car. It doesn't pretend to be anything it is not. Being an honest piece of machinery, it is one the owner can be proud of. Wherever he looks, he sees honest design and workmanship. There are no places where parts don't fit, where paint is thin, where the trim is shoddy. There are no body rattles, no water leaks. Neither, of course is there overstuff, false luxury either. There is nothing about the car that is not sincere. One cannot imagine for instance, a Volkswagen with a fake air scoop or tail fins to make it look like an airplane in flight."

Of course, *Popular Mechanics'* audience consisted largely of "techno-geeks", many of them auto engineers, who were interested in function over form and weren't impressed with the status that supposedly came with the needless gimmicks weighing down American cars and driving up their prices. Unlike most of the public, they saw the flaws and dangers in what Detroit was putting out.

One other thing setting the Beetle apart from other cars was customer service. Volkswagen sent its top mechanics to the U.S. to teach American mechanics how to service their cars. Maybe of even greater importance was the fact that there was just one standard model of the Beetle that hardly changed from year to year. As a result, it was much easier

for Volkswagen dealers to keep parts in stock than it was for dealers of other brands with multiple models that changed each year.

GM did make a half-hearted effort at creating an efficient compact car: the Chevy Corvair, whose name was meant to evoke images of its much sexier sports care, the Corvette. Unfortunately, over the protests of the engineers, GM cut corners on the cost and safety of the Corvair, in particular, using small tires and not putting in a stabilization bar that cost only \$14-15 per car. As a result, it had a tendency to flip when taking sharp corners at high speeds. (The car itself may have been as safe as the Beetle, but the image its commercials and name evoked probably encouraged faster driving and more fatal wrecks.) Not until 1963, after numerous lawsuits, did GM add the stabilization bar. This also brought to the forefront a young crusading consumer advocate, Ralph Nader.

But GM and the American auto industry had learned their lesson. Unfortunately, it was the wrong lesson. Instead of manufacturing smaller cost effective cars that were also safer, it largely gave up on the small-car market and kept making behemoths that remained an icon of American industry, although in an increasingly negative way. This would really catch up with Detroit in the 1970s when cheap plentiful oil started to become less cheap and plentiful.

In fact, Detroit would start making smaller and more fuel-efficient cars in the 1970s. However, in the 1980s, oil prices came back down and American cars got bigger again, the new poster children for the industry being SUVs (sports utility vehicles), updated station wagons, some of which were so big they were mounted on truck chassis. Until the first decade of the new millennium, oil availability and prices remained fairly stable, and so did the size of American cars, although their quality and reliability did improve during this time.

Another growing problem for American auto-makers and other industries since the 1970s has been the emergence of industrial economies in East Asia with much cheaper labor that has allowed them to undersell their American competition. In response, companies in the U.S. started outsourcing production to other countries to take advantage of their cheap labor. While this would keep these

companies more competitive, it also drained jobs from the U.S., making more of its people unable to afford cars.

As other countries' middle class grew after 2000, so did competition for oil, thus driving its price up again and spurring the American auto industry to develop more fuel-efficient cars, including ones that use alternate fuels, to keep it competitive in the twenty-first century. The days of the oil century were clearly numbered.

THE HEIGHT OF THE COLD WAR (1957-72)

“Why not throw a hedgehog at Uncle Sam’s pants?”—Khrushchev on his decision to put missiles in Cuba

Rising tensions. As we have seen, Khrushchev’s efforts to ease East-West tensions couldn’t overcome the inertia of Stalin’s legacy. Adding to the tensions, the Soviets developed the Bison Bomber and intercontinental ballistic missiles (ICBMs) in the 1950s, both of which could deliver nuclear weapons to the United States. The American public became increasingly concerned about the so-called “bomber gap.” Therefore, the U.S. increased its spy flights over the Soviet Union to determine how large the “bomber gap” was. It turned out that such a gap did indeed exist, but it was in America’s favor. However, the top-secret nature of this information and how it was obtained kept President Eisenhower from using it to silence Democrats who were constantly criticizing him for being soft on defense.

Meanwhile, Khrushchev had one more ace up his sleeve.

Sputnik. On October 4, 1957, the Russians launched Sputnik, the world’s first space satellite, into orbit around earth. Although it was only a small metal ball emitting a weak radio signal, it shocked Americans who saw this as a threat to their security. Once again, the response was two-fold. In 1958 Congress passed the National Defense Education Act. From this point on, American schools would stress math and science in their curriculum in order to compete with Soviet science and technology.

The second American response was to launch its own space program. After an embarrassing initial failure, the Americans launched their own space satellite in 1958. The Space Race was on. Over the next decade, the two powers competed to achieve the first manned space flight, the longest space flights, the first walk in space, the first manned orbiting of the moon, and ultimately the first lunar landing. On July 16, 1969, millions of Americans watched a live broadcast of the first human to walk on the moon. Although the space race itself accomplished little of value, it spawned a technology revolution, especially in

communications as television broadcasts and telephone calls could now span the globe.

“Long live Soviet-American friendship”: *Khrushchev in America (1959).* Khrushchev (and the Soviets in general) had a bit of an inferiority complex about the rest of the world, and the United States in particular, taking Russia seriously as a major power. Therefore, it would mean a lot to his and Russia’s prestige if Eisenhower would invite him to America for a visit. So, in 1959 Khrushchev got his invitation for a two-day visit, accepted for a 10-day visit, and arrived in Washington D.C. (with his wife and grown sons, another innovation for the Soviet era) for what turned into a 13-day media circus.

At first, Americans were somewhat cool to the leader of the communist world (a busload of kids even calling him a “meatball”). Khrushchev explained the cool silent reception from crowds along a parade route as being like people who hadn’t seen a camel before. If you displayed a camel they would come out to see it out of curiosity and maybe pull its tail. Pure Khrushchev.

Nikita’s boisterous style was also a bit much for the more reserved Ike, but they got along well enough. However, tight security kept the Soviet premier from getting out to meet people, which was what he liked to do. When he wasn’t allowed into Disneyland for security reasons, he remarked somewhat angrily, “Is there an epidemic of cholera or something? Or have gangsters taken hold of the place?” then, during his tour of Twentieth Century-Fox Studios, he got into an argument with the studio president Spyros Skouras about the merits of capitalism versus communism.

But he did get to schmooze with stars like Shirley Maclaine and Frank Sinatra, and then the trip turned upbeat. On the train from Los Angeles to San Francisco, Khrushchev’s traveling host, Henry Cabot Lodge, decided to loosen up and let his Russian guest go out and meet people. This was just what Nikita wanted, going out to meet real live Americans and turn on the charm. Later, to reporters he beamed, “I have seen some real live Americans. It seems they are just as real and as good as our kind Soviet people.”

After visiting an Iowa farm where he got excited about growing corn in Russia, Khrushchev moved on to two days of talks with Eisenhower. Although no substantive agreement about Berlin was reached, Nikita confessed he had acted brashly by laying down an ultimatum about the city, while Ike admitted that a Western city stuck in the middle of communist territory was a bit “abnormal.” The tour ended with Eisenhower agreeing to reciprocate by visiting Russia the next year, although events would prevent that from happening. By the end of the tour Khrushchev had largely won over the American public, one woman in Des Moines referring to him as a cute little man. Upon his return to Moscow, he proclaimed, “*Long live Soviet-American friendship!*”

Unfortunately, the honeymoon wouldn’t last.

Gary Powers and the U2 incident. Around the time of his visit Khrushchev had proposed a massive disarmament deal involving a unilateral withdrawal of one-third of the Soviet forces in Eastern Europe and offering mutual disarmament of both sides’ missiles along with verification by on-site inspections. The CIA saw this as a serious proposal, but the Democrats and generals kept pounding the drums about the “bomber gap” (which they didn’t realize actually favored the U.S.). Therefore, CIA director, Allen Dulles, proposed one more U-2 spy flight to confirm whom the “bomber gap” favored, if it existed at all. This is where everything went wrong.

The Soviets knew about our spy flights and denounced them as violations of their borders, but couldn’t prove to the world they were taking place by shooting them down...until now. When this U-2 was shot down, the pilot, Gary Powers, was supposed to take a cyanide pill so that there would be no living proof of such a mission. Instead, Powers parachuted to the ground and was captured alive.

At first the Soviets just revealed they had shot down the plane, so Ike went into standard denial mode. Only then did they parade out Powers who had confessed to the mission, forcing Eisenhower to admit he had lied. Khrushchev was furious. Trusting Ike’s good intentions from their previous meeting, he felt personally betrayed. Not only that, but he had taken tremendous political risks by

proposing massive disarmament. Now, not only the generals in the Kremlin, but also Mao, condemned him as a traitor to communism.

It was in the context of this betrayal and humiliation that Khrushchev became much more belligerent: storming out of peace talks in Paris, angrily pounding his shoe on his desk in the UN, openly embracing Castro as a new communist ally in America’s backyard, renewing threats about Berlin to the new president, Kennedy, and finally shipping nuclear missiles to Cuba.

More atomic tests. Because of the spy flights, Khrushchev had to worry about how much the U.S. knew about how vulnerable the Soviet Union really was. Therefore, to deflect public attention, he increased Soviet nuclear testing, even detonating a 57-megaton H-bomb (1961), the largest man-made explosion in history. Increased nuclear testing by both sides accomplished nothing except for raising tensions further and increasing worldwide concern about the higher levels of radiation being released into the atmosphere.

The Berlin Wall. Ever since 1945, the West’s control of West Berlin had presented major problems, since it was situated in the middle of East Germany with several very vulnerable routes there from West Germany. In 1948, Stalin had tried to gain control of West Berlin by cutting off its land corridors to the West, but the Americans and British had successfully air-lifted supplies into the beleaguered city until Stalin gave in. However, West Berlin continued to present a growing problem for the Soviets, since it was a constant reminder to East Germans all around of the much better standard of living in the West. Complicating this was the fact that there was free access between East and West Berlin. This and the lure of a better lifestyle caused growing numbers of East Germans to defect to the West, which only hurt the East German economy more and made the West that much more enticing. This led to Soviet demands for the West to abandon West Berlin, but this only increased tensions that drove even more East Germans to flee to the West and so on.

People worried that Berlin would be the spark to ignite World War III. Then, on August 13, 1961, Berlin awoke to find the East Germans building a wall to cut off all access between the two parts of

the city. Despite public indignation, Western leaders breathed a sigh of relief, because the Berlin Wall solved the problem of mass defections to the West without damaging their prestige. However, the Berlin Wall would separate families for nearly thirty years and stand as the most visible symbol of the Cold War until its fall on November 9, 1989.

The Cuban Missile Crisis. For years, Cuba had suffered under the corrupt dictatorship of Juan Batista while serving as a playground for rich Americans. In the 1950s Fidel Castro started a small insurgency that gradually grew into a full-fledged revolution and overthrew Batista in 1959. Although Castro had socialist leanings, he was not a declared communist. However, the United States, in the midst of the Cold War, tended to see red when any leader with the slightest socialist leanings appeared in the Western Hemisphere. When it refused to recognize Castro's regime, he formed closer ties with Russia. The U.S. responded by refusing to refine imported Soviet oil in its Cuban refineries, spurring Castro to nationalize those refineries. When the U.S. put an embargo on all Cuban goods, Castro retaliated by nationalizing all American owned businesses in Cuba. Then it turned nasty, with the CIA launching air raids on Cuban sugar fields and plotting against Castro by putting chemicals in Castro's cigars to make his beard fall out and spraying LSD into a studio he was visiting to make him act crazy. Finally, Castro declared his movement a communist revolution.

Under Eisenhower, the CIA had organized an invasion of Cuban émigrés to overthrow Castro. However, in 1961, a new president, John F. Kennedy, took office. When presented with the CIA's plan for an invasion, he agreed to go ahead with it, but cut critical American air support, fearing to expose American involvement in this plan. Consequently, the ensuing Bay of Pigs invasion was an unmitigated disaster that embarrassed Kennedy and infuriated Castro. Khrushchev convinced Castro to let him put medium and intermediate range missiles armed with nuclear warheads in Cuba. For the first time in the Cold War, most American cities were within range of Russian missiles. Therefore, when American U-2 spy planes spotted these missiles in October 1962, Kennedy treated this as a major threat.

The question was how to get rid of the missiles. Just as appeasement had led to World War II in 1939, a mere diplomatic response seemed too mild and ineffective for this situation. By the same token, while the generals pressured Kennedy to invade Cuba or launch an air strike against the Soviet missiles, he remained acutely aware that such aggressive actions could trigger a third world war and nuclear holocaust. (At the time, Kennedy was reading Barbara Tuchman's *The Guns of August* that told how aggressive diplomatic actions had led to World War I.) Along those lines, he saw that it was unclear as to who was the "home team" defending its turf, because, while Cuba was geographically closer to the U.S., it was firmly allied with the Soviet Union.

He finally decided on the strong but less provocative course of a naval blockade to stop more Soviet missiles from reaching Cuba. While the United States and Britain had been able to airlift supplies into West Berlin over Stalin's blockade in 1948-9, airlifting heavy missiles into Cuba over such a long distance was not an option for Khrushchev. A few days later, the policy bore fruit when an approaching Soviet convoy turned back rather than trying to crash the American blockade. However there was still the much stickier issue of how to remove the missiles already in Cuba.

By late October tensions were near breaking point as the American military moved to Def-Con 2, signaling that war seemed imminent. Civilians made plans to evacuate major cities that might be targeted for a nuclear strike. The military was pressuring Kennedy to invade Cuba, unaware that the Soviets had tactical nuclear weapons on Cuba that would have immediately destroyed any invading force. Just to add to the tension, on several occasions false alarms nearly launched our bombers.

Then Kennedy received two messages from Moscow, one fairly conciliatory, the other more provocative. Such mixed signals further confused him about the proper response, there even being speculation that a military coup had seized power in the Kremlin in the interim between the two messages. Kennedy decided to respond to the more conciliatory message and ignore the other one, thus establishing a calmer basis for negotiation. On this basis he struck a deal with Khrushchev. Russia

would publicly remove the missiles in return for an American promise not to invade Cuba. Privately, Kennedy agreed to remove American missiles from Turkey that posed a similar threat to Russia. Therefore, publicly it seemed the U.S. had won, while behind the scenes the net result was that fewer missiles threatened Russia than before 1961 and no more missiles threatened the U.S.

The Cuban Missile Crisis was a major turning point in the Cold War. It was the closest we ever came to unleashing a nuclear holocaust that would have devastated civilization. Both sides clearly saw this and worked harder to avoid such a scenario. They installed the “Hot Line” to ensure better communications between the two sides and avoid unnecessary speculation, such as whether the other side had had a military coup. In 1963, the two sides agreed to a ban on atmospheric testing of nuclear weapons, thus putting an end to such ridiculous saber rattling. The Cold War would continue for almost another thirty years, but the two sides had planted the seeds of at least some level of mutual trust that would form the basis of more substantial progress in the years to come.

Vietnam (1954-75). American involvement in Vietnam was its most disastrous move of the Cold War. Driving it was a fear and hostility toward communist Russia and China that blinded American leaders to any other possible causes of an uprising with the slightest socialist elements as examples of Soviet and Chinese aggression. Out of this came the unfortunate policy of backing any anti-communist regime, no matter how corrupt and repressive. Therefore, The US missed two important facts about Vietnam. One was that the government it supported in Saigon (the South Vietnamese capital) was a brutal dictatorship and anything but democratic. Secondly, ignoring the centuries-long animosity between the Chinese and Vietnamese, it saw North Vietnam as a pawn in a Chinese plot to conquer all of Asia.

After Vietnam won its independence in 1954, it had been divided between North and South at the 17th parallel, with planned elections to reunite the country in 1956. However, The United States, fearing a communist victory, prevented the elections from taking place, thus keeping Vietnam divided between the communist North and a “democratic” South that actually functioned under a

series of American-backed dictators. Civil War soon erupted with North Vietnam supporting a communist insurgency known as the Viet Cong in the South.

Acting on these assumptions, the U.S. felt it imperative to support the government in Saigon against the Viet Cong and North Vietnam. At first, Eisenhower sent only a few hundred military advisors and Kennedy slightly increased this commitment. However, it was President Johnson who heavily committed American forces and aid to South Vietnam in the 1960s.

Unfortunately for American forces, this was very different from any war they had ever fought in before. Instead of the traditional head-on clashes between clearly identifiable armies, this was a guerilla war where insurgents would attack American soldiers and then melt back into the civilian population, often making it impossible to identify and catch them. Out of frustration, American troops would retaliate against any civilians in the area of the attack, inevitably killing innocent people in their efforts to find the Viet Cong. This would increase public support for the Viet Cong and feed more guerilla attacks which, in turn, would trigger both increased American involvement in Vietnam and more retaliation against innocent civilians, and so on. Vietnam’s jungles also made it virtually impossible for American forces to sweep through the countryside or even effectively disrupt enemy supply lines, known as the Ho Chi Minh Trail. This trail ran largely through neighboring Cambodia and Laos to avoid American attacks, unless the U.S. wanted to complicate its situation further by sending forces into those countries.

This was a different kind of war where traditional benchmarks of progress didn’t apply for several reasons. First of all, the jungle made it impossible to advance along a visible front with visible battle lines in contact with one another. Also, there were also diplomatic factors that shackled the war effort. For one thing, US forces couldn’t unleash their total firepower, fearing that they might cross a threshold that would bring in China or Russia and trigger World War III. Likewise, North Vietnamese forces were supplied along the “Ho Chi Minh Trail”, an ever-shifting supply line that ran through neutral Laos and Cambodia. Launching an offensive

against this would violate the neutrality of Laos or Cambodia, with all sorts of complications. In fact, when Richard Nixon did send troops in to Cambodia, it triggered massive demonstrations across the US. In one of those, four students were shot and killed, which escalated protests to a new level still.

Another factor hampering the war effort was television coverage. This was the first television war, where Americans would watch updated accounts and images of the war every night on the evening news. This can make progress in any war seem unbearably slow, but especially so in Vietnam where the nature of the fighting eliminated the traditional measure of success: geographic advance along a front towards a stated goal, typically the enemy capital. However, there were no geographically defined fronts in this war, only isolated raids where American troops would be airlifted by helicopters into remote villages, try to identify and catch the enemy, and then get airlifted out, abandoning control of the villages to the enemy once again. This daily repetition of seemingly identical raids with no apparent progress or purpose increasingly frustrated the American public.

Added to this frustration was the media's portrayal of the war as a losing cause, especially after the Tet Offensive in 1968. This was a surprise attack that did catch U.S. and South Vietnamese forces off guard, but turned into a major defeat for the communists. However, the media's portrayal of this battle as a defeat (because of its initial surprise) turned much of the American public against the war. This generated another vicious cycle where media portrayal of the war as a losing cause would trigger student protests that also got heavy TV coverage. These would reinforce the media's negative portrayal of the war, causing more protests and so on.

The war's unpopularity forced President Johnson out of the presidential race in 1968. The winner was Richard Nixon who told the public he had a secret plan for ending the war while he was secretly telling the North Vietnamese to keep fighting while Johnson was still in office, saying they could get a better deal with him if he were elected. When Nixon took office, he pushed for "Vietnamization" of the war, replacing American troops with South Vietnamese conscripts, many of who proved

unreliable in the fight to defend a corrupt and failing dictatorship. However, this gave Nixon the chance to negotiate a "peace with honor" (1973), which left communist forces still operating in South Vietnam intact, but gave American forces enough time to exit Vietnam before the Saigon government fell. In 1975, North Vietnamese forces entered Saigon, thus reuniting Vietnam. Three years later, as if to underscore the nationalist nature of this prolonged struggle and debunk the idea that the war was a Chinese plot, Chinese and Vietnamese forces were firing at each other as they had for centuries.

"Long live Soviet-American friendship": Khrushchev in America (1959)

Khrushchev (and Russians in general) had a bit of an inferiority complex about the rest of the world, especially the United States, taking them seriously as a major power. Therefore, it would mean a lot to his and Russia's prestige if Ike would invite him to America for a visit. So, in 1959 Khrushchev got his invitation for a two-day visit, accepted for a 10-day visit, and arrived in Washington D.C. (with his wife and grown sons, another innovation for the Soviet era) for what turned into a 13-day media circus.

The many contradictions in Khrushchev's personality often made him difficult to deal with, thus making the period of the Cold War when he ruled Russia an exceptionally dangerous time as well. While from a humble background, working as a shepherd and coal miner as he grew up, his personality was anything but simple.

By nature, Khrushchev was bubbly and enthusiastic about life, enjoying it to the fullest when given a chance. However, all those years as one of Stalin's top advisors had also taught him to be somewhat circumspect when he needed to be, making him seem devious and duplicitous when he was probably just trying to be careful.

Like Stalin, he was a natural born actor, able to do his boss' bidding, no matter how horrible or humiliating that might be, and act like he enjoyed it. Unlike Stalin, he was a ham who loved the spotlight and meeting people. Thus as an actor, he could be either extremely charming, an intimidating bully, or both all at the same time as required.

Although able to keep a low profile to avoid undue attention from Stalin, Khrushchev could be bold, as seen in his daring speech in 1956 denouncing Stalinist rule to a closed meeting of the party faithful, most of whom, like it or not, owed their careers to Stalin. But he could be a bit too bold and impetuous and do things like putting nuclear missiles in Cuba.

Khrushchev was also very emotional and wore his heart on his sleeve. While this meant that people knew where he stood on an issue...at that particular time, he also had a tendency to experience rapid mood swings that could create uncertainty and confusion, which isn't always the best thing to do when engaged in high-stakes international diplomacy involving nuclear weapons. For his trip to America in 1959, advisors thought the presence of Khrushchev's wife, Nina, might act as a calming influence on the Soviet leader's volatile temper.

Khrushchev had both a huge ego and inferiority complex, the latter not being helped by all those years under Stalin. He was virtually obsessed with the Soviet Union and himself getting respect as world leaders. To him, the ultimate sign of such respect was getting an invitation to visit the United States, so he was overjoyed when he got that invitation in 1959, feeling the Soviet Union had finally gained the respect it deserved.

The Kitchen Debates. This came in the wake of the nearly disastrous visit of Vice President

Nixon to Russia. Nixon, hoping to run for president as Ike's successor the next year, wanted to score points with his constituents back home by confronting Nikita over Cold War Issues. With the Soviet leader as eager to steal the show and make his points, the result was a series of contentious arguments between the two men known as the Kitchen Debates, since two of them took place in model kitchens that were part of an American exhibition in Moscow. When the two men met again in Washington, they resumed their argument, Khrushchev even inviting Ike to decide who was right.

During his visit, Nixon had tried to impress Khrushchev with his own working class background working in his father's grocery as he grew up. Nikita merely replied that all merchants are thieves.

Ike's invitation to Khrushchev was supposed to be contingent on progress in peace talks that spring, but the aide delivering the message forgot that part of it, and Nikita jumped immediately to accept what he saw as an unqualified invitation.

A place where stray dogs are sent to die. One aspect of Ike's invitation that worried the Soviet premier was this mysterious place called Camp David where they would meet. Nikita remembered that in the early days when relations with the West were first being established that a Soviet delegation was being invited to the Prince's Islands, which they learned was supposedly a place where stray dogs were sent to die. Similarly, he worried that Camp David might be some similar place where mistrusted foreigners were kept under quarantine.

None of the Soviet officials seemed to know what this Camp David was either. Even more worrisome was the fact that Russian spies couldn't figure it out for some time. Finally they learned it was the presidential retreat, meaning Khrushchev was being invited to Ike's country "dacha".

This delighted Nikita, who had only one other complication to deal with, a previously planned

trip to Norway, Sweden, and Denmark. In order to break that date without insulting the Scandinavians, he used a Swedish article criticizing his visit as an excuse to feel insulted and cancel the Scandinavian trip. He kept his date with Sweden in 1964 and had lots of fun.

Twenty-one guns and not one gun less. One issue dogging the visit was the State Department's refusal to give Khrushchev the full diplomatic honors given to a head of state, since technically he was only head of the Soviet government, not head of the Soviet State, an honor due to the titular president, Kliment Voroshilov. This meant he would be greeted by only a 19-gun salute and Vice President Nixon (whom he hated from the previous Kitchen Debate) rather than a 21-gun salute and President Eisenhower. Nikita finally got his way by threatening to visit the same indignities on Ike when he visited Russia.

The twenty-one-gun salute apparently had its origins in the 1600s. When a warship wanted to signal its peaceful intentions as it approached a foreign port or ship, it would fire all its guns to empty them of all live ammunition, thus leaving it helpless in the face of retaliation.

Communists not welcome. Not all Americans were happy to see Khrushchev come for a visit. The FBI knew of at least 25,000 people that supposedly wanted to kill him. While the National Review sold stickers saying "Khrushchev Not Welcome Here," at least one cemetery had a sign saying Khrushchev *was* welcome there. A Hungarian refugee put a blindfold on the Statue of Liberty so she wouldn't have to see "this murderer, Khrushchev." And an Iowa college student charged with murdering a young mother and her baby even claimed that he got the urge to kill from watching Khrushchev's arrival on TV.

Congress felt somewhat obligated to invite the Soviet leader to speak to a joint session of the two houses, but many legislators personally hated the idea or feared popular backlash back home for welcoming a communist. Faced with this dilemma, they came up with the brilliant

solution of adjourning Congress and leaving town before Khrushchev arrived.

On the other hand, many Americans welcomed the opportunity to show off their version of the American way of life to Khrushchev. A Philadelphia restaurant had fifty pounds of borscht flavored ice cream delivered to the Russian leader, while the National Institute of Dry Cleaning announced it would give Khrushchev and his entire party free dry cleaning for the duration of the trip. The American Trampoline Company in Jefferson, Iowa offered him a free trampoline if he'd just visit for ten minutes. Different communities tried to lure Nikita to visit them with gifts of such things as shoes, gunstocks, and, in one case, use of a luxury apartment with a Japanese houseboy.

The tallest airplane in the world. Even Khrushchev's method of arrival in America was loaded with theater. Back in 1956, when Eisenhower had arrived for a conference in Geneva in a plane twice the size of Khrushchev's, the Soviet leader was irate that it made his plane look "like an insect" and ordered a giant plane of his own. The result was a giant 50-foot tall, 4-engine turbo-prop monster known as the TU114, which was ready by 1959 for his U.S. visit. On a preliminary visit, the TU114 proved so tall that when it landed at Andrews Air Force Base, there weren't any stairways that could reach the main door and the occupants had to crawl down a ladder.

Despite microscopic cracks in the engine, Khrushchev insisted on flying it to the U.S. Technicians on the flight monitored the cracked engines with tubes resembling stethoscopes, while the Soviet merchant fleet was on alert along its flight path to fish out Khrushchev's body if it crashed. Luckily it didn't, and by the time the Russians landed, the Americans had built a mobile stairway tall enough to reach the door of the plane.

According to Soviet propaganda, the TU114 was also “carried across the ocean not only by its mighty engines...but by the solicitous and considerate strength of millions of Soviet toilers, of all progressive people on earth, by their indomitable and passionate desire for peace.”

Shooting the moon. Forty-one hours before Khrushchev’s scheduled arrival, the Soviets landed an unmanned satellite, Lunik II, on the moon, announcing: “For the first time in history, a space flight has been achieved from the earth to another celestial body.” The pinpoint accuracy with which the Soviets had achieved this feat suggested that they could also deliver nuclear-armed ICBMs anywhere in America. Although the Soviets claimed the event was purely a “happy coincidence” with Khrushchev’s visit, no one believed them.

Of course, after the usual diplomatic niceties, Nikita couldn’t resist mentioning this in his speech upon landing in America: “*On the eve of our meeting with you, Mr. President, Soviet scientists, engineers, technicians and workers gladdened us by launching a rocket to the moon. We do not doubt that the United States will likewise deliver their emblem to the moon. The Soviet emblem, an old resident of the moon, will welcome your emblem and they will live in peace and friendship.*” Later, whether out of a spirit of genuine friendship or a desire to rub it in further, Khrushchev presented Ike with a scale model of the Lunik II.

Nikita’s boisterous style was a bit much for the more reserved Ike, but they got along well enough. At the state dinner, Nikita and the entire Soviet delegation wore dark suits and ties instead of white ties and formal tuxes, which he claimed were signs of decadent capitalism.

Khrushchev was hesitant to take a helicopter tour over Washington D.C. until he was assured Ike would be on the chopper with him, concerned that it might be “accidentally” rigged to crash. Of course, who could blame Nikita after all the years he had served Stalin? As it turned out, the Soviet leader loved the tour, and in

particular the helicopter ride. When he returned to Russia, he ordered three for himself, just like the ones Ike had.

One of Khrushchev’s scheduled stops was an experimental government farm in Maryland, which was known for such things as trying to develop sunburn resistant hogs. After listening to boring speeches about such things as pre-emergent pesticides, Nikita entertained reporters by insulting American hogs as being too fat and questioning why America would specially breed turkeys to be smaller just to be more suitable in size for smaller families.

At first, Americans were somewhat cool to the leader of the communist world (a busload of kids even calling him a “meatball”). Khrushchev explained the cool silent reception from crowds along a parade route as being like people who hadn’t seen a camel before. If you displayed a camel they would come out to see it out of curiosity and maybe pull its tail. Pure Khrushchev.

Throughout the tour, Nikita, never willing to be one-upped, constantly bragged about the superior quality and numbers of Soviet missiles, which he liked to brag were being manufactured like sausages.. From the Soviet leader’s point of view, this was probably to cover up Russia’s overall nuclear inferiority. However, to Americans, this seemed like provocative rhetoric designed to scare them about war with Russia. Aggravating these fears were Khrushchev’s occasional outbursts of temper, especially when hit with hard and embarrassing questions about repression in the Soviet Union and Hungary (whose uprising had been brutally suppressed just three years earlier).

While in New York City, Khrushchev’s hotel elevator got stuck just short of one of the floors. As a result, the whole party had to climb out and up to the next floor and then walk up the remaining five flights of stairs to their destination. Later, as he was riding in a limousine through the slums of Harlem, Khrushchev remarked to his guide, Henry

Cabot Lodge: "This isn't bad. We have a lot of areas just like this in the Soviet Union."

The day after Frank Pace, the CEO of General Dynamics, a major defense contractor, told Khrushchev "it was absurd to think that American capitalists supported the cold war in order to make money in the arms business," Khrushchev gave a speech for disarmament. That day the stock market lost \$1.7 billion.

On his flight to Los Angeles in a Boeing 707 jet, Khrushchev was so impressed with the plane that he offered to trade his TU114 for it. His hosts explained that they didn't have the power to authorize such a trade.

Nikita's boisterous style was also a bit much for the more reserved Ike, but they got along well enough. However, tight security kept the Soviet premier from getting out to meet people, which was what he liked to do. When he wasn't allowed into Disneyland for security reasons, he remarked somewhat angrily, "Is there an epidemic of cholera or something? Or have gangsters taken hold of the place?"

But Nikita did get to schmooze with Hollywood stars like Shirley MacLaine (below) and Frank Sinatra. He was also treated to a special performance from the somewhat risqué *Can Can*. Although he later blasted it as immoral, he didn't seem to object to it close up. His wife's reaction wasn't so clear.

Khrushchev also got to meet Marilyn Monroe, who was instructed:

- a) to wear a low-cut dress
- b) to leave her husband, playwright Arthur Miller, at home; and
- c) to know who Khrushchev was and the importance of his visit.

Ms. Monroe thought Khrushchev was nice, but said she'd never want to have a president who was so short, bald, and ugly.

But the Hollywood visit turned sour again when Nikita got into an argument with Twentieth Century-Fox Studios president, Spyros Skouras, about the merits of capitalism versus communism. Adding to his anger and another temper tantrum were the rudeness of L.A.'s mayor and replacing his desired tour of Disneyland with a long boring tour of a suburban development project.

One incident hints that at least part of this was theater on Khrushchev's part. After his outburst in LA, the Russians returned to their hotel room, which Nikita assumed was bugged. While silently indicating to his colleagues that he thought they were being listened to, he launched into a half-hour tirade about his treatment by the Americans, just to throw them off balance.

Then the trip turned upbeat. On the train from Los Angeles to San Francisco, Khrushchev's traveling host, Henry Cabot Lodge, decided to loosen up and let his Russian guest go out and meet people. This was just what Nikita wanted, going out to meet real live Americans and turn on the charm. Later, to reporters he beamed, "I have seen some real live Americans. It seems they are just as real and as good as our kind Soviet people."

Mr K visits Big Blue. One of the icons of American business in 1959 was IBM, already becoming the giant in the computer industry. (In the 1960s, the computer industry would be described as IBM and the seven dwarfs.)

Like Khrushchev who had succeeded the egomaniacal Stalin, IBM's president, Thomas J. Watson Jr., had followed an almost equally egomaniacal father, Thomas J. Watson Sr., who had built IBM around his own bizarre personality cult. Besides a strict dress and conduct code (dark suits, white shirts, no facial hair, no drinking or smoking at company events), he also had pictures of himself in every

office, along with the IBM Band, IBM Orchestra, IBM Men's Glee Club, and IBM Mixed Chorus. There was also an IBM songbook with songs like "March on with IBM", "Hail to the IBM" and even "To Thomas J. Watson", with the lyrics: "*Pack up your troubles—T.J. Watson's here!
And smile, smile, smile.
He's the genius in our IBM
He's the man worthwhile.
He's inspiring all the time
And very versatile.*"

Luckily Watson Jr. had dismantled this ridiculous Stalinist type personality cult before Khrushchev's visit. While anxious to show off his star computer, RAMAC, he was worried about Khrushchev's pending visit to his factory, given the contentious arguments that had accompanied so many of his other visits. Luckily, the IBM cafeteria took care of the problem.

Watson made the fortuitous decision to take Khrushchev to lunch first. Food always made Mr. K, a heavy eater, in a better mood. What really impressed him was the concept of self-service, which had the double advantage of saving worker time and giving him unlimited access to food. For Khrushchev this particular lunch included fried chicken, potatoes, fruit salad, onion soup, orange juice, and iced tea. Khrushchev wasn't impressed with the computers, but he loved IBM's food.

For his afternoon snack to hold him till dinner, Khrushchev ordered clam chowder, abalone steaks, filet of sole, roast pheasants, roast beef, baked potatoes, vegetables, fruit tarts with whipped cream, coffee, tea, and milk.

A visit to the cathedral of consumption. American capitalists were anxious to show Khrushchev an American supermarket. When they finally did get him into a Quality Foods store in San Francisco, it triggered a virtual riot as the crowd, wishing to see the Soviet premier, surged forward, with children shrieking and teenage girls squealing as if they had seen Elvis.

Khrushchev's guards, alarmed by this scene, formed a protective wall around the Soviet

premier. In response, the photographers climbed all over the products to get their pictures, squishing sticks of butter, shattering displays of instant coffee, stomping across salami and cheese in the deli, and trampling over the chickens in the meat department. Teenage boys stood in shopping carts to get a better view, only to tumble out when they started rolling. Another teenager made five dollars carrying a photographer on his shoulders to give him a better view. As AP reporter, Seth Pett described the scene: "*It was like happy hour in a manic depressive ward.*"

Nikita was especially impressed with hot dogs and corn grown on Roswell Garst's farm near Coon Rapids, Iowa. Garst had been corresponding with the Russian leader for several years about corn and even traveled to the Iron Curtain in 1955 to promote corn agriculture there.

While the leader of the communist world was welcome on Garst's farm, the huge cadre of reporters and photographers wasn't, especially when they started trampling his corn to get better views of Nikita. Garst even resorted to pelting the press corps with wet silage (which really stinks).

Khrushchev thought that was outrageously funny.

Unfortunately, this would inspire him to try growing corn in Siberia, an experiment that unfortunately would help cost him his job five years later.

After visiting an Iowa farm where he got excited about growing corn in Russia, Khrushchev moved on to two days of talks with Eisenhower. Although no substantive agreement about Berlin was reached, Nikita confessed he had acted brashly by laying down an ultimatum about the city, while Ike admitted that a Western city stuck in the middle of communist territory was a bit "abnormal." The tour ended with Eisenhower agreeing to reciprocate by visiting Russia the next year, although events would prevent that from happening. By the end of the tour

Khrushchev had largely won over the American public, one woman in Des Moines referring to him as a cute little man. Upon his return to Moscow, he proclaimed, “Long live Soviet-American friendship!”

Not only that, he went out on a limb by offering a sweeping arms reduction deal. Unfortunately, the honeymoon wouldn’t last, because, before accepting this remarkable deal, hardliners pressured Ike to send one more spy flight over Russia, and that would ruin everything.

The U-2 Incident (1960)

The U-2 spy plane

One of the asymmetries of the early Cold War was the openness of American society, which gave relatively easy access to Soviet Spies, compared to the closed society of the Soviet Union. To even the playing field, the United States developed increasingly long-range photography and the U-2, a spy plane that could fly at altitudes beyond the reach of Soviet air defenses. As a result, it could send flights over Russia with impunity.

The Soviets knew about our spy flights and denounced them as violations of their borders, but couldn’t prove to the world they were taking place by shooting them down...until 1960 when they shot down a U-2. Rather than be captured, the pilot, Gary Powers, was supposed to take a cyanide pill so that there would be no living proof of such a mission. Instead, he parachuted to the ground and was captured alive.

Years later, different versions emerged of how the U2 plane was brought down. In one, a pilot, Igor Mentyukov, claimed he caught the U2 in the slipstream of his unarmed Su-9, causing Powers’ plane to flip over and break its wings. According to Mentyukov, if a Russian SAM (Surface to Air Missile) had hit the U2, Powers

would never have survived. Metyukov’s Su-9 had been disarmed so it could reach the 65,000-foot altitude at which the U2 was flying. Being without weapons, he was ordered to ram the American plane.

It does seem a SAM inadvertently hit and brought down a pursuing MIG-19, killing the pilot. According to Khrushchev’s son, Sergei, only one of a battery of three SAM’s even ignited when fired against the U2 and it exploded behind the plane, breaking off its wings, but allowing Powers to eject. Since the Soviets didn’t know for some time if they had downed the American plane, they fired thirteen more missiles, and it was one of these missiles that accidentally shot down the MIG-19.

Part of Powers’ survival kit when he ejected consisted of 7500 rubles and jewelry for any women he encountered.

Powers was sentenced to three years in prison and seven years of hard labor. However, he was exchanged for a Russian prisoner in 1962 after only 21 months in a Russian prison.

Among other things, the Gary Powers incident served as a boost to America’s space program. Since Soviet defenses apparently could reach the U2, the US accelerated development of the Corona spy satellite program run by the CIA until 1972. Flying in a low earth orbit (LEO), it provided the US with photographic surveillance of Russia, China, and other areas.

The political ramifications were a bit more severe. Khrushchev had had to use a lot of intense persuasion to get hardliners in the Kremlin to agree to his massive disarmament proposal after his visit to America. Therefore, not only did he feel betrayed by Eisenhower’s sending another U2 flight, he also faced serious backlash in the Kremlin for going so far out on a limb to make the offer.

Therefore, when he returned to the U.S. in 1960 to speak to the U.N. in New York, Americans saw a much different and angrier Khrushchev from the one they had seen in 1959.

His most notorious outburst during this trip came when, to protest another delegate's speech, he took off his shoe and pounded it on his lectern. The other members of his delegation followed suit and pounded in rhythm with him. To further annoy the U.S., he stayed in New York for two weeks, making a series of long provocative speeches against the West, generally behaving badly, and making few new friends, most notably the communist leader of Cuba, Fidel Castro.

This also sent U.S.-Soviet relations into a tailspin.

The Great Nuclear Bomb Firing Contest of 1961-62

The Tsar Bomb test, the largest manmade explosion in history (October 30, 1961)

Nuclear bomb tests. In the early 1950s, when we only had “small” fission devices such as those dropped on Japan in 1945, we could carry out tests in the desert and even send out troops into the Ground Zero after the blast. Twenty years later, many of these soldiers developed radiation related maladies such as leukemia, and some even sued the government.

Some civilians even got to view early nuclear tests, as long as they wore their protective goggles. Others took the nuclear threat more seriously, building and stocking fallout shelters in preparation for the Apocalypse. However, as thermonuclear devices multiplied and grew in destructiveness, such precautions seemed increasingly pointless to many.

In the 1960s, the period of greatest tensions between the two powers, the number of American and Soviet nuclear tests peaked at ridiculous levels, mainly to show each other our respective destructive potentials, while also poisoning the planet with radioactive fallout. The record year was 1962, with nearly 140 nuclear tests by the nuclear powers, almost all of them by the Soviet Union and United States.

The Tsar Bomb (October 30, 1961). The record for the biggest bomb test was reached on October 30, 1961 when the Soviet Union detonated the largest man-made explosion in history: the Tsar Bomb. Luckily, it was just a nuclear test blowing up some of their own territory north of the Arctic Circle.

Originally, the Tsar Bomb was designed as a 100-megaton device, but scientists cut its yield to only 50 megatons so the plane dropping it could escape the blast. Considering it would take 80 Hiroshima size bombs to equal one megaton, it would take 4000 such bombs to equal the yield of the Tsar Bomb.

Even with its “reduced” yield, the Tsar Bomb created total devastation over a 15-mile radius (225 square miles) and could inflict third degree burns out to 10 kilometers from ground zero. Or to put it another way, it could completely flatten a city like New York, Chicago or Los Angeles while also inflicting widespread death and devastation in their suburbs.

The largest device developed by the U.S. had a possible yield of 25 megatons, but was never tested. The largest actual U.S. test, Bravo, was designed to give a 5-megaton yield, but due to miscalculations, created a 15-megaton blast.

More “Fun Facts” about the Tsar Bomb:

- The mushroom cloud was 25 miles (40 km) wide and 40 miles (64 km) high, nearly seven times the height of Mt. Everest.
- Its seismic shock was equal to 7.1 on the Richter scale. But being an airburst, it only measured up to 5.25
- Its blast was seen and felt up to 1,000

kilometers away, breaking windows in Finland and Sweden.

- Its shockwave was measurable even after travelling around the globe three times.
- Its yield was equal to 1.4% of the output of the sun.

*The "Anti-Fascist Protection Rampart"
(AKA The Berlin Wall)
(1961)*

Ever since 1945, the West's control of West Berlin had presented major problems, since it was situated in the middle of East Germany with several highly vulnerable routes there from West Germany. In 1948, Stalin had tried to gain control of West Berlin by cutting off its land corridors to the West, but the Americans and British had successfully air-lifted supplies into the beleaguered city until Stalin gave in.

In 1952, Stalin ordered the border between East and West Germany sealed by a barbed wire fence, although passage between East and West Berlin remained free.

Fleeing the East. Between 1949 and 1961, some 3.5 million people, roughly 20% of East Germany's population, fled to the West by way of Berlin. This was easy to do, since Berlin was an open city. One could just hop on the metro in East Berlin and five minutes later be in the West where they would be welcomed and assimilated into the economy.

In 1957, East Germany's ruler, Walter Ulbricht, made fleeing to the West a criminal offense, which was fairly pointless. After all, it was impossible to prosecute offenders once they were in the West, and the authorities couldn't prove

they were fleeing (as opposed to just visiting, going to work, or shopping) until they hadn't returned.

This situation was both costly and embarrassing for the communist East, especially since it was young skilled workers who were most likely to flee. For example, seventeen key engineers from one factory all fled to the West (with the factory's blueprints). In one day, the entire faculty of the University of Leipzig's law department defected. Industrial production slowed down and, in some cases, factories shut down altogether. The East German leader, Ulbricht even demanded \$17 billion in reparations from the West for all the lost labor. Maybe he could have sued the West if so many of his lawyers hadn't already fled.

However, West Berlin was also an extremely vulnerable part of the West. As Khrushchev put it in his own incomparable way: "*Berlin is the testicles of the West...Every time I want to make the West scream I squeeze on Berlin.*"

Realizing this weakness and concerned about both the surging West German economy and the absence of any formal treaty ending World War II, the Soviet leader issued an ultimatum in 1958, demanding that the Western powers sign a treaty recognizing East Germany and end their military presence in West Berlin or lose all rights of access to the city.

However, West Berlin continued to present a growing problem for the Soviets, since it was a constant reminder to East Germans all around of the much better standard of living in the West. Complicating this was the fact that there was free access between East and West Berlin. This and the lure of a better lifestyle caused growing numbers of East Germans to defect to the West, which only hurt the East German economy more and made the West that much more enticing. This led to Soviet demands for the West to abandon West Berlin, but this only increased tensions that drove even more East Germans to flee to the West and so on.

In 1959, Khrushchev visited the U.S. and relations eased a bit. Unfortunately, in May 1960 when the Soviets downed an American U2 spy plane and captured its pilot, Gary Powers, tensions shot back up again. And, as tensions rose, more East Germans fled. By 1961, there were 1000 people defecting to the West every day.

People worried that Berlin would be the spark to ignite World War III. Then, on August 13, 1961, Berlin awoke to find the East Germans building a wall to cut off all access between the two parts of the city. Despite public indignation, Western leaders breathed a sigh of relief, because the Berlin Wall solved the problem of mass defections to the West without damaging the communists' prestige and thus reduced the chances of war. However, the Berlin Wall would separate families for nearly thirty years and stand as the most visible symbol of the Cold War until its fall on November 9, 1989.

Because West Berlin was surrounded by East Germany, the Wall had to encircle the entire city. When complete, it had 96 miles of barbed wire to seal off any access to the western part of the city. Since the construction of the Berlin Wall was such a surprise, there were a number of West Germans visiting relatives and friends in the East who woke up to find themselves trapped in the communist bloc.

On the other side, the West could do about the Wall short of starting a war, so it remained undisturbed. However, something had to be done to bolster the morale of the West Berliners. Therefore, the U.S. sent 1500 troops to reinforce the city's garrison. Their commander was General Clay, the man who had led the allied efforts in Berlin during the Airlift twelve years earlier.

Clay felt the only thing the Soviets understood was strength, so he did everything he could to bully and worry them. He would send squads of armed soldiers on pointless or nearly pointless missions into East Berlin, such as to accompany any diplomat going there. He even built a

concrete wall in sight of the real wall and had his men practice knocking it down.

His most provocative act was to bring ten tanks up to the border at Checkpoint Charlie, as if he was threatening to break into East Berlin. In response the Soviets brought up ten tanks. For the first time in the Cold War American and Soviet tanks were nose to nose. The Russians were authorized to respond to force, while NATO and American forces went on full alert worldwide.

Worried that a nervous soldier might fire his rifle and trigger World War III, Kennedy offered to withdraw the American tanks if the Soviets withdrew theirs. One Soviet tank backed up five meters, and one American tank followed suit. Eventually the crisis was defused after sixteen hours.

In the months and years that followed, East Germans tried to escape in various ways. The first was an East German guard, Conrad Schumann (below), who jumped the barbed wire to safety, followed by someone else who drove his Volkswagen through the barbed wire. Since windows along the border weren't bricked up at first, East Germans would signal they were going to jump on a particular day so the West Berlin Fire Department would show up with a net to catch them. The first person to die trying to escape, Ida Siekmann, was killed jumping from a third floor window.

After the windows were sealed shut and the barbed wire was replaced by a concrete wall, people tried a multitude of others ways to escape: hanging underneath trucks passing through the checkpoints, swimming the canal, climbing through the city's old sewers, or tunneling under the wall.

At first, breaking or cutting through the wire barrier was the simplest and easiest manner of escape. One East Berliner hijacked a Soviet vehicle and ran it into the barbed wire, where it got entangled. He was seriously wounded, but a West German policeman, firing at the East Germans, saved him. When the East Germans put a metal bar across the barbed wire to stop any other cars, four men (real low riders) rigged a detachable top that was torn off as they drove under the bar. When a concrete wall replaced the barbed wire, people would scale it, so the East German government outlawed the sale of rope and twine

There was a large network of escape tunnels built by East Berliners, mostly college students, although used by a large number of people. The first known successful such tunnel was dug in a graveyard. People would come to lay a wreath of flowers then suddenly drop out of sight, never to be seen in the East again. It was discovered when a woman accidentally dropped in, leaving her baby carriage behind. The most successful tunnel led to the escape of 29 people.

Hot air balloons, of course, were not offered on the market in East Germany. Therefore, two families wanting to fly to freedom, the Wetzels and Strlzycks, had to construct them, buying small amounts of nylon at a time to keep from arousing suspicion. They had just enough fuel to get them over the wall, which took several hours. After their escape, sales of lightweight cloth were strictly controlled.

Buildings along the wall were destroyed to provide a clear field of view and fire from a chain of 116 watchtowers interspersed along the way. To better spot potential escapees, bright searchlights lit up the area at night and the Wall was painted white. (The western side of the Wall was decorated with all sorts of graffiti, including one that said it was the training ground for the East German high jump team.)

Before even reaching the Wall, one had to get through coils of barbed wire and then cross a field of sand or gravel, known as the “Death

Strip”, that would show footprints of any escapees. This would also reveal which guards had been derelict in their duty, thus giving them extra incentive to shoot anyone trying to escape. Anyone violating the strip would be shot, and anyone trying to give them medical aid risked being shot as well.

To further impede and discourage escape attempts, there were land mines planted in parts of the Death Strip and guard dogs chained to pulleys (to keep them from accidentally detonating the mines). There were also trip wires that could activate automatic machine gun fire aimed at that section.

However, the Wall, or as the communist leaders called it, the "Anti-Fascist Protection Rampart" to protect the East from an invasion by the West, effectively stemmed the tidal wave of defections. Between 1961 and 1989, around 5,000 people would successfully escape and at least 100 people died in the attempt. (Estimates range between 86 and 239.) Even pregnant women were shot to death attempting to escape. The most notorious incident was the shooting of 18-year old Peter Fechter in 1962, who was left to die a slow agonizing death in full view of crowds while East German guards just looked on. The last person shot trying to cross the Wall was Chris Gueffroy on February 6, 1989.

“I am a jelly donut.” When President Kennedy visited the Wall in 1963 to show solidarity with the people of Berlin, he uttered the famous phrase “Ich bin ein Berliner”, meaning “I am a Berliner.” JFK’s intentions were clear, and contrary to popular belief, he didn’t mispeak, saying he was a jelly donut. The term “Berliner” can mean either jelly donut (like a Danish) or

inhabitant of Berlin. It all depends on context, which the crowd understood perfectly well.

However, many Berliners, still mad that Kennedy had not reacted more strongly to the building of the Wall two years earlier, chose to spread the version that made him sound like a fool or very hungry tourist.

The Cuban Missile Crisis (1962)

A map showing the range of various Soviet missiles stationed in Cuba and the American cities they could hit

The Cuban Revolution. For years, Cuba had suffered under the corrupt dictatorship of Juan Batista while serving as a playground for rich Americans. In the 1950s Fidel Castro started a small insurgency that gradually grew into a full-fledged revolution and overthrew Batista in 1959.

Although Castro had socialist leanings, he was not a declared communist. However, the United States, in the midst of the Cold War, tended to see red when any leader with the slightest socialist leanings appeared in the Western Hemisphere. When it refused to recognize Castro's regime, he formed closer ties with Russia. The U.S. responded by refusing to refine imported Soviet oil in its Cuban refineries, spurring Castro to nationalize those refineries. When the U.S. put an embargo on all Cuban goods, Castro retaliated by nationalizing all American owned businesses in Cuba.

Then it turned nasty, with the CIA launching air raids on Cuban sugar fields and plotting against Castro by putting chemicals in his cigars to make his beard fall out and spraying LSD into a studio he was visiting to make him act crazy. Finally, Castro declared his movement a communist revolution.

The Bay of Pigs Invasion (1961). Under Eisenhower, the CIA had organized an invasion of Cuban émigrés to overthrow Castro. However, in 1961, a new president, John F. Kennedy, took office. When presented with the CIA's plan for an invasion, he agreed to go ahead with it, but cut critical American air support, fearing to expose American involvement in this plan. Consequently, the ensuing Bay of Pigs invasion was an unmitigated disaster that embarrassed Kennedy and infuriated Castro. In the aftermath, Khrushchev convinced Castro to let him put medium and intermediate range missiles armed with nuclear warheads in Cuba. For the first time in the Cold War, most American cities were within range of Russian missiles. Therefore, when American U-2 spy planes spotted these missiles in October 1962, Kennedy treated this as a major threat.

The Bay of Pigs invasion by the numbers:

- 1,400 Cuban expatriates took part
- 4 American pilots and over 100 Cubans were killed
- 1,197 invaders were captured
 - 200 of them had been soldiers in Batista's army
 - 14 of those were wanted for murder in Cuba

In June 1962 Khrushchev sent ships carrying 80 missiles, each with a one-megaton warhead, 42 Mig-21 fighter jets, 24 surface-to-air missiles (SAM's), two tank battalions, four elite combat regiments, and a total of 40,000 troops and personnel overall. He was so obsessed with secrecy he didn't even tell his ambassadors to the U.S. and U.N.

Nuclear proliferation (1954-62). Documents declassified and released in 1999 give an idea of how much the Soviet Union was surrounded and outgunned by the U.S. in 1962 when the Cuban Missile Crisis erupted.

1954- The U.S. starts stockpiling nuclear weapons on various Japanese islands without informing the Japanese or American public. The purpose of these stockpiles is to reload nuclear submarines and bombers for further attacks on

Russia, just 600 km (400 miles) from Japan, in case of nuclear war.

1956- The U.S. deploys “tactical” nuclear warheads mounted on Corporal and Honest John intermediate range missiles (IRBMs) in Italy. Contrary to the Atomic Energy Act, they can be launched at the discretion of local officers. Nuclear bombs are also deployed to Puerto Rico.

1957- the Soviet Union successfully tests the first long-range intercontinental ballistic missile (ICBM) and uses it in October to launch Sputnik. The U.S. counters by putting IRBMs capable of hitting Russia in the Philippines. By the end of the year, the U.S. has stockpiled 5,828 nuclear missiles, while Russia only has 650.

1958- The U.S. deploys nuclear bombs in Greenland, Spain, France, South Korea, and Taiwan.

1960- The U.S. deploys 15 Jupiter missiles in Turkey, each with a 1.45-megaton warhead (nearly 100 times the destructive power of the bombs used against Hiroshima and Nagasaki). The Soviet Union deploys its first four SS-6 ICBMs in Russian territory. Because they are stationed in the far north so they can hit the U.S., one of the engines explodes from the extreme cold, killing the chief of the Strategic Rocket Forces. No more of the SS-6 missiles are deployed as weapons, only being used after this for space exploration.

The Bomber Gap” The U.S. also had decisive supremacy in strategic bombers, in particular, its fleet of B-52 jet bombers that far outnumbered and outclassed Russia’s bison bombers, although there had been a perceived bomber gap due to an incident at the Soviet Aviation Day demonstration in 1955 when the Soviets flew 10 of their new Myasishchev M-4 Bison bombers over the airfield. Then, when out of sight, they turned around and flew back over the field, doing this five times, giving the impression they had brought 60 bombers, not just 10. Based on that misperception. American analysts calculated the Soviets could quickly produce 600 such planes.

Adding to the paranoia next July was Martin Knutson’s U-2 flight over Engels airfield near Saratov that photographed 20 Bison Bombers. Assuming the Soviets had such a squadron at every base, the U.S. believed the Soviets had, or were close to deploying hundreds of these bombers. This spurred the production of over 2,000 B-47s and nearly 750 B-52s to match this hypothetical fleet.

In reality, Knutson had inadvertently photographed the *entire* Soviet bomber fleet, which later U-2 flights clearly showed. However, the myth of the bomber gap persisted in the American public’s mind and couldn’t be disproven since the information proving otherwise was highly classified.

Besides all that, the Bison bomber was of little use to the Soviets, since its range (8,000 km.) wasn’t enough to bomb the U.S. *and* return to Russia. And since the Soviets had no friendly bases outside of Eastern Europe, it was virtually worthless to them. Thus, only 93 Bisons were produced and, of those, only 19 were used on nuclear alert.

The crisis mounts. The question was how to get the Soviet missiles out of Cuba. Just as appeasement had led to World War II in 1939, a mere diplomatic response seemed too mild and ineffective for this situation. By the same token, while the generals pressured Kennedy to invade Cuba or launch an air strike against the Soviet missiles, he remained acutely aware that such aggressive actions could trigger a third world war and nuclear holocaust. (At the time, Kennedy was reading Barbara Tuchman’s *The Guns of August* that told how aggressive diplomatic actions had led to World War I.) Along those lines, he saw that it was unclear as to who was the “home team” defending its turf, because, while Cuba was geographically closer to the U.S., it was firmly allied with the Soviet Union.

He finally decided on the strong but less provocative course of a naval blockade to stop more Soviet missiles from reaching Cuba. While the United States and Britain had been able to airlift supplies into West Berlin over Stalin's blockade in 1948-9, airlifting heavy missiles into Cuba over such a long distance was not an option for Khrushchev. A few days later, the policy bore fruit when an approaching Soviet convoy turned back rather than trying to crash the American blockade. However there was still the much stickier issue of how to remove the missiles already in Cuba.

By late October tensions were near breaking point as the American military moved to Def-Con 2, signaling that war seemed imminent. Civilians made plans to evacuate major cities that might be targeted for a nuclear strike. The military was pressuring Kennedy to invade Cuba, unaware that the Soviets had tactical nuclear weapons on Cuba that would have immediately destroyed any invading force. Just to add to the tension, on several occasions false alarms nearly launched our bombers.

Resolution. Then Kennedy received two messages from Moscow, one fairly conciliatory, the other more provocative. Such mixed signals further confused him about the proper response, there even being speculation that a coup had seized power in the Kremlin in the interim between the two messages.

Kennedy decided to respond to the more conciliatory message and ignore the other one, thus establishing a calmer basis for negotiation. On this basis he struck a deal with Khrushchev. Russia would publicly remove the missiles in return for an American promise not to invade Cuba. Privately, Kennedy agreed to remove American missiles from Turkey that posed a

similar threat to Russia. Therefore, publicly it seemed that the U.S. had won, while behind the scenes the net result was that fewer missiles threatened Russia than before 1961 and no more missiles threatened the U.S.

A timeline of the Cuban Missile Crisis:

October 14- Soviet missiles are first spotted in Cuba. Secretary of Defense, McNamara calculates they will be operational in two weeks.

October 21- After weighing different options, President Kennedy decides a "quarantine" (i.e., blockade) of Cuba would be the strongest action without being too provocative. Curtis Lemay, head of Strategic Bomber Command, wants an all out bombing attack, saying: "*The Russian bear has always been eager to stick his paw in Latin American waters. Now we've got him in a trap, let's take his leg off right up to his testicles. On second thought, let's take his testicles off too.*"

October 22- Kennedy informs the public and our allies of the crisis and the blockade.

- B52s are put on full alert, with at least one in eight always in the air. For the first time, all of them are armed with nuclear weapons, four hydrogen bombs apiece.

- Khrushchev authorizes his commander in Cuba to use tactical nuclear weapons against any invasion force. Throughout the crisis, the Americans were unaware of these tactical nukes, which, if used, would have automatically incinerated any invasion force before it reached the beach.

- U.S. Forces go to DEFCON-3. (On a scale of one to five, DEFCON 5 was normal alert and DEFCON 1 was war. The U.S. military probably reached DEFCON 3 one other time, in 1973 during the Yom Kippur War.

October 23- The Soviet ship *Alexandrovsk*, carrying 24 warheads, beats the blockade to Cuba. Five other ships with nuclear warheads turn back.

October 24- Khrushchev warns that his subs will sink any US ships trying to stop Soviet ships, saying he won't be the first to use nukes, but "*if the US insists on war, we'll all meet together in Hell.*"

- The U.S. goes to DEFCON-2, the only time it has gone that close to nuclear war.
- After approaching the blockade, Soviet ships turn around, leading to Secretary of State Dean Rusk's famous saying "We've gone eyeball to eyeball and the other fellow just blinked."

October 25- The CIA reports the Soviet medium range SS-4 missiles are operational.

October 26- Kennedy, conceding the blockade won't get the existing missiles out of Cuba, discusses launching an invasion of 125,000 men. He is shaken by an estimate of 18,500 casualties in 10 days of fighting, not even realizing the Russians also have tactical nuclear weapons to defend the beaches, which would have made casualties many times greater still.

- That evening, Khrushchev sends a message proposing to remove the missiles if the U.S. promises not to invade Cuba.
- In a meeting with Soviet ambassador Dobrynin, JFK says American missiles in Turkey might be brought into the equation.

October 27 (AKA "Black Saturday")- Reconnaissance flights showed six Soviet missile launchers in Cuba were now operational.

- A second letter from Khrushchev arrives demanding the U.S. take its missiles out of Turkey. Since no one on the National Security Council (NSC) had heard of this previous proposal by JFK, outraged hawks said it would be tantamount to surrender. Many NSC members feared Khrushchev had been overthrown by hardliners. Adding to this uncertainty was the absence of direct communications between the White House and Kremlin, so that it took 12 to 15 hours for messages to travel back and forth.
- A Soviet SAM shoots down an American U-2 plane over Cuba, triggering calls by the American military to bomb and/or invade Cuba.
- Someone, probably Bobby Kennedy, the president's younger brother and attorney general, suggests that they ignore Khrushchev's second letter and just respond to his first one, although the U.S. secretly agrees

to take its missiles out of Turkey in several months if the Soviets keep quiet about it.

October 28- Because of the slowness of communications with the White House and fear that a nuclear war might accidentally be triggered, Khrushchev announces the agreement over Radio Moscow. Curtis Lemay still wants to invade Cuba even after the Soviets have agreed to take out their missiles, calling the peaceful resolution of the crisis "the greatest defeat in our history."

Several near misses occurred during the Cuban Missile Crisis that might have accidentally launched World War III.

October 25- A guard at a base in Duluth Minnesota fired at an intruder climbing the fence, triggering alarms at bases across the region. Unfortunately, some wires got crossed and the klaxon to launch bombers sounded at Volk Air Base in Wisconsin. Crews scrambled to their planes while the base commander checked with Duluth for confirmation. Finding the real story, he sent an officer to drive in front of the taxiing B-52s to stop them. It turned out the original intruder was a bear.

October 26- Despite the mounting crisis, which had reached DEFCON-2, a scheduled test launch of an unarmed ICBM went ahead. If the Soviets had seen it, that might have triggered World War III.

October 27 (Black Saturday)- A routine computer simulation of a nuclear attack just happened to coincide with a satellite in position to hit Tampa, Florida at 9:02 AM. The confused program alerted SAC, NORAD, and the Pentagon that an attack was coming. Luckily, other tracking systems detected the error and the original base in New Jersey realized it was an error when Tampa didn't blow up.

October 27- A U-2 flight over the Arctic Circle accidentally drifted into Soviet air space when the Northern Lights blotted out the stars used for navigation. Luckily, after unsuccessful attempts by Russian MIGs to intercept it, the Soviets didn't escalate this incident into World War III.

Conclusion. Publicly the resolution of the Cuban Missile Crisis may have looked like an American victory. But privately, the Soviets could be seen as the winners, since before the crisis, only the U.S. had missiles threatening Russia from Turkey, and after the crisis those missiles were gone. On the other hand, the U.S. still had an estimated nine to one advantage in strategic nuclear weapons when it was all over, so removing the one viable Soviet threat to the U.S. while still keeping such an advantage might be seen as an American victory.

In the greater scheme of things, the Cuban Missile Crisis may have been the single most important event of the twentieth century, since an unsuccessful resolution could have crippled or even ended civilization as we know it. Instead, it set in motion efforts that gradually defused the Cold War and allowed it to come to a peaceful conclusion.

Bombs Away with Curtis Lemay

Curtis Lemay was one of the most controversial military leaders during World War II and the Cold War. During World War II he had initiated the firebombing campaign against Japan that may have killed 500,000 Japanese civilians and military personnel. He himself said that if we had lost the war he would have been tried as a war criminal. However, he was completely unrepentant about his role, saying it was worth it if it shortened the war by one day.

He was famous for his strict orders for crews not to return with a single bomb undropped. In accordance with these orders, when a bomb got stuck with the bomb bay doors open, one airman had to climb out to cut it loose, a scene

reminiscent of the end of the movie, *Dr. Strangelove*.

After the war, Lemay became the head of Strategic Bomber Command (SAC), building it into the most powerful nuclear strike force on the planet, with 244,000 airmen, a fleet of ICBM's that eventually would include 1054 missiles, and nearly 2,000 heavy bombers and 800 tanker aircraft for in-flight refueling. He also successfully pushed for expanding use of space satellites & electronic warfare.

Lemay advocated justified preemptive nuclear attacks on Russia if it was clear they were preparing to attack. However, he doesn't seem to have supported randomly initiating such an attack without justification.

He was also famous for his ever-present cigar. Supposedly, when asked by an airman to get rid of it to keep it from igniting an aircraft's fuel, he replied: "It wouldn't dare."

Some choice quotes by Curtis Lemay:

"I think there are many times when it would be most efficient to use nuclear weapons. However, the public opinion in this country and throughout the world is to throw up their hands in horror when you mention nuclear weapons, just because of the propaganda that's been fed to them."

"That was the era when we might have destroyed Russia completely and not even skinned our elbows doing it."

"We should bomb Vietnam back into the stone age."

"If you kill enough of them, they stop fighting."

Vietnam (1954-75).

American involvement in Vietnam was its most disastrous move of the Cold War. Driving it was a fear and hostility toward communist Russia and China that blinded American leaders to any other possible causes of an uprising with the slightest socialist elements as examples of Soviet and Chinese aggression. Out of this came the unfortunate policy of backing any anti-communist regime, no matter how corrupt and repressive. Therefore, The US missed two important facts about Vietnam. One was that the government it supported in Saigon (the South Vietnamese capital) was a brutal dictatorship and anything but democratic. Secondly, ignoring the centuries-long animosity between the Chinese and Vietnamese, it saw North Vietnam as a pawn in a Chinese plot to conquer all of Asia.

After Vietnam won its independence in 1954, it had been divided between North and South at the 17th parallel, with planned elections to reunite the country in 1956. However, The United States, fearing a communist victory, prevented the elections from taking place, thus keeping Vietnam divided between the communist North and a “democratic” South that actually functioned under a series of American-backed dictators. Civil War soon erupted with North Vietnam supporting a communist insurgency known as the Viet Cong in the South.

Acting on these assumptions, the U.S. felt it imperative to support the government in Saigon against the Viet Cong and North Vietnam. At first, Eisenhower sent only a few hundred military advisors and Kennedy slightly increased this commitment. However, it was President Johnson who heavily committed American forces and aid to South Vietnam in the 1960s.

Unfortunately for American forces, this was very different from any war they had ever fought in before. Instead of the traditional head-on clashes between clearly identifiable armies, this was a guerilla war where insurgents would attack American soldiers and then melt back into the civilian population, often making it impossible to identify and catch them. Out of frustration, American troops would retaliate against any civilians in the area of the attack, inevitably killing

innocent people in their efforts to find the Viet Cong. This would increase public support for the Viet Cong and feed more guerilla attacks which, in turn, would trigger both increased American involvement in Vietnam and more retaliation against innocent civilians, and so on. Vietnam’s jungles also made it virtually impossible for American forces to sweep through the countryside or even effectively disrupt enemy supply lines, known as the Ho Chi Minh Trail. This trail ran largely through neighboring Cambodia and Laos to avoid American attacks, unless the U.S. wanted to complicate its situation further by sending forces into those countries.

This was a different kind of war where traditional benchmarks of progress didn’t apply for several reasons. First of all, the jungle made it impossible to advance along a visible front with visible battle lines in contact with one another. Also, there were also diplomatic factors that shackled the war effort. For one thing, US forces couldn’t unleash their total firepower, fearing that they might cross a threshold that would bring in China or Russia and trigger World War III. Likewise, North Vietnamese forces were supplied along the “Ho Chi Minh Trail”, an ever-shifting supply line that ran through neutral Laos and Cambodia. Launching an offensive against this would violate the neutrality of Laos or Cambodia, with all sorts of complications. In fact, when Richard Nixon did send troops in to Cambodia, it triggered massive demonstrations across the US. In one of those, four students were shot and killed, which escalated protests to a new level still.

Another factor hampering the war effort was television coverage. This was the first television war, where Americans would watch updated accounts and images of the war every night on the evening news. This can make progress in any war seem unbearably slow, but especially so in Vietnam where the nature of the fighting eliminated the traditional measure of success: geographic advance along a front towards a stated goal, typically the enemy capital. However, there were no geographically defined fronts in this war, only isolated raids where American troops would be airlifted by helicopters into remote villages, try to identify and catch the enemy, and then get airlifted out, abandoning control of the villages to the enemy once again. This daily repetition of seemingly

identical raids with no apparent progress or purpose increasingly frustrated the American public.

Added to this frustration was the media's portrayal of the war as a losing cause, especially after the Tet Offensive in 1968. This was a surprise attack that did catch U.S. and South Vietnamese forces off guard, but turned into a major defeat for the communists. However, the media's portrayal of this battle as a defeat (because of its initial surprise) turned much of the American public against the war. This generated another vicious cycle where media portrayal of the war as a losing cause would trigger student protests that also got heavy TV coverage. These would reinforce the media's negative portrayal of the war, causing more protests and so on.

The war's unpopularity forced President Johnson out of the presidential race in 1968. The winner was Richard Nixon who told the public he had a secret plan for ending the war while he was secretly telling the North Vietnamese to keep fighting while Johnson was still in office, saying they could get a better deal with him if he were elected. When Nixon took office, he pushed for "Vietnamization" of the war, replacing American troops with South Vietnamese conscripts, many of who proved unreliable in the fight to defend a corrupt and failing dictatorship. However, this gave Nixon the chance to negotiate a "peace with honor" (1973), which left communist forces still operating in South Vietnam intact, but gave American forces enough time to exit Vietnam before the Saigon government fell. In 1975, North Vietnamese forces entered Saigon, thus reuniting Vietnam. Three years later, as if to underscore the nationalist nature of this prolonged struggle and debunk the idea that the war was a Chinese plot, Chinese and Vietnamese forces were firing at each other as they had for centuries.

The beginnings of American Involvement

"You can kill ten of my men for every one I kill of yours, but even at those odds, you will lose and I will win."--Ho Chi Minh to the French, late 1940s-- Ho Chi Minh (1890-1969

Involvement in Vietnam was America's most disastrous move of the Cold War. Driving it was a fear and hostility toward communist Russia and China. This blinded American leaders to any other possible causes of an uprising except as examples of Soviet and Chinese aggression if it had the slightest socialist elements. Out of this came the unfortunate policy of backing any anti-communist regime, no matter how corrupt and repressive, as long as it wasn't communist. Therefore, The US missed two important facts about Vietnam. One was that the government it supported in Saigon (the South Vietnamese capital) was a brutal dictatorship and anything but democratic. Secondly, ignoring the centuries-long animosity between the Chinese and Vietnamese, it saw North Vietnam as a pawn in a Chinese plot to conquer all of Asia.

The Domino Theory was the belief that, if we let one country go communist, it would lead to all its neighbors falling to communism like a row of dominoes. In the case of Southeast Asia, Vietnam was seen as the lead domino, with its neighbors (Laos, Cambodia, Thailand, Burma, and maybe even India) being the next to fall, thus allowing the Soviet Union and Red China to expand their power globally at our expense.

While this may seem naïve in retrospect, we have to view it from the point of view of President Johnson and the generation who had seen Central Europe fall like this to the Nazis in the 1930s and Eastern Europe fall to Stalin after 1945. Thus, in their historical experience, the Domino Theory was not just a theory, but

something they had seen happen and could not afford to recur.

By the same token, since it had been the policy of appeasement that had allowed Hitler to advance across Europe, many American leaders in the Cold War felt that showing and using military strength was the only appropriate response to any communist aggression. Even when that aggression took place in a region that was of little or no strategic value to the U.S., it still had to be stopped.

Ho Chi Minh was the communist leader of North Vietnam. After attending school in the Vietnamese city of Hue, he took a job as a cook on a French steamship, and lived for a while in London and Paris, where he helped found the French Communist Party. He was then summoned for further training in Moscow, whence he moved to China to help Vietnamese exiles. While there, he founded the Indochinese Communist Party (ICP), was expelled from the country, and returned in 1938. During World War II, Ho organized the Viet Minh independence movement against Japan.

After World War II, he led the Viet Minh in the war for independence from France. With help from China and the Soviet Union, the Viet Minh were able to surround the French at Dien Bien Phu in 1954 (below) and force their surrender. After the division of Vietnam at the 17th Parallel, Ho became the president of the communist North and worked tirelessly to bring the whole country under unified communist rule.

Ngo Dinh Diem has generally been seen as a brutal and corrupt dictator of South Vietnam whom the U.S. supported to stop a communist takeover from the North. In fact, he was the one leader in the South who realized that winning the hearts and minds of his people through

honest and responsible government was the best way to fight the communist insurgency.

Unfortunately, despite the advice of Edward Lansdale whose policies Diem had followed, the dominant voices in Washington saw Diem as a corrupt leader. Reinforcing this view was the corrupt behavior of his brother, Ngo Dinh Nhu, that especially discredited Diem. Therefore, Washington went along with the coup that killed Diem in 1963. In retrospect, failure to support Diem may have been the worst mistake the U.S. made in Vietnam.

In 1960, the National Liberation Front (NLF), a more broadly based movement opposed to Diem's regime, was formed in the South. However true US claims that North Vietnam controlled the communist dominated group may have been, it did signal increased turmoil in Vietnam, including growing North Vietnamese support for the NLF, which the US dubbed the Viet Cong.

Mounting troubles. In June 1963 during religious & political protests against the regime of Ngo Dinh Diem, a 73year- old Buddhist monk, doused with gasoline by fellow monks, set himself on fire in Saigon, followed by another one on October 5. On November 1st a military coup, with US knowledge, overthrew Diem, but the following regime was little better and turmoil continued.

On November 1, 1963, a military coup, with US knowledge, overthrew and killed Diem but the following regimes proved to be much worse and turmoil continued.

On November 22, less than a month after Diem's overthrow, President Kennedy was assassinated. It was with Kennedy's successor, Lyndon Baines Johnson, that America's involvement in Vietnam would get especially serious.

Selling the War: the Gulf of Tonkin Incident

Secretary of Defense, Robert McNamara, briefs the press on the Johnson administration's version of what happened in the Gulf of Tonkin.

Kennedy's successor, Lyndon Baines Johnson (LBJ) began his political career during the 1930s under FDR. This had two major effects on his policies. One was The Great Society, a continuation of the social programs begun with the New Deal. The other, influenced by Hitler's expansion in the face of appeasement, was a near obsession with showing America's strength to stop communist aggression. Therefore, LBJ became increasingly committed to saving South Vietnam from a communist takeover.

As LBJ himself put it: "I knew from the start...that I was bound to be crucified either way I moved. If I left the woman I really loved—the Great Society—in order to get involved with that bitch of a war on the other side of the world, then I would lose everything at home. All my programs. All my hopes to feed the hungry and shelter the homeless. All my dreams to provide education and medical care to the browns and the blacks and the lame and the poor. But if I left that war and let the Communists take over South Vietnam, then I would be seen as a coward and my nation would be seen as an appeaser, and we would both find it impossible to accomplish anything for anybody anywhere on the entire globe.

From the point of view of LBJ and his advisors, not taking a stand in a local war in Vietnam would lead inevitably to a catastrophic world war as had happened in 1939. Thus it would be totally irresponsible to turn our backs on South Vietnam.

On August 2, 1964, an attack in the Gulf of Tonkin by North Vietnamese patrol boats on the

USS Maddox, plus a second attack two days later (either by North Vietnamese torpedoes or dolphins) gave LBJ the convenient excuse to widen the conflict in Vietnam. Since the incidents took place offshore, reporters could neither confirm nor deny they had even happened, let alone question LBJ's version of what had happened and the threat he claimed it posed to American forces and its allies.

Despite the pending election, the American public bought LBJ's version of what happened, and he convinced Congress to pass (nearly unanimously) the Gulf of Tonkin Resolution, giving the president broad discretionary war powers to send American forces to Vietnam without requiring an official declaration of war. During the election campaign, LBJ constantly reassured the public that "the United States... seeks no wider war".

After his reelection in November, LBJ rapidly widened the war.

Waging war without declaring war. The Gulf of Tonkin Resolution effectively gave LBJ and his successor, Richard Nixon, the power to keep American troops in Vietnam indefinitely without officially declaring war. This made it easier to soft sell the war to the public by referring to it as a police action or some other innocuous-sounding name. Along those lines, there weren't the sorts of sacrifices associated with wartime: rationing, extra taxes, recycling, bond drives, etc. Thus, for many Americans, life seemed to go on completely unaffected by the war. However, for many others, especially the young and poor, there was the draft, so the war was very much a reality in their lives.

In 1973, when the war and Nixon had both become very unpopular, Congress would pass the War Powers Act, which limited to 60 days the president's power to use American military forces without Congressional consent or a formal declaration of war. Nixon vetoed this act, but Congress overrode his veto.

The War Powers Act tried to strike a fine balance between the need to react quickly to a

national emergency and Congress' need for time to deliberate on the need to go to war. However, it's much harder to get out of a war than it is to get into it, especially after a nation's forces have already been committed to combat or even just deployed for combat for 60 days. Thus, although, the U.S. has not officially declared war on anyone since World War II, the inertia of events have committed its forces to long-term combat in a number of situations: Korea, Vietnam, Iraq (twice), and Afghanistan. In addition, there have been a number of short-term actions as well, such as in Somalia, Grenada, and Lebanon.

The 1964 Presidential Campaign and the "Daisy Girl" Ad

A screen shot from the Daisy Girl Ad

The 1964 presidential campaign pitted the very conservative Barry Goldwater against LBJ. Goldwater is largely credited with sparking the revival of conservatism in America in the 1960s, being strongly opposed to what he saw as the socialistic aspects of FDR's New Deal and its successor, LBJ's Great Society.

Goldwater, who was cast as an extremist in his views, is probably best remembered for his saying: "Extremism in the defense of liberty is no vice; Moderation in the pursuit of justice is no virtue!" This did nothing to win him the votes of political moderates. Neither did his statement in 1961 that "sometimes I think this country would be better off if we could just saw off the Eastern Seaboard and let it float out to sea". Thanks largely to such comments, he lost the election by one of the biggest landslides in American history.

The 1964 campaign may be most famous for an anti-Goldwater ad showing a little girl picking petals off of a daisy. As she plucks the last petal,

an ominous voice starts counting down from ten. The camera freezes and zooms in on her eye until the screen is filled with darkness. When the countdown reaches zero, a nuclear explosion lights up the dark screen. Then comes a voiceover of an LBJ speech: "*These are the stakes! To make a world in which all of God's children can live, or to go into the dark. We must either love each other, or we must die.*" Then another voiceover: "*Vote for President Johnson on November 3. The stakes are too high for you to stay home.*"

The ad was exploiting a comment Goldwater had made about the possibility of using nuclear weapons in Vietnam. Although it was aired only once, being pulled as too provocative, it was replayed widely on local TV stations and talk shows, thus giving it wide airplay and publicity while making LBJ look ethical by immediately pulling it. It remains one of the most controversial political ads in history and marks a turning point in both commercial and political advertising.

Escalation and "Search and Destroy"

We should declare war on North Vietnam. . . . We could pave the whole country and put parking strips on it and still be home by Christmas. -- Ronald Reagan, 1965

Full American involvement didn't come all at once, but escalated somewhat gradually before really starting to accelerate after LBJ's election in 1965:

- 3,000 by the end of 1961.
- 11,500 by the end of 1962.
- 20,000 by the end of 1963.
- 23,000 by the end of 1964, by which time LBJ had secured reelection.
- 3500 marines, the first U.S. ground combat troops, land in Vietnam in 1965. The first

major battle in the Vietnam War involving American troops was at Ia Drang in 1965 where 2500 Vietnamese and 234 Americans were reported killed.

- 183,000 by the end of 1965, while a coup led by General Nguyen Van Thieu prompts the U.S. commander in Vietnam, General Westmoreland, to request 100,000 more troops for 1966.
- 485,000 by the end of 1967.

“Search and Destroy” or “Zippo” missions.

Because of Vietnam’s jungle terrain and the guerilla warfare the Viet Cong favored, conventional tactics of sweeping back enemy forces and taking their territory along a continuous front were impractical. Therefore, American forces used a strategy known as Search and Destroy.

During the daytime the Americans would seek out enemy forces in the countryside, try to destroy them, and then retire to a secure base camp for the night, conceding control of the countryside back to the Vietcong. Every day or so they would repeat the process, hoping to kill enough of the enemy to wear them down. Therefore, rather than territory held, which was irrelevant to this new kind of warfare, success was measured in body counts.

Thus the war assumed the nature of repetitive raids to seemingly identical villages with no apparent progress being made. GIs, angered and frustrated by the elusiveness of the Vietcong and the deaths of comrades to various booby traps and mines, would lash out against the peasants, brutally interrogating them, killing or raping some, and burning their thatched huts, often using Zippo lighters. Thus the term Zippo missions. As a result, American GIs became increasingly numbered by this process and correspondingly insensitive to the fates of the Vietnamese peasants who found themselves caught in the middle of a conflict of which they had little or no understanding. The dynamics of such a war created a vicious cycle of atrocities and counter-atrocities that continued to escalate with no apparent end in sight.

Another aspect that made Vietnam so difficult for Americans was its hot tropical climate. Besides the heat and humidity, this meant frequently having to ford rivers and cross rice paddies, so that clothes and equipment never seemed to dry out.

Adding to the Americans’ mobility was a new technology, the helicopter, which could quickly leapfrog across large areas of jungle, drop soldiers at their destination, and then take them back to base camp when finished. Helicopters were even used for lifting whole pieces of artillery into otherwise inaccessible areas. To the Vietnamese peasants isolated from the modern world, these strange machines suddenly descending from the sky along with the huge soldiers they disgorged to terrorize and brutalize them, and then just as suddenly disappear back into the sky, were especially puzzling and frightening.

Above. Not that Americans were always on the attack. GIs at Khe Sahn, one of our most important bases in Vietnam, head for cover during a mortar attack by the Viet Cong in 1968.

Bombs, Napalm, and Other Chemicals

The Air War. The U. S. had total command of the air during the Vietnam War, which provided it the opportunity to engage in large scale conventional bombing raids, even using B-52s, which were the workhorse of our nuclear bomber fleet. Bombing had two purposes. One was to destroy enemy targets, which was difficult because they were generally hidden by the jungle. Therefore, part of the air war consisted of spraying defoliates, notably Agent Orange, to kill that cover. The second purpose was to exert political pressure on North Vietnam to agree to a negotiated settlement. Neither strategy really worked toward winning the war, although they did inflict untold suffering on the Vietnamese people.

Napalm is a highly flammable petroleum-based jellied compound, similar to Greek Fire (AKA sticky fire) used by the Byzantines in the Middle Ages. Its use as an incendiary weapon during the Vietnam War was extremely controversial and triggered numerous protests on college campuses against recruiting by its producer, Dow Chemical (also known for Saran Wrap).

It was originally developed during World War II for use in flame-throwers and then for firebombing cities and hard to reach Japanese positions, such as caves and bunkers. Its effects were horrific, sticking to the skin and burning at temperatures of 1200° Celsius. Even Japanese soldiers, who were known for fighting to the death defending their positions, would surrender rather than face the fiery death napalm brought. It was probably the most ghastly and provocative symbol used by protestors to end the Vietnam War.

Its effects were horrific, sticking to the skin and burning at temperatures of 1200° Celsius. Even Japanese soldiers, who were known for fighting to the death defending their positions, would surrender rather than face the fiery death napalm brought. It was probably the most ghastly and provocative symbol used by protestors to end the Vietnam War.

Agent Orange was the most famous of the so-called “Rainbow Herbicides” used in a program called Operation Ranch Hand to defoliate rainforests and destroy crops in Vietnam. Its use against forests was to deprive enemy troops of cover, while destruction of crops was to force peasants to move into the cities where the Americans had greater control. Between 1958 and 1971 the urban population of South Vietnam more than tripled from 2.8 million to 8 million, largely because of this policy.

Spraying Agent Orange and other herbicides, such as Agent Blue, destroyed at least 10 million hectares (25 million acres) of farmland. Altogether, 12% of South Vietnam was sprayed, some areas with several hundred times the amount considered safe in the U.S. The resulting loss of ground cover led to widespread soil erosion and disruption of animal life.

The effects of Agent Orange on people, although less dramatic than those of napalm, were still awful, since it contained a carcinogenic dioxin that one researcher described as “*perhaps the most toxic molecule ever synthesized by man.*” Several million Vietnamese were affected by Agent Orange, with between 150,000 and 500,000 children born with birth defects such as cleft palates, mental disabilities, and extra fingers and toes

In areas most heavily affected, people still suffer from skin diseases and cancer of the lungs, larynx, and prostate. Similarly, a high ratio of returning American soldiers exposed to Agent Orange developed various forms of cancers, while higher rates of miscarriages and birth defects affected their wives and children respectively.

Tragically, the effects of Agent Orange seem to keep wearing on, as a third generation of Vietnamese is experiencing abnormally high levels of birth defects.

Tunnel Rats, Mercenaries, & Fake Villages

Entrance to a Viet Cong Tunnel

The Vietnamese had been using tunnel systems for many years against Chinese, Japanese and French invaders. There were numerous underground guerilla bases in South Vietnam that had been built and supplied by forced labor from the surrounding villages. The largest systems could be over 200 kilometers (130 miles) long. They would be constructed with water traps to keep out poisonous gases, were strong enough to withstand explosions and could house barracks, armories, supply depots, air raid shelters, classrooms, hospitals and factories.

The US employed specially trained volunteers, known as "Tunnel Rats", to go into these systems in search of the enemy and information. They were hand picked men with nerves of steel, able to stay calm in highly tense situations. They could not suffer from claustrophobia and had to be of a strong but small stature. They would enter tunnels armed with only hand grenades, a pistol and a flashlight. They frequently engaged in hand-to-hand combat and were subjected to snipers, booby traps, rats, snakes and scorpions. Tunnel Rats received "hazardous pay" as extra compensation and would generally not serve for more than an average of four months.

A Navy Seal waiting in ambush. Special forces troops such as the Navy Seals and Green Berets were especially valuable in the irregular type of warfare fought in Vietnam.

The Montagnards were highlanders in Vietnam and Laos who opposed the Communists and fought loyally beside American forces, being especially valuable as guides and interpreters. In addition, the U.S. also used Cambodian mercenaries (below) working for them inside Vietnam close to the Cambodian border in order to help cut off the Ho Chi Minh Trail, the primary supply line for the Viet Cong.

Taking a lesson from Potemkin. As part of a propaganda campaign, the U.S. built a fake North Vietnamese fishing village where they took some 1000 kidnapped Vietnamese civilians (1964-8) to convince them that this was a base for an anti-Communist resistance group, the Secret Sword of the Patriots' League, operating in N. Vietnam. All this in the hope of recruiting insurgents to operate in the communist North. In the 18th century, Catherine the Great's minister, Potemkin, had reportedly built similar fake villages stocked with healthy happy peasants to convince the tsarina that she was ruling a prosperous realm.

South Vietnam Transformed

Nearly as much as the war itself, the mere presence of so many Americans in South Vietnam transformed the country. The U.S. built a huge infrastructure of roads, bridges, harbors, airfields, and communications networks in the country. By 1967, an estimated 1 million tons of goods were entering South Vietnam every month. Much of these vast stores leaked out to create a huge black market of stolen guns, ammunition, office furniture, etc. Unfortunately, the massive sums spent in South Vietnam also led to rampant inflation and a growing gap in the country between rich and poor.

At the same time, fighting, shelling, bombing (including the controversial use of the incendiary napalm) and defoliation with carcinogenic herbicides such as Agent Orange drove tens of thousands of refugees from the countryside to the cities, where they settled in makeshift shanty towns. Thousands more were forcibly resettled in new, supposedly secured villages that functioned largely as concentration camps, despite the American government's intentions. All these factors in turn combined to shatter Vietnam's traditional social and family structures.

Americans Transformed

A marine's face reflects the stress of having just been on a 6-day patrol in the jungle.

The growing futility of the war in Vietnam and its unpopularity back home had unfortunate effects on American soldiers too. Adding to these effects were two other factors. First of all the average American soldier serving in Vietnam was only 19 years old, a young age to be exposing someone to the psychologically upsetting experiences of such a war. Secondly, a soldier's tour of duty was usually done in thirteen months. While this did give him a concrete date to look forward to going home, the rapid turnover in personnel also created instability in units, along with barely giving raw recruits enough time to learn the ropes before they left.

The demoralizing effects of all this caused many GIs to try to kill the pain with drugs that were often supplied by South Vietnamese officers. Both marijuana and highly potent heroin were cheap and plentiful, neither of which added to soldiers' combat readiness. By 1971 an estimated 30% of American troops had tried opium or heroin, and many of them returned to the states as addicts.

At the time, the prevailing belief was that one couldn't break heroin addiction by just going "cold turkey" without the help of an established drug treatment program. Amazingly, a number of former GIs disproved this by checking into hotels with some friends who kept them there for several days as they went through the extremely painful process of withdrawal until they were clean.

My Lai (March 16, 1968)

Probably the most transformative experience in war is how it brutalizes normally decent men and turns them into vicious killers. Nothing symbolized this more than the massacre of the innocent civilians in a South Vietnamese village in 1968.

My Lai was in the middle of an area where the Vietcong were heavily entrenched. In previous weeks American GIs had suffered numerous casualties from ambushes and mines set by an elusive enemy they could never bring to grips. The frustration spilled over when the men of Charlie Company, 11th Brigade, American Division entered the village in a search and destroy mission.

As typically happened, they found no Vietcong upon whom to wreak vengeance. What was different was that something snapped and they took out their frustrations on the helpless civilians left behind. According to eyewitness reports, women and children were shot in the backs of their heads while praying, old men were bayoneted, and at least one girl was raped before being killed.

When news of this atrocity leaked out, the American public was shocked that its young men could act in such a way. What they didn't understand was that this wasn't so much about the character of these young Americans as it was about war and what it can turn the best of us into. The commanding officer, Lieutenant William Calley, was later convicted of murder (despite appeals he was acting on orders from above), sentenced to life in prison, and released in 1974. He was discharged dishonorably from the army and got a job selling insurance

Dissension in the Ranks

As morale declined and resistance to the war rose, growing numbers of soldiers protested the war in various ways. Some grew their hair longer than regulation, listened to rock music, took drugs, wore peace signs and black arm bands, and some, like the 1st Air Cavalry (below), outright refused to go on missions they saw as suicidal and fight in a war they saw as senseless. As one soldier put it: *"I always did believe in protecting my own country, if it came down to that. But I'm over here fighting a war for a cause that means nothing to me."*

Soldiers engaged in "search and avoid" missions, deliberately avoiding clashes with the enemy. They would sometimes carry enemy weapons on patrol and return with them as "evidence" of engaging the enemy. Some units made their own private ceasefires with the enemy. North Vietnamese soldiers were told not to fire on Americans carrying their weapons pointed down or wearing anti-war symbols such as red bandanas and peace signs.

Eventually, the army made accommodations for the growing numbers of soldiers who joined what was known as the "grunts' peace." As one veteran testified in a *New York Times* article *"They have set up separate companies for men who refuse to go out into the field. It is no big thing to refuse to go. If a man is ordered to go to such and such a place, he no longer goes through the hassle of refusing; he just packs his shirt and goes to visit some buddies at another base camp."*

Fragging. One of the most disturbing aspects of the breakdown of discipline in Vietnam was fragging: the act of trying to maim or kill a superior officer, usually because he was incompetent or too enthusiastic about going after the enemy, even when it put his men's safety at risk. Incidents of fragging (called that since it was typically done with a fragmentation

grenade) increased as the war seemed to become more fruitless and unpopular. Most soldiers, typically young draftees who didn't want to be there, had little motivation to take extra risks in order to win the war since they knew they would be going home after 13 months...if they survived.

Also, because of heavy attrition or rotation back home most of the good experienced officers were replaced by young and inexperienced junior officers fresh out of Officers Candidate School (OCS), which did little to prepare them for jungle war and tactics. One common and unpopular mistake they made was to order their men to travel along jungle trails where they could easily be ambushed, rather than take the slower, harder, but safer routes off the trails.

Sometimes, soldiers would leave a grenade pin on an officer's bed to warn him he would be fragged if he didn't change his ways. There were 230 confirmed cases of officers killed by fragging and 1400 other suspicious deaths that went unexplained. Among those officers that GIs secretly considered fragging for careless leadership was Lieutenant William Calley who led the My Lai massacre.

The Anti-War Movement

A variety of factors converged to make opposition to involvement in Vietnam the largest anti-war movement in American history. Much of it had to do with demographics: millions of baby-boomers who were in their teens or early twenties, an especially energetic and potentially volatile age. A mixture of their youthful idealism, hormones, and the fact they were the group being drafted for service in Vietnam made them especially vociferous and active in their resistance to the war. They were also inspired by the spirit of activism that had fueled the Civil Rights and Free Speech movements. Also, as the

war took more lives and drained American resources at home, Martin Luther King denounced American involvement in Viet Nam.

The stresses of the war also helped split the Civil Rights Movement, as frustrated Blacks advocated a more violent strategy to achieve their aims. This helped spark destructive riots in many American Cities in the mid and late 1960s. Those riots, in turn, may have inspired violence in antiwar demonstrations.

There was also the issue of whether the U.S. should be involved in a far off land that didn't seem crucial to national interests or security. Popular perception is that disagreement about the war followed a fracture line corresponding to age: younger people being opposed to the war while the older generation, which had gone through World War II, was more willing to support the government unquestioningly and even brand opponents to the war as traitors. Although this was true later in the war, at first there was more opposition to the war from those over 50 and support for LBJ's policies by younger adults. For example, a Gallup poll in 1966 showed that 71% of those age 21-29 thought sending troops to Vietnam was not a mistake, while only 48% of those over age 50 thought that way.

Similarly, there were protests involving thousands of people from the very start of serious American involvement. In April 1965 an estimated 25,000 people demonstrated against the war in Washington D.C., while 30,000 attended a teach-in about the war in Berkeley. A demonstration at the Washington Monument in November drew 40,000 protesters. That same month, a 31-year-old pacifist named Norman Morrison, burned himself alive outside the Pentagon. The following year saw similar, if somewhat smaller protests. Meanwhile, Muhammed Ali's public opposition to the war helped catalyzed the opinions of African-Americans who bore a disproportionate burden of the fighting.

The movement really started to swell in 1967. On April 15, an estimated 400,000 protesters

marched in New York City and another 100,000 in San Francisco. In October, 100,000 people demonstrated against the war in Washington D.C.

Many people consider the turning point of the war as the Tet Offensive in February 1968. Despite an understood truce to observe the New Year festival, communist forces made surprise attacks on several South Vietnamese cities, apparently catching the Americans off guard and even penetrating into the U.S. embassy. Although the communists were heavily defeated, the Tet offensive was perceived in the U.S. as a defeat for the Americans and opposition to the war grew rapidly from that point.

A picture of Saigon police chief Nguyen Ngoc Loan about to execute a Viet Cong insurgent. What the public generally didn't know when viewing this what that it took place after Nguyen had learned his wife had just been killed by the Viet Cong.

Another turning point was an editorial (2/27/1968) by CBS anchorman, Walter Cronkite, the "most trusted man in America". Having returned from Vietnam to see the situation for himself, he concluded the U.S. could not win the war. As he put it: *"To say that we are closer to victory today is to believe, in the face of the evidence, the optimists who have been wrong in the past. To suggest we are on the edge of defeat is to yield to unreasonable pessimism. To say that we are mired in stalemate seems the only realistic, yet unsatisfactory, conclusion. On the off chance that military and political analysts are right, in the next few months we must test the enemy's intentions, in case this is indeed his last big gasp before negotiations. But it is increasingly clear to this reporter that the only rational way out then will be to negotiate, not as victors, but as an*

honorable people who lived up to their pledge to defend democracy, and did the best they could."

After Cronkite's editorial, LBJ reportedly remarked, "If I've lost Cronkite, I've lost Middle America." LBJ was pretty much right.

Ironically, the growth of the anti-war movement led to a lot more violence in 1968, not just in the U.S., but also in France and West Germany. Not only was there violence at Berkeley, Columbia University, and in particular the Democratic National Convention, it got widespread media coverage that helped widen the generation gap in America. Older people saw the demonstrations as shameful hooliganism and even treason, while younger people saw them as evidence of police brutality and a repressive government.

Same images, but widely different interpretations. That was America in 1968.

1969 saw a new president, Richard Nixon, and a certain wait-and-see attitude about how he would handle the war, which continued to become more unpopular. However, by that fall, many people saw Nixon as no different from LBJ, and organized the Moratorium to End the War in Vietnam. On October 15, millions of Americans took off from work and school to participate in local protests. A month later up to half a million people marched against the war in Washington, with a parallel march taking place

in San Francisco. Thus 1969 was relatively peaceful. It wouldn't last.

In April 1970 Nixon sent troops into Cambodia to disrupt the Ho Chi Minh trail and other North Vietnamese operations based in that neutral country. This triggered a storm of protests across the nation, but nothing compared to the uproar when four students were shot dead by the National Guard at Kent State University in Ohio on May 4 (below). College campuses erupted in the most widespread protests yet, many of them violent. A subsequent National Student Strike shut down over 450 university, college, and high school campuses, while seriously impairing normal operations at many more.

What happened at Kent State is still open to dispute, although one likely scenario was that a nervous guardsman (probably only 19 or 20 himself) panicked at the sound of something in the chaos going on all around him and inadvertently fired his gun, triggering his comrades to do the same. Although probably not a premeditated act, thousands of college students across the nation felt differently and took to the streets. A similar incident that killed several Black students at Jackson State that week created much less of a stir on predominantly white campuses.

As the war's popularity continued to plummet, the anti-war movement attracted a wider cross-section of people to its ranks: blue collar workers, clergy, and Vietnam veterans. Such people, especially veterans, gave the movement more credibility with mainstream society who had largely perceived it as consisting mainly of unkempt spoiled middle class brats. As the

movement became more widely accepted, it also tended to become less violent.

However, there were violent splinter groups, such as the Weathermen, who went underground to carry out violent revolutionary activities. The most notable such action was the bombing of Sterling Hall in Madison Wisconsin, because it housed government-funded research. One physics researcher, who was not involved in government research, was killed. The bomb wrecked the university's physics department, but barely touched the part of the building housing government research.

One interesting aspect of the anti-war movement concerned the elements of humor, satire and irony demonstrators often injected into events. For example, after the march in Washington, 30,000 of the demonstrators went to surround the Pentagon, some of them trying to "exorcise" and "levitate" the building into space. By most accounts, they failed. When the CIA also foiled an attempt to "bomb" the Pentagon with 10,000 flowers, demonstrators put the flowers in the barrels of the rifles of the troops opposing them.

During the protests at the Democratic Convention in Chicago in August 1968, demonstrators nominated their own candidate, a pig named Pigasus, for president, a slam at the establishment, and especially police, who were typically called pigs by protestors. The police got their revenge by "kidnapping" the protestors' presidential candidate.

The Bitter End (1973-5)

South Vietnamese civilians try to escape Saigon as communist forces approach in the final days of the war.

With their ships so overloaded with refugees, Americans have to make room by shoving helicopters into the South China Sea.

The war's unpopularity forced LBJ out of the presidential race in 1968. The winner and his successor was Richard Nixon who claimed he had a secret plan to end the war. Meanwhile he was secretly telling North Vietnam to keep fighting while Johnson was still in office, saying they could get a better deal with him if he were elected. When Nixon took office, he pushed for "Vietnamization" of the war, replacing U.S. troops with South Vietnamese conscripts, many of whom proved unreliable in the fight to defend a corrupt and failing dictatorship.

However, this gave Nixon the chance to negotiate a "peace with honor" (1973), which left communist forces still operating in South Vietnam intact, but gave American forces enough time to exit Vietnam before the Saigon government fell.

While this did allow American forces to withdraw peacefully, North Vietnam stepped up its war with the South. For the regime there, it was only a matter of time. In April 1975 North Vietnamese forces closed in on Saigon as resistance crumbled.

The scene in Saigon as communist forces closed in was both chaotic and pathetic. While Americans in the embassy scrambled to evacuate, thousands of South Vietnamese afraid of communist reprisals, tried desperately to escape with them.

THE U.S AND LATIN AMERICA

“America’s back yard”. The relationship between the U.S. and its Latin American neighbors has always been fraught with problems, especially since the Spanish-American War in 1898. Much of this is the result of the United States’ condescending, often times arrogant, and even exploitative attitudes and treatment of Latin America as its “backyard.” Three things especially fed into a pattern of intervention after 1898. The first was a document known as the Monroe Doctrine (1823), which warned European powers against trying to retake the newly independent republics then forming in South America. Part of this was an aspect of the “Era of Good Feeling” in the U. S. at the time, a sense of being a unique experiment in democracy that we wanted to encourage and maybe even nurture in our image without foreign interference. It was also a result of fear about the big European powers coming back to conquer, not just South America, but also the U.S., coming less than a decade after the British had taken and burned Washington D.C. in the war of 1812. Ironically, it was Britain, the power that had burned our capital, that enforced the Monroe Doctrine, but for reasons of its own, namely to open South American markets to British goods.

This brings us to the second factor influencing our policies in Latin America: the cycle of instability (discussed in FC.108A) where encouragement of one product economies by European powers (Britain in particular) created economic instability, which led to political instability and military dictators, which further encouraged economic instability, and so on. Added to this type of economic imperialism was industrial expansion in the U.S., especially after 1900, where American corporations had vested interests in Latin American economies much as the British had before.

Unfortunately, ongoing political instability in many of these nations made corporations nervous about their investments, thus leading to a long history of intervention in Latin America. Among the countries affected were Haiti (1915-34), Mexico (1846-48, 1914, 1916), Puerto Rico (1898-present), Panama (1903-18 to build the canal), Cuba (1898-1902, 1917, 1921-23, 1933), Nicaragua (1912-33), and the Dominican Republic (1916-24). Of course, most Americans didn’t think of this as intervention

or imperialism, but rather as helping our little brothers south of the border keep their lives in order, because they couldn’t do it for themselves. This situation became more serious in the 1950s.

Before the Cold War, there had been no viable threat to our security. However, after 1945 the Soviet Union was increasingly perceived as such a threat. By extension, anything that even suggested socialist tendencies was seen as the work of the Soviets and must be crushed. At first, the Soviet Union was too weak to extend its influence directly into Latin America by military means. However, if it were to ally with an already established communist state in the region, we feared it could use that as the gateway for the Red Army to threaten us. Therefore, the prevailing feeling in the U.S. was that any perceived communist threats in Latin America must be eliminated before they could blossom into a Soviet satellite.

The first major Cold War intervention in Latin America was in Guatemala, where a progressive reformer, Jacobo Arbenz, was working for land reform. Unfortunately, the United Fruit Company, which owned much of the country, convinced members of the Eisenhower administration, some of who owned stock in the company, that Arbenz was a communist. Therefore, the CIA, in conjunction with a slick media smokescreen showing supposed communist incursions from Honduras, overthrew Arbenz and replaced him with a brutal dictatorship in 1954.

A more serious threat emerged less than a decade later in Cuba. Fulgencio Batista was the U.S.-backed dictator of Cuba, served as a resort and playground for the rich as well as a source of bananas and sugar. In 1959 after years of trying, a young revolutionary, Fidel Castro overthrew Batista’s corrupt regime. At the time, Castro had some socialist leanings, but wasn’t looking to the Soviet Union for support. However, for many in the U.S., some having corporate interests in Cuba, even a hint of socialism was enough for them to see Soviet communism. Therefore, as the U.S. tried to destabilize Castro’s regime with such things as an economic embargo, he struck back by progressively nationalizing more American owned companies. Finally, faced with economic ruin, he declared his regime was socialist and allied with the Soviet

Union, which bought Cuban sugar in return for letting the Soviets put military installations on the island, including medium range nuclear missiles. The result was the Cuban Missile Crisis, which nearly triggered a thermo-nuclear war. Luckily for all, the crisis was defused peacefully, but now Russia had a communist ally only ninety miles from our shores.

For many in Latin America, the presence of a communist bloc nation in the Western Hemisphere created a viable alternative to the military dictators in power in many countries, which encouraged other reformers to come forth. The problem was that Washington equated anything socialist with the Stalinist model, which it usually wasn't, thus driving the U.S. to make an unlikely alliance with those dictators, who were also supported by the middle class that feared a socialist takeover. Supposedly these efforts were to save democracy, which the dictators feared nearly as much as socialism. For the U.S., it was a choice between what it thought the lesser of two evils. Unfortunately, many people living under those dictators did not agree. Therefore, the more the U.S. supported dictatorial regimes in Latin America, the more popular socialism became, causing the U.S. to push harder in support of the dictators, and so on.

Three examples especially stand out in that respect. The first was Chile in 1973, when the CIA helped a General Pinochet overthrow a popular, but socialist leaning, reformer, Salvador Allende. The second example was Nicaragua, where a socialist movement known as the Sandinistas overthrew a U.S.-backed dictator, Anastasio Somoza in 1979. In reaction, the CIA backed another group, the Contras, in its efforts to overthrow the Sandinistas. The result was nearly a decade of civil war that wrecked the economy until U.S. money got the Sandinistas voted out of office. Finally, a U.S. backed dictator in Panama, Manuel Noriega, became so hated that even the middle class wanted him out, which finally encouraged the U.S. to remove him in 1989, showing that business even trumped dictators when push came to shove.

THE NUCLEAR ARMS RACE (1945-2001)

Introduction. We have already seen how Stalin's domination of Eastern Europe after World War II and the West's reaction to his aggression led to a vicious Cold War cycle of one side, fearful of the other, developing new weapons, which caused the other side to do the same and so on. Of course, the single factor making the Cold War so unique and dangerous was nuclear weapons. And just as the Cold War's roots lay back in World War II, so did the roots of the nuclear arms race.

Starting in 1942, almost immediately after its entry into World War II, the United States had worked intensively to develop an atomic bomb before Nazi Germany could do the same. On July 15, 1945 the American program, known as the Manhattan Project, successfully tested the first nuclear bomb at Alamogordo, New Mexico. The United States expected to keep its monopoly on the atomic bomb well into the 1950s, by which time its nuclear arsenal would be virtually impossible for anyone else to match or threaten. However, Stalin's scientists, thanks partly to espionage reaching into the ranks of the Manhattan Project, successfully developed and tested their own atomic bomb in 1949. The Americans, desperate to regain their technological edge to counterbalance Stalin's huge conventional forces, decided to work on what was referred to as the Super bomb. This device, also known as a hydrogen bomb, would create a fusion reaction and thermonuclear explosion as much more powerful than the fission bomb that destroyed Hiroshima and Nagasaki as those bombs were compared to the conventional bombs used in World War II. In 1952, the United States successfully developed and tested such a fearsome weapon. However, the Russians, following the same line of research, produced their own super bomb in 1953, only a year after the Americans had done the same.

In 1957 Soviet military technology seemed to surpass that of the Americans when the Russians developed the first Intercontinental ballistic missiles (ICBMs) capable of delivering nuclear warheads to targets in the United States when fired from Soviet territory. That same year, the Soviets launched the first space satellite, Sputnik, raising American fears of Russia launching nuclear attacks from outer space. Also, the Russians started developing their first long-range bomber force, another area where

the United States previously had a monopoly. Although the perceived missile and bomber gaps were myths, or more accurately, were real in favor of the West, both the threat and fear of nuclear war grew throughout the 1950s. Therefore, as nuclear arsenals grew and with them the threat of nuclear Armageddon, an anti-nuclear movement emerged in the West.

However, in the late 1950s Cold War rhetoric made the American public even more afraid of growing Soviet military power than nuclear holocaust, so that President Eisenhower, under increasing criticism for being soft on communism, increased military spending, which only brought a similar reaction from the Soviet Union and a spiraling arms race. Ironically, Ike did this knowing (through top secret information that he could not make public) that the feared "bomber gap" actually heavily favored the United States. Along these lines the United States embarked on an expensive space program to close the "space gap" and reoriented its school curricula to emphasize math and science to close the perceived "education gap".

Meanwhile, the U.S. tried to close the "espionage gap" by increasing spy flights over Russia to compensate for the fact that it was easier for the Soviets to infiltrate America's open society with spies than it was for the U.S. to do the same into the much more tightly closed Soviet society. Unfortunately, in 1960 an American U-2 spy plane was shot down over Russia and its pilot, Gary Powers, was captured. In addition to the diplomatic furor this raised, it also alarmed Khrushchev about how much the Americans knew concerning Russia's relative nuclear weakness. In order to cover this up, he ordered a series of massive atmospheric tests of Hydrogen bombs as a warning to the West. The U.S. responded in kind and nuclear tensions (and fallout) continued to increase into the 1960s.

MAD. Out of this situation evolved the dominant nuclear strategy of the Cold War: mutually assured destruction (MAD). The basic idea was that each side built up such an overwhelming amount of nuclear firepower (known as overkill) that no one would dare launch a war out of fear of massive retaliation. The basic psychological assumption of MAD was sound, because it did scare each side away from intentional aggression that might lead to an all-out thermonuclear exchange. However, there

was the danger that human or mechanical (especially computer) error could accidentally trigger World War III. Growing fears of such a scenario were reflected in several books and movies of the era, notably *Fail Safe* and *Doctor Strangelove*. In fact, there were several incidents where some sort of mechanical error did nearly launch a nuclear war. Fortunately, in each case disaster was averted, typically by an individual who refused to believe the launch orders were real.

MAD produced several results that together seemed to be both hurtling the human race toward certain destruction and bringing it to its senses. For one thing, MAD demanded that each side keep a large retaliatory (second strike) force that could survive a surprise attack by the enemy and act as a deterrent to such an attack. Therefore, both sides continued to build huge nuclear stockpiles and progressively more accurate delivery systems that gave them the combined capability of destroying the human race many times over.

However, despite the perception that nuclear weapons were more cost effective than conventional weapons, providing more “bang for the buck”, so to speak, they were also prohibitively expensive. This was especially true for the research and development of new weapons systems, since the arms race catalyzed increasingly high-tech research that became more costly as the technology involved became more sophisticated. Eventually, the huge price tag of the arms race would drive the Soviet Union into financial oblivion and help end the Cold War. However, that would not happen until the 1980s. In the 1960s, it was a more immediate crisis that would help cool down the arms race: the Cuban Missile Crisis.

Gradually defusing the nuclear time-bomb (1962-2001). The realization of how close we had come to World War III over Cuba woke many people to the dangers of thermonuclear war. As a result, both sides were much more careful to take precautions to avoid such a disaster. The major obstacle to overcome was the deep distrust between the Soviets and Americans. Therefore, bringing the nuclear genie under control involved starting with relatively small measures to gradually build mutual trust as a foundation for more substantial measures. The first such step was installing the Hot Line, a direct line of communications between Washington

and Moscow that would speed up communications and reduce the chances of a garbled misunderstood message triggering an unintended war. Along these lines, both sides were constantly upgrading their control systems to minimize the chances of some officer or mechanical error launching World War III without authorization from above. In 1963 came an atmospheric test ban treaty to protect the atmosphere from fallout. In 1968 the nuclear non-proliferation treaty committed a large number of nations to not developing nuclear weapons.

In the 1970s, the United States and Soviet Union took a giant step forward with the Strategic Arms Limitations Treaties, SALT I (1972) and SALT II (1979), which put caps on the number of new weapons being produced. Although this did not stop the spiraling arms race, at least it put some limits on it and kept both sides talking. Unfortunately, during the 1980s, the Cold War heated up again, and with it the arms race. However, by this time, high tech, especially computer technology, was making possible a whole new generation of sophisticated weapons systems, including the possibility of mounting a guided missile defense system against an incoming nuclear attack. President Reagan’s proposed Strategic Defense Initiative (AKA “Star Wars” or SDI), although technologically unfeasible at the time, still upped the stakes (and price tag) of the arms race. By this time, the Soviet Union’s economy was already sinking under the burden of trying to keep up with the United States’ buildup. Therefore, its new leader, Mikhail Gorbachev, announced a unilateral withdrawal of some Soviet forces from Eastern Europe as a gesture to the West for more substantial talks. These renewed disarmament negotiations produced a series of new treaties that significantly reduced nuclear stockpiles and ended the Cold War on a much happier note than it might have:

- Intermediate Nuclear Forces (INF) Treaty eliminates many missiles, especially in Europe (1987)
- Strategic Arms Reduction Treaty (START I) cut number of Nuclear warheads from 23,500 → 15,400 (1991)
- START II Eliminated land based MIRV’s (Multiple Independent Re-entry Vehicles) (1993)
- Agreement to cut American & Russian nuclear forces below 2000 warheads each (2001)

The arms race between the Cold War superpowers ended much better than it might have. That's the good news, that human beings are capable of resolving their differences peacefully. However, we're not out of the woods yet as other people try to get and intend to use "weapons of mass destruction". Still, the final lesson of the Cold War is that there is still hope, and that, as always, is a priceless commodity.

The Effects of a Nuclear Detonation

The EMP range of damage caused by a high yield burst detonated at 400 km over the United States.

Following is a brief description of what happens during a nuclear blast.

1. *An immediate or Prompt Radiation burst of primarily gamma rays and neutrons.* Gamma-rays, which are generated by radioactive atoms and in nuclear explosions, have the smallest wavelengths and the most energy of any other wave in the electromagnetic spectrum. Gamma-rays are produced by such violent events as supernova explosions or the destruction of atoms. They can kill living cells, and are used discretely to kill cancerous cells. When unleashed in the massive burst of a hydrogen bomb, they are indiscriminately deadly to any cells in their path.

The best shield from gamma radiation is a dense mass of material, such as lead, although a thick mass of lighter materials such as aluminum, concrete, or soil can be as effective as a thin shield of lead.

A burst of gamma rays from an exploding supernova may have been responsible for the extinction of 70 percent of the marine creatures that thrived during the Ordovician period (488

to 443 million years ago) by destroying the ozone layer and cooling the planet.

2. *EMP (electromagnetic pulse), also caused by lightning and solar flares, is an intense pulse of electromagnetic energy lasting some 200 nanoseconds with a peak power on the order of 500 billion megawatts.* EMP will fry the circuits of any unshielded electronics within its range. On July 8, 1962, in the "Starfish Prime" test, the EMP from a 1.4 Mt burst 250 miles above Johnston Island in the Pacific turned off 300 streetlights in Oahu, Hawaii (740 miles away). Today's integrated circuits are one million times more vulnerable to EMP than older vacuum tube electronics in use in 1962. We still face the threat of a thermonuclear blast 300 miles above the center of the United States that could critically damage our nation's infrastructure.

This and the following pictures are screen shots from Peter Watkins' film *The War Game*, which was commissioned by the BBC. Despite winning an Oscar, the BBC declined to air it since it was deemed too realistic for public viewing.

3. *Thermal radiation.* Directly viewing a nuclear explosion can burn the retinas, although the eyes will often recover if bandaged for a couple weeks. More serious are the heat effects. Direct exposure of flesh to a 1-megaton blast from seven miles away will cause first-degree burns, comparable to a bad sunburn. A person will suffer second-degree burns at a distance of six miles, and third degree burns five miles out. At a closer range, the heat can sear the flesh and even melt one's eyeballs. It can also ignite flammable materials such as wood, clothes, and draperies, causing widespread fires.

4. *The blast and shock wave* can travel several hundred kilometers per hour, atomizing just about anything close to ground zero and doing progressively less damage outward. It can also start fires by rupturing natural gas lines and fuel tanks. The blast wave is measured in pounds per square inch (psi) "overpressure" beyond normal psi. Even a moderate overpressure of 5 psi can rupture internal organs and do substantial damage to normal buildings. The overpressure created by the shock wave's outward motion leaves a low-pressure area at ground zero, causing a subsequent strong backwash of winds to fill in that low-pressure area. The fires ignited by the blast wave may join with those triggered by thermal radiation to generate what is known as a firestorm.

5. *Firestorms*. In some cases, the fires created by the heat flash and shock waves combine to create intense fires. These lead to low pressure in the middle as the heat rises, sucking in surrounding air to stoke the fire, generating hotter fires, etc. This rush of air into the center of the fire causes gale force winds that suck people into the firestorm. The firestorm also replaces surrounding oxygen with carbon monoxide and carbon dioxide, leading to asphyxiation of people even in the supposed safety of shelters. Firestorms were generated by the conventional fire bombings of Hamburg, Dresden, and Tokyo as well as the atomic attack on Hiroshima. However, hilly terrain at Nagasaki blocked winds and the formation of a firestorm.

A firestorm continues until there is nothing left to burn.

6. *Radioactive Fallout* starts within hours of detonation as ionized radioactive particles lifted into the mushroom cloud fall back to earth. A ground burst ionizes more dust particles than an air burst does, thus leading to more fallout. It takes 2-3 weeks for the fallout to settle back to earth. Where fallout comes down and in what concentrations depends on wind patterns. People in fallout areas should remain in airtight shelters with supplies of uncontaminated food and water stored beforehand, until the fallout has settled out of the atmosphere.

Since it takes thousands of years for radioactive isotopes like strontium-90 and cesium-136 to deteriorate, everything must be thoroughly cleaned and several inches of the topsoil buried before "normal" life resumes.

Exposure to large doses of fallout can lead to radiation sickness. The heavier the dose, the more quickly symptoms show up, with severe doses leading to symptoms occurring within 30 minutes. Radiation especially attacks reproductive, intestinal, and hair cells. Early symptoms are nausea, vomiting, and bloody diarrhea (from the breakdown of intestinal cells) while hair loss, the inability of wounds to heal, dizziness, fatigue, and headaches also typically occur. Roughly 50% of those exposed to heavy doses of radiation die from radiation sickness. Even after recovering from radiation sickness, other long-term effects may show up, such as cancer, tumors, and birth defects.

MAD and the Real Dr. Strangelove

Herman Kahn, the inspiration for *Doctor Strangelove*

The man considered the creator of the concept of Mutually Assured Destruction (MAD) was Herman Kahn, a 5'8" 350 pound man who

worked for the RAND think-tank of intellectuals (philosophers, mathematicians, physicists, economists, etc.) in the 1950s thinking up ways to justify big Air Force budgets.

RAND began as a small group of scientists in World War II in response to the more highly technical aspects of warfare emerging in the 1940s. Besides the atomic bomb, it dealt with such things as radar, depth charges, long-range rockets, and infrared sensors, along with how to use them most efficiently (e.g., the maximum destructive radius of a particular charge of explosives, the best formation for flying bombers, etc.). Out of this came the field of systems analysis. After the war, the air force was concerned about reduced military budgets and being able to retain skilled scientists, so it retained four of the scientists as the air force RAND group to deal with questions of the increasingly complex technologies of war: long-range missiles, atomic weapons, robots, etc.

1959 was the year of the “missile gap” when many policy makers tried to convince people scared of nuclear attack that we should just make more missiles. Civil defense authorities testified that a “moderate sized” nuclear attack of 263 H-bombs against 70 American cities and 151 air bases would instantly kill 23-million Americans and ultimately 26-million more, while irradiating half of the homes in the U.S. In addition, atmospheric tests were creating dangerously high levels of radioactive strontium-90 in America’s milk.

During the 1950s the war strategy for Strategic Air Command (SAC) was simply to unleash a total nuclear attack on the Russians and Chinese as soon as war should begin. Such an attack would involve 3,423 nuclear bombs, unleashing the equivalent of nearly 8 billion tons of explosive power. It was estimated that would kill 285,000,000 Russians and Chinese with unknown collateral effects (such as radioactive fallout) in other areas such as Europe.

According to Kahn, this wasn’t a war strategy but a “war orgasm”. To make his point, Kahn proposed with mock sincerity a “doomsday

machine”, a massive stockpile of hydrogen bombs set to go off in case of Soviet aggression and unleashing massive amounts of fallout that would kill hundreds of millions of people globally, if not exterminate the entire human race. He even drew up plans for such a device to prove it could be done. When, as expected, every SAC officer rejected the idea, Kahn told them their own plans were little short of such a doomsday device.

Kahn’s deeper point was that no one realistically expected such a war to take place. Therefore, if we didn’t take our own plans seriously, why should the Soviets, who might call our bluff by facing us with the choice of surrender or mass suicide/murder? Instead, Kahn advocated a “counterforce” strategy that would meet a Soviet conventional attack with a limited nuclear attack on several select strategic targets along with the threat to escalate unless the Soviets backed off. Of course, the Soviets might call our bluff and respond in kind, thus raising the odds of a thermonuclear Armageddon taking place. Thus the “counterforce” strategy drew little support with SAC generals, who saw the risk it ran as making it hardly a credible strategy either.

But Kahn, who didn’t do things in half measures, saw differently, and proposed large-scale civil defense measures to make a counterforce strategy credible and nuclear war seem winnable. Therefore, he became obsessed with surviving nuclear war by means of massive fallout shelter building programs and evacuations of cities. Nelson Rockefeller, governor of New York, even introduced a bill that every homeowner in his state be required to build a fallout shelter. Other governors supported this idea, which went nowhere.

Another problem with Kahn’s ideas about fallout shelters and evacuation of cities was that they would bring in no funding for new air force weapons, so he quit RAND in 1959, wrote a 652 page book called *On Thermonuclear War*, and went on a lecture tour explaining how to survive nuclear war.

According to Kahn, if 53 of America's major cities were wiped out in a thermonuclear attack, that would *only* kill 40% of the population, leaving 60% alive. Asking his audiences if they could live with that, he would answer for them in the affirmative, saying the destruction of the cities would be so remote from survivors who wouldn't be faced with seeing the actual carnage.

Of course, he admitted things would be different. People's diets would change. And sure, some people would get apathetic and others would get nauseous. That's why people needed radiation meters so they could tell their vomiting neighbors, "The meter says you only got ten roentgens. What are you throwing up for? Shut up!"

When asked if such a world would make normal happy lives impossible for most survivors, Kahn replied, "Who's happy and normal now?"

Kahn proposed an ascending scale of nuclear strategies for deterring or, if necessary, winning a nuclear war with the Soviets:

- Type I was the simple threat, with the apparent intention, to annihilate Russia if it attacked.
- Type II was the counterforce strategy backed up by and made credible by extensive civil defense measures.
- Type III was a "prolonged" war (i.e., lasting between two and twenty days) in a "tit-for-tat" exchange of nuclear attacks until the enemy gave up.

There was one other catch. In order to keep this strategy credible, we had to sustain a high level of tension with the Soviets so that our government and people would be willing to maintain a correspondingly high level of arms production and readiness to fight a nuclear war. Of course the Soviets would respond in kind, thus perpetuating a spiraling arms race that would create the paradox that the strategy, also known later as Mutually Assured Destruction (MAD), both kept the peace while putting the survival of the human race at increasingly higher levels of peril.

Even Kahn would concede to audience members that a thermonuclear exchange would destroy the communications infrastructure necessary for the president to know the real situation beyond his bunker and be able to order either more attacks or a ceasefire. In fact, this uncertainty was built into the system whereby nuclear submarine commanders who lost contact with strategic command and the president had the discretionary power to order a nuclear attack if they thought the United States had been attacked.

In the meantime, crowds flocked to see Kahn and buy his book, *On Thermonuclear War*. He would later become the intellectual model for film director, Stanley Kubrick's dark nuclear war comedy *Dr. Strangelove*, with whole lines of dialogue in the movie taken from Kahn's book.

Nuclear strategies. While MAD was a general philosophy or strategy on how to wage nuclear war, there were two basic types of strategies for nuclear war: counter-value and counterforce.

Counter-value. In the early days of nuclear weapons, guidance systems were so inaccurate that neither side could count on hitting anything smaller than a city. Therefore, each side targeted the other's cities, the understanding being that you destroy one of my cities, I destroy at least one of yours. This was the approach especially associated with MAD.

Counterforce. As guidance systems got more accurate in the 1960s and 1970s, each side was able to accurately target the other's missile silos, thus avoiding the massive loss of life caused by hitting the enemy's cities. Unfortunately, this also made it seem that nuclear war could be limited and won. Of course, the question was, would both sides be able to keep such a war limited to enemy silos when no other known war had been voluntarily limited?

Weapons blurring the Distinction between Conventional & Nuclear War

A Cruise Missile, capable of carrying a conventional or nuclear warhead

Tactical nuclear weapons were “smaller yield” weapons with a yield of 10-15Kt (kilotons), comparable to the bombs dropped on Hiroshima and Nagasaki. They were specially deployed by NATO against the Warsaw Pact’s larger conventional forces. Of course, if we initiate the use of nuclear weapons, where would it stop?

Enhanced Radiation Warheads (Neutron Bombs) yield up to 80% of their energy in the form of high-energy neutrons. This is six times the yield of ordinary nuclear weapons, which produce most of their energy as blast and heat. In the mid 1970s neutron bombs were proposed for development and deployment against Soviet tank columns to fry the tank crews inside their tanks with a burst of radiation while doing minimal damage to civilian property and creating little fallout.

A one kiloton enhanced radiation warhead can deliver an instantaneous lethal dose of 8000 rads over a radius of 690m (2260 ft) while the blast radius would be limited to approximately 550m (1800 ft). In contrast a regular 10 kiloton nuclear device would have the same lethal radiation radius but a blast radius of 1220m (4000 ft).

Degraded uranium is extremely dense, and thus very effective when used for the tips of anti-tank shells. Unfortunately, the shell’s explosion spreads radioactive uranium all over. D-tipped shells were used extensively in the Gulf War and Kosovo, and have been blamed for the mysterious malady, Gulf War Syndrome, found in many soldiers who were sent, without chemical protection suits, to clean up after the shells. The symptoms for Gulf War Syndrome are consistent with radiation sickness.

Soviet and American Nuclear Delivery Systems

The B-52, workhorse of our strategic nuclear bomber fleet since 1960, is still used as a static bomber for launching cruise missiles and is expected to stay in service until 2030.

The nature of the respective nuclear delivery systems for the Soviets and Americans during the Cold War was largely determined by the fighting in the Second World War. Until June 6, 1944 the Americans (and British) were confined to Britain, making large-scale bombing of German cities by long-range strategic bomber fleets the only way they could hurt Germany. By 1945, they were launching raids of up to 1000 “flying fortresses” at a time to devastate Germany’s cities.

For the Russians, it was a very different story, being nose to nose with the Germans from day one of the fighting. Therefore, nearly all of their resources for an air force had to be put into fighters and ground support planes to combat their German counterparts, leaving very little for development of long-range bombers. One thing they did develop were rockets. The infamous Katyushas, although, only short-range weapons, served as the basis for Russia’s long-range missile forces after the war, also being helped by captured German scientists who had worked on the long-range V-1 and V-2 rockets for Hitler. However, half of Germany’s scientists had been captured by the Americans and put to work in their programs.

As a result, during the Cold War, the U.S. continued development of both strategic bombers and missiles, while the Russians, without a strategic bomber fleet to build upon, focused almost totally on missiles. The Russians came up with the first long-range

Intercontinental Ballistic Missiles (ICBMs) in 1957, followed closely by the U.S. (The Soviets used one of their ICBMs to launch Sputnik that October to start the space race.)

ICBMs could fly on a suborbital path across the North Pole at a speed of four miles *per second* and were capable of hitting within a few yards of their designated targets on the other side of the globe. Civilians targeted for such an attack would only have a few minutes warning time to find shelter before detonation.

Complicating matters further in the late 1960s was the development of Multiple Independent Reentry Vehicles (MIRVs), making it possible to carry up to ten warheads on one missile and deliver them to ten different targets along the missile's path.

The Cold War also saw both sides develop another type of delivery system, submarines armed with Submarine Launched Ballistic Missiles (SLBMs). Leading the American fleet were the Ohio class Trident submarines, which were the backbone of the submarine leg of America's nuclear triad. They had 24 Submarine Launched Ballistic Missiles (SLBMs), which individually could carry up to eight 100Kt warheads (each one roughly equivalent to 8 Hiroshima bombs). Thus each submarine could deliver 192 nuclear bombs

against an enemy. Some people described a Trident submarine as the third largest nuclear power on the planet.

These submarines, which are still in service as of 2013, are extremely quiet and virtually invulnerable to enemy attack. To maintain communications with the mainland, they use ultra-low frequency radio waves that are as secure as the communications for land-based ICBMs. The Navy, which once worried about being made obsolete by nuclear weapons in the 1950s, now contends land-based ICBMs and the manned bomber forces of SAC (Strategic Air Command) are what are obsolete.

The B-2 Stealth bomber, able to avoid detection by enemy radar, largely replaced the B-52 as America's main strategic bomber.

U.S. Nuclear Free-Fall Bombs

| Bomb | Yield | = to how many Hiroshima blasts | Type |
|-------------|------------------------|---------------------------------------|------------------------|
| B28 | 70kt to 1.45 MT | 4.6 - 95 | Fusion |
| B43 | 1MT | 66.6 | Fusion |
| B53 | 9MT | 600 | Fusion |
| B57 | 5kT to 10kT | 0.3 - 0.6 | Fission |
| B61 | 10kT to 500kT | 0.6 - 33.3 | Boosted Fission |
| B83 | 1-2 MT | 66.6-133.3 | Fission |

THE LIKELY EFFECTS OF A LIMITED NUCLEAR ATTACK

While most people tend to think of an all-out exchange of nuclear weapons when they think of nuclear war, both sides planned for many different scenarios and how they would respond. An example of one scenario is what would happen in case of a limited strike on just a few cities that have most of our oil refining capacity. Besides the psychological shock of such a catastrophe on the nation, such an attack would trigger a whole chain reaction of problems.

One problem would be agriculture. For one thing, farmers would probably be allocated some fuel for their tractors and other machinery, but not as much as before. Therefore, fewer acres of crops would be planted. Also, there would probably be no chemical fertilizers, herbicides, or pesticides, thus drastically reducing crop yields per acre that was planted. As a result, food supplies would be severely reduced, especially meat, and what food there was would be hard to get to markets, not to mention the greater difficulties for people to get to market to buy it.

This brings us to the next problem: no fuel for a society almost completely dependent on the family car. One immediate victim would be the auto industry and other industries feeding into it, such as glass, steel, and upholstery, not to mention all the auto mechanics and other auto service people. For people spread out into the suburbs, this would create particular problems for getting to work, school, the market, etc. Outlying malls, another common feature of America, would become inaccessible and almost certainly go out of business. All of these would create massive unemployment on a scale dwarfing the Great Depression. And all those unemployed people would create a huge strain on an economy already severely reduced.

The effects wouldn't stop there. For one thing, the severe psychological shock of the attack and its aftermath would seriously discourage any potential consumers (what few are left) from buying all but the bare necessities, if they could even get those. This would trigger more business failures, further discouraging spending, and so on.

The effects would also be global, discouraging Americans from buying foreign goods (if they could get them to market). It would also discourage other people from buying American goods. Thus more businesses would collapse, further discouraging domestic buying, which would further discourage foreign trade, etc.

Thus, even if only the U.S. were bombed, the effects of a limited nuclear attack would trigger a worldwide depression and the collapse of the global economy for an indefinite period.

Charlottesville: A Fictional Account Of Post-Nuclear Survival By Nan Randall

Screenshot from the 1983 film *The Day After* that describes the effects on Lawrence, Kansas of a fictional nuclear attack that hits nearby Kansas City. It closely follows the scenario described in the following study done for the Office of Technology Assessment of how a similar attack would affect Charlottesville, Virginia.

At first, it seemed like a miracle. No fireball had seared the city, no blast wave had crumbled buildings and buried the inhabitants, no dark mushroom cloud had spread over the sky. Much of the country had been devastated by massive nuclear attack, but the small, gracious city of Charlottesville, Virginia had escaped unharmed.

The nuclear attack on the Nation did not come as a complete surprise. For some weeks, there had been a mounting anxiety as the media reported deteriorating relations between the superpowers. The threat of possible nuclear war hung heavy

in the world's consciousness. As evidence reached the U.S. President's desk that a sizable number of Americans were deserting the major cities for what they perceived to be safety in the rural areas, he considered ordering a general evacuation. But, with the concurrence of his advisors, he decided that an evacuation call from the Federal Government would be premature, and possibly provocative. There was no hard evidence that the Soviets were evacuating and there was a good chance that the crisis would pass.

Spontaneous evacuation, without official sanction or direction, grew and spread. A week before the attack, Charlottesville had no free hotel or motel rooms. A few evacuees found lodgings with private families, at great expense, but most were forced to camp by their cars in their trailers next to the fast-food chains on Route 29. The governing bodies of Charlottesville and surrounding Albemarle County were rumored to be concerned about the drain on the area resources, without really having any way of turning back newcomers. "If this keeps up," remarked a member of the Albemarle Board of Supervisors, "we're going to be overrun without any war."

A few of the students at the University of Virginia left Charlottesville to join their families. But the majority of the students stayed, believing that they could go home easily if it were necessary.

Refugees came from Washington, 130 miles to the north, and they came from Richmond, 70 miles to the east. A few of the hardier types continued on into the mountains and caverns near Skyline Drive; the majority sought the reassurances of civilization that the small city could provide.

The population of Charlottesville normally stood a little above 40,000, while Albemarle County which surrounds the city like a

donut boasted an additional 40,000 to 50,000. With the arrival of the city evacuees, the combined population was well over 120,000.

In the week before the nuclear attack, much of the population familiarized itself with the location of fallout shelters. Little hoarding took place as retailers limited sales of food and other necessities. Transistor radios accompanied both adults and children when they were away from home. However, most of the residents of Charlottesville continued to live as they always had, although they were particularly alert for sirens or bulletin broadcasts on the radio. Many children stayed out of school.

*

At the sound of the sirens and the emergency radio alerts, most of Charlottesville and Albemarle County hurried to shelter. Fortunately, Charlottesville had a surplus of shelter space for its own population, though the refugees easily took up the slack. Many headed for the University grounds and the basements of the old neoclassical buildings designed by Thomas Jefferson; others headed downtown for the office building parking garages. Carrying a few personal effects, blankets, cans and bottles of food, and transistor radios, they converged in a quiet if unorderly mass. For most people, the obvious emotional crises—grief at leaving behind a pet, anxiety at being unable to locate a family member or relative—were suppressed by the overwhelming fear of the impending attack.

Some residents chose not to join the group shelters. Many suburbanites had ample, sturdy basements and food stocks. They preferred not to crowd themselves. In the event, those who had taken the precaution of piling dirt against the windows and doors of their basements found that they provided adequate shelter. Among the rural poor, there was a reluctance to desert

the small farms that represented the sum of their Life's work. They wondered whether, if they left, they would return to find their means of livelihood gone. Further, many lived far from an adequate public shelter. So they stayed.

* * *

Most did not see the attacks on Richmond and on Washington as they huddled in their shelters. But the sky to the east and north of Charlottesville glowed brilliant in the noonday sun. At first no one knew how extensive the damage was.

Communication nationwide was interrupted as the Earth's atmosphere shivered with the assault of the explosions. Each town, city, village, or farm was an island, forced to suffer its selected fate of death or salvation alone. (Some time later it was learned that more than 4,000 megatons (Mt) had destroyed military and industrial targets, killing close to 100 million people in the United States. The U.S. counterattack on the Soviet Union had had a similar, devastating effect. Destruction ranged from the large industrial centers on the coasts and Great Lakes to small farming communities that had the misfortune to be close to the great missile silos and military bases.)

Areas of the country such as the northeast corridor were reduced to a swath of burning rubble from north of Boston to south of Norfolk. Still, there were some sections of the Nation that were spared the direct effects of blast and fire. Inland in Virginia, only the town of Radford, west of Roanoke, received a direct hit. The farming and orchard land of the rural counties were not targets.

Charlottesville, the small but elegant center of learning, culture, and trade in central Virginia, was not hit either. This monument to the mind and manner of Jefferson retained its status as a kind of genteel sanctuary, momentarily immune to

the disaster that had leveled the cities of the Nation.

An hour after nothing fell on Charlottesville, rescue squads and police were dispatched to scour the countryside for stragglers to get them to shelters. Because, even if the population was safe from the direct effects of the nuclear warheads, another danger was imminent. Fallout, the deadly cloud of radioactive particles sucked up by the nuclear fireballs, could easily blanket the town of Charlottesville in a matter of hours. And no one could predict how much, and where it would go. Fallout could poison many of those idyllic rural towns and villages that seemed light-years away from the problems of international power and politics. While a few places, such as Roseberg, Oregon, would receive no fallout at all, the rest of the Nation would have to constantly monitor to know the level of radiation and where it was located. Fortunately for Charlottesville, the University and the hospitals had sophisticated radiological monitoring equipment, and the training to use it. Many other towns were not so lucky.

Two and one-half hours after the warnings had sounded, the nuclear engineering staff from the University picked up the first fallout. Starting at a moderate level of about 40 rems an hour — a cumulative dose of 450 rems received in a 1-week period would be fatal to one-half of those exposed — the intensity rose to 50 rems before starting the decline to a level of about four-tenths of a rem an hour after 2 weeks. (The total dose in the first 4 days was 2,000 rems, which killed those who refused to believe shelter was necessary, and increased the risk of eventually dying of cancer for those who were properly sheltered.) For the immediate period, it was essential to stay as protected as possible.

For several days, Charlottesville remained immobile, suspended in time. It was unclear just what had happened or would happen. The President had been able to deliver a message of encouragement, which was carried by those emergency radio stations that could broadcast. As the atmosphere had cleared, radio station WCHV was able to transmit sporadically on its backup transmitter and emergency generator in the basement. However, the message from the President posed more questions than it answered — the damage assessment was incomplete. Nevertheless, he said that there was a tentative cease-fire.

In the first days of sheltering, only those with some particular expertise had much to do. Nuclear engineers and technicians from the University were able to monitor radiation in the shelters they occupied, and CB radios broadcast results to other shelters. The doctors were busy attempting to treat physical and psychological ailments — the symptoms of radiation sickness, flu, and acute anxiety being unnervingly similar — while the police and government officials attempted to keep order. The rest waited.

For the time being, the food stocks brought to the shelter were adequate if not appetizing. The only problem was the water supply, which, though it kept running because of its gravity system, was contaminated with iodine 131. Potassium iodide pills, which were available in some shelters, provided protection; elsewhere people drank bottled water, or as little water as possible.

Not all of the shelters had enough food and other necessities. Most shelters had no toilets. The use of trashcans for human waste was an imperfect system, and several days into the shelter period, the atmosphere was often oppressive. As many suffered from diarrhea —the result either of anxiety, flu, or radiation

sickness— the lack of toilet facilities was especially difficult.

Shelter life was bearable in the beginning. Communications by CB radio allowed some shelters to communicate with one another, to locate missing family members and friends. A genuine altruism or community spirit of cooperation was present in almost all the shelters — though some of them were fairly primitive. Even those refugees who were crowded into halls and basements with the local residents were welcomed. Parents watched out for one another's children or shared scarce baby food. Most people willingly accepted direction from whomever took charge. Among the majority of the shelter residents, the out-of-town refugees being an exception, there was a sense of relief, a sense that they had been among the lucky ones of this world. They had survived.

Within a few days, the emergency radio was able to broadcast quite regularly. (As the ionosphere does not clear all at once, occasional interruptions were expected.) The station had had no protection from the electro-magnetic pulse that can travel down the antenna and shatter the inner workings of electronic equipment during a nuclear explosion. However, by detaching the back-up transmitter at the sound of the warning, the station engineer had protected equipment. Intermittent communications from Emergency Operations Centers got through to Charlottesville officials, though the main communications center at Olney, Md., was silent. Telephone switching facilities were almost entirely out, although the small, independent phone company could expect to be operational fairly quickly. The complex, coast-to-coast trunk lines of Ma Bell might take a year or more to reconnect.

Lifeline of the sheltered community was the CB radio. Rural Virginians had been CB fans long before it became a national craze,

and they put their equipment to imaginative use. Prodded by anxious refugees, as well as by local residents who had relatives and friends in other parts of the world, CBers tried to set up a relay system on the lines of an electronic pony express. Though less than perfect, the CB relay was able to bring limited news from outside, most of that news being acutely distressing. From the limited reports, it was clear that there was little left in the coastal cities; those who had abandoned family or friends to come to Charlottesville understood that probably they would never see them again.

The first surge of grief swept over the refugees and those Charlottesville residents who were affected. In time, the sorrow of loss would affect almost everyone. Although they had survived themselves, still they had lost.

Three days after the attacks, the next large influx of refugees poured into Charlottesville, many of them suffering with the early symptoms of radiation sickness. They had been caught poorly sheltered or too close to the nuclear targets them. A few showed the effects of blast and fire, bringing home to Charlottesville the tangible evidence of the war's destruction. Some refugees had driven, while others had hitchhiked or even walked to reach what they hoped was safety and medical help. On the way, many were forced to abandon those who were too weak to continue.

The hospitals were completely overwhelmed. Up to now, the hospitals had managed to treat the ill with some modicum of order. The hospitals themselves were fallout shelters of a kind; patients' beds had been moved to interior corridors for fallout protection; emergency surgery was feasible with the emergency generators, hospital staff slept in the most protected areas. Some borderline cases in

intensive care were released to nature's devices while any elective medical procedures were eliminated. Still, hospitals were able to cope, even with the increasing number of common ailments caused by the shelter crowding.

Suddenly, this changed. Fallout levels were too high for anyone to be out in the open for any length of time, but the people came anyway. The carefully laid plans of the University of Virginia Emergency Room, devised for the possibility of peacetime accidents, were hurriedly modified. No longer was the careful showering and decontaminating of victims possible with the single shower and uncertain water pressure. Instead, patients were stripped of their clothes and issued hospital gowns. With no time for studied decision, doctors segregated the very sick from the moderately sick — the latter to be treated, the former given medication and allowed to die.

Nevertheless, the day came when the hospitals were full. The University Hospital, Martha Jefferson Hospital, the Blue Ridge Sanatorium, and the others were forced to lock their doors to protect those patients they had already accepted.

After being turned away, the sick had no specific destination. Many still clustered around the middle of town near the two major hospitals taking up residence in the houses abandoned by local residents several days before. With minimal protection from fallout and no medical treatment for other trauma, many died, their bodies left unburied for several weeks.

The combined populations of Charlottesville and Albemarle County rose to 150,000 in the 7 days after the nuclear attack. Slowly, hostility and resentment wedged a gap between residents and refugees who attempted to join the group

shelters, The refugees, still in a daze from their experience, believed that they had priority rights after all they had suffered. The local residents viewed the outsiders as a threat to their own survival, particularly as the extent of the war damage was becoming evident.

In fact, the supply of food was not a problem in the short run. Like most other towns and cities, Charlottesville and Albemarle had some 3 weeks worth of food on hand, on home shelves, in supermarkets and wholesale outlets. The Morton Frozen Food plant could be expected to supply a rich diet of convenience foods for a short time, even after the refrigeration was off. The problem was, after the local supplies were exhausted, where could they get more?

Nerves, already frayed by the stresses of the past days, threatened to snap. Older people were irritated by the noise and commotion of children; children resented the lack of freedom. The friction between differing groups became increasingly evident, and vocal. An experiment in communal living was clearly not to the taste of many, and the discomforts, both physical and psychological, had the effect of pushing local residents out of the shelters. (There was some effort to stop them as the radiation levels still posed some hazards; they were urged at least to stay inside most of the time.) Left in the shelters, now, were mostly those out-of-town refugees who had no homes to go to.

Not all the residents of Charlottesville and Albemarle found their homes intact. In some cases they returned to find the house looted or occupied by refugees who were unwilling to give up squatters' rights. Sometimes claims were backed with guns; in a few cases, squatter and owner worked out a modus vivendi of sharing the property.

Some animals had survived, in varying states of health. Unprotected farm animals were dead, while those that had been confined to fairly solid barns with uncontaminated feed had a fair chance of surviving. Many of these farm animals, however, were missing, apparently eaten by hungry refugees and residents. Some pets had remained indoors in good de facto shelters so that, if they had found water, they needed only to be fed to regain health. Worried about the amount of food pets could consume, many families simply put them out to fend for themselves.

For the first week or so after the nuclear attacks, authorities had few options. Simple survival was the priority, the elements of which included food and water distribution, fallout protection, and retention of some civil order. Government was ad hoc, with the leadership of the city and county naturally cooperating, along with the different police forces. As the population left the shelters, however, officials felt that some more formalized system was desirable. After several long meetings — in the basement of the courthouse where the government officials had stayed to avoid fallout — an emergency government, led by the city manager of Charlottesville, was agreed on. The combined city council and the Albemarle County Board of Supervisors also elected the chairman of the board of supervisors as deputy, and the sheriff of the county as chief of public safety to oversee the combined police forces and provide liaison with those military units, which were still in the area.

The powers given to the city manager were sweeping in scope, certainly far beyond any powers he had held before, and ran “for the duration of the emergency.” While some considered the new form of local government close to martial law, great care was exercised to be sure that the offensive

term was not used. In effect, however, Charlottesville and Albemarle were under a highly centralized, almost totalitarian rule.

Whatever it might be called, under the new system, the city manager was able to take over all resources and their allocation. Following to some extent the paper plan that the area had developed, the new government attempted to set out priorities. It was greatly aided by the experts from the University, who volunteered time and expertise to analyzing the needs of the area. (In this respect, Charlottesville was particularly fortunate in having an extensive pool of talent on which to draw.)

However, if Charlottesville was lucky to have reasonably functioning government and a number of experienced planners and managers, and to have suffered comparatively modest disruption from refugees and fallout, the city and county authorities were becoming painfully aware that they were not set up to 'go it alone' without any outside help. Even were the weather suitable for planting, Charlottesville was no longer an agricultural center. There wasn't enough energy to process any food that might be grown. Where would people get clothes and building materials and medicines and spare parts for the cars and buses? The very complexity of American society — its technological marvels and high standard of living — could well prove to be a barrier to the reconstruction of any one part.

During the third week after the attacks, the new rationing system came into force. Individual identification cards were issued to every man, woman and child. Food was distributed at centralized points. Those without I.D. cards were unable to get their ration of flour, powdered milk, and lard — and the processing of cards could take 3 or more days. Some desperate refugees resorted to stealing I.D. cards in order to

get food, while an enterprising printer started turning out forgeries within 2 days after the government had first issued cards. Rumors of hoarding and black marketeering abounded. Some of the missing supermarket food turned up in black market centers, accompanied by exorbitant prices.

Fuel supplies were dropping more rapidly than the government had hoped. Most families were heating their homes with wood, either in fireplaces or in recycled oil drums for stoves. As the winter was waning, the most desperate need was for fuel for driving motors and generators. Even the drinking water was dependent on the emergency generator that ran a single purifying system for the Rivanna Water and Sewer Authority. (Water for other uses could simply be drawn from the gravity-powered reservoir system, bypassing the filtration system entirely.) The hospital and radio stations all ran on small generators. The University could luxuriate in its coal-powered steam heat, but there was no way, save generators or candles and lanterns, to get lights.

No one was exactly certain how much fuel there was in the area. Both jurisdictions had once surveyed, for emergency planning purposes, the fuel storage capacity, and they hoped they could count on having about half of that on hand. Armed guards were assigned to those larger facilities that had not already been raided by the desperate. All private use of cars or tractors was outlawed, and the government threatened to confiscate any moving vehicles.

Electricity was restored, partially, some two weeks after the attack. Workers from the small Bremo Bluff generating plant, about 15 miles away from Charlottesville, succeeded in starting the plant with the coal reserves that were on hand. From then on, limited electricity use was

permitted for a few hours a day. This was particularly pleasant for those families whose water came from electrically powered well pumps. Well water was issued to children for drinking, as it had escaped the Iodine 131 contamination, which was still elevated in the reservoirs.

The radioactivity level continued to drop (after two weeks it was 0.4 rem per hour) and it was “safe” to go outdoors. However, the resulting doses, though too low to cause immediate illness or deaths, posed a long-term health hazard. The authorities, while recognizing that everybody would receive many times the pre-war “safe dose,” tried to reduce the hazards by urging people to stay inside as much as possible when not picking up food rations at the distribution centers. Life for the residents of Charlottesville revolved around those trips and figuring out ways to make do without the normal supplies and services. Some chanced outings to forage for a greater variety of food, but most were resigned to waiting. There wasn’t much else they could do.

Three weeks after the nuclear attack, almost all the Charlottesville and Albemarle County residents had returned to their homes. Those few whose homes had either been occupied by squatters, or been destroyed by fire, easily found some alternate housing with the government’s help.

This left the refugees. Though the drop in fallout intensity allowed the refugees to move out of basements and interior halls, they still were forced to live a version of camp life. They spent their endless, empty hours waiting in lines for food, for a chance to use the bath-rooms — which at least functioned now — for a chance to talk to authorities. Information from the outside was still sketchy, and for the refugees, this uncertainty added to their already high level of anxiety.

The city manager and the emergency government attempted to solve the refugee-housing problem by billeting refugees in private homes. At first they asked for volunteers, but got few, the authorities then announced that any house with fewer than two people per room would be assigned a refugee family. Resistance to this order was strong, and, particularly in the outlying areas where it was hard to check, outright defiance was common. Families would pretend to comply and then simply force the refugees out as soon as the authorities had left. The refugees would struggle back to town, or take up residence in barns or garages.

And still the refugees came to Charlottesville, bringing with them stories of the horrors they had experienced. They camped in schools, in banks, in warehouses. By night the neoclassical architecture of the University was packed with the residents of Arlington and Alexandria. By day, the new downtown mall was awash with a floating mass of men, women, and children, who, with nothing to do, milled around the unopened stores. A retired ambassador was overheard comparing the scene to that of downtown Calcutta.

By now, the emergency government recognized that the need for food was going to be acute. Without power for refrigeration, much food had spoiled; stocks of nonperishable foods were mostly exhausted. As the shortages became clear, the price of food skyrocketed. Many people refused money for food, preferring to barter. Food and fuel were the most valuable commodities, with shoes and coats high on the list as well.

Since shortly after the attack, the city manager had been in contact both with the Federal Government and with the relocated State government in Roanoke.

He had repeatedly asked for emergency rations, only to be met with vague promises and explanations about the problems of transportation. He was generally urged to cut rations further and hang on. Help would arrive when it could.

For some time, the relatively few surviving farm animals had been gradually and mysteriously disappearing. The farmers concluded that “those damned city folks” were stealing them for food, although some of the local residents were also making midnight forays on the livestock. Farmers themselves slaughtered animals they had planned to fatten-up for the future. They couldn’t spare the feed grain, and they needed food now.

Finally the emergency authorities announced that they would take a percentage of every farmer’s livestock to help feed residents and refugees. Farmers were outraged, considering the action simple theft. There were rumors that angry farmers had shot several agents who had tried to confiscate the animals. Though they were offered promissory notes from the city authorities, the farmers thought such payment worthless.

(The radiological experts at the University had been questioned on the advisability of eating the meat of animals with radiation sickness. Many of those beasts which had remained outside during the high fallout period were showing clear signs of illness. The experts decided that the meat would be edible if cooked sufficiently to kill any bacterial invasion— the result of the deterioration of the animal’s digestive tract. Strontium 90 would be concentrated in the bones or the milk, not the muscle tissue.

Although the city government had relatively frequent contact, mostly by radio, with the Federal and State

governments, the citizens had to rely on the occasional Presidential message that was broadcast on WCHV. Three weeks after the attacks, the President made a major address to reassure the people. He announced that the cease-fire was still holding and he saw no reason why that would change. He described the damage that the U.S. Retaliatory strike had done to the Soviet Union. He also noted that the United States still retained enough nuclear weapons, most of them at sea on submarines, to inflict considerable damage on any nation that attempted to take advantage of the recent past. He did not mention that he suspected that the Soviets also held reserve weapons.

Describing the damage that the country had suffered, the President noted that, even with the loss of over 100 million lives, “We still have reserves, both material and spiritual, unlike any nation on earth. ” He asked for patience and for prayers.

There had been broadcasts earlier by the Lieutenant Governor of Virginia —the Governor was killed in Richmond — from his shelter in Roanoke. However, as fallout in the Roanoke area was quite high (Radford just to the west had been struck), he was effectively immobilized for some time. The State government appeared less organized than the Federal.

Charlottesville was still on its own. Residents hunted game as the last of the food stocks disappeared, but the fallout had killed most animals that were in the open. Refugees were reduced to stealing. A number of people managed to fill their gas tanks with contraband gasoline and set out to forage in the mountains to the west.

Three and one-half weeks after the attack, an old propeller-driven cargo plane landed at the Charlottesville Airport with a supply of flour, powdered milk, and vegetable oil.

The pilot assured the few policemen who guarded the airstrip that more would be on the way by truck as soon as temporary bridges could be built over the major rivers.

The emergency airlift was supposed to supply Charlottesville with food for a week or two. However, the officials who had calculated the allotment had overlooked the refugees. Charlottesville's population was some three times the normal. (No one was absolutely sure because the refugees moved around a good deal, from camp to camp.

The first of the deaths from radiation had occurred 10 days after the attacks, and the number grew steadily. By now, it was not uncommon to see mass funerals several times a day. The terminally ill were not cared for by the hospitals — there were too many, and there was nothing that could be done for them anyway — so it was up to their families to do what they could. Fortunately there were still ample supplies of morphine, and it was rumored that college students had donated marijuana. The city set aside several locations on the outskirts of town for mass graves.

In addition to those with terminal radiation sickness, there were those with nonfatal cases and those who showed some symptoms. Often it was impossible for doctors to quickly identify those with flu or psychosomatic radiation symptoms. The number of patients crowding the emergency rooms did not slacken off. The refugees, crowded together, passed a variety of common disorders, from colds to diarrhea, back and forth, several public health experts worried that an outbreak of measles or even polio could come in the late spring. "So far, we have been lucky not to have a major epidemic of typhus or cholera," a doctor observed to his colleagues.

The supply of drugs on hand at the hospitals was dwindling fast. Although penicillin could be manufactured fairly easily in the laboratories at the university, many other drugs were not so simple, even with talent and ingenuity. (The penicillin had to be administered with large veterinary hypodermics, as the homemade mix was too coarse for the small disposable hypes that most doctors stocked. There was a considerable shortage of needles.) Other medications were in such short supply that many patients with chronic illnesses such as heart disease, kidney failure, respiratory problems, hypertension, and diabetes died within a few weeks.

Food riots broke out 4½ weeks after the attacks — precipitated by the first large shipment of grain. Three large tractor-trailers had pulled into the parking lot of the Citizens Commonwealth Building quite unexpectedly, the word of their arrival somehow misplaced between the Agriculture Department dispatchers and the local authorities. The trucks were greeted with cheers until the residents of Charlottesville discovered that they had been shipped raw grain rather than flour. The drivers were taken unawares when empty cans and bottles showered them and one driver jumped in his cab and departed. (The official explanation, delivered some time later, was that processed food was going to those areas where the bulk of the population was sick or injured. It was also assumed that Charlottesville had some livestock reserves.)

With only a fraction of the population knowing what to do with raw grain, a number of angry citizens broke open the sacks and scattered wheat through the parking lot. They in turn were set upon by those who wanted to conserve as much as possible. The local public safety forces waded into the melee with nightsticks and tear gas.

Everyone blamed everyone else for the incident, but the fragile glue that had held public order together began to unstick.

From this time on, it was almost impossible for the local authorities, not to mention the State and Federal governments, to convince everyone they were getting a fair share. People in one section of town would watch suspiciously as delivery trucks passed them by and headed somewhere else. Blacks distrusted whites, the poor distrusted the rich and everyone distrusted the refugees as “outsiders.”

The refugees were convinced that the local authorities were favoring the residents and tried repeatedly to get State intervention, with little success. Still billeted in dormitories, schools, and motels, the refugee camps were a breeding ground for discontent and even rebellion.

The presence of the Federal Government was not entirely confined to the occasional delivery of food or radio broadcast. Some time before, the National Guard and the Reserve Unit were moved to North Carolina, partly to give the impression of military readiness, and perhaps to be assigned to dig out cities and start reconstruction. The Government had put out calls for volunteers to help in the reconstruction, but found that most workers, young and old, wanted to stay with their families. A system of national conscription for young men and women with no children was in the planning stage.

The Federal Government attempted to urge refugees back to where they had come from, first to assist in the rebuilding of the damaged cities which were rich in resources, and ultimately to redistribute the population to a more normal pattern. Some refugees were happy to attempt to return, particularly those whose houses were more or less intact. However, those

who found their homes destroyed preferred to return to the refugee camps inland. There was nothing to hold them to their former lives. Fearful memories of the past made any time spent in the cities painful.

One day, quite without warning, the city manager was informed that one-half of his fuel stores were to be confiscated by the Federal Government, for the military and for the re- construction effort. (Earth-moving equipment was gathering on the outskirts of the devastated cities and needed fuel.) After it was clear that there was no way to stop the Government from taking the fuel, the city manager suggested that unmarked tank trucks, well-guarded, pick up the stocks at night. He was aware of the effect this action would have on the morale of the population.

Already transportation was difficult for the elderly and those who lived in the rural areas. A sporadic bus service ran from one end of town to the other once a day and an occasional school bus made a sortie out into the suburbs. Bicycles were prized, and sometimes fought over. Those gentlemen farmers whose thoroughbred horses had been protected from fallout could use these animals for transportation, but it was risky to let the animals stand unprotected. Horse thievery had made an anachronistic reappearance.

With even less fuel, the bus service would be cut in half.

By now, barter was clearly established as the preferred means of trade. For a time, the government had paid for commandeered foodstuff and resources with checks and promissory notes, but no one wanted them any more. The local banks had opened for a few days, only to find all their savers lined up to withdraw everything. They closed down. Stores either never opened, or shut down quickly when

they were overrun. (Many stores had been looted in the second week after the attack, when the fallout intensity had dropped.) A few people hoarded money, but most thought money worthless.

Workers in the small industries in the Charlottesville area saw no point in turning up for work if all they could get was paper money. They preferred to spend the time hunting for food and fuel. If barter was a highly inefficient way to do business — it's hard to make change for a side of beef—still, it was preferable to using worthless currency.

Psychologically, the population seemed to be in a quiet holding pattern. The refugees, many of them, had survived experiences that would mark them for years. The memories of fire, collapsing buildings, and screaming, trapped people were still vivid, and some would tremble at loud noises. However, the profound grief over what they had lost—family members, possessions, or friends — underlay emotions and made many apathetic and passive victims of the nuclear attacks, they appeared willing to be victims afterwards too. Still shunned as outsiders by the resident population, most refugees appeared to accept the exclusion just as the surviving population of Hiroshima and Nagasaki had 30 odd years before.

The effect on the Charlottesville and Albemarle residents was less pronounced. They were disoriented. For each lucky one who had a specific job to do, there were many more who were in effect unemployed. They turned inward to their families or else friends and relatives. Their worries about the future—would there be another attack, would they go back to their old jobs, etc.? — Made most days rather anxious, unproductive ones. Children particularly reflected a continuous nervousness, picked up from their elders, and had difficulty sleeping at night. Though many parents

hoped for a return to normalcy once the school re-opened, others quietly decided not to send their children for fear of a second outbreak of war.

Spring changed a lot of things. A new optimism surfaced as everyone looked forward to planting, to good weather and warmth. The residents of Charlottesville had survived the first hurdle; they felt confident they could survive the next.

At the University, agronomists studied the best crops to plant in the Charlottesville area. No one was certain what effect the nuclear explosions had had on the ozone layer. If indeed the ozone was severely damaged, more ultra-violet rays could reach the crops and perhaps burn them. This effect would be more pronounced on delicate crops such as peas and beans. Instead it was suggested that potatoes and soybeans be encouraged and whatever limited fertilizer became available go to farmers who followed the government guidelines.

The emergency government announced that two-thirds of the former pasture land was to be cultivated. Feed grains were to be used for humans, not livestock. Dairy cattle and chickens were the only exceptions.

The next few months in Charlottesville and Albemarle County had a slow, almost dream-like quality. Fears of new attacks had abated. It was a time of settling into a new lifestyle, a severely simplified way of being, of making do. Children ate meat, cheese, or eggs rarely, adults practically never. A good pair of shoes was guarded — and worn only on special occasions. (With warmer weather, most children and adults went barefoot, bringing concern to doctors that there would be an increase in parasitic diseases such as hookworm.)

Many people were unable to return to their former jobs. In some cases, their employers never reopened for business, their goods and services being irrelevant in the post attack society. College teachers, for example, had no students to teach; computer programmers had no computers to program.

For some, it was relatively easy to adapt. Electronics experts set up CB and short wave radio repair shops. Cottage industries — sandal and clothing manufacturing from recycled materials, soap and candle making — sprang up in many homes. Some workers were able to acquire new, relevant skills quickly.

Others had to make do with menial jobs—burying the dead, cleaning the streets, assisting carpenters and bricklayers— that took little skill.

And then there were those who could not fit in anywhere. Many found it difficult to adapt to the idleness. Disruption of the 9 to 5 work ethic was a disruption of basic psychological props, of a sense of identity. In the immediate period after the attacks, parents concentrated on protection of their families. Once their families were no longer directly affected, adults were robbed of their traditional roles.

By now, a few of the refugees had melted into the general population. But the vast majority was no further along than in the late winter. The drag on the area resources was significant, and many in the leadership wanted to force them out.

Charlottesville was fortunate in many respects, however. Being located on two easily repairable rail lines — with a major storage yard for cars only two counties away—there was some access to the outside world. Travel was only

permitted with a special pass, naturally, and so the younger members of the community resorted to the hallowed art of riding the rods.

Government officials, many of whom had visited Charlottesville and the University frequently in the past, kept in closer contact with the city than with many other locales. Doubtless the area residents benefited with more Federal assistance, As a result, Charlottesville became the unofficial “capital” of the area, economically and politically.

But as autumn approached, a universal depression settled on the residents and refugees. Starvation had been held at bay by the planting — but crop yields were smaller than expected. No one was cold, but the weather was still fine. There seemed to be no appreciable progress towards pre-attack conditions. Those young men and women who had been conscripted to build housing for the Nation’s refugees returned with gloomy reports of the devastation to the Nation’s commerce. The east coast was effectively leveled. Where factories were rebuildable, the shortage of materials precluded their operation.

Recognizing that many families would have to make do without heating oil or gas, the Agriculture Extension Service issued pamphlets on how to make your own wood-burning stove. Fortunately for Charlottesville and the surrounding area, trees were plentiful. However, the momentum that had started with the spring planting slowed,

Winter was harder than anyone had expected. There were few additional deaths that could be directly attributed to the nuclear blast effects or the radiation; however, a large percentage of the surviving population was weakened. Lack of medicines, lack of adequate food

and reasonable shelter, plus the lingering physical and psychological effects, meant that many were unable to work effectively, even if there were work available. An epidemic of flu raged through the cities of the east where refugees were huddled in camps. Many died, especially children and old people. Although vaccine for this particular common strain of flu had been developed, the stocks had been destroyed in the attacks.

In the northern sections of the country, food supplies were inadequate and poorly distributed. The average diet — day in, day out — consisted of unleavened bread and potatoes, where there were enough of those. As animal herds, both domestic and wild, had been decimated by fallout and indiscriminate hunting, the only available meat came from dogs, cats, and rats — those animals whose living habits protected them from fallout. Dietary deficiency diseases appeared.

Growing children were the first to notice the lack of replacement clothes— particularly leather shoes. Coats and blankets were highly prized in the cold climates.

Next to food, the most severe shortage was housing. Even with the temporary barracks that had been erected in a cluster around the damaged cities, refugees were crowded two or three to a room. Kitchens were shared by four and five families; bathrooms by as many as 12 people.

Although there was relatively little work to occupy time, and schooling was strictly curtailed, if indeed it existed, there was also very little available recreation. The entertainment industry located in California and New York had been particularly hard hit. Local TV stations could broadcast and rebroadcast those old films and cartoons they had in stock, but

little was fed nationwide, in the small towns, public libraries were overwhelmed. In the large cities, the libraries had been destroyed. There were no movie houses to speak of; there were no professional sports. The lack of recreation, perhaps a minor problem, still served to underscore the bleakness of the winter.

In Charlottesville alone, several thousand people died in the first winter after the nuclear attack.

A year almost to the day after the nuclear war between the United States and the Soviet Union, Charlottesville was host to a blue ribbon panel of experts on reconstruction planning. The University had not returned to normal — there were no undergraduate classes as the students had been conscripted for reconstruction work in the cities — but it was a natural meeting place since so many centers of learning had been destroyed.

The questions before the group centered on setting priorities: what were the goals and how could the country reach them?

The U.S. Government still existed, if in a slightly reordered form. The President, now permanently located in the Midwest along with the surviving Members of Congress and the Cabinet, retained the emergency powers he had taken just after the attacks. (Congress had had no choice but to ratify his assumption of these extraordinary powers at the time. However, there was growing resentment that he showed few signs of relinquishing them. Congress was reduced to a kind of advisory body, its members spending most of their time on helping constituents relocate or obtain an ID.)

The State governments had, by and large, reestablished themselves, often in new locations. Virginia's government was

located in Roanoke, for example, under the Lieutenant Governor. State governments were not as well respected as before; citizens tended to blame them for the mix-ups in aid distribution. Only the refugees looked to the States for assistance against the local governments, which they distrusted. The residents of an area such as Charlottesville were most loyal to their local government, particularly when that government had a reputation of basic evenhandedness.

Everyone, however, was growing hostile to the imposition of strict governmental controls over their lives — what they could or could not buy, or eat, where they could travel, etc. In certain rural sections, such as Nelson County, south of Charlottesville, farmers had barricaded themselves off, ignored government orders, and occasionally, it was rumored, took potshots at the government agents.

Attempts to conscript the able-bodied to rebuild the damaged areas often failed miserably. Many simply walked off the job and returned to their families. Since there were no adequate records remaining of the prewar population, and no records at all of war deaths, the Government found it an impossible task to track down offenders. (Criminals in medium- and light-security detention facilities had simply evaporated into the population.)

Charlottesville, like the rest of the undamaged parts of the country, still had a huge refugee population that was unwilling or unable to return to former homes. The majority was in camps such as the large facility in the old Lane School, and children were in day care or orphanages, depending on the status of their surviving families. If anything, the refugees were both more apathetic and more rebellious when faced with simple assignments. Lawless bands of teenaged refugees roamed the countryside, hijacking

supply trucks and raiding farms and villages. Partly it was simple bravado, partly a way to feed them. Most refugees simply sat and waited for the next meal.

Yet even now, the flow of refugees continued. The winter had driven out those who could not find enough to eat or enough shelter. Stories of Vermont families subsisting on maple syrup and wild rabbits might have proven entertaining in the retelling, but those who had survived did not want to repeat the performance.

The medical problems were still acute. Drug supplies were almost exhausted, but the weakened population remained more susceptible to disease. The birth rate had fallen drastically 9 months after the attacks, partly because of the radiation, which produced temporary sterilization — but there had also been a rise in miscarriages, stillbirths, and abnormalities. Infant mortality soared. Experts worried that an unprecedented increase in cancer, particularly in children, could be expected in several years. And there was still the possibility of some devastating epidemic as cholera running unchecked through the population. The Blue Ridge Sanatorium in Charlottesville, which had seen few tuberculosis patients in the last years before the attacks, was making plans to convert back to specializing in the disease. TB was making a comeback.

The Nation's economy was in shambles. The bulk of the oil refining capacity had been knocked out, and only a few facilities were functioning again. The small oil wells around the country that were situated away from target areas produced more oil than the refineries could handle— and it was only a fraction of the need. Coal mining, mostly by the time-honored pick and shovel method as strip mining took heavy equipment, was the only industry that could be called booming. (There was a major migration to the mining areas by the

unemployed.) Agriculture, of course, was a major undertaking for much of the population. However, yields from the farms were considerably below what had been hoped for. The lack of pesticides and fertilizer cut heavily into the crops and there was concern about a major insect invasion next summer. Food processing — wheat and corn milling particularly— showed encouraging signs of recovery.

Most major industries, however, were in disarray as a result of lack of energy, lack of raw materials, and lack of managerial expertise. The world economy was staggering from the effect of losing both the United States and the Soviet Union as suppliers and markets. (If the Latin Americans were able to make small fortunes on selling the U.S. refined petroleum, political pressures were building in those countries to raise the prices to double the current rates.)

An efficient system of money still had not been reestablished. The Federal Government paid the military and other Federal employees with dollars and tried to preserve purchasing power through a series of price controls. However, most people were reluctant to accept dollars in exchange for essentials such as food or clothing. As a result, a barter system continued to flourish and the black market, with its highly inflated prices, continued to encourage defiance of the law.

Most experts believed that the experience of post-World War II in Europe and Japan could provide the model for currency reform, including replacement of the dollar, that was necessary to restore an economy based on the division of labor. However, the resolution of two policy issues stood in the way. First, should the market, on one hand, or Government control, on the other, determine the distribution of scarce resources? Second, should the new money go to those with legitimate claims,

pensions, promissory notes for goods confiscated during the post attack period etc., or to those who held productive jobs, or even to the entire population even if many were more drag than help to the recovery? Politically, the Government was unable to deny any one of the groups; practically, it was obvious the Government could not satisfy all three.

It was clear that if the economy did not get moving again soon, it might never. Already there were indications that manufacturing was not reestablishing itself with anywhere near the speed the planners had hoped. The amount of shipping, by rail and by truck, was actually down from the mid-summer high.

“We are in the classic race,” remarked one of the participants who had written a major study of post attack recovery some years before. “We have to be able to produce new goods and materials before we exhaust our stored supplies. We can continue to eat the wheat that is in the grain elevators of the Midwest for another year, perhaps. But after that, we have to have the capacity to grow new wheat. When our winter coats wear through, we have to have the capacity to weave the cloth for new ones. When our railroad cars break down, we have to be able to make new ones, or replacement parts. Right now we are a long way from that capacity.” Privately, he and a group of conferees agreed that heavy controls on the economy, and ultimately on the population, would be the only way to get things going. Resources, both material and human, were severely limited,

One of the major problems, it was obvious to everyone, was the drag the huge refugee population had on the recovery effort. While numbers of workers were actively engaged in the rebuilding of the cities as well as the factories and services that powered the economy, there were as many

more who were unemployed and unemployable for the time being. Their skills were not suited to the priority tasks. Several participants had prepared a statement on what should be done with these nonproductive members of society. “We cannot let this mass of people drain our resources while they do nothing to contribute,” it was rumored to say. “If we cannot let them starve outright, we suggest that they be issued only that amount of food which is minimally necessary to sustain life. They should be moved to camps away from the center of activity for reason of public morale.” The report was suppressed but several copies were leaked to the press anyway.

The most basic disagreement among the participants in the conference was over the level of reconstruction that might actually be feasible. Optimists cited the phenomenal recovery of Japan and West Germany after World War II and insisted that these be the models for the United States in the next 5 to 10 years.

Pessimists, noting the major differences between the post-World War II era and the situation of Japan and Germany, felt these examples were irrelevant, or worse, misleading. “Everyone forgets the amount of aid that came in from outside in the late ‘40’s and early ‘50’s. We don’t have the United States’ wealth to turn to. Such a goal is unrealistic and unreachable, even with absolute controls on the economy.”

The pessimists were divided. Some saw the nation building itself along the line of some of the Asian nations, which boasted a small technologically advanced segment in the midst of a large agrarian or unskilled worker population, on the model of India or Indonesia. Some thought technology itself would eventually disappear from American society. “If you don’t have computers to run, you don’t train computer programmers,” one expert was

overheard to say. “After a while, in a few generations, no one remembers how the machines worked at all. They remember the important things: how to plant crops, how to train draft horses and oxen, how to make a simple pump. We will have survived biologically, but our way of life is going to be unrecognizable. In several generations, the United States is going to resemble a late medieval society.”

Because the conferees could not agree on what was a reasonable goal, much less how to get there, the conference report straddled all fences and concluded nothing. Follow-up task forces were appointed and the conferees agreed to meet again in the summer. Perhaps by then they would have a better idea of whether or not they were winning the race.

FRAGMENTATION & COUNTERCULTURE IN THE 1960'S

"The past isn't what it used to be"—Yogi Berra
"If you remember the 60s, then you weren't there?"—common joke

Prelude to the 60s. While the 1960s are remembered as one of the most turbulent, creative, and controversial decades in our history, all that disruptive energy had roots going back through the 1950s to World War II. In a broad sense, the 1950s provided Americans new technologies and unprecedented prosperity. At the same time these seemed to impose an almost military conformity on men at work and housewives left behind in the cookie-cutter style suburbs that were springing up outside of the cities. Together, these triggered some unforeseen side effects. For one thing, the new electronic medium, television, provided viewers with increasingly graphic coverage of the news, making it harder to hide or sugarcoat what was really going on in the world. At the same time, a small, but visible, group of people, generically labeled beatniks, was starting to challenge the old values at the very core of American culture and society. By the 1960s there was growing dissatisfaction in the mainstream culture with traditional values that seemed to many to be increasingly repressive. These factors, along with World War II, would help trigger two major movements in the 1960s: The Civil Rights movement and the youth counter-culture.

The Civil Rights movement. In 1943, towards the end of the Second World War, another new technology made its debut on a plantation near Clarksdale, Mississippi: the mechanical cotton picker. Its inventors meant to ease farm workers from the backbreaking labor of picking cotton by hand. Instead, it put thousands of African-Americans in the South out of work. This triggered the next, and biggest, wave of the Great Migration to cities in the North. However, the influx of so many poor people just led to more crowded cities with fewer jobs. At the same time, thousands of African Americans who had served their country during World War II were returning home, feeling entitled to more rights than the various forms of racism had allowed them up to that point. Out of these frustrations and rising expectations arose the Civil Rights movement.

The central figure in the Civil Rights movement was a young preacher from Atlanta, Martin Luther King Jr. King had studied the nonviolent tactics used by Gandhi to win India's independence from Britain in 1947. He saw that the new medium of television would make such tactics even more effective since they would expose many more people across the country and world to the brutality of racism in the South, thus winning wide public support for his movement and putting pressure on the federal government to intervene. This had become apparent in the 1950s with the heavy media coverage of the Montgomery Bus Boycott and the murder of Emmett Till. The key to King's strategy was to keep his marches peaceful in the face of brutal police reprisals, all of which played out dramatically on TV screens across America. The images of peaceful demonstrators being beaten and attacked with high-pressure hoses and police dogs graphically imbedded the plight of African Americans into millions of viewers' consciousness and generated the sort of public sympathy and federal support that King needed. Bit by bit, federal backing, peaking with the Civil Rights Act in 1964, officially desegregated schools, restaurants, and other public facilities across the country.

However, King's opponents in the South caught on to his tactics and worked to thwart them in various ways. For one thing, they learned to exercise more restraint in dealing with demonstrations, thus making them less interesting to watch on TV and therefore reducing media coverage. Another tactic was to open private facilities, such as schools and swimming pools, where only White children could go, thus leaving the public schools and pools inadequately funded by White-controlled state and local governments. Therefore, the struggle was just beginning.

Vietnam and the invasion of the Baby Boomers. World War II had two other effects. One was the Cold War, which thrust the United States into the role of a global superpower determined to stop communism wherever it appeared. In the 1960s Vietnam was the primary battlefield of that struggle. However, this was a guerrilla war with no set battle lines or clear markers to indicate victory. As it dragged on, the media turned the American public increasingly against involvement there.

The end of World War II also saw the couples that had to delay having children during the war joined by those who were coming of age to start families. The result was a massive “baby boom” after 1945. The baby boomers, besides being numerous, were also the best-educated and most affluent generation in history. By the 1960s, many of them were becoming teenagers who, besides being idealistic, were also impatient for change. No issue galvanized them more than the Vietnam War. Every night on the evening news they saw graphic news reports of this war, which took the lives of friends and family and threatened many of them with the draft. Bit by bit, student radicalism grew as the media exposed more unpleasant facts about the war. In the late 1960s, growing frustration and anger with the seemingly slow progress of change would erupt into some of the most turbulent years in American history.

Coming apart (1965-70). For several years, the United States, seemed to be a society at war with itself, caught up in a vicious cycle of challenges to traditional middle class values that triggered backlashes along generational and class lines, causing more challenges, and so on. This conflict played out in both the Civil rights Movement and in protests against the Vietnam War.

In the Civil Rights Movement, the unprecedented gains made by African Americans by 1965 raised hopes of even more spectacular gains. However, racism, in both the North and South, began to take on less blatant forms that were harder to combat. For example, homeowners in white neighborhoods faced heavy pressure from neighbors not to sell their houses to African Americans on the pretext that property values would fall. Similarly, real estate agencies practiced “redlining” where they would only show African American families houses in African American neighborhoods, making it hard to prove discrimination.

Public school funding was (and is) another major issue, being mainly dependant on local property taxes, so that children from rich White neighborhoods attended the best schools while African American children had to attend poorly funded schools. When the courts ordered integration of schools by busing Black and White students to each others’ neighborhood schools, parents strongly protested.

Martin Luther King especially encountered these problems when he moved the Civil Rights Movement to the North, which on the surface was much less blatantly racist. However, when northern Whites faced integration as real issues in their own neighborhoods and schools rather than just as abstract Southern issues viewed on TV, they often proved as intransigent as Whites in the South.

As the movement got bigger, it became harder for King to control it, especially keeping it non-violent. Starting in 1965, Black frustration spilled over into violent rioting in various American cities. Americans watched as the evening news showed riots burning down large sections of Los Angeles (Watts) in 1965, Chicago in 1966, and Detroit and Newark, New Jersey in 1967. As a result, the Civil Rights movement lost support among many Whites who had previously sympathized with its peaceful tactics. By the same token, the rioters had mainly burned down large parts of their own neighborhoods and driven businesses and jobs away, making economic progress even harder. Therefore, the movement’s momentum was already starting to dissipate when King was assassinated on April 4, 1968. While it is anyone’s guess what the great civil rights leader could have accomplished if he had lived, it seems likely that things would have worked out better.

King’s death led to disillusionment among many Blacks, a feeling that was reinforced two months later with the assassination of Bobby Kennedy, a presidential candidate who held out hope for better times to the nation’s poor. No leader of King’s caliber stepped up to carry the civil rights banner, and the movement further lost steam as it fractured into different sub-groups that stood for various goals and tactics, both violent and non-violent.

Meanwhile, America’s youth were also getting caught up in the vicious cycle of rebellion and backlash, with Vietnam being the main catalyst for trouble. The anti-war movement grew steadily on college campuses in 1967 and 1968, with student protests and riots sharing the headlines with racial strife. While the Vietnam War was the main driving issue, a whole range of other social and cultural issues were caught up in the turmoil of the times. For example, the Women’s Liberation movement, which would blossom in the 1970s, had its

beginnings here. Many of these issues largely centered around replacing the older generation's Puritan values of hard work and self-denial with a preoccupation with individual experiences. Many young people, growing up in the midst of affluence, thought life, including its more sensual pleasures, should be enjoyed more. Some adopted a totally hedonistic lifestyle of experimenting with free love and drugs.

Out of this emerged the so-called Counter-culture, a primarily white middle class phenomenon, but one, which did attract a number of African Americans as well. Three things largely characterized the Counter-culture. One was experimentation with drugs, especially the hallucinogenic LSD, in attempts to expand one's experiences and awareness of the universe. Another feature, largely made possible by the birth control pill, was a much freer attitude toward sex, not just within marriage, but also before it and outside of it. The last feature was very experimental rock music that went far beyond the limits of what top 40 radio would play.

Towards the 70s. While relatively few people engaged in the more extreme cases of experimenting with sex and drugs, the Counter-culture did enter the mainstream culture in more diluted forms and with lasting effects on attitudes toward these issues that continue today. Some of these new attitudes involved things as basic as the food we eat and clothes we wear. The traditional American meat and potatoes diet became less dominant fare at people's dinner tables as awareness of the dangers of various chemicals in our food and the advantages of a more vegetarian and less fat laden diet entered the mainstream consciousness. Women no longer mindlessly accepted the dictates of fashion designers who decreed what new styles to switch to each year. While styles continue to change, they seem to do so over longer cycles of time so that women don't feel pressured to buy a whole new wardrobe every spring and fall.

Starting in the late 1960s and continuing into the following decades, attitudes toward sexual preferences and gender roles would experience especially radical changes. The big story of the 70s would be the Women's Liberation movement as women questioned their traditionally subordinate roles at home and at work. Whole new careers were

opened to women who also fought for equal pay for equal work. At the same time, gay rights groups worked for acceptance in mainstream society. Both of these movements continue working for equality and acceptance.

Closely related to these issues were changing standards of sexual behavior and attitudes toward marriage. The birth control pill, which freed women from the fear of unwanted pregnancies,, enabled men and women in mainstream society to engage in pre-marital and extra-marital sex. The latter, combined with the greater career opportunities for women, helped trigger rising divorce rates, with a corresponding rise in one-parent families. Within marriage, the Women's Liberation movement made housekeeping and child raising duties a major issue. On the one hand, wives and mothers were working full-time and expecting help at home from their husbands. On the other hand, most men were still stuck in the older more traditional patterns of behavior in which they had been raised and taught to be the correct way to live.

Finally, in April 1970, a new issue made its official debut with the first observance of Earth Day. The 1970s would see growing amounts of public concern and legislation to curb air and water pollution. To this day, these issues and concerns, especially global warming, loom ever larger in our consciousness.

The Beatles

For many Baby-boomers, the 1960s started in 1963 with the Beatles. Not only did they provide the soundtrack for a generation, that soundtrack became the main attraction.

However, in the early 60s, rock and roll had hit a low point. The fresh energy of Elvis, Chuck Berry, and Buddy Holly had faded away, succeeded by a much blander music. The idea that rock and roll would never die sounded a bit hollow at the time.

John Lennon, Paul McCartney, and George Harrison had been playing together at church socials, local dances, and birthday parties since 1957, originally as the Quarrymen when Harrison was 14, Lennon was 16, and McCartney was 15. However, with 400 other competing bands in Liverpool at that time, one thing that distinguished this group was they played their own songs. At first that wasn't even enough as they struggled through years of "paying their dues", even in Hamburg, Germany for a time.

Then, in 1961, Brian Epstein became their manager and polished up their image. For one thing, he dressed them in the fashionable Mod style with skinny black ties and even skinnier pants, something that seemed quite alien to four working class lads from Liverpool. Still, they were rejected by various record companies until they met record producer, George Martin. If Epstein cleaned up their image, Martin cleaned up and refined their sound to make it more marketable. On Martin's advice, they also dumped their drummer Pete Best, replacing him with Richard Starkey (AKA Ringo Starr).

On October 5, 1962 the Beatles released their first single, "Love Me Do," which rose to a respectable number 17 on the charts. Their next single, "Please Please Me," hit number one in Britain on March 2, 1963 and the Fab Four took off like a rocket.

Much of their success was due to timing. British papers at the time were full of stories about political scandal, so a group of (apparently) clean-cut young men with happy bouncy music was just what the nation was looking for. And the Beatles delivered with a virtual non-stop barrage of hits, including "I Want to Hold your Hand," the biggest selling single in British pop history.

Beatlemania. While Elvis had also inspired hordes of screaming teenage girls in the 1950s, when the seats and floor were found soaked with urine after a Beatles concert in Cambridge in November 1963, serious questions started being asked...and some strange answers were forthcoming.

- Some people thought that this mass loss of bladder control was because girls didn't have the same outlets for their pent up energies as boys did with football and rugby.
- One doctor thought this was an important preparation for standing the pains of pregnancy when the girls got older.
- The Daily Telegraph just saw disturbing similarities with Hitler's Nuremburg rallies.

Beatle mania even captured the imaginations of staid music critics, such as William Mann for the Times: *"But harmonic interest is typical of their quicker songs too,...so firmly are the major tonic sevenths and ninths built into their tunes, and the flat sub-mediante key switches, so natural is the Aeolian cadence at the end of 'Not a Second Time.'"*

In 1964 the Beatles hit America. Music executives were skeptical about the British being able to show America something about rock and roll. They were rapidly convinced when hordes of American teenage girls mobbed the Fab Four wherever they went and an all time high 78 million people tuned in to watch them on the Ed Sullivan Show. By April they had the top five selling records on the American charts with seven more in the top 100, either on their way to the top or gradually fading from that pinnacle.

Merchandising of Beatles paraphernalia (dolls, wigs, trading cards, haircuts, lunch boxes, action figures, puppets, etc.) just added to the growing hysteria that became known as Beatle mania.

As a band, the Beatles dominated pop music for seven years, an amazingly long time by modern music standards. Much of the key to their success was they didn't let themselves go stale by writing and playing the same songs over and over. And much of that was due to their decision to stop touring and playing live to crowds that screamed so loud that they could barely hear themselves play. (You Tube has several videos from their performance at Shea Stadium in New York if all you want to see and hear is screaming teenage girls with a faint backdrop of music.) As George Harrison put it after their last concert: "I don't have to pretend being a Beatle anymore."

The Beatles' discography in essence chronicles a band and a whole generation growing up in the 1960s. Their early songs were simple, happy, and innocent, perfectly suited for a young adolescent audience. (College students at this time typically dismissed them as kids' stuff.) By 1966, their music was a bit more sophisticated and their behavior more rowdy. The original cover for their album "Yesterday and Today" (sometimes called the Butcher Block cover) had a picture of them in butchers' coats holding chopped up baby dolls and raw meat, supposedly as a protest of the Vietnam War. It was withdrawn from sale after one day and all copies were either destroyed or pasted over with a much tamer cover. Around the same time, John Lennon outraged much of the public by saying the Beatles were more popular than Jesus.

The Beatles' retirement from the exhausting tedium touring in 1966 freed them to experiment with their music in ways never before tried, especially in the studio. The result, released in 1967, was "Sgt. Pepper's Lonely Hearts Club Band", widely considered the greatest rock album of all time. Combining the most sophisticated studio recording techniques of the time with elements of jazz, rock, classical, dance hall, and Indian music, it marked rock music's coming of age.

The next two years saw the Beatles gradually coming apart as a group as its individual members grew apart as individuals. Recording sessions for their 1968 release, "The Beatles" (AKA White Album) became increasingly fractious, as Ringo briefly quit the group and at times John and Paul were recording separately in different studios. The next album to be recorded, "Let it Be", was equally acrimonious, with George Harrison briefly walking out this time. It was also the subject of a documentary by the same name, which chronicled the Beatles' breakup as much as their music.

The final Beatles' album recorded was "Abbey Road". Although still largely reflecting four different personalities at work, it did show the Beatles going out on a high note, especially with a brilliant suite of songs on side two that were a collection of short and/or unfinished Beatles songs not previously recorded. Although "Abbey Road" was the last album recorded by the Beatles, "Let it Be" was the last one released (May, 1970). Shortly afterwards, Paul announced he was leaving the group, which is generally seen as the final breakup of the Fab Four.

The British Invasions

However, the Beatles weren't the only British band to take America by storm. Liverpool in the early 1960s had up to 400 bands competing with them for gigs. So, when the Beatles hit it big, they brought in their wake a virtual tidal wave of other British bands that adapted their sound and look to that of the Fab Four: The Dave Clark Five, Peter and Gordon, Gerry and the Pacemakers, Freddy and the Dreamers, and Herman's Hermits. Most were short-lived, although there were serious discussions in 1964 about who would emerge as the most popular band, the Beatles or Dave Clark Five.

Nor were all the British invasion bands mere flashes in the pan. A number survived and evolved into some of rock music's most legendary groups: the Rolling Stones, The Who, the Kinks, the Animals, Fleetwood Mac, and the Yardbirds, the last of which would help give rise to other legends such as Eric Clapton (who became part of Cream, Blind Faith, and Derek and the Dominoes before going solo) and Jimmy Page who would go on to form Led Zeppelin. Many of these bands had strong blues roots, since Britain's history without slavery made African Americans and their music more acceptable, especially to younger musicians.

The Times They Are a-Changin': Bob Dylan

For those trying to find the true meaning of the 1960s, Bob Dylan's music is both the first and the last place to go: the first because his music, nearly as much as that of the Beatles, epitomizes the spirit of the decade; the last because his lyrics are not so topical as universal. Therefore, one can read nearly anything he or she wants into them. For example, many interpreted the song "A Hard Rains A-Gonna Fall" as being about nuclear fallout. According to Dylan, it wasn't about that or anything else in particular.

Or so Dylan said. Imagine how difficult it is interpreting Dylan's lyrics when it used to be hard even getting a straight story from him about something as simple as where he was from. While we know and he now says that he's from Hibbing, Minnesota, he used to tell people he grew up all over from New Mexico to the Dakotas, even joining the carnival at age 14. Early in his career, he did side work on various albums under such pseudonyms as Blind Boy Grunt, Bob Landy, and Tedham Porterhouse. Dylan wasn't even his given name. It was Zimmerman, which he changed after going to New York. Learning anything more substantive about Dylan and his music gets progressively harder, mainly because he was a somewhat reluctant standard bearer for the causes of the 60s and was frustrated by how the public projected its own ideas into his lyrics.

Robert Zimmerman was born in 1941 in Duluth, Minnesota and grew up mainly in the small town of Hibbing from age six after his father was stricken with polio. There seems to have been nothing that remarkable about him as he grew

up, although he got interested in a variety of musical styles (blues, folk, country and western, gospel, rock 'n roll) from listening to late night radio broadcasts when far off stations could reach Minnesota.

After a brief stint at the University of Minnesota, he settled on folk music, which was quite popular at the time, seeing it as more serious than rock 'n roll. He was especially influenced by the music of Woody Guthrie and in 1961 moved to New York City, hoping to sing there and also visit Guthrie, who was in a hospital suffering from Huntington's disease.

In September 1961, music critic Robert Shelton wrote a positive review of a Dylan performance, which got him enough notice to land a recording contract with Columbia Records. His first record, which was mostly covers of other songs along with a couple original compositions, didn't do very well, and Columbia thought of dropping him from the label.

In 1962 he legally changed his last name to Dylan for as many reasons as there are people to speculate on it. He also signed on an aggressive and protective manager, Albert Grossman, who oversaw his career until 1970. After a tour of Britain, he released his second album, *The Freewheelin' Bob Dylan*, in May 1963. This was when he especially started earning a reputation as a protest singer, with such songs as "Oxford Town" (about James Meredith's attempt to become the first African American student at the University of Mississippi), "Talkin' World War III Blues", "Masters of War", and "A Hard Rain's A-Gonna Fall," which came out right before the Cuban Missile Crisis, but with predictable results as to how people would interpret it.

Dylan's third album, *The Times They Are a-Changin'*, released in 1963, was even more political than *Freewheelin'*, with two songs in particular about the Civil Rights Movement: "Only A Pawn In Their Game" and the

"Lonesome Death of Hattie Carroll" about the murders of Medgar Evers and a black hotel barmaid respectively. He also played for the civil rights March on Washington on August 28, 1963, further evidence of his prominence in the movement.

Besides his unique voice and style of singing, what made Dylan so dynamic was how he was transforming folk lyrics from being mostly straightforward ballads or protests into a much more literary and obscure art form that remained open to various interpretations. This inspired a multitude of rock bands in the mid-60s to do covers of his songs: most notably the Byrds, but also Sonny and Cher, the Turtles, the Hollies, Manfred Mann, and the Association.

Also among his fans were the Beatles, who were impressed and influenced by his attitude as well as the themes and lyrics of his songs. By the same token, when the Beatles hit America in 1964, they would have a profound effect on the direction his music would soon take.

Dylan never liked to be stereotyped and included songs on his albums tinged with romance, and tongue-in-cheek humor. During the *Freewheelin'* sessions, he even recorded a rockabilly song with a backup band. Although released as a single, it was quickly withdrawn out of concern for how folk purists would react to it. For those paying attention, the storm was already looming on the horizon.

Hard Rain at Newport. In July 1965 Dylan went electric, releasing the single, "Like a Rolling Stone". Clocking in at over six minutes, it transformed pop music with both its length and serious, if obscure, lyrics. In 2004 *Rolling Stone Magazine* listed it as number one in its list of the 500 greatest songs of all time. He didn't get quite so friendly a reception at the Newport Folk Festival when he debuted an electric band and material to the folk purists. Similarly, on tours in Britain and Australia, he met with the same hostility from large sections of the crowds, while

younger fans embraced his new style, dubbed by some as folk-rock.

Dylan persevered with his new direction, releasing three primarily electric albums in 1965 and 1966: *Bringing it all Back Home*, *Highway 61 Revisited*, and *Blonde on Blonde*, the last a double album. Then, in July 1966 he crashed his motorcycle near his home in Woodstock, New York. How bad a wreck it was is a matter of question. Dylan said he broke four vertebrae in his neck, but no ambulance was called and he didn't go to a hospital. However bad it may have been, it gave him a chance to retreat from the musical controversy and rat race of an intense work schedule. He wouldn't tour for another eight years.

In the meantime, he stayed busy with various projects. In 1967, he changed styles again, recording *John Wesley Harding* in Nashville, a much quieter album that ran against the grain of the louder psychedelic sound then emerging. Returning again to Nashville, he recorded and released *Nashville Skyline* in 1969 (pictured below), which was essentially a straight country album, probably best remembered for the song "Lay Lady Lay."

As the 1960s segued into the 1970s, the rest of the rock world starting catching up to Dylan. The Byrds, the band probably most directly influenced by Dylan, released *Sweetheart of the Rodeo*, a straight country album for which they were practically booed off the stage when they premiered its material in Chicago. Other bands, such as the Flying Burrito Brothers and the Grateful Dead followed suit, so that in the early 1970s country rock had become mainstream, much like Dylan had help popularize folk and folk rock in the early and mid 60s.

Since the mid 70s, Dylan has toured practically non-stop and continued releasing albums. Recently, two of his albums, *Modern Times* (2006) and *Together Through Life* (2009), rose to the top of the American charts.

Mod: A fashion revolution for a new generation

Along with Vidal Sassoon, Mary Quant (above) also influenced hairstyles with the geometric cut in 1963, a low maintenance variation of the bob cut from the 1920s.

The music scene started by the Beatles had its fashion counterpart, making London the fashion capital of the world in the 1960s, mainly because of a young art student named Mary Quant.

During the 1930s and 40s British fashion went into a long hibernation, first because of the Depression, then wartime rationing, and then postwar rationing. During the War, in addition to requisitioning fabrics and dyes for the army, leaving only grey woollens for the public, the government dictated the length of skirts and the number of pleats they had. Even when Christian Dior revived the fashion world with the New

Look in 1947, his styles were too elegant and expensive for most British.

By the 1960s more money was coming into circulation and a new generation was growing up that had not known the deprivations of war and depression and wanted more from life.

Therefore, when Mary Quant opened Bazaar, a clothing shop on King's Road in London, that carried a fresh young style, she tapped into a latent need among London's younger generation and triggered a fashion movement that was as revolutionary as the music permeating the airwaves.

One of Mary Quant's innovations was the mini-skirt, named after her favorite brand of car. She had been experimenting with progressively shorter dresses since the 1950s until she introduced the mini-skirt with the hemline nearly four inches above the knee. When Jean Shrimpton, in essence the world's first supermodel, showed up for an event in Australia in a minidress, it created a sensation. Soon other major designers had caught on and were introducing their own miniskirts.

Naturally, the miniskirt created a scandal, especially among parents of teenage girls who *just had* to wear them in order to stay in fashion. As a result, school administrators on both sides of the Atlantic would soon be racing around with rulers to measure girls' skirt and dress lengths to make sure they conformed with their dress code standards.

Besides saving on fabric, the miniskirt had another money saving feature in Britain, because anything less than 24 inches from waist to hemline was considered children's clothing and was not taxed.

Among Quant's other fashion innovations were plastic raincoats, knee-high, white, patent plastic, lace-up boots, tight skinny rib sweaters, paint box make-up, and hot pants. Just as revolutionary were her bright color schemes, often in bold stripes & checks.

Shopping is fun. Previously, shopping for clothes was a mundane experience. Shop assistants were older and often less than friendly, seeming to have the attitude they were doing customers a favor just by letting them in the store.

Mary Quant changed all that by making shopping a fun experience. Her boutiques were decorated brightly, contemporary music was constantly playing, and the sales girls were the same age as the customers, dressed the same way, and apparently having fun. Everything about the boutique was designed to make it inviting so customers would stay: to listen to the music, visit with friends, and let the overall atmosphere seep in until they wanted to take part of it home with them...all for a price, of course.

Naturally, Mary Quant's success inspired lots of imitators. One of the most famous was Biba (below), which started as a boutique and expanded into a full-scale department store. Art Deco influence, low lighting, and pop music gave it more the feel of a discotheque than a store.

For the first time, young people had a style of their own, rather than just a lame variation on their parents' fashions. The clothes were colorful and relatively cheap, thanks largely to the invention of synthetic fabrics. Since fashions changed so quickly and weren't meant to last long, some dresses were even made of paper.

The new youthful look called for a new body type. A full-bodied, large-breasted look implied motherhood, and that wasn't cool anymore. Rather, a waifish flat-chested, long-legged image was in. The poster girl for that look was Twiggy (below), a hyper-thin, doe-eyed supermodel who epitomized the youthful look of the 60s. At first her boyish figure was the source endless jokes. But even as the jokes faded away, this new body type didn't. Not only were the young dictating fashion, they were dictating the culture's beauty standards. And despite fashion's vagaries, those standards have largely held up, much to the chagrin of millions of women whose bodies are less (or more) than Twiggy.

This brings up the larger issue of whether these fashions, the miniskirt in particular, were a sign of women being more liberated or reduced to sex objects. Opinions were sharply divided among women. Some women liked the freedom of movement and expression the new fashions offered. They saw it as only natural that the sexual freedom offered by the Pill should have a corresponding liberation in fashion. However, a growing number of feminists, like Germaine Greer, author of *The Female Eunuch*, saw such things as the miniskirt as catering to men's

sexual fantasies and further stereotyping women as sex objects.

Both views were at least partly right, depending on whom women were dressing for: men or each other. In the cases of those who were dressing to please and entice men, the feminists (as they would later be called) were to a large degree right. However, women often dressed for each other as a sort of social bonding rather than as a means of attracting a mate.

Coming from a cultural heritage where sex was often a taboo subject for everyone, most men and women were probably clueless as to each others' intentions and impressions. Men typically didn't realize there were other reasons for women to wear the more revealing clothes than just to be sexually attractive. On the other hand women often failed to understand the provocative effect the way they dressed had on men, even if they were just out for a night with the girls.

Anti-fashion & non-conformity. If Mod was a rebellion against the dictates of adult fashion in the mid-60s, the end of the decade would see a rebellion against fashion itself. In a sense, the Mod look carried the seeds of its own demise, since it thrived on constant innovation and change in the search for the next look. Its very spirit was one of non-conformity against older styles, so once that spirit of non-conformity was set loose, there was no telling where it would go.

After 1966, fashion morphed from the clean geometric lines and bright crisp colors of Mary Quant's designs to flowing luxuriant fabrics and deeper off-tone colors. Similarly, replacing the influence of Art Deco with its clean crisp lines was the flowing style of Art Nouveau from the early 20th century. Paisley was an especially popular design.

The rebellious spirit of the 60s even created a backlash against the fashion industry. The hippies, in particular, consciously rejected most aspects of mainstream culture, and that included the dictates of the fashion world, which used to parade out its new fall and spring fashions each year, expecting women to slavishly pitch last year's wardrobe and buy a whole new one. Hippie fashions, if one wants to use that somewhat oxymoronic term, were nearly the antithesis of mainstream fashion, a virtual anti-fashion if you will.

Some women started making their own clothes or finding them in thrift shops, which rarely carried cute little mini-skirts and dresses. Almost as if in reaction to the shorter fashions, they started wearing full-length peasant skirts and dresses.

Central to hippie fashion were blue jeans, basic durable long-lasting clothes that never went out of style and had to be replaced a lot less often than paper dresses. Jeans also functioned as a quasi-socialist "uniform" for the younger generation, not just leveling the differences between classes, but also genders. The combination of practicality and "cool" look also made jeans appealing to a broader cross-section of the younger generation well beyond the fringe elements called hippies.

Another common article of clothing for both males and females was the t-shirt, very often decorated at home through tie-dying. Others might have peace signs or some other political or social message on them.

Of course, the fashion world wasn't about to roll over and die in the face of these changes. As with the music industry, it would co-opt hippie styles, "clean" them up, and mass-market them in trendy boutiques in shopping malls. Partially replacing basic Levis jeans would be expensive designer jeans. (In the 1990s, when tattered jeans again became the fashion, clothing companies would hang pairs of jeans on fences, shoot them full of holes with buckshot, and jack up their prices.) Going along with the designer jeans would be expensive designer t-shirts that typically advertised the company their wearers had paid through the nose for the privilege of advertising. Go figure.

The Counterculture

*"Give me a head with hair, long beautiful hair
Shining, gleaming, streaming, flaxen, waxen
Give me down to there, hair, shoulder length or
longer
Here baby, there, mamma, everywhere, daddy,
daddy"*

-- from "Hair" by James Rado and Gerome Ragni

Hair club for men. More than nearly any other era in history, men's hair became a political issue in the 1960s. The Beatles are generally seen as starting the trend for longer hair on men, although their image in 1964 seems remarkably tame in retrospect. So why did men's hair get so long and become such an issue?

Once again, it largely had to do with timing: there were a lot of Baby-boomers in their teens itching to rebel and find their own identity. It also had to do with the older generation's association of long hair on men with being

effeminate or even homosexual, nearly every father's worst nightmare back then, especially for a generation of veterans who had defended and preserved freedom in The War.

Finally, long hair was increasingly seen and/or used as a protest against the Vietnam War and what many young men saw as senseless militarism. All of these factors combined created an extremely volatile mix in millions of American homes (including that of this author) in the late 1960s and early 1970s.

“Lucy in the Sky with Diamonds”: The Drug Culture. For many people mentioning the 1960s immediately conjures up images of drug use, in particular lysergic acid diethylamide (Aka, LSD or “acid”). Although by no means taken by the population in general, LSD profoundly affected the counter-culture and, through that, the mainstream culture to a lesser extent.

LSD basically switches off the filters in the brain that govern conscious thought. As a result, things we see and intellectualize as objects in order to get by on a day-to-day basis become indiscriminate sensory impulses. To a large extent, the user is experiencing the sensory world much as a newborn infant does, but with his brain still functioning (more or less) as that of an adult. While users typically enjoy this experience, they still are carrying their various personal hang-ups, which, if dwelled upon, can create a “bad trip.”

Albert Hoffman, who discovered LSD in 1938, holding a model of the LSD molecule. For his first experimental trip with the drug in 1943, he took 250 micrograms, thinking that was the minimum threshold dose. He should have taken only 20 micrograms.

The foremost advocate of LSD was Timothy Leary, who saw the drug as the means to achieving personal and collective enlightenment. Another advocate, the Beat poet, Allen Ginsberg, urged people to use LSD as a vehicle to greater spirituality.

Unfortunately, many people missed the part of the message that urged them to be actively and intellectually engaged while on acid. Instead, they just put their brains on autopilot and expected the drug to effortlessly take them to spiritual bliss.

As a result, for many people, drugs like LSD became nothing more than sensory carnival rides that they could come down from and sleep off before going to work the next day. And like a carnival ride, they may have had fun, but probably learned nothing.

To many in the establishment, drugs like LSD, and even marijuana, were a major threat to society, having the potential to rob society of productive minds and bodies needed to work in labs, teach in schools, drive buses, and go to war. One type of response was a media scare campaign with fabricated stories of people on LSD jumping off cliffs, going blind from staring at the sun, murdering their mothers, and breeding mutant children with exposed spines or two heads.

So what were the effects of the drug culture? Questionable stories of birth defects, self-induced blindness, and matricides aside, it did have its negative impact. Some people were outright casualties and even fatalities of the drug culture, especially as they went on to experiment with harder drugs, such as heroin, crack, and meth.

But the drug culture also created the subtler and wide ranging of an unbounded faith in science that could do everything for us effortlessly just by taking a drug, whether it was LSD, a diet pill, or methamphetamine. That mindset is still very much with us today.

The Hippies were the poster children for the counterculture of the 1960s, but who were they? Good question, but one without any clear answer, much like who were the beatniks in the 1950s. And much like the beatniks, hippies were largely a media creation built up around a central core of people with some common values, and then blown way out of proportion.

The stereotype of the hippie was someone who was dirty, sexually promiscuous, wore tattered clothes and long hair, didn't work, and did drugs all the time. While there were those sorts of people, many were latecomers to the scene who used the "hippie culture" as an excuse for their behavior. Much like the saying that if you think you understand Zen, then you probably don't, those who were first branded as hippies would say if you called yourself a hippie, you probably weren't one.

The beginnings of the "hippie" movement can be traced to the Bay area around San Francisco in the early 1960s. Part of it was musical, centered around various folk, blues, and jazz musicians playing together in different combinations in small clubs and eventually evolving into rock bands such as the Grateful Dead, Big Brother and the Holding Company, Jefferson Airplane, and Quicksilver Messenger Service.

Part of it was chemically influenced, in particular by marijuana and LSD. The best known proponents of this were Ken Kesey and the Merry Pranksters who held crazy free-form events known as Acid Tests where participants, having access to open microphones, musical instruments, paint, etc., indulged in LSD and did pretty much whatever they felt like. The Acid Tests were a sort of

participatory theater much like the art happenings taking place on the East Coast.

However, with nearly everyone (in one case 6000 people) high on acid, these were incredibly chaotic events with experimental films, flashing strobe lights, and a psychedelic light show engulfing the hall, the Grateful Dead playing at one end of the auditorium, Kesey and the Psychedelic Symphonette experimenting with random sequences of notes at the other end, and open microphones all over the place. When the police showed up after curfew to shut down one Acid Test, the Pranksters followed them around turning everything back on as they turned them off. Meanwhile, people in the audience were trying to scale the balcony with ladders to reach the police, chanting "Hug the Heat. Hug the Heat."

Kesey and the Pranksters even held an Acid Test in Watts just months after the race riots there. Despite the racial tension, the locals thought the Pranksters in their Day-Glo superhero outfits were hilarious. A good time was held by all.

Ironically, Kesey was introduced to LSD by the U.S. Army, which in the late 1950s and early 1960s conducted tests with the drug. The thinking was that LSD's psychoactive properties might have some military application, such as disorienting and freaking out prisoners to more easily get information out of them. Contrary to the Army's expectations, Kesey enjoyed taking the drug (and getting paid for it) and started introducing his friends to it, since it was legal until 1966.

In 1964 Kesey and the Pranksters took a legendary bus/acid trip across America in a 1939 International Harvester school bus named Further and painted with psychedelic colors and designs. A sign on the back of the bus warned “Caution: Weird Load.” The bus driver on that trip, described in Tom Wolfe’s *Electric Kool Aid Acid Test*, was Neal Cassidy (Aka Dean Moriarty), Jack Kerouac’s traveling partner in *On the Road*. Cassidy was symbolic of the link between the Beats and the Hippies, although many of the former viewed the latter as a bunch of stupid kids.

By the mid 1960s an amorphous sort of community was coming together in the Bay area, consisting of people who enjoyed the experimental music that was evolving, may or may not have been doing drugs, but generally enjoyed and cherished the artistic and lifestyle freedom of San Francisco. From their point of view, they weren’t a self-conscious movement with a label or name, like *hippies*.

Then the media caught on.

The Grateful Dead perform a free concert in San Francisco

Maybe it was Jefferson Airplane’s “fault”, because they were the first local band to have a hit record, “Somebody to Love”, which brought in a flood of record executives hoping to cash in

on the “San Francisco Sound” in 1967. Time Magazine didn’t help matters with its cover story of its July 7, 1967 issue entitled “The Hippies: Philosophy of a Subculture.”

It was downhill from that point on, as the Haight Ashbury district of San Francisco became a virtual Mecca for a generation of starry-eyed dreamers, teenage runaways, drug dealers, and tourists during what was ironically labeled the “Summer of Love”. There were even bus tours through the area advertised as the only tour of a foreign country inside the U.S.

Local “hippies”, overwhelmed and frustrated by this floodtide of outsiders, even tried to put an end to it by declaring the “Death of Hippie” on October 6, 1967 when they ritually buried the media creation called “Hippie”. Not surprisingly, it didn’t work. “Hippies” kept multiplying and spreading to other cities across the nation, which attracted drugs, crime, teenage runaways with no idea of how to get on in the real world, and sleazy opportunists wearing long hair and bellbottoms to exploit those kids.

Meanwhile, many of the “real” hippies, meaning those who really did want some peace, quiet, and freedom from a materialistic society, moved to communes in the countryside to raise their families in as honest and sane fashion as they could.

Although most of those communes eventually failed and their somewhat disillusioned inhabitants moved back into town, they still had an impact on two levels. On one level, there remained a small core of genuine people, what we might call hippies for lack of a better name who truly epitomized the “hippie values” of

peace and love. They persisted in living uncluttered lives, forsaking the glittering materialist trappings of modern society for a simpler and ecologically sustainable way of living.

On another level there was the hippie “trademark” that continues to be marketed as a stereotyped commodity. (Just Google “hippie images” and see how many ads for clothes and costumes and how few authentic pictures of “hippies” you get.) In the 1970s, men generally wore their hair longer than in 1960, but it was styled at salons (not barbershops) in order to make it more acceptable for graduation pictures and office jobs. Likewise, clothing mimicked hippie styles, but was standardized and made respectable for mainstream society.

The ultimate sign that the hippie movement had been commercialized into a parody of itself: when Barbie and Ken showed up on store shelves as hippies.

Still, in the midst of all this cultural static, it became clear that a major cultural shift had taken place, and continues to take place. Many people have learned to question on some level the unrestricted material consumption at the center of modern society and the mass media that promotes it. Decades later, that lesson has become even more profound and is largely the legacy of relatively small fringe groups sometimes referred to as “hippies.”

A Tale of Two Festivals: Woodstock & Altamont (1969). If any type of event typified the counterculture, it was the rock festival, a multi-day event filled bringing tens (sometimes hundreds) of thousands of young people together to party, listen to their favorite bands, and, in many cases, to get high. Two such festivals in 1969, Woodstock (above) and Altamont, came to

represent the best and the worst of the counterculture. However, the truth in each case didn’t live up to the legends they spawned.

In August 1969, the most famous rock festival of the era took place in upstate New York at Woodstock. Estimates varied to the size of the crowd, but it was probably 250,000-300,000 people. Despite traffic jams, rain and mud, Woodstock attained mythic status as proof that the younger generation could create a world of peace and love. The Promoters bragged how much money they lost by making this a “free” festival (after gatecrashers had made it free, anyway). What they didn’t talk about was all the money they made from the movie and albums.

Just a few months later, the myth of the Woodstock Generation was shattered at Altamont. Held near Oakland, California in December 1969 to cap off the Rolling Stones US tour, it was a free concert that drew 300,000 people. Unfortunately, for security, the Stones hired the Hell’s Angels who beat a spectator to death for knocking over their bikes near the stage. And that is how it was portrayed in the movie, *Gimme Shelter*, and has been perceived ever since. However, most people were too far from the stage to be aware of the violence, one spectator noting on a snapshot of the concert that he had a great time.

Instead of ending on a high note hopeful of a world filled with peace and love, such as portrayed at Woodstock, the 60s bowed out with the debacle at Altamont. It was an unsettling end to a decade marred by the Vietnam War, racial violence, and a huge cultural divide between Baby Boomers and their elders.

Maybe the best epitaph for the decade was that if you remember the Sixties, you weren’t there.

The “Sexual Revolution”

So where to start with the so-called Sexual Revolution? Some might start with the Suffrage Movement that gave women the vote and, by extension, various other rights and prerogatives, including greater choice of mates. Others might start with the “flappers” in the 1920s whose clothes, slang (e.g., “handcuff” for engagement ring), and behavior showed freer attitudes about sex. There was also Coco Chanel, who revolutionized fashions in the 1920s, further freeing women with comfortable clothing that felt as good as it looked. Then again, a case could be made to start with Margaret Sanger who crusaded tirelessly from the early twentieth century to gain women access to birth control.

A nerdy looking college professor named Alfred Kinsey also deserves mention, since he exposed just how much sex was really going on despite what society and its guardians of morality said. However, up to now, the twentieth century had seen rapid change or evolution in patterns of sexual behavior, but not a revolution.

Then in 1960 came The Pill. Now women could have sex without worrying about getting pregnant (unless their teenage daughters switched mom’s pills for aspirins). The Pill was certainly the biggest game changer yet.

Another big factor was the Baby Boomer generation that inherited the pill. Besides being numerous and having unprecedented affluence and freedom, they also had youthfully high levels of impatience and hormones. Affluence gave them such things as cars and the freedom to go off and get what they wanted. Impatience and hormones made them want sex.

Finally, since the decade was so much about change and challenging old values (e.g., civil rights and the Vietnam War) it was natural that people would include personal sexual freedom as part of the overall agenda of change. It was in the 1960s that all these forces converged to create the perfect storm, often referred to as the sexual revolution.

Free Love was the term most often associated with the sexual revolution although love didn’t seem to have much to do with it. Free love was largely interpreted as promiscuous sex with multiple partners, supposedly as an emotional bonding experience that transcended “selfish” romantic love between just two people. It was partly rooted in Marxist philosophy, which was trendy among many young people, as an act of political defiance against the bourgeois capitalist order that used the family as a mechanism of control. A widely read book at the time that further publicized the idea of free love was Aldous Huxley’s *Brave New World*, although many people missed Huxley’s real point about free love.

It didn’t take long for free love to devolve into a vulgar, aggressive, and unfeeling act devoid of any transcendent emotions beyond base sensual pleasure. And for many, particularly women who were pressured into these situations, the pleasure itself was dulled or missing.

The problem was that we are products of millennia of cultural conditioning, and very likely instinct, so that emotions such as love and jealousy cannot be automatically turned off like a light switch. There was a pill to prevent pregnancies. There wasn’t one to prevent or cure broken hearts.

Women especially suffered in this respect. While a lot of men (and some women) used free love as an excuse to sleep with multiple partners without any emotional attachments or responsibility, many women (and some men) did fall in love, but were pressured to stifle such feelings, since

they impinging on their partners' freedom. In addition, many women became pregnant, which often scared off their partners, leaving them as single mothers with no financial or emotional support for raising their children.

way for the Feminist Movement of the 1970s when women would work to end its abuses.

Therefore, the sexual revolution was a mixed bag, in particular for women. For the first time in history they did have the freedom to freely choose their own partners and enjoy sex. However, this often came with a heavy emotional price tag, as pre-marital sex became a sort of litmus test for how free women were, with men pressuring them into having sex to prove they were truly liberated. For many women, pre-marital sex became a virtual obligation for which it was often too much trouble just to say no.

Although the 60s are often remembered for free love and group sex (i.e., orgies), those represent merely the most extreme and relatively few examples of an overall shift in behavior. For example, in 1963 some 80% of American women thought premarital sex was wrong. By 1975 that number had dropped to 30%. However, instead of a long string of one-night stands, a more typical pattern was a series of monogamous relationships until the "right man" came along for marriage.

Not to say that this approach always worked, since from that time on, nearly half of all marriages have ended in divorce. Many of those marriages ended because of infidelity in a society with much looser moral expectations. But many ended because of domestic abuse, whereas those same marriages might have continued in an earlier era with the woman having no way out.

However, while the sexual revolution of the 1960s often cost women heavily in unforeseen ways, it also helped pave the

THE CIVIL RIGHTS MOVEMENT (1954-68)

“Darkness cannot drive out darkness; only light can do that. Hate cannot drive out hate; only love can do that.”

-Martin Luther King Jr.

Background to the movement. While the dates for this reading encompass only fourteen years of a battle for racial equality that goes back to the abolitionists and Civil War in the 1800s and continues today, the years from 1954 to 1968 represent the climax of that struggle when institutions, programs, and legislation were put in place that remain the foundation of the movement

Three main factors, going back to the 1930s and 1940s, set the stage for the Civil Rights Movement. One was World War II, which itself had several effects. First, there was exposure of the atrocities of the Holocaust at the end of the war. While this specifically concerned racism against the Jews, it carried over in many people’s consciousness to awareness of racism in America and where it could lead. Second, there were unprecedented job opportunities in Northern cities provided by government war contracts. This, plus the invention of the mechanical cotton picker in 1944, which put many African-American sharecroppers out of work, led to the Second Great Migration of African Americans to the North. In fact, plantation owners bought many of their train tickets in order to get rid of them.

Finally, African-American veterans of the war who had served their country and seen less racism abroad returned less willing to tolerate racism at home. Also helping were actions by Presidents Roosevelt and Truman that improved African Americans’ status, most notably President Truman’s executive order to integrate the ranks of the American military in 1948. All these helped pave the way for the landmark Supreme Court decision in 1954: *Brown vs. Board of Education*. Very simply, it said that the “separate but equal” principle of racist legislation in the South was not equal, and therefore was illegal. This opened the gates for the Civil Rights Movement that followed.

The cycle of progress (1955-65). The first major challenge to the separate but equal principle was the Montgomery Bus Boycott in 1955. When an African American woman, Rosa Parks, was arrested

for refusing to move to the back of a public bus for a white passenger, the African American community in Montgomery Alabama organized a boycott of the city bus system. Since Blacks were a major source the city’s revenues, this cost Montgomery a lot of money for months on end while the boycott lasted. Finally the city gave in and integrated its buses.

Over the next decade, the Civil Rights Movement succeeded in overturning a wide range of racist policies and laws across the South. While each episode had its own story of persistence and sacrifice, they tended to follow a basic pattern. First there would be non-violent demonstrations and acts of civil disobedience, often led by church ministers, most notably Martin Luther King Jr. who had studied Gandhi’s non-violent tactics in his fight for Indian independence a decade earlier. Since they had rarely, if ever, been challenged like this before, the authorities typically would react violently with clubs, tear gas, attack dogs, and high pressure hoses, figuring no one would notice, since no one had paid attention to the plight of Blacks in the South before. However, there was one new factor in the equation that made a huge difference from before: television.

King realized the power of this new medium, since it broadcast graphic images instead of just words into millions of homes across America. What people saw were peaceful protestors being brutally attacked and yet taking it with incredible courage. These images broadcast by the liberal media especially resonated with white families in the North for whom race was a distant issue, so it was safe to sympathize with the marchers. Each round of such images led to more popular support for the Civil Rights Movement in the North, which encouraged more protests, leading to more violent reprisals, more TV coverage, and so on. By the early 1960s, many young northern Whites went south to help the movement along. When some of them were killed in the reprisals, sympathy among northern Whites especially grew.

The Democratic President, Kennedy, was initially reluctant to get involved, since the Democrats drew much of their support from southern whites, who mostly opposed the Civil Rights Movement. However, he, President Johnson, Congress and the courts, eventually got on board, striking down racist

laws and passing legislation that culminated with the Civil Rights Act in 1965

One of the more interesting angles in this regard was role of a short passage in the Constitution, known as the Interstate Commerce Clause. Very simply, it gave Congress the right to regulate commerce between the states. Originally, this was to keep states, which exercised much more autonomy in the 1780s, from levying unreasonable tolls or shutting off waterways to other states. However, the Interstate Commerce Clause was also useful in the 1960s, since any business doing any commerce with people from another state came under its jurisdiction. Thus Congress could order any restaurant that served just one bit of food, drink, or spices originating in another state to open its doors to all people, regardless of race, color or creed. Similarly, it could order hotels, which were on carrying any interstate commerce to do the same.

The cycle of frustration (1965-68). In the mid 1960s, opponents of the Civil Rights Movement started using more subtle arguments and tactics. Most notably, they stopped committing blatant acts of violence in front of the TV cameras. As a result, the movement started getting less media coverage, causing interest and support among Whites to wane. Another problem was that, as King and his supporters started expanding their activities into the North to combat such things as housing discrimination, many northern Whites started feeling threatened now that the movement was affecting their own lives.

As the pace of change and progress slowed in the face of more subtle institutionalized racism, such as redlining neighborhoods and opening private schools to exclude African Americans, infighting began within the movement about the effectiveness of non-violent tactics. As the Civil Rights Movement started to sputter, frustrated militants, who were becoming a larger part of the movement as it grew, turned to more militant tactics. In the mid and late 1960s African American's frustration boiled over into a series of urban race riots. However, these were not organized protests, but rather spontaneous reactions to local incidents and conditions. Consequently, there was little or nothing King and other leaders could do to stop or control these events. Unfortunately, these riots received widespread TV coverage, which alienated

many Whites who had previously been sympathetic to the movement. This just encouraged racists to continue using more subtle tactics, which got little media coverage, leading to more frustration, infighting about tactics, and urban riots out of frustration at the slowing rate of progress.

On April 4, 1968 Martin Luther King was assassinated, depriving the Civil Rights Movement of a great leader. After this the Civil Rights Movement stalled as the Vietnam War took over the headlines, thus fragmenting activism even more over tactics and what issues to pursue. However, despite the lack of dramatic progress, laws and institutions had been put in place that in the following decades would lead to slow but steady progress for African Americans, symbolized especially by the election of an African American, Barak Obama, as president in 2008.

Legalized Racism: Jim Crow

Southern Whites may have lost the Civil War, but in a very real sense they won the peace, as institutionalized racism in new forms (aka Jim Crow) resurfaced in the South almost immediately after the abolition of slavery and end of Reconstruction. The legal phrase describing this was “separate but equal” and was based largely on the Second Morrill Act of 1890 which stated that states establishing federally funded land grant colleges should not use race as the basis of admission or should establish separate but equal institutions for people of color. Southern legislatures seized upon this principle to expand segregation to a wide array of institutions such as public transportation, restrooms, drinking fountains, and restaurants.

At the same time, Southern states, starting with Mississippi in 1890, adopted new constitutions that effectively disenfranchised any Blacks who had gained full citizenship rights during Reconstruction. Poll taxes, literacy and comprehension tests, and strictly documented

residency requirements were the means by which Blacks, and many poor whites, were kept from voting, holding office, and serving on juries, the last being especially crucial to keeping the legal system rigged.

Violence on an organized or quasi-legal level was another a means of repression. The most infamous organization was the Ku Klux Klan, in particular its second incarnation (1915-44). Known for their white robes and conical hoods, the Klan terrorized Blacks through burning crosses (as warnings) or outright violence. KKK propaganda and extreme acts of racism done openly in public especially peaked early in the 20th century.

Lynchings in the South by state & race, 1882-1968

| State | White | Black | Total |
|----------------|-------|-------|-------|
| Alabama | 48 | 299 | 347 |
| Arkansas | 58 | 226 | 284 |
| Florida | 25 | 257 | 282 |
| Georgia | 3 | 492 | 531 |
| Kentucky | 63 | 142 | 205 |
| Louisiana | 56 | 335 | 391 |
| Maryland | 2 | 27 | 29 |
| Mississippi | 42 | 539 | 581 |
| North Carolina | 15 | 86 | 101 |
| South Carolina | 4 | 156 | 160 |
| Tennessee | 47 | 204 | 251 |
| Texas | 141 | 352 | 493 |
| Virginia | 17 | 83 | 100 |

Lynching was a term derived from the infamous Willie Lynch, meaning to murder an accused person by mob action without lawful trial, as by hanging. Because African-Americans were prohibited by U.S. law to "testify against a white

man," they could be easily framed for the unscrupulous deeds of others. Without "due process," vengeful Lynch Mobs would exact their own brand of "swift justice.

In the 1920s there was even a series of postcards published with pictures of Blacks being lynched, as if it were a thing to be proud of.

However, racial violence didn't require organized backing, as long as the legal system of all-white juries was in place to acquit even the most obviously guilty defendants. Nothing bore this out more than the murder of Emmett Till and the acquittal of his murderers, J. W. Milam and Roy Bryant by an all white jury after less than an hour of deliberation. Later, Milam and Bryant sold the true story to *Look Magazine*, knowing they couldn't be tried a second time for the same crime.

The murder of Emmett Till was the first example of TV bringing the brutality of Jim Crow racism into the national spotlight. Mamie Till-Mobley, Emmett's mother especially stirred a reaction by insisting on an open casket to show her son's mangled face to the world. When a Black congressman from the North showed up for the trial, locals were dumbfounded who couldn't conceive of an African American being elected to office. Similarly, Northern reporters at the trial faced open hostility from Southerners as if they were from a foreign country.

However, it was the presence of those reporters and the mass media they represented that was about to turn the tide.

Beginnings (1943-57)

Rosa Parks

In 1943, towards the end of the Second World War, another new technology made its debut on a plantation near Clarksdale, Mississippi: the

mechanical cotton picker. Its inventors meant to ease farm workers from the backbreaking labor of picking cotton by hand. Instead, it put thousands of African-Americans in the South out of work. This triggered the next, and biggest, wave of the Great Migration to cities in the North. However, the influx of so many poor people just led to more crowded cities with fewer jobs. Old Red now resides in the Agricultural wing of the Smithsonian.

At the same time, thousands of African Americans who had served their country during World War II were returning home, feeling entitled to more rights than the various forms of racism had allowed them up to that point. Also, exposure to the atrocities of the Holocaust at the end of the war, while specifically concerning racism against the Jews, carried over in many people's consciousness to awareness of racism in America and where that could lead. Out of these frustrations and rising expectations arose the Civil Rights movement.

The Montgomery Bus Boycott in 1955 was the first major challenge to the separate but equal principle. When an African American woman, Rosa Parks, was arrested for refusing to move to the back of a public bus for a white passenger, the African American community in Montgomery Alabama organized a boycott of the city bus system. Since Blacks were a major source of the city's revenues, this cost Montgomery a lot of money for months on end while the boycott lasted. Finally the city gave in and integrated its buses.

In 1954 in one of the landmark rulings in American legal history, *Brown vs. Board of Education*, the Supreme Court overturned the principle of "separate but equal", thus opening the way for the integration of American schools. Three years later, this ruling was put to the test as nine African American students (top left) tried to enroll in the all-white public high school in Little Rock Arkansas.

Because of the violent reactions against integration this triggered, President Eisenhower sent the elite 101st Airborne to calm the turmoil

at Little Rock. Although the nine students had to be constantly escorted and guarded, they made it through the year, one of them graduating in June.

The long process of integrating America's schools had begun.

A New Kind of Leader

The central figure in the Civil Rights movement who emerged from the Montgomery Bus Boycott was a young preacher from Atlanta, Martin Luther King Jr. King had studied the nonviolent tactics used by Gandhi to win India's independence from Britain in 1947. He saw that the new medium of television would make such tactics even more effective since they would expose many more people across the country and world to the brutality of racism in the South, thus winning wide public support for his movement and putting pressure on the federal government to intervene. This had become apparent in the 1950s with the heavy media coverage of the Montgomery Bus Boycott and the murder of Emmett Till.

The key to King's strategy was to keep his marches peaceful in the face of brutal police reprisals. Since they had rarely, if ever, been challenged like this before, the authorities typically would react violently with clubs, tear gas, attack dogs, and high pressure hoses, figuring no one would notice, since no one had paid attention to the plight of Blacks in the South before. However, there was one new factor in the equation that made a huge difference from before: television.

King realized the power of this new medium, since it broadcast graphic images instead of just words into millions of homes across America. The images of peaceful demonstrators being

beaten and attacked with high-pressure hoses and police dogs graphically imbedded the plight of African Americans into millions of viewers' consciousness and generated the sort of public sympathy and federal support that King needed. These images broadcast by the liberal media especially resonated with white families in the North for whom race was a distant issue, so it was safe to sympathize with the marchers.

The power of these images especially hit home with Peter Rodino, member of the House judiciary sub-committee hearing on the Kennedy civil rights bill, 1963: *"I was attending a conference at Geneva... and the incident of the police dog attacking the Negro in Birmingham was printed all over the world. One of the delegates from one of the nations represented at the conference there showed me the front page of the European edition of the Times and he was a little more frank than some of the others, and he asked me, 'Is this the way you practice democracy?' And I had no answer."*

Each round of such images led to more popular support for the Civil Rights Movement in the North, which encouraged more protests, leading to more violent reprisals, more TV coverage, and so on. One famous incident was the bombing of the 16th Street Baptist Church on September 15th, 1963 when four little African American girls were killed.

In the early 1960s, many young northern Whites went south to help the movement along. When some of them were killed in the reprisals, sympathy among northern Whites especially grew even more. Among the most dramatic events was the freedom ride in 1961 by a racially mixed group of people through the South to challenge segregation on public transportation. Things turned especially bad at the Greyhound bus station in Anniston, Alabama when a mob

slashed the tires of the freedom riders' bus. The bus raced out of town then broke down. The mob caught up, firebombed the bus and badly beat the passengers.

The Democratic President, Kennedy, was initially reluctant to get involved, since the Democrats drew much of their support from southern whites, who mostly opposed the Civil Rights Movement. However, he, President Johnson, Congress and the courts, eventually got on board, striking down racist laws and passing legislation that culminated with the Civil Rights Act in 1964. Bit by bit, schools, restaurants, and other public facilities across the country were officially desegregated, although there was still a long way to go as far as ending racism was concerned.

In 1963, Martin Luther King Jr. organized a massive civil rights march in Washington D.C. It was here that he gave his famous "I have a Dream" speech. The next year, Congress passed the Civil Rights Act.

"Freedom Summer." In the summer of 1964, a number of young idealistic Northerners went to Mississippi to help register Black voters. On June 21st, police arrested three young men, a 21-year-old black Mississippian, James Chaney, and two white New Yorkers, Andrew Goodman, 20, and Michael Schwerner, 24, near Philadelphia, Mississippi on trumped up charges. That night they released them into the charge of Ku Klux Klansmen who beat and murdered them.

The FBI arrested 18 men, but state prosecutors refused to try them, saying there wasn't enough evidence. So the FBI brought federal charges of conspiracy (but not murder) in 1967 and got seven of the men convicted, for which none of them served more than six years. Eight others were acquitted by all-white juries, and three others went free because of mistrials. One mistrial, that of Edgar Ray "Preacher" Killen, occurred because of a deadlocked jury where one woman couldn't bear to convict a preacher. If the murder of Blacks aroused sympathy in the North, the murder of Whites produced outrage.

In 2005, four decades later, Edgar Ray Killen, then 80, was charged with three counts of murder. He was finally convicted on the lower charge of manslaughter and sentenced to a maximum sentence of 60 years. The grand jury declined to indict the seven other surviving conspirators indicted back in 1967.

The Interstate Commerce Clause. Federal involvement in the Civil Rights movement was often based on the Commerce Clause, sometimes called the Interstate Commerce Clause, in the U.S. Constitution (Article I, Section 8, Clause 3). This gave Congress the power "to regulate Commerce with foreign Nations, and among the several States, and with the Indian Tribes". Its primary domestic purpose originally was to keep interior waterways open and free for trade and not subject to local or state tolls.

However, its use was expanded to protect civil rights in anything that vaguely involved interstate commerce. Thus in *Heart of Atlanta Motel v. United States*, 379 U.S. 241 (1964), the Supreme Court ruled that since most of a motel's customers were from out of state, that constituted interstate commerce and gave the federal government the right to dictate that all potential customers be treated equally, regardless of race. Similarly, in *Daniel v. Paul*, 395 U.S. 298 (1969) the court ruled that the federal government could regulate a recreational facility because three-fourths of the items its snack bar sold came from out of state.

Eventually, King's opponents in the South caught on to his tactics and worked to thwart them in various ways. For one thing, they learned to exercise more restraint in dealing with demonstrations, thus making them less interesting to watch on TV and therefore reducing media coverage. Another tactic was to open private facilities, such as schools and swimming pools, where only White children could go, thus leaving the public schools and pools inadequately funded by White-controlled state and local governments. Therefore, the struggle was just beginning.

King especially encountered these problems when he moved the Civil Rights Movement to the North, which on the surface was much less blatantly racist. However, when northern Whites faced integration as real issues in their own neighborhoods and schools rather than just as abstract Southern issues viewed on TV, they often proved as intransigent as Whites in the South. During a march for equal housing opportunities in Cicero, Illinois, King was hit in the head with a rock by an angry spectator. This was a sign of tougher times to come.

The Movement Starts to Fragment: Black Power and Malcolm X

A man who stands for nothing will fall for anything.—Malcolm X

Elijah Muhammad, Malcolm X, and the Nation of Islam. Not all African Americans followed King's path to peaceful integration, or integration at all. Especially notable in this respect was Elijah Muhammad, leader of the Nation of Islam. He saw Whites as "blue-eyed devils" who could never be trusted, and Christianity as a religion of subservience used by Whites to keep Blacks down.

While King worked for racial harmony, Elijah Muhammad preached his own brand of separate but equal, urging Blacks to be self-sufficient and independent of White society, opening their own businesses and building their own homes.

Although he didn't preach aggressive violence, he didn't condone pacifism either: *"There is nothing in our book, the Koran that teaches us to suffer peacefully. Our religion teaches us to be intelligent. Be peaceful, be courteous, obey the law, respect everyone; but if someone puts his hand on you, send him to the cemetery. That's a good religion."* Ultimately, Elijah Muhammad did envisage a Black Nation born out of revolution and overthrowing the White Man.

As this poster indicates, Elijah Muhammad had a somewhat exalted view of himself as the sole messenger of God.

Malcolm X. Elijah Muhammad's religion had limited appeal among Blacks, but it did attract enough followers to open seventy congregations in thirty cities across America by 1960. Among his converts was a bright ex-con, Malcolm Little, who did away with his "white" surname, just changing it to X.

At first, Malcolm X was a devoted follower of Elijah Muhammad, but over time, he started to carve his own spiritual path. Key to this was his pilgrimage to Mecca where he saw all different races, including Whites, as devoted Muslims, which contradicted Elijah Muhammad's own narrowly racial view of Islam. As Malcolm formed his own views, this angered, and maybe even worse, aroused the jealousy of, Elijah with whom he eventually broke.

Malcolm was a brilliant, powerful and funny speaker who, above all else, made African Americans, both men and women, proud of themselves. He was particularly respectful to

Black women, making them feel beautiful in a culture that especially derided them. He didn't mince words, saying the assassination of JFK, whom he said had been involved in violence and repression in Asia, Latin America, and Africa, was "chickens coming home to roost." By the same token, he founded the Organization of Afro-American Unity and was increasingly open to reconciliation with all races, including Whites who would treat all other races with respect.

Unfortunately, on February 21st, 1965, Malcolm X was gunned down. Many have suspected Elijah Muhammad of being behind the murder. Where Malcolm would have gone from there if he had lived is anyone's guess.

From Cassius Clay to Muhammad Ali

Cassius Clay was a brash young black man who emerged from Louisville, Kentucky to become the world heavyweight champion boxer, possibly the greatest boxer in the history of the sport. He was called the Louisville Lip and The Mouth for his brazen ego and predictions (which usually came true) of how quickly he would defeat an upcoming opponent. Concerning the current champion, Sonny Liston, he said, "The man can't talk. The man can't fight. The man needs talking lessons. The man needs boxing lessons. And since he's gonna fight me, he needs falling lessons. I'm gonna give him to the local zoo after I whup him....He's too ugly to be the world champ. The world champ should be pretty, like me."

"Float like a butterfly, sting like a bee" is how Ali described his style of fighting. Instead of the old-fashioned lumbering, slug-it-out style of boxing, he based his success on his mobility and ability to wear out his opponent's legs as well as arms.

On February 26, 1964, the day after he pummeled Liston and took the crown (just as he had predicted), Clay announced he had converted to Islam and was a follower of Elijah Muhammad. A week later, Elijah honored him with the name Muhammad Ali, an honorific title that people usually had to wait ten years to receive. However, Elijah had recently broken with Malcolm X and probably was trying to use Clay against him. Although he was also a close friend of Malcolm, he followed Elijah's direction to break with him.

Clay's acceptance of Islam and change of name came as a shock to White America. Starting with Jackie Robinson sixteen years earlier, African Americans in professional sports had been very careful to act respectfully and respectably in order to gain their acceptance by White sports fans. By and large, it worked, especially with younger fans, including this author whose childhood hero was the Chicago Cubs' star shortstop, Ernie Banks. Muhammad Ali's change of religion and name was the first example of an African American athlete "betraying" those expectations.

Ali was in no way apologetic about it either: "I ain't no Christian. I can't be when I see all the colored people fighting for forced integration get blowed up. They get hit by stones and chewed by dogs and they blow up a Negro church and don't find the killer...I'm the heavyweight champion, but right now there are some neighborhoods I can't move into...I'm no troublemaker. I'm a good boy. I never have done anything wrong. I have never been to jail. I have never been to court. I don't join any integration marches.... A rooster crows only when it sees the light. Put him in the dark and he'll never crow. I have seen the light and I'm crowing."

Ali again: "The government should ...get down on their hands and knees every morning and thank God that 22 million black people have not become anti-American. You've given us every right to. The whole world would side with us if we became anti-American."

Another issue between Ali and the U.S. government was the draft. Right before the Liston fight, and again right after, he took and failed the military qualification exam, scoring in the 16th percentile when the cutoff for passing was 30. However, as the Vietnam War called for more and more draftees, the passing score was lowered from 30 to 15, making Ali eligible.

Although Ali had previously taken no strong position on the war, now that he was eligible for the draft he claimed he was a conscientious objector on the basis of being Muslim. At first, the judge granted him CO status, but the government, concerned this ruling would allow anyone to become a Muslim to avoid the draft, ordered the Kentucky selective service appeal board to ignore the ruling and draft Ali. In April 1967 he refused to take part in the induction ceremony and was tried and convicted by an all-white jury of draft evasion.

Top African American athletes join Ali at a press conference in 1967 where he explains his reasons for rejecting the draft.

Not only did Ali spend three years in jail, he was also stripped of his boxing crown. Therefore, when he emerged from prison, despite the fact that he was aging by boxing standards and had been out of training for three years, he proceeded to fight his way back to the top and reclaim his crown. The "Rumble in the Jungle" in Kinshasha, Zaire (10/30/1974), as the fight between Muhammad Ali and George Foreman was called is still considered one of the greatest fights in boxing history. Ali won in the eighth round.

Naturally, Ali's remarks and actions alienated much of White America, and even some Blacks who saw him jeopardizing the gains they had recently made. Journalists and reporters called him a member of the Black Muslims, even

though there was no such group. Many African Americans took pride in his accomplishments and stance, which signaled a significant shift in race relations in America. For many Blacks, the time was past when they would feel grateful for any rights they received, since they should have had those rights all along. Replacing the old chant of “We shall overcome” was a new battle cry: “Black Power.”

Tommie Smith and John Carlos raise their fists in the Black Power salute during the medal ceremony at the Mexico City Olympics in 1968, an act that outraged many Americans who saw it as unpatriotic. Smith and Carlos weren't trying to be unpatriotic, but were pointing out racial injustice in America and how it could lead to divided loyalties.

Burn Baby Burn: Fire and Malaise in the Promised Land

National Guardsmen in Detroit, 1967

As the movement got bigger, it became harder for King to control & especially keep non-violent. Starting in 1965, Black frustration spilled over into violent rioting in various American cities. Americans watched as the evening news showed riots burning down large sections of Los Angeles (Watts) in 1965, Chicago in 1966, and Detroit and Newark, New Jersey in 1967.

As a result, the Civil Rights movement lost support among many Whites who had previously

sympathized with its peaceful tactics. By the same token, rioters had mainly burned down large parts of their own neighborhoods and driven businesses and jobs away, making economic progress even harder.

Therefore, the movement's momentum was already starting to dissipate when King was assassinated in Memphis on April 4, 1968. While it is anyone's guess what the great civil rights leader could have accomplished if he had lived, it seems likely that things would have worked out better.

Predictably King's assassination only made many African-Americans more frustrated and angry, encouraging many to take more aggressive actions against the system. Disillusionment among Blacks over King's death was reinforced two months later with the assassination of Bobby Kennedy, a presidential candidate who held out hope for better times to the nation's poor. No leader of King's caliber stepped up to carry the civil rights banner after that, and the movement further lost steam as it fractured into different sub-groups that stood for various goals and tactics, both violent and non-violent.

Over sixty percent of those arrested in the Watts' riot had been born in the South. For them, northern industrial cities like Los Angeles, Chicago, and Detroit had represented the Promised Land, a promise that was at least partially fulfilled when jobs were plentiful during the Second World War. However, that dream had turned sour since 1945 for several reasons.

One was living conditions. Most Black migrants had come from rural areas that at least offered fresh air and room to live. Even if they did enjoy indoor plumbing and electricity for the first time when they moved north, they also were crammed into tiny, dilapidated and rat-infested tenements.

A half-empty part of Chicago's Cabrini Green, one of the nation's most notorious housing projects, burns, probably set on fire by arsonists.

And, like rats crowded in a cage, they were more prone to turn on one another, especially in the breezeless summer heat, which is also when most urban riots took place. In addition to alcohol, there were also hard drugs to kill the pain and/or earn a living. Therefore gangs formed and gang wars erupted to claim markets (AKA turf) or just vent frustrations.

Another problem was opportunistic exploitation. The perpetrators were absentee landlords and grocers who sold substandard food for outrageous prices because they knew the locals had nowhere else to go. No surprise then that popular targets for rioters were white-owned businesses that had been exploiting them for years. A new word entered the American vocabulary: the ghetto. More than a slum, it was cage or a trap from which there seemed to be no escape.

Finally there was "White flight" from the cities. Part of it was racially motivated, to get away from the people moving in by the thousands from the South. But it was also motivated by the opportunity to own a tiny plot of land and house in that new phenomenon known as the suburbs. Whatever the reasons, millions left the cities taking their money with them. And with them vanished the hopes and opportunities for those moving in.

What was left was the hollow shell of inner cities, now inhabited by people who thought they had finally reached their goal, the Promised Land, but found instead they had reached a dead end. There was no Promised Land. Or if this was it,

it didn't matter if it burned on a hot summer night when nothing seemed to matter anyway.

Therefore, the urban riots of the 1960s were about more than traditional racism, although that entered into the equation. They were also about urban neglect and decay, and how that affected the people who had moved in right before the trap door closed behind them. There were studies on what had gone wrong, most notably that done by the Kerner Commission, which bluntly stated that the nation was "*moving toward two societies, one black, one white — separate and unequal.*"

ISRAEL AND THE ARABS (c.1880-1973)

Introduction. Possibly the most volatile area of the world today is the Mid-east, focusing especially on the Jewish state of Israel placed in the midst of various Arab Muslim states. It is here that religious, economic (i.e., oil), and historical issues have converged for centuries to create, what seems to many, a problem that will only be resolved through violence. However, given the crucial economic and religious importance of this region to the rest of the world, a violent solution to these issues is not a realistic one. Therefore, if we are to arrive at a reasonable settlement, it is important to understand the historical forces that have created this situation.

Historical roots. There are five historical threads that made Palestine so highly valued. One of these, going back 3,000 years, sees Palestine as the Jews' religious and historical homeland. Although the Jews were scattered from there after their unsuccessful revolts against Rome some 1900 years ago, they have always seen Palestine as their legitimate homeland to which they would return one day. Similarly, Muslims have viewed Jerusalem as one of their holy places for almost 1400 years, since it was supposedly where Mohammed started on his night journey to visit Paradise. In addition, primarily Muslim populations have inhabited Palestine for most of that time. Thus there is the age-old argument of which holds priority: being there first or being there now.

The third thread was the Zionist movement, starting in Europe in the late 1800s. The liberal and democratic movements of the 19th century had made Jews more acceptable to European societies, leading many of them to emerge from their ghettos and largely assimilate into the mainstream culture. However, as economic and political tensions increased later in the century, Jews were more visible targets that many people used as scapegoats for their mounting problems. Consequently, many Jews saw Palestine as a homeland safe from the growing anti-Semitism in Europe. Also, with the Ottoman Empire in severe decline and strong European influence in the region, the opportunity for settling in Palestine never seemed better. At first, small numbers of Jewish settlers moved in, thus creating few problems with the Palestinian Arabs already settled there. However, two events in

the twentieth century would radically alter that situation.

One was the stalemate in Europe during World War I and the search for victory on other fronts. Britain, desperate to defeat Germany's Ottoman allies, issued the Balfour Agreement (1917) promising the Jews a homeland in Palestine in return for their help against the Turks. Unfortunately, Britain had promised liberation to the Arabs under Ottoman rule in return for similar help. Therefore, there were two seemingly contradictory promises that would serve as a source of conflict and tension, not just turning Muslims against Jews, but also against Britain and the West, which supported the Jewish presence in Palestine.

Finally, there was the Holocaust during World War II, which slaughtered some 6,000,000 of Europe's 10,000,000 Jews. This, and continuing anti-Semitism after the war, convinced surviving Jews that they could not trust the good will of a non-Jewish state to protect them from the recurrence of such a disaster. Consequently, they felt they must establish their own state and homeland in Palestine where they already had a foothold and which Britain still ruled as a mandate since World War I.

The foundation of Israel (1948). Therefore, after 1945 the trickle of Jewish settlers from Europe to Palestine became a virtual floodtide, as thousands of Jewish refugees arrived packed into any ship they could hire for the journey. Soon, the mounting tensions between Palestinian Arabs and the growing number of Jewish refugees flared into open violence, often taking the form of terrorist acts by both sides. Caught in the middle of this was Britain, exhausted from World War II and incapable of handling the growing chaos in Palestine. At a loss for any other kind of solution, the British rounded up Jewish refugees and shipped them back to Europe. Unfortunately, the war's destruction and the problem of 50,000,000 other refugees in Europe at this time often left only one source of shelter for many of the returning Jews: the old concentration camps they had inhabited during the Holocaust. Not surprisingly, many Jews escaped and made their way back to Palestine, further aggravating the growing violence there and Britain's inability to handle it.

Finally, in 1948, the newly formed United Nations, hoping to resolve the crisis, partitioned Palestine between Jews and Arabs, thus creating the Jewish state of Israel. Unfortunately, the proposed Jewish and Arab states were each split into three parts separated from one another by the other state's territory. Reacting against what they saw as a high-handed act by a pro-Jewish West, five neighboring Arab states declared war on the fledgling state of Israel.

A continuing cycle of violence. Thanks to hard fighting, a defense network of existing Jewish communities, and some outside help, Israel managed to win this war and seize more land to create one unified bloc of territory. However, Israel's problems were hardly over, for a new cycle of violence took over which still dominates the politics of the region today. Israel's victory caused thousands of Palestinian Arabs to flee to neighboring Arab states, most notably Jordan, Lebanon and Syria. Unfortunately, these were poor countries unable or unwilling to absorb so many refugees into their societies. In order to deal with the resulting instability and tensions as well as other internal problems, Arab leaders would often turn the anger of their own people and the Palestinian refugees against a convenient common enemy: Israel. Throughout this period, charismatic leaders such as Gamal Abdul Nasser of Egypt, Bashar al-Assad of Syria, and Saddam Hussein of Iraq would exploit this anger against Israel for their own political purposes and expand what could have been a local problem into a regional and global one. Then another war would break out (1956, 1967) where Israel would expand or tighten its hold on previously Arab lands, thus creating more refugees, and continuing the cycle.

Further complications. Israel's victory in 1967 proved a major turning point, because it virtually tripled the size of Israel giving it control of two things: millions of new Palestinian subjects and most of the old biblical land of Israel. Both of these factors vastly complicated Israel's situation. Ruling over a large Palestinian population meant the Palestinians were no longer just refugees scattered among neighboring Muslim states and looking for a home. Many of them were now gathered together under one government (Israel's), which gave sharper focus for the foundation of a Palestinian state. The Palestinians' high birth rate also

presented Israelis with the specter of eventually becoming a minority within their own country. With each successive year, the enemy within Israel's borders seemed more of a threat than the enemy without.

Then there was the issue of ruling the biblical Promised Land. From the start, the Zionist movement had been largely secular in spirit. Not that there weren't religious Jews involved, but the goal was to gain a Jewish homeland. There had even been talk of creating such a homeland in the middle of Africa. The 1948 partition created such a homeland in the territory of ancient Israel, but it by no means contained all or most of it. Thus Israel was a secular Jewish state for its first twenty years. However, gaining control of the biblical homeland in 1967 changed all that, since it triggered an influx of religious Jews determined to settle in the Promised Land. Unfortunately, Palestinians who had been there for centuries occupied most of that land. Feeling this was their God-given Promised Land, newly arriving Jews started destroying and replacing Palestinian communities with their own settlements along the West Bank of the Jordan River.

Although this was actively carried out and supported by a relatively small number of Israelis who fervently believed it their God-given right to do so, they had a disproportionate amount of influence in Israeli politics. This was because the large number of parties in Israel's political system made it virtually impossible for one party to gain an outright majority in elections, forcing it to form a coalition government with other parties. Therefore, small hard-line parties could threaten the stability of such a coalition if the ruling party did not allow continued expansion along the West Bank. Also, Israel's dangerous position made it easy for the right wing to play upon the wider public's fear of surrounding Muslims and gain its tacit, if not active support for continued expansion in the West Bank. Of course, Palestinian Arabs and their Muslim supporters viewed such a policy as aggression by *all* Israelis, much as Israelis would come to view all Muslims as terrorists.

Thus Israel was faced with a complicated dilemma. If it kept all Palestine as its Biblical heritage, it would give up being a predominantly Jewish and democratic state. However, if Israel gave up these

lands to stay Jewish and democratic, it would lose credibility and valuable support from a large number of Jews who felt the Israeli government had betrayed their faith. As a result, the Israeli government remained indecisive about the West Bank settlements, which just led to more Jewish settlements whose growing power kept the government from interfering with them, leading to more settlements, and so on.

With each year the tensions only grew worse.

ISRAEL AND THE ARABS SINCE 1973

New weapons: terror and oil. In 1973 another, conflict, known as the Yom Kippur war, broke out in the Middle East. As before, Israeli firepower, especially thanks to timely aid from the United States, led to a decisive victory. As Israeli troops surrounded the Egyptian army and threatened to destroy it, Egypt's leader, Anwar Sadat, asked for both American and Soviet troops to enforce a ceasefire on the victorious Israeli army. This raised the prospect of the two superpowers' forces meeting face to face in the Mid-East and starting World War III. Luckily, Sadat withdrew his invitation to the Soviets, thus defusing the situation, which had gone to Def Con 3, the highest it had been except for the Cuban Missile Crisis in 1962, when it had reached Def Con 2. (Def Con 1 would be nuclear war.)

Having suffered a continuous string of defeats at the hands of Israel in 1948, 1956, 1967, and 1973, it was clear that Israel, with American backing, was the big military power in the Middle East. Therefore, surrounding Arab states were reluctant to commit themselves to any more wars with Israel for the sake of a bunch of Palestinian refugees. Along with this frustration from repeated military defeats at the hands of the outnumbered (though not outgunned) Israelis, two other factors fed the Arabs' and Palestinians' mounting anger and led them to change their strategies. One was the continued encroachment of Israeli settlements along the West Bank and the resulting displacement of Palestinians from their homes. The other was growing support for Israel by the U.S., which was also increasingly dependant on the Mid East for oil. Out of this came two new weapons.

One was irregular and seemingly random terrorist attacks on Israel and, to a lesser extent, its Western supporters in Europe. Under the leadership of Yassir Arafat, a new disruptive force, the Palestinian Liberation Organization (PLO), emerged. Through hijacking airliners, attacking remote Israeli settlements, planting bombs in public places, and even the murder of eleven Israeli athletes at the 1972 Olympic Games in Munich, Germany, they sought to even the score against Israel. Much of their strategy was aimed to provoke a harsh over-reaction by Israel that would harm its image in the world. This largely worked, helping

spark a growing number of UN resolutions against Israel.

The U.S. also had a growing public relations problem with the Muslim world, since it was Israel's main arms supplier. To a certain extent, Mid-East wars were becoming testing grounds for American and Soviet weapons (the USSR supplying the Arabs with their weapons). After another humiliating defeat in the Yom Kippur War (1973), the Arabs turned to their second new weapon designed especially to hurt the U.S.: an oil embargo. The oil-rich Muslim states formed the Organization of Petroleum Exporting Countries (OPEC), which dramatically raised oil prices while drastically reducing oil supplies to the West. This especially hurt the United States whose giant gas guzzling cars were making it increasingly dependent on Mid-East oil.

Besides prompting efforts to make more fuel-efficient cars, the oil embargo forced the U.S. to be more sensitive to Arab feelings. A more peaceful approach especially suited the new American president elected in 1976, Jimmy Carter. Thanks largely to Carter's influence, Anwar Sadat, the Egyptian leader who had started the disastrous Yom Kippur War against Israel, realized the futility of further fighting and made peace overtures to Israel. At Camp David in 1978, Carter helped hammer out a peace settlement between Sadat and the Israeli leader Menachem Begin (a hardliner who had taken part in the bombing of the King David Hotel in 1946). In return for land taken in 1967, Israel gained recognition as a state, making Egypt the first Arab state to grant such recognition.

It was the first major breakthrough in establishing peace in the Middle East. However, a new vicious cycle took hold that frustrated further progress toward peace. As new Jewish settlements continued to replace Palestinian ones along the West Bank, the PLO would launch new terrorist attacks while Israeli F-16 jets retaliated against Palestinian camps. After both sides had suffered and realized the futility of the situation, there would be renewed peace efforts. However, this would worry extremists on both sides that too much would be given up in a compromise, so they would renew the violence and the cycle would repeat itself.

In 1987, Palestinians rose up against the Israelis in what is known as the First Intifada (literally “shaking off”). What made this especially noteworthy was the fact that it was a more or less spontaneous uprising by the Palestinian people instead of just another terrorist act carried out by the PLO. In fact, Yasser Arafat had to hustle to make a somewhat disingenuous claim to leadership of the movement. Although the Intifada, which lasted until 1993, accomplished nothing concrete, it did show there was a rising consciousness of nationalism among the Palestinian people.

Two events in 1991 radically altered the political landscape of the Middle East: the collapse of the Soviet Union at the end of the Cold War and the First Gulf War. The collapse of the Soviet Union opened the way for some 600,000 Jews to emigrate from Russia to Israel. Israel’s standing policy was to welcome any Jewish immigrants, but such a huge influx all at once proved impossible to handle alone. So Israel turned to the United States for economic aid for handling all these new people. The collapse of the Soviet Union also hurt the PLO, which relied heavily on the Soviets for military aid and diplomatic support in the United Nations.

The First Gulf War arising out of the invasion of Kuwait by Iraq’s dictator, Saddam Hussein, also hurt the PLO, because it supported Iraq for its missile attacks on Israel. However, since the rest of the Arab world opposed Saddam Hussein, the PLO lost support from oil-rich Arab nations. Saddam Hussein’s missile attacks also showed Israel’s vulnerability. Further exposing this vulnerability was a series of attacks within Israel led by a new organization, Hamas, which Israel had initially supported as a counterweight to the PLO.

All these factors, the decline of the PLO, Israel’s vulnerability to attack, and its reliance on American money, led to Israel and the PLO sitting down to talk face to face for the first time in 1992. The resulting Oslo Accords the next year called for more self-rule for the Palestinians and withdrawal of Israeli forces from parts of the Gaza Strip and West Bank. Unfortunately, hard-liners in Israel, led by Yigal Amir, feared a peace plan would jeopardize Israel’s security and assassinated their prime minister, Yitzhak Rabin, who along with Yasser Arafat and Shimon Peres had won the Nobel Prize for their peace efforts.

Once again, the cycle of violence started up as more Israeli settlements on the West Bank displaced Palestinians, triggering the Second Intifada in 2000. Israel would consistently respond to any Palestinian attacks and suicide bombings with harsh reprisals that only encouraged Palestinian reprisals of their own, and so on. While the Israeli army was an excellent fighting force for conventional warfare against other armies, it was not suited for dealing with the random acts of violence coming from civilians within its own country. Any reprisals were likely to kill innocent people, which hurt Israel’s public image in the rest of the world. The seemingly endless vigilance required for guarding against such things as suicide bombers also proved exhausting and frustrating, and at times resulted in Israeli soldiers lashing out at Palestinians, which just fed back into the cycle of violence.

At the same time, America’s apparent indifference to Muslim feelings and working for a lasting Mid East peace further angered many Muslims against Israel, the U.S., and the West in general, providing valuable recruitment propaganda for such terrorist organizations as Al Qaeda. As a result, starting in the late 1990s there was a surge of attacks against the U.S.: two American embassies in Africa in 1998, the USS Cole in 2000, and the World Trade Center in New York City in 2001. This provoked American intervention in Afghanistan and Iraq that dragged on for years.

COMPETING CROSSCURRENTS IN THE MUSLIM WORLD SINCE 1945

Historical background. In order to understand the complex problems of the Middle East, one has to understand their deep historical roots. One major component of that history is the centuries-long antagonism between Shi'ite Iranians (AKA Persians) and Sunni Arabs. Three major factors feed into this. One is Persia's long and proud historical and cultural tradition going back to the Achaemenid Dynasty (550-330 B.C.E.). Second was the Arab Muslims' conquest of Persia in the seventh century whereby Persia passed on its heritage to the conquerors while adopting their religion, Islam. The Third factor was the Sunni-Shi'ite split, which helped the Persians maintain a somewhat separate identity from their Arab neighbors.

A more recent catalyst to turmoil in the Middle East has been the state of Israel, founded in 1948. The one ethnic group this has hurt the worst has been the Palestinians, who fled as refugees in periodic waves to Israel's neighbors. Using Islam's message of social justice, they would pressure their hosts and other richer Arab states to help them regain their Palestinian homeland. Such a cause typically fit into the agendas of national leaders who were also dealing with complex domestic issues as well as problems with local and tribal loyalties inside their borders. Therefore, attacking Israel could serve the dual purpose of diverting their people's attention from local issues and also enhance their own prestige by posing as champions of Islam. Unfortunately, Israel, with Western aid, always won these wars (1948, 1967, and 1973), so that after 1973 the leaders of the various Arab states largely gave up on fighting Israel. Therefore, the Palestinians turned to "terrorist" tactics and organizations, in particular the Palestine Liberation Organization led by Yassir Arafat.

One state in the region that had not given up on leading a pan-Islamic crusade against Israel was Iran after its revolution in 1979 had replaced the pro-American shah with a radical Shi'ite Muslim regime. Therefore, soon after other Arab states had given up on fighting Israel, Iran took up the banner of supporting holy war against it. In addition to weakening or destroying Israel, Iran also hoped to gain status as the leader of Islam, subvert and

weaken neighboring Sunni Arab states, undercut American power and influence in the Middle East, and become the main regional power. Toward these ends, it embarked on an ambitious nuclear program, most likely with the intention of developing nuclear weapons. However, a powerful Iran is about as scary to Arab states as are Israel and the United States. Therefore, when Saddam Hussein, ruler of Iraq, attacked Iran in 1980, he got support from neighboring Arabs as well as the US. Also, the Gulf War (1991) and invasion of Iraq (2003) saw the growing presence of American forces in the region, which Iran viewed as a threat to its own power and even independence.

These developments have left Arab states torn between various policies. One is their fear and dislike of Iran versus their fear and dislike of America. They are also torn between loyalty to Sunni Islam and therefore hostility toward Iran on the one hand, and their loyalty to Islam overall (including Iran) and antagonism toward Israel and the United States on the other.

IRAN (1872-2009)

Historical background. Since its religious revolution in 1979, Iran has been the most fervent opponent of American policy in the Middle East. This is rooted in three historical threads. One is Iran's long proud history going back to the Persian Empire of the Achaemenid Dynasty (550-330 B.C.E.), reviving with the Sassanid Dynasty (224-651 C.E.) and again with the Safavid Dynasty (1501-1722). However, under the corrupt Qajar Dynasty (1794-1925) Iran fell increasingly into debt. Another important strain in Iranian history and culture comes from the Zoroastrian belief that rulers must rule justly or be overthrown. This fit in with the Muslim belief in social justice and especially fit in well with the Shi'ite branch of Islam in expressing the Persians' ethnic and cultural pride and independence from the ruling Arabs.

Iran and the West. The third historical thread was Iran's increasing contact with the West. By the 1800s, while the Qajar Dynasty was running into growing financial problems, Great Britain was forging ahead with the industrial revolution, which gave it tremendous technological and economic power. Therefore, British banks took the opportunity to gain increasing control of Iran's economy through loans that the government could not repay. Meanwhile, Russian expansion southward led to both Britain and Russia taking over parts of Iran. The British policy of setting up a dependant Iran as a bulwark against Russian expansion would be taken up by the United States.

By the late 1800s Iran was caught in a vicious cycle of conceding whole sectors of its economy to the British in return for loans, leading to rising popular discontent and a growing inability to pay off its loans, forcing it to make more concessions for loans, etc. In the twentieth century, the Iranian commodity attracting particular interest was oil. In 1908 the Anglo-Persian Oil Company, now known as British Petroleum (BP), struck a deal whereby nearly 85% of Iran's oil revenues went to BP. Its refinery in Abadan was the largest in the world for a good part of the century, indicating the growing importance of Iranian oil to the world economy. After the fall of the Qajar Dynasty in 1925, the new Pahlavi Dynasty tried to renegotiate the terms with BP, but gained nothing substantial.

At the same time, Iranians were becoming increasingly influenced by liberal and nationalist ideas from the West, and the Russian Revolution to the north, and the government was beginning efforts to modernize. However, any major reforms were put off during World War II, when Britain and the Soviet Union jointly occupied Iran to keep its oil out of Nazi hands. While the British honored the agreement to leave Iran at war's end, Stalin kept his troops in Iran until pressure from the US through the United Nations finally convinced him to leave.

Nationalization and repression (1951-79). In 1951, a new prime minister, Mohammed Mossadegh, came to power and nationalized Iran's oil, planning to use oil revenues to modernize Iran. In retaliation, the British pulled their trained technicians out of Iran, thus cutting its oil production in half, and blockaded its remaining oil exports, while increasing production in Saudi Arabia, Iraq, and Kuwait. One group supporting Mossadegh's moves was that of the Iranian communists, a fact that the British would distort and use to alarm the United States.

In 1952, the British tried to convince President Truman to overthrow Mossadegh in order to protect their oil supply, but Truman refused, largely because the US was virtually self-sufficient in oil at the time and had little sympathy for European imperial aspirations. Therefore, the next year, the British changed their approach toward the new president, Dwight D. Eisenhower, by saying that Mossadegh was turning communist. This convinced Eisenhower to authorize Operation Ajax, a joint CIA and British operation to overthrow Mossadegh and restore full power to Shah Pahlavi. The shah dismissed his prime minister and then fled to Rome until the CIA had staged a coup and overthrown Mossadegh. Mossadegh was imprisoned for three years and then kept under house arrest until his death from cancer in 1967.

In the aftermath of the coup, an oil consortium was formed to handle Iran's oil production and export, the bulk of the profits going to Britain and the United States. In return, the U.S. supported the shah, especially his army and brutal secret police (SWAK), which kept the Iranian people under his thumb and the Soviet Union at bay for the next quarter century.

The Iranian Revolution (1979) and Iran-Iraq War (1980-88). Public resentment against the shah finally boiled over in the Iranian Revolution led by the religious leader Ayatollah Khomeini. Khomeini established a strict and radical Islamic republic, which was staunchly opposed to Western, especially American, influence. The Iranians even seized the American embassy in Tehran, holding fifty Americans hostage until January 1981.

In 1980 Iraq's leader, Saddam Hussein, taking advantage of the turmoil caused by its revolution, attacked Iran to quell unrest by Iraqi Shi'ites and gain full control of the Shat al Arab, a 200 kilometer waterway between Iran and Iraq, the latter's only outlet to the Persian Gulf. The Iran-Iraq War was a prolonged agony for both nations, with neither side able to win a decisive victory, despite Saddam Hussein's use of chemical weapons and some help from the CIA. The conflict finally fizzled out under a UN ceasefire in 1988.

Growing American intervention and Iran's reaction (1990-2009). The cost of the war had been heavy for both sides, prompting Saddam Hussein to launch an invasion of Iraq's tiny but oil-rich neighbor, Kuwait in 1990. Once again, the Iraqi dictator had miscalculated as the US led a large coalition of powers in driving Iraqi forces from Kuwait in 1991. However, despite some urging to go all the way to Baghdad, President H.W. Bush stopped at the Iraqi border in accordance with his UN Mandate. This left Saddam Hussein in power, although Iraq was put under a strict embargo that hurt its people rather than its dictator. Twelve years later, Bush's son, President George Bush, invaded Iraq and overthrew Saddam Hussein under the pretext he was developing weapons of mass destruction, although UN inspectors said there was no evidence of such weapons. Unfortunately, the occupation of Iraq was badly handled, triggering factional fighting across much of the country.

Naturally, a strong American presence in the region worried the religious mullahs ruling Iran who reacted in several ways. For one thing, they clandestinely encouraged and supported Shi'ite groups in the factional fighting raging in Iraq, hoping to weaken American strength and resolve there. Secondly they embarked on an ambitious program to develop nuclear weapons and the missiles to deliver them, presumably against Israel.

However, this program was ruinously costly at the expense of the Iranian people and economy overall. Thus the third thing the mullahs did was maintain tight repressive control of the country while pursuing their other goals.

In 2009, disputed election results triggered massive demonstrations by Iranians protesting government fraud and oppression. Although the demonstrations were put down, resentment against the ruling regime continued to grow.

The Iran-Iraq War (1980-88)

The war between Iran and Iraq can be seen as another chapter in the Arab-Persian conflict spanning the centuries since the time of Mohammed. Border disputes dating from European colonial partitions after World War I also played a part, as did Saddam Hussein's own ambitions and fears. His ambition was to unify the Arab world against Iran and replace it as the major power in the Persian Gulf. His fear was that the Iranian Revolution in 1979 would incite uprisings against his own brutal and secular regime by Iraqi Shi'ites, who comprise 60% of Iraq's population,. Exacerbating matters was the fact that he had expelled the Ayatollah Khomeini from Iraq in 1977 and Khomeini vowed revenge after he seized power in Iran.

Geopolitically, Iraq was also in a precarious position since Iran controlled most of the outlets to the Persian Gulf. The main issue was the Shat al Arab, the 200 km. waterway between Iran and Iraq that led to the Gulf. Saddam claimed Iraq's share extended to Iran's shore. Iran, following an agreement in 1975, said the border ran down the middle of the channel.

The time seemed right militarily for Saddam, since Iraqi intelligence reported that Khomeini's religious revolution had purged the Iranian army

of many of its best officers for ideological reasons, replacing them with religious mullahs who had little or no military experience. In addition, Iran's bad relations with the US meant that it could not get spare parts for the American-made equipment the shah had built up in the 1970s. By contrast, Saddam had built up an army of 190,000 men supplied by its ally, the Soviet Union.

In 1979, relations between the two nations especially deteriorated after an assassination attempt on Iraqi foreign minister, Tariq Aziz, triggered the expulsion from Iraq of Iranian-born Shi'ites. Border incidents increased until September 22, 1980 when Saddam attacked.

Iraq on the Offensive (1980-82). The initial attack was an air strike, hoping to destroy Iran's US-supplied jets, much like the Israelis had done to their opponents in 1967. However, the strike failed in its mission, and Iranian jets struck back against Iraqi targets. Despite this failure, the Iraqi land assault quickly overran Iranian towns, especially in the South near Basra. This rapid advance continued until Iranian president, Bani Sadr, released from jail pilots thought to be loyal to the shah. With their planes adequately piloted, the Iranians blunted the Iraqi offensive. Early in the war, American planes flown by well-trained Iranians proved superior to their Iraqi counterparts flying Russian Mig 23s.

By November 10, 1980, Iraqi forces controlled the Shatt al Arab and an 80-mile wide swath of territory inside Iran. Iran called for 200,000 volunteers and recalled some men from the shah's old army. Iran's religiously devoted, but poorly armed and trained, soldiers stopped the main Iraqi advance in the south, but at a frightful cost. Many Iranian volunteers even carried burial shrouds, anticipating martyrdom. Iranian commandos and jets also attacked Iraqi oil installations and pipelines to destroy its economic ability to wage war. Saddam hoped the 3 million Arabs in southern Iran would join his cause, but they fought for the Iranian regime instead. Similarly, later Iranian attempts to rally Iraqi Shi'ites to their cause would fail. With their offensive stalled, Iraqi troops dug in to hold their gains.

Iran's first major offensive failed largely for political reasons. Iranian president, Bani Sadr, locked in a power struggle with the religious leaders, courted the old regular army's support and launched a disastrous offensive that failed largely because of his own military inexperience. Consequently, Khomeini ousted Bani Sadr from power, made peace with the army which now cooperated with his volunteer militia, known as the *Basji*. This cooperation led to two major Iranian victories in late 1981 and early 1982. However, religious ideology, superior manpower, and the steady depletion of its American-made equipment without access to spare parts, led to the Iranian tactic of human wave assaults that would cost hundreds of thousands of Iranians their lives. Luckily for Iran, Iraqi troops were much more reluctant to take casualties in such offensives since they were heavily outnumbered.

Iran resurgent (1982-84). In March, 1982, Iran's regular army and militia launched a major offensive that pushed the Iraqis out of Iran and onto the defensive. In June, Saddam withdrew all his forces into Iraq, hoping to end the war. However, Iran's religious leaders were back in control of the military operations, refused to make peace, and launched Operation Ramadan on Iraqi. However, instead of using artillery to clear the way, they sent in human waves of barely trained soldiers, some as young as age 9, to clear minefields for their tanks. Much like World War I, these efforts gained minimal territory at horrific cost.

In late 1982, the Soviet Union, fearing the spread of Iran's Islamic revolution to its Muslim republics, heavily reinforced Iraq with new weapons that it used to restore its defensive lines. Throughout 1983, Iran launched more human wave assaults that, once again, made minimal gains while taking staggering losses. By the end of the year, an estimated 120,000 Iranians and 60,000 Iraqis had been killed.

In 1984, Iraq bought more equipment from Russian and France. Although mostly on the defensive, Saddam launched air raids on Iranian cities and chemical attacks on Iranian forces. The US helped in the latter by providing Iraq detailed information on Iranian positions.

Stalemate (1984-7). By the end of 1984, Iran had lost an estimated 300,000 killed and wounded, while Iraq had lost 250,000. Western military analysts pointed out the inefficient use of modern weapons on both sides. Instead of using tanks to spearhead assaults, they dug them in and used them as stationary artillery. Modern sighting technology was rarely used, reducing tank and artillery accuracy to World War II levels. Both sides would also abandon disabled heavy equipment, because they lacked the training or skills to repair them. Neither army coordinated movements between different units, while officers lacked the training and initiative to take action before referring back to central command for orders. As a result, the war ground to a stalemate with neither side able to dislodge the other.

Desperate to gain an edge, both sides launched air, artillery and missile attacks on each other's cities, while Iraq continued use of mustard and nerve gas against Iranian positions. In 1986, the UN formally charged Iraq with violating the 1925 Geneva Protocol that banned using such weapons. Saddam tried denying their use, but chemical weapons victims flown to European hospitals thoroughly discredited him. Chemical warfare led to an estimated 10,000 casualties by 1986. In 1988, Saddam again used chemical weapons, this time against his own rebellious Kurdish subjects who had helped Iranian forces in the North.

By 1987, Iraq had constructed a sophisticated defensive network along its southern border with Iran. However, a successful Iranian offensive in the North forced Iraq to adopt a more offensive strategy. By now, Saddam had learned to entrust his officers with more initiative. The resulting improvement in Iraqi effectiveness and change to an offensive strategy now neutralized Iran's military advantages. Gradually, the Iraqi air

force, being constantly re-supplied by its allies, dominated the skies against the Iranian planes which suffered increasingly from the lack of spare parts. By late 1987, Iran had lost the ability to mount effective offensives against the massively re-supplied Iraqi forces.

The Tanker War. Meanwhile, both sides were waging war on each other's oil producing and selling capabilities. Iran, was helped by Syria which cut off Iraq's pipeline to the Mediterranean, Iraq's oil exports were reduced by 70%, while Iraqi air raids cut 50% of Iran's oil exports. Since Gulf oil supplied 70% of Japan's, 50% of Western Europe's, and 7% of America's oil needs, this aspect of the war had serious international implications. Complicating it further was the fact that most of the tankers attacked were neither from Iran or Iraq.

At first, only Iraq attacked neutral ships in its self-declared war zone. However, in 1984, Iran started retaliating. In 1984, the Saudis shot down an Iranian plane intruding on their air space, which prompted both sides to agree to a moratorium on attacking civilian targets.

However, Iraq soon resumed its attacks on tankers. When an Iraqi missile hit the USS Stark and killed 37 crewmen, the US used the incident to blame Iran and send naval ships to the Gulf. After an Iranian attack on a reflagged vessel, the US retaliated by destroying two Iranian oil platforms. By 1988, ships from at least 10 Western and 8 regional navies were in the Gulf to protect tankers.

The End of the War. Diplomatic pressure from both superpowers increased in 1987, although American aid to Iran supposedly in return for freeing hostages in Lebanon, discredited US efforts in the eyes of many Arabs. From April to August, 1988, Iraq launched three major offensives, using chemical weapons to pave the way. The success of these offensives convinced Iran to agree to a UN sponsored ceasefire on August 20. The war resolved none of the issues that started it. Iraq suffered an estimated 375,000 casualties, while some 300,000 Iranians were killed and another 500,000 were wounded.

AN OVERVIEW OF THE CHINESE REVOLUTION (1911-?)

Introduction. Although the Chinese Revolution is still a work in progress, one can see how it has followed the patterns of other revolutions (i.e., English, French, and Russian) and the direction it could very well be headed based on those revolutions. Of course, there are elements unique to Chinese history that could cause it to end very differently than is conjectured here, just as there are any number of unforeseen events (e.g., a comet hitting the earth) that could do the same. Still, based on the historical record to date the last part of this chapter still stands as a probable outcome and is worth considering.

The Revolution's initial moderate stage (1911-25). As with other revolutions, the Chinese Revolution started out with a moderate phase, more specifically the liberal republic under Sun Yat Sen. And, as with other revolutions, it had its good and bad points. On the plus side, it was moderate enough to be acceptable to a wider range of people. On the negative side, it couldn't afford to take the drastic steps necessary to solve the crisis situation that led to the revolution in the first place. Therefore, the initial transition to a new system of government, known as the Nationalist government, created more confusion and turmoil, in particular fighting with two main elements: the communists, who would eventually be led by Mao Zedong, and various independent warlords scattered across China. Therefore, one can say that Sun Yat Sen's death in 1925 serves as a watershed as the revolution moved into its crisis phase.

The Revolution's crisis stage (1925-1949). As with other revolutions, the Chinese Revolution became caught in a vicious cycle whereby civil war primarily between the Nationalists, now led by Chiang Kai Chek, and the communists (with the various warlords peripherally involved) created more chaos and turmoil in the 1920s and 1930s, which fanned the flames of civil war, and so on. And, as so often happens, neighboring powers got involved for their own purposes. First, Japan seized Manchuria in 1931. Then, six years later, moles working for the Soviet leader Stalin instigated an all-out war between Japan and China in order to keep Japan diverted from attacking the Soviet Union.

As the Pacific theater of World War II expanded, the Nationalists and communists put their own conflict on hold (for the most part) until the end of the war.

After Japan's defeat in 1945, the civil war between the Nationalists and communists resumed, and Stalin's intervention played a major role in two ways. One was supplying the communists with captured Japanese weapons and training officers. The other was, once again, Stalin's moles in high positions in Chiang Kai Chek's army that repeatedly betrayed the Nationalist cause. On October 1, 1949 the Mao and the communists proclaimed victory in Tiananmen Square in Beijing. The revolution now moved into its dictator phases.

China under Mao (1949-76). Much like Stalin, whom he consciously imitated, Mao's long reign would leave a long-lasting legacy that it would take China decades from which to recover. In fact, Mao gained the dubious distinction of being responsible for an estimated 70,000,000 deaths, more than any other man in history including Hitler and Stalin. Of all the dictators in history, none has done more damage to more people in the pursuit of his own narrow personal goals.

From the start, Mao followed aggressive and destructive foreign and domestic policies. Like Stalin, he arbitrarily chose some peasants for other peasants to purge as an imagined group of landlords. Likewise, he purged religious groups (especially Catholics), bureaucrats, and businessmen. He enforced his terror through the use of propaganda, torture, forced labor camps and mass rallies where communists would incite crowds to attack Mao's enemies. In order to get military aid from Stalin, he traded vital supplies of food, starving his own people in the process. He also aggressively pursued a program to get the atomic bomb. (He even test flew a notoriously unreliable missile with a nuclear warhead on a flight path over his own cities. Luckily, this time it worked right.) In foreign policy, he entered the Korean War (1950-3) as part of a military aid deal with Stalin, sacrificing several hundred thousand Chinese lives in the process, not to mention contributing to the total devastation of North Korea.

At one point, he seemed to lighten up by encouraging free speech in his "Let a Hundred

Flowers Bloom” campaign. However, when people started criticizing him, he had them arrested and “corrected”. After that he launched “The Great Leap Forward”, a crazy scheme to take peasants out of the fields and focus on China’s industrialization, largely by building backyard steel furnaces that produced worthless third-rate steel. Even worse, neglect of the agriculture led to a famine that cost anywhere between 30-45,000,000 lives.

In 1965, Mao launched the “Great Cultural Revolution” (1966-70), a campaign to purge anyone who opposed (or did not slavishly follow) his policies and personality cult. While the Great Leap Forward killed millions, the Great Cultural Revolution created a deeper and more widespread swathe of turmoil and disruption across China. For one thing, most teachers were purged, so the army ran the schools and converted them into brainwashing classes where students endlessly studied and memorized the writings of Chairman Mao. By the time Mao died in 1976, China was in much worse shape than it had been in centuries. Luckily, help was on the way.

Economic development toward democracy (?): Deng Xiao Ping and the Four Reforms. Even before Mao died, he was losing his grip on power and more moderate leaders were coming to the fore, most notably Deng Xiao Peng. China since Mao’s death has largely resembled France under Napoleon III (1851-70): combining strong autocratic rule with economic development. As a result, China has experienced remarkable economic growth since 1976, but growth that may contain the seeds of trouble for the ruling regime, because with economic growth comes an expanding and educated middle class who want more political freedom. As the gap between economic progress and lack of political progress widens, the stresses and strains within China are increasing, raising the possibility of democratic reforms or revolution in the near future.

MAO ZEDONG AND CHINA (1937-76)

"A revolution is not the same as inviting people to dinner... or doing fancy needlework-- Mao Zedong

World War II (1937-45). When war broke out with Japan in 1937, the Nationalist leader, Chiang Kai Chek, had to put the civil war on hold and allow Mao Zedong and the communists autonomy in exchange for help against Japan. Despite this truce, Mao continued to attack Nationalist forces instead of the Japanese and to follow in the wake of the Japanese advance to take over the countryside, since the Japanese only had enough forces to hold the cities. The Communist Party (CCP) would also exploit Nationalist defeats by rounding up recruits from their beaten army.

Although Stalin pushed the CCP to fight the Japanese, the only major battle against Japan for years was an ambush of a Japanese convoy at Pingxingguan in 1937 that killed some 200 Japanese soldiers. And this engagement was fought by Lin Biao, acting in *defiance* of Mao's orders. When Germany attacked Russia in 1941 and the Soviets were unable to provide Mao with as much aid, he promoted the opium trade to raise cash. Unfortunately, the huge influx of money into Yenan province, Mao's base of power, triggered rampant inflation that impoverished the area for decades.

Since the Chinese army was no match for the more mechanized Japanese forces, switched to a strategy of trading space for time by retreating into the vast interior of China. This drew the advancing Japanese forces further and further inland and stretched their lines to the limit. The war now settled down to a costly stalemate that burnt, bled, and bent China, but could not break it. Thus the Chinese grimly hung on until victories on other fronts would finally beat Japan. The war would cost 20,000,000 Chinese their lives and leave another 95,000,000 uprooted and homeless.

Resumption of Civil War (1945-49). Just as the war in Asia was almost over, Stalin declared war on Japan, seized Mongolia and occupied Manchuria which had China's best deposits of coal, iron, gold, timber and 70% of its industries, although Stalin

had whole factories carted off and others demolished. Not until May, 1946 did the Russians leave Manchuria, turning it over to the communists.

While his generals wanted to establish bases along the Soviet border where their troops could get training and then concentrate on taking the countryside, Mao insisted on the wholly unrealistic strategy of trying to take and hold cities. Only after his urban strategy proved a disaster, did Mao adopt his generals' strategy, which his propaganda would insist was his idea all along.

The U.S. also helped ensure a communist victory, since secretary of state, George Marshall, didn't like Chiang Kai Chek and believed the communists when they said they wanted to establish an American style democracy and even change their party name from communist. Meanwhile, Stalin disavowed support for the communists to make them look more moderate. As a result, Marshall forced Chiang to agree to a ceasefire just as he was about to destroy the communist forces.

This may have been the most decisive event in ensuring the communist victory, because by the time war did resume in October 1946, Stalin had built up the communist army with captured Japanese and even German weapons: some 700 tanks, over 3700 artillery, mortars and grenade launchers, and almost 12,000 machine guns. Japanese prisoners of war were used to train the Red army and show them how to use Japanese weapons; while Japanese pilots trained the Red air force, some even taking part in combat against the Nationalists.

Another factor giving Mao and the communists victory was the fact that a number of Chiang's top general were actually moles working for Stalin. Time and again they would follow ridiculous self-destructive strategies that delivered hundreds of thousands of Nationalist troops into communist hands. Yet amazingly, Chiang refused to replace them with loyal commanders.

As the communists advanced through China, Mao proved himself a ruthless victor. For example, when besieging the Manchurian city Chanchun, he told his commander, Lin Biao, "Turn Changchun

into a city of death.” As a result, the city was besieged mercilessly, with no civilians allowed out. In the end, 350,000 out of 500,000 innocent people died. That was more than died at Nanjing.

In 1949 Mao’s forces, supported by Stalin, finally prevailed against the American backed Nationalist forces. Chiang Kai Chek retreated to the island of Taiwan where his government continued to rule, claiming it was the only legitimate regime for all of China. The status of a prosperous democracy on Taiwan, backed by American military support and claiming independence from the mainland communist regime, remained a serious source of tension into the 21st century.

“Many places ...don’t dare to kill counter-revolutionaries on a grand scale with big publicity. This situation must be changed.”—Mao
“This is a war on food producers as well as on food consumers.”--Mao

War on the Peasants. In the immediate aftermath of his victory, Mao kept most pre-communist bureaucrats and the old machinery of government until he was more established. Likewise, much of the economy remained in the hands of private individuals who were told to keep the factories running and shops open. However there were major changes in censoring the media and replacing the law courts with Party committees, which stripped people of any legal protection. Supposedly people had the right of appeal, but exercising such a right was treated as a crime, with officials doubling the sentence. In addition, a registration system locked everyone in China into fixed, and usually immutable, jobs and places to live. It was enforced by a nation-wide system of Order-Keeping Committees, often composed of a village’s nosiest and most hyperactive people.

In the early 1950s, Mao started to suppress various secret societies and religious groups, branding them as reactionary enemies of the revolution. He especially targeted China’s 3,300,000 Catholics through smear campaigns, charging them with cannibalism and conducting bizarre medical experiments. Hundreds were executed, and by 1953, most foreign clergy and businessmen had been expelled from China

However, instead of easing up on his terrorist tactics, Mao merely made them more pervasive and systematic. One campaign of terror was euphemistically called the “Struggle against the landlords,” a misnomer, since there were few rich landlords left in China. Much like Stalin’s collectivization campaign against a non-existent class of kulaks, Mao settled on attacking anyone who was relatively better off than his neighbors or was just disliked for whatever reasons, having an illicit affair being an especially popular reason. Cadres (gangs of party officials, many of them former Japanese soldiers) were told to randomly pick whole families, including their children, as targets. Village children were even organized and encouraged to beat up the “little landlords” Mao constantly berated provincial cadres for being too soft and urged more “massive arrests, massive killings”. When he criticized one province’s cadres for “being much too lenient and not killing [enough], they raised the execution rate, causing Mao to applaud this “improvement” and feeling “very delighted”.

Torture was also rampant. One older man had a wire run through his nose and his son was forced to pull him through the village like an ox with blood streaming down his face. Babies still nursing were torn apart at the limbs and tossed into wells. One village had a rule that “anyone not active in denouncing landlords will be stoned to death.”

Mao liked to carry out these purges at mass rallies where the victims had to face large crowds who were whipped up into frenzies against them. Mao’s son, An-ying described how in one case 10,000 people were herded together for a week in extremely cold weather. “*After careful rehearsals, on the fifth day, denunciations began...all the masses were told to raise their weapons when the word was given and shout several times: ‘kill, kill, kill’ ...the rally site was in a chaotic storm and ended in eight people being beaten to death.*”

Beijing alone witnessed some 30,000 sentencing and execution rallies. In one rally, 200 people were paraded and shot in the head so their brains splattered onto onlookers. It was common to see trucks carrying corpses through streets, still

dripping blood. The main difference between Mao versus Stalin and Hitler was they kept their worst atrocities secret, while Mao publicized them.

In an anti-corruption campaign the Communists grilled and screened 3.83 million bureaucrats, torturing some by having their testicles crushed in bamboo pliers. In January 1952 Mao launched the “Five antis” campaign against corruption to purge private businessmen whose property still had not been confiscated. This program led to some 200-300,000 suicides. Typically, a victim would jump onto a sidewalk instead of into a river so the government had a body and couldn’t punish his family because he had fled. This, along with the “land reform” then running led to some 3,000,000 deaths from execution, mob violence, or suicide

Like Stalin, Mao also had a vast labor camp system in the north with an estimated 10,000,000 inmates sentenced to backbreaking labor, many of them in dangerous mines. All told, Mao’s camps, purges, rallies, etc. killed some 27,000,000 people, as many as all the Soviets who died in World War II

The Korean War (1950-53). One common myth about Mao is that he committed Chinese troops to the Korean War to aid an Asian ally. Rather, he joined the Korean War as part of a deal with Stalin: China would fight the Americans as Russia’s proxy in exchange for Soviet technology and equipment. By 1951, Mao had taken 100,000 casualties and was ready to expend another 300,000 lives through human wave assaults and exposing his troops to starvation and temperatures as cold as 30 degrees below zero.

Chinese intervention in the Korean War was especially disastrous for North Korea. Kim Il Sung constantly begged Mao and Stalin to agree to a truce, but they insisted on dragging out the fighting to weaken America. By war’s end in 1953, virtually all of North Korea had been destroyed.

Mao’s foreign policy or The Great Chinese Food Give Away. Mao’s driving ambition was to make China an industrial and military superpower. For this he needed Stalin’s help, and Stalin wasn’t about to give it away for free. Mao paid for Russian aid with Chinese food, despite the fact that China was a

food *importer*, having 22% of the world’s population and only 7% of its arable land.

After Stalin’s death in 1953 and the emergence of a new leader Nikita Khrushchev, relations between Russian and China soured, but this didn’t stop Mao from exporting more food. In order to undermine Khrushchev’s influence, Mao actually gave food to richer Eastern European nations such as Hungary after the 1956 uprising, Romania, and East Germany, which was even able to lift its own food rationing in 1958. Under Mao, China gave 6.92% of its GDP in foreign aid, often to countries richer than itself, while the richest countries were giving no more than 0.5%.

To do this, he drove China’s peasants to near starvation, and many of them past it. To gain greater control over the food supply, Mao kept peasants from moving to other village. Mao’s policy was to leave people just enough to subsist and take the rest to trade away. He determined 200 kilograms of grain a year per peasant was enough for basic subsistence, and then decided they only needed 140 kilograms and some (especially women) only 110 kilograms. In 1953, he declared to his politburo they were “at war with the whole population” and prepared for deaths and riots in 100,000 villages (10% China). Many Chinese saw suicide as the only way out of their misery, and as many as 250,000 people took their own lives in despair during this short period.

In 1955, Mao tightened the screws more tightly on the peasants, by ordering forced collectivization of the land. This made it harder for China’s 100 million peasant families to hide grain, Collectivization also made it easier to supervise the peasants’ work and double their hours, in particular those of women who before had not worked in the fields.

Mao also nationalized industries, but left businessmen alone since he needed their skills. That isn’t to say that life in China’s cities was any bargain. Under Mao, virtually no new housing was built in Chinese cities despite rapid population growth.

The Hundred Flowers Campaign. In 1956, with

the slogans “Let a hundred flowers bloom” and “Let a hundred schools of thought contend.” Mao encouraged China’s intellectuals, even those who felt estranged from his revolution, to freely speak their minds. After some initial hesitation, scholars did just that, even questioning the legitimacy of Mao’s rule. Unfortunately for those intellectuals and dissidents, it was a trap set to lure them out into the open. Quickly ending the Hundred Flowers campaign, Mao rounded up 5000 free-speaking “rightists” for “rehabilitation”. Eventually, Mao’s regime would identify and “rehabilitate” 450,000 more “rightists”.

The Great Leap Forward (1958-62). In May 1958, Mao launched The Great Leap Forward, probably the most disastrous domestic policy in all of history, at least in terms of lives lost. Its avowed purpose was to make China an industrial power that would overtake the West in 5 to 10 years. It was based on Mao’s almost total ignorance on agricultural and industrial matters and the mistaken belief, which no one dared contradict, that much greater crop yields could be produced in much less time and on a fraction of the previous land in cultivation. This would also free tens of millions of peasants for Mao’s industrial ambitions.

The main goal was to produce steel by setting up backyard furnaces across China. Anything made of iron was thrown in, including farm implements, and what came out was a lot of worthless third-rate steel. Peasants were also drafted to build roads, bridges, railroads, and dams with little more than their bare hands, making most of these projects structurally unsound and unusable.

With so many peasants taken from the fields, hunger and starvation soon followed. Adding to the misery were local officials who had promised Mao unrealistic amounts of grain and had to take everything from the peasants to meet their quotas. Severe penalties, such as being buried alive, having limbs amputated or noses cut off, were given to those suspected of stealing or hoarding food. In one case hungry children were hung from a wall by wires piercing their ears. While people were reduced to eating grass, leaves, and tree bark, the government suggested they eat chlorella, a type of algae growing in stagnant pools of urine. People

even resorted to cannibalism. Some dug up bodies from graveyards. Others ate dead relatives while concealing their deaths so they could use their ration cards. In the most horrific cases, neighbors traded each other their children so at least they didn’t have to eat their own offspring.

During the Great Leap Forward, Mao experimented with the idea of replacing everyone’s names with numbers. He also mobilized children in their own campaign to eliminate the Four Pests: flies, mosquitoes, rats, and sparrows. Unfortunately, killing so many sparrows upset the ecological balance, leading to bug infestations on crops. So bedbugs replaced sparrows as the fourth pest

If Mao or other officials toured the countryside, local officials would hide the horrible conditions prevailing by replanting crops along the side of the road and stocking selected peasants’ huts with ample amounts of food. They even painted trees to hide the fact that the people were eating tree bark. Meanwhile, as millions of his own people starved, Mao was still trading much of China’s food to Russia and Warsaw Pact nations in return for military aid.

As the scope of this disaster became apparent, a power struggle broke out between the realists and the extreme ideologues headed by Mao. However, instead of abandoning the Great Leap Forward, Mao turned it into an anti-rightist campaign to eliminate his enemies. Meanwhile unrealistic quotas were set for 1959. The Great Leap Forward continued until 1962. Estimates of deaths from this catastrophe range from 30 million to 45 million. World War II was the only man-made disaster that killed more people.

“The more books you read, the more stupid you become.”--Mao

“We need the policy of ‘keep people stupid.’--Mao
The Great Cultural Revolution (1966-70). Mao’s anger and insecurity about his position of power set up one of his best known and most disruptive programs: The Great Cultural Revolution. As the quotations above suggest, Mao’s intention was more to destroy culture than to revolutionize it. Essentially, he wanted a brain-dead society of people with no feelings at all and the willingness to

obey him mindlessly. Even Hitler allowed apolitical entertainment and Stalin kept the classics, for which Mao criticized him.

In May 1966, Mao created a new office, The Cultural Revolution Small Group that would form the new inner circle with Chou En-lai, Lin Biao, and Kang Sheng. The first stage of the Cultural Revolution was to terrorize China back into submission. For this Mao would use China's teenagers, who were naturally prone to activism and he figured could be easily manipulated for his own purposes. Unfortunately, he was right.

In June Mao urged students to condemn their teachers for poisoning their minds with "bourgeois ideas" and persecuting them with exams, which were now abolished. Furthermore, he told them to "safeguard Mao", although how teachers or any other group were a threat to the "Great Helmsman" was not specified.

On June 13, Mao ordered all schools closed, which freed the young to carry out his purge. Two days later, students dragged scores of teachers and party cadres at Beijing University in front of crowds who blackened their faces, put dunce hats on their heads and forced them to kneel. Many of the teachers were beaten up, while some of the women were sexually molested. These sorts of scenes were repeated across China and led to a wave of suicides. Mao's followers were called the Red Guards, after a name adopted by students at a particularly vicious girls' middle school.

On August 1, Mao circulated a letter announcing his fiery support for the Red Guards and told officials to promote more such groups. As a result, officials had their children form Red Guard units that would carry out terror, little suspecting how that terror would later be expanded to purge them. As a result, the leadership by the officials' children would end and the Red Guard units they led would fall apart.

August 5th saw the first known death by torture when the girls at a school with lots of officials' daughters in it kicked and trampled the school's 50-year-old headmistress. Then they poured boiling water on her and forced her to carry a heavy load of bricks while being beaten with brass belt buckles

and sticks studded with nails. Her death and the authorities' failure to say anything to discourage such behavior were interpreted as a sign to continue the violence.

On August 18, Mao, dressed in military uniform for the first time since 1949, addressed several hundred thousand Red Guards, encouraging more violence by telling them "Be violent!" Violence indeed multiplied in schools and universities as Red Guards spread across China to show others how to do such things as thrash victims and make them lick their own blood off the pavement.

Travel, food, and lodging for Red Guards was free, bringing some 11,000,000 of them to Beijing to attend huge frenzied but well drilled mass rallies in Tiananmen Square where Mao appeared seven times in August. These mass demonstrations contributed to the further worship and deification of Mao, and helped him to vanquish local political and Party resistance to the Cultural Revolution.

On August 18, Lin Biao called on the Red Guards to "smash...old culture", leading them to attack shop and street signs with hammers and rename them something more revolutionary. They also attacked anyone in the streets wearing long hair, skirts, shoes with high heels, giving them haircuts and ill-fitting uniforms, now the mandatory attire of the Cultural Revolution. Children of officials led these actions reciting this poem, not realizing they were setting up their own "hero fathers" for later purges.

On August 23, Mao declared "*Beijing is not chaotic enough...Beijing is too civilized.*" This inspired Red Guards to attack two dozen of China's best known writers, hanging big signs with thin wire around their necks while thrashing them with belt buckles in the hot sun. Then they were taken to an old Confucian temple where they had to kneel before a bonfire of opera costumes and props, while constantly being punched and kicked. One writer, Lao She, once lauded by the regime as "the people's artist", drowned himself the next day.

On August 21 and 22, Mao ordered the army and police not to interfere.

During the Cultural Revolution, discussions could

border on the absurd. There were serious discussions on whether to switch stoplight colors, so that red, the color of revolution and progress, would stand for go and green, the color of capitalist green money, would mean stop. Mao specifically chose targets for Red Guards to attack. All across China, gangs of Red Guards broke into homes, burned books, cut up paintings, trampled phonograph records and musical instruments and destroyed anything that had to do with “culture”. Many victims were tortured to death in their own homes; others were hauled off to makeshift prisons in former theaters and stadiums. In August and September, 33,695 homes in Beijing alone were raided, leading to 1772 people being tortured or beaten to death.

The Communist paper, *People’s Daily*, called these raids “simply splendid”.

Then on August 31, Mao did an apparent about face, proclaiming “*Denounce by words, and not by violence.*” This allowed some Red Guards to opt out of violence and helped save some victims who shouted this slogan to threatening Red Guards. House raids allowed Party officials to confiscate tons of gold, silver, platinum, jewelry, foreign cash, art objects, paintings, and books, much like Nazi leaders had done. These raids also emptied many homes, providing living space for others while the owners were moved into one room or deported to the countryside. Many people, fearing Red Guards would burst in and find “culture”, destroyed their own books and art objects, helping Mao in his campaign to eliminate culture.

In addition to book burnings and methodical destruction of works of art, Mao also destroyed historical monuments. Mao ordered the desecration of Confucius’ home in Shandong, a richly endowed site, proclaiming, “*Confucius is humanism...that is to say, People-centered-ism*”. Of 6,843 historical monuments still standing in 1958, 4,922 had been destroyed by 1966.

On September 15, 1966, Mao shifted the focus of the Cultural Revolution to his real goal: purging party officials he saw as a threat to his power. Addressing a mass rally in Tiananmen Square in Beijing, he told his followers to pursue these

people, calling them “capitalist-roaders” for supposedly pursuing a capitalist road. These purges were led by new groups, also calling themselves Red Guards, but consisting primarily of adults known for taking on bosses. The more unruly Red Guard units made up mostly of teenagers fell apart as their leaders, often themselves the children of officials being purged, were also eliminated.

People were told that since 1949 the Party had been in the hands of villains called “the black line” and that all except Mao and a few close associates must be purged. Of course, this might raise the obvious question of why should the Party rule at all if it was so corrupt, but no one ever dared to openly ask such a question. The standing order was to purge all party bosses, whether they had been loyal to Mao or not. Some rebels did it out of loyalty to Mao, others did it out of hate for their old bosses, ambition to seize power, or just a sadistic love of violence. Whereas Stalin had purged, tortured and killed victims behind closed doors, Mao did it publicly, making the people his accomplices in crime. He even had these tortures openly photographed and filmed tortures, so he could enjoy watching them at home.

Millions of officials were exiled to de facto labor camps called “May 7 Cadre Schools”. Some victims were tortured by having loudspeakers placed directly by their ears so they could be deafened and never hear reactionary ideas again.

Replacements now had to be found for the 50,000 purged officials. Most of them came from the army, along with a handful of old officials kept on for continuity. In March 1967, schools were reopened, but now also run by soldiers who had little or no knowledge of the academic subjects normally being taught. Therefore they replaced real education with readings from Mao’s *Little Red Book* and endless indoctrination in Maoist theory. The result was a lost decade of education for that generation of Chinese.

For the most part, the regular economy of shops, banks, factories, and farms kept running during all this with only minor disruptions from personnel changes at top. However, for life outside work, leisure disappeared as books, magazines, plays,

operas, films, and light music on the radio were replaced by endless mind-numbing and nerve-racking meetings full of public humiliations, readings from Mao's book, and Mao Thought Propaganda teams singing songs of Mao's sayings and dancing while militantly waving the Little Red Book to raucous music.

During the Cultural Revolution, days were structured around "*asking for instructions in the morning, thanking Mao for his kindness at noon, and reporting back at night*". In the mornings, everyone would announce what he or she planned to accomplish for the revolution that day. In the evenings they would report on their successes and failures for the revolution that day and make resolutions for the next day. They also engaged in ritualistic bowing three times, singing the national anthem, reading passages from Mao's Little Red Book in front of his picture or bust, and wishing him "10,000 years". They might also do the "loyalty dance" which mostly involved stretching one's hand from the heart to Mao's picture.

Meanwhile, Mao cavorted at his estate at Zhongnanhai with a continuous stream of girls brought in for his entertainment. One by one, old colleagues disappeared, either purged or disgusted by the whole thing. In February 1967, some Politburo members did speak out against all this, but being old-time devotees of Mao and conditioned to obey, they caved in when harassed and Mao let them continue in office.

Amazingly, some individuals defied this madness.

One such protester was Nien Chang, a woman with ties to the old regime who was targeted by the Red Guards during the Cultural Revolution. In this case, the Red Guards had tangled with more than they could handle, since she was a woman of iron will who never backed down to their terror tactics. When in jail, she picked arguments with her guards whose mindless quotes from Chairman Mao wilted against her powerful arguments. In response they tortured her and forced her to live in an unheated cell with her hands tied behind her back, even for her meals. She survived bouts of fever and the malpractice of peasants turned into doctors by the Maoist quote "We learn to swim by swimming."

When the Cultural Revolution calmed down and Nien Cheng was given her release from prison, she refused to leave until she was given a written apology by the authorities. She got her apology and soon afterwards emigrated to Canada. The Chinese authorities were probably glad to see her go.

***"I'm not going to reveal the bottom line to you in this campaign, we must put to death about one-third or a quarter of the class enemies by bludgeoning or stoning."* –Mao**

In 1967 Mao, wanting a paramilitary group like Hitler's storm troopers, decided to distribute guns to groups loyal to him. Unfortunately, it wasn't always easy to tell which groups truly supported Mao, since they all claimed to be loyal. Therefore, the Army had to decide which groups were truly "leftist" and should be given guns for pursuing Mao's enemies. Factions not so favored merely raided arsenals for their own munitions, often helped by sympathizers in the army. Consequently guns became widely available to groups that were nothing more than gangs of thugs with a thin veneer of political correctness. The result was violence across China, often escalating into mini civil wars, especially in the cities.

Finally realizing what a blunder he had made, Mao rescinded his decree to "arm the Left" and ordered all guns returned. However, many "bandit" groups refused to give them up and the fighting continued, disrupting the economy as many people, fearing for their lives, stopped going to work. A year later (1968) factional fighting had shown little sign of abating.

In order to get the troublesome teenage Red Guards out of the cities and restore stability to Chinese life, authorities organized "field trips" to the countryside. Dubbed "educated youth" or "May 7th soldiers", they were now the problem of the peasants, who considered them lazy and worthless.

Mao cultivated a culture of hate, telling people that to hate class enemies is as good as loving one's country. Until 1964 the main objects of his hate had been the Soviet Union and especially Khrushchev whom he condemned as revisionists.

The populace was constantly force-fed hatred for Khrushchev by the press and at weekly indoctrination meetings. This helped set up Mao's campaign against Liu Shao-chi as the Chinese Khrushchev, since he had led the attempt to force Mao to end the Great Leap Forward. At a mass rally Red Guards wielding copies of the Little Red Book, first struck, and then trampled Liu on the ground while forcing his wife to wear a necklace of ping pong balls symbolizing her bourgeois pearls. Liu was purged and tortured until he died in prison in 1969.

Luo Rui-qing was another victim of Mao's purge, not because he did anything to anger Mao, but because Lin Biao hated him. Needing Lin's help with the Cultural Revolution, Mao agreed to charge Luo with treason. Luo jumped off a roof in a suicide attempt, but only broke both ankles. Since suicide was one of the worst crimes against the Party, Luo was dragged to denunciation meetings in a basket with his broken ankles hanging out and oozing blood. Amazingly, he survived the Cultural Revolution and Mao.

In April, 1969, feeling his enemies were finally eliminated and his new power apparatus was secure, Mao convened a new Party Congress, the first since 1956, with new delegates chosen just for their slavish devotion to him. However, the delegates showed their fanatical loyalty by constantly interrupting his speech, jumping up and chanting slogans like "Long live Chairman Mao". These interruptions merely annoyed Mao who issued rules against unscheduled slogan shouting.

"Respectfully wish Chairman Mao eternal life."

—Chinese poster

Mao's personality cult. Largely in emulation of Stalin's personality cult in Russia, Mao heavily promoted himself as the focus of the Chinese Revolution. This campaign attained egomaniacal proportions with posters that, at least to outsiders, seemed ridiculous in their claims. Mao's personality cult was designed to replace normal culture. To this end some 1.2 billion portraits of Mao and 4.8 billion badges with his face on them were produced. Likewise, copies of Mao's Little Red Book were given to everyone, who had to carry and brandish them on all occasions and recite sayings daily.

Mao was represented as the Four Greats: the great teacher, the great leader, the great (or supreme) commander, and the great helmsman. And, just as there were the Four Greats, there were also the Three Loyalties: "*Boundlessly loyal to the great Chairman Mao, boundlessly loyal to Mao Zedong Thought and boundlessly loyal to Chairman Mao's revolutionary line.*"

"Mao Ze Dong is the red sun in the hearts of all people of the world"

"The sunlight of Mao Ze Dong thought illuminates the road of the Great Proletarian Revolution."
(1969)

Mao replaced traditional places of pilgrimage with those associated with his life: Mao's birthplace at Shaoshan; Yan'an in Shaanxi Province, Mao's main base after the end of the Long March; the Luding Bridge over the Dadu River, scene of the epic (and totally fictional) crossing during the Long March.

Mao's collected readings were the virtual Bible of the Chinese revolution. Of course, few people actually read all of these. More accessible was his book of select quotations, commonly referred to as the Little Red Book. Much like Hitler's *Mein Kampf* in Nazi Germany, Mao's Little Red Book could be found in nearly every home as a sign of loyalty, was typically used as a reward for good schoolwork or service to the revolution, and, despite the posters, was rarely read, except under duress.

That's not to say Mao's writings were not used. Selected articles were mandatory reading for all school children and were widely quoted during the Cultural Revolution. However, as a result of the rote learning of these simplified versions of Mao's writings, most political discussions degenerated into rampantly and excessively used clichés, fixed formulas and empty sloganeering.

"Everything that Mao Zedong says is the truth; every statement he utters is worth 10,000 sentences."—Lin Biao

The more widespread the study of the book became, the more devastating the effects that were ascribed

to it. In 1960, Mao Thought was described as an arrow aimed at the target of revolution. By 1965, it had become a mighty "ideological weapon" in the struggle against imperialism, revisionism and dogmatism. One year later, Mao Thought had grown into a "spiritual atom bomb" of infinite power.

Supposedly, a study session with the *Quotations* "... supplied the breath of life to soldiers gasping in the thin air of the Tibetan plateau; enabled workers to raise the sinking city of Shanghai three-quarters of an inch; inspired a million people to subdue a tidal wave in 1969, inaccurate meteorologists to forecast weather correctly, a group of housewives to re-invent shoe polish, surgeons to sew back severed fingers and remove a ninety-nine pound tumor as big as a football."

Mao had high hopes that his personality cult would catch on in other countries. Pushing it with a hard sell, Beijing proclaimed that "*the world has entered the new era of Mao*" calling this an "*an event of immense joy for the people of the world,*" who "*love Chairman Mao's books more than any other books*" and to whom his Little Red Book "*is like the sweet rain to crops withering in a long drought, and the shining beacon to ships sailing in the thick fog.*" Along these lines, he set up secret training camps in China to spread Maoism across the world. As an incentive for Burmese Communists he had trained in China, before sending them home, he let each of them pick a Chinese girl from streets to marry, whether the girls wanted to marry them or not.

Yet, for some reason and despite Mao's best efforts, Maoism failed to catch on to any great extent outside of China. For example, in Burma Mao launched a hard-sell campaign to promote Maoism, with his communist followers there distributing badges and copies of his book, singing songs in his praise, and saluting his portraits. When the Burmese government banned these activities, Mao goaded the large ethnic Chinese community to demonstrate, leading only to violence, bloodshed, many deaths, and retribution against ethnic Chinese in Burma. One major obstacle to the spread of the Maoist cult was Mao's insistence that other communist nations look exclusively to him for

leadership and cut their ties with Moscow. However, most communists outside China and Russia saw Communism as an all-inclusive ideology and refused to choose between Beijing and Moscow.

In 1967, apparently frustrated with the failure of Maoism in other countries, Mao authorized attacks on missions of some twenty other countries, including those of the Soviet Union, India, Indonesia, Burma, Mongolia, and Great Britain. The forms of these "Punishments" ranged from huge demonstrations with giant Mao posters and slogans broadcast through loud speakers to breaking into the missions where they would burn cars, manhandle diplomats and their wives, and terrorize their children while chanting "Beat to death, Beat to death." On August 22, 1967, a mob burned the British mission in Beijing, trapping its staff inside and almost burning them alive, while also subjecting women to gross sexual harassment. By September 1967, China was embroiled in disputes with most of the 48 countries with which they had any diplomatic or semi-diplomatic relations.

***"We may lose more than 300,000,000 people. So what? War is war. The years will pass and we'll get to work producing more babies than before"--
Mao, 1960s***

On the brink of war with Russia (1969-71). Since the Cultural Revolution was largely aimed against Soviet Style revisionism, Mao felt he needed a symbolic triumph against Russia. He pursued it with what was supposed to be a small controlled border clash along the Ussuri River in the Northeast where the Soviets had a dubious claim. On March 2, 1969, specially trained and equipped Chinese troops ambushed a Soviet force, killing 32 Russians.

Then it spun out of control.

Twelve days later, Russian heavy artillery and tanks, opened fired, sending shells 20 kilometers into China, killing at least 800 Chinese while losing 60 of their own men in the clash. A CIA photo expert said the Chinese side of the Ussuri was so pock marked by Russian artillery it looked like a moonscape.

Mao was shocked by the fierceness of the fight and feared the Russians might invade. Yet, when the Soviet leader, Kosygin, called him on the Hot Line, after virtually no diplomatic contact in three years, the Chinese operator refused four times to take a call from that “scoundrel revisionist”, Kosygin. Therefore the Soviets moved up more troops, which quickly convinced Mao to send a message he was ready to talk.

Then, on August 13, 1969, the Russians attacked 100s of miles to the west, driving deep into Chinese territory where they surrounded and destroyed a force of Chinese troops. Having no effective defense against Russian armor, Mao launched a huge and worthless project to build artificial mountains 20-40 meters high and 250-400 meters wide. He was especially worried about a nuclear strike on his atomic facilities, an operation Moscow had actually discussed with the US. The CIA estimated the chances of this escalating into an all-out war as one in three.

An article in a London newspaper saying the Soviet Union was planning to bomb China's nuclear test site and replace Mao worried him enough to set up talks in Beijing in October. However, Mao was so worried the plane carrying the Russian diplomats actually had a nuke that he left Beijing and hid until the Russian plane had peacefully landed without detonating a nuclear explosion.

In the end, Mao's miscalculation created an expensive war scare that led to drafting millions of Chinese to build underground tunnels and shelters, not to mention fake mountains, at huge cost. Even worse, Mao used the scare to accelerate his nuclear program, spending more from 1971 to 1975 than in the 15 previous years. Despite this, China's nuclear program was incredibly unreliable, especially its missiles. Amazingly, Mao ordered the test of a missile with a live nuclear warhead and a flight path over populated areas. Luckily, the missile hit its target and the Chinese people were spared the added pain of being nuked by their own government.

Meanwhile per capita income in China had fallen to less than that in Somalia and calorie intake for the Chinese people was lower than in it had been in 1930. Except for the Great Leap Forward, people

remembered this as the worst period of Mao's rule. Yet there was virtually no resistance to his military spending, since he had purged all possible opposition in his Great Cultural Revolution. Instead, one governor offered to provide the government with seven times as much grain than it had supplied before.

“Ping-pong” diplomacy and the Western card (1970-73). By 1970, international Maoism was a flop and China was nearly at war with the Soviets. Just then, a new hope for Mao arose from the least likely direction when America's new president, Richard Nixon, expressed interest in improving relations with China. Mao's relations with America had been particularly hostile ever since his victory in 1949. At first, he had provoked the US to get military aid from Stalin, whom he hoped would see China as a valuable ally against the American threat. Then after Stalin died, Mao tried to court the US, now portraying China as a potential ally against the Russian threat. However, Korea being too fresh a memory, Washington, snubbed Beijing's overtures and Mao had followed an aggressively anti-US posture ever since then.

Mao's chance to establish relations with the US came in March 1971 when a Ping-pong match in Japan led to inviting the US ping-pong team to China. The ping-pong visit created a sensation in the West, causing Nixon to see a visit to China as a valuable run-up to the '72 election. Therefore, in February 1972 he made his dramatic trip to China, thus establishing relations between the two nations for the first time in over twenty years.

Mao wanted two things: international status and American military technology, claiming he feared a Soviet attack, much as he used the same sort of threat from the US to get arms from Khrushchev in 1954 and 1958. To that end, he even hinted Hanoi was a mutual enemy of China and the US, thus raising Nixon's hopes for a long-sought way out of the war in Vietnam. In the rush to gain Mao's favor, Nixon betrayed America's long-time ally, Taiwan, by helped Mao take China's seat in the UN. US aid also revived China's decrepit aircraft industry, whose planes had a bad habit of crashing or exploding in midair. Nixon even considered

airlifting tactical nukes to China in the event of war with Russia.

Nixon's visit gave Mao the global popularity and nearly cult status he had wanted for so long. Nixon said, "*under Mao the lives of the Chinese masses have been greatly improved.*" Secretary of State, Henry Kissinger, suggested Mao's regime could "challenge us in a moral way" and Mao's goal was a "*quest for egalitarian virtue*". In the US there was even a somewhat tongue-in-cheek opera about Nixon in China

Other world leaders then scrambled to get audiences with Mao, putting up with slights considered intolerable coming from anyone else. Amazingly, Mao openly flaunted his dictatorial ruling philosophy, saying, "*Napoleon's methods were the best. He dissolved all the assemblies and simply appointed those who were to govern with him.*" Yet world leaders ate up his words like candy.

In the end, Mao's ping-pong diplomacy gained little for China, largely because it spurred Russia to pursue better relations with the US. The result was Détente, a period of relative calm between the US and Soviet Union. For Mao, that meant the massive military aid he hoped to receive from America never materialized. For the Chinese people, better relations with the West gained them nothing, as foreigners were carefully denied any access to see their true living conditions and do anything to help. In fact, to many these were the worst years since the Great Leap Forward as Mao gave huge amounts of foreign aid to countries far richer than China while his own people suffered.... as always.

The fall of Lin Biao (1971). After 1970, Mao found his position in China progressively weakening. When he wanted to abolish the office of president, Lin Biao pushed him to take the office himself so he (Lin) could be vice president and the official second in command. Surprisingly, four of the top five men on the Politburo voted with Lin and against Mao. Therefore, Mao decided he had to purge Lin.

But Mao now faced another obstacle: old age. The stress of purging so many people had sapped his energy, and, at age 77, he came down with

pneumonia. Controlling everyone's actions in his weakened condition would be increasingly more difficult from now on.

Purging Lin would be especially hard since he'd been entrusted with so much power to carry out the Cultural Revolution. In particular, he had packed the army with his own men who would likely be more loyal to him than Mao. Therefore, Mao tried to bring Lin into line by demanding a self-abasement, a public admission of all his faults and sins against the Revolution that was designed to humble and break the spirits of those performing it. Lin Biao was the only major party official Mao had never subjected to a self-abasement. And when finally ordered by Mao to perform one, Lin refused.

However, Lin realized he was in great danger. At first he considered fleeing to Hong Kong. But then his son came up with a plot to assassinate Mao. However, everything went wrong, the plot failed, and Lin had to flee. Unfortunately, he had to leave before his plane could be refueled and it crashed in the countryside, killing him.

Lin's death created a new problem for Mao: replacing Lin's men who filled many critical offices, especially in the military. But there weren't enough qualified and loyal candidates to fill these spots, so he had to call on others who had already been purged and were currently in labor camps. Given the questionable loyalty of these men, Mao felt he had to rule more moderately in order to keep from antagonizing them.

Prison abuses decreased greatly and violent denunciation meetings were called off, even for Lin Biao's men. Mao even allowed a few songbooks and entertainments for the Chinese people, many of who were exhibiting facial tics and other signs of extreme stress brought on by Mao's harsh rule. In February 1972, Mao fell very ill again, further hurting his ability to rule effectively.

Mao's final years (1972-6). Right from the start of Mao's rise to power, his foreign minister, Chou En-lai had been his very capable and loyal follower, putting up with constant humiliations at the hands of his boss. After Lin Biao's betrayal, Mao became suspicious of the ever-loyal Chou. Therefore, when

Chou was diagnosed with cancer, Mao told the doctors not to tell him, since he didn't want Chou to outlive him. Then, to weaken him further, Mao, ordered Chou to do a detailed self-denunciation before 3000 top officials about all his past errors. It was so long it took Chou three nights to deliver and was such a pathetic sight that many in the audience cringed during Chou's delivery.

By early 1973, Chou's cancer had worsened critically and he was finally told about his condition. Yet, when the doctors begged Mao to let them treat him, he replied that Chou was quite old enough to die. Finally, he agreed to treatment, but in two stages, the first being only an exam, and the second stage actually removing the tumor. The chief surgeon, realizing Mao wouldn't allow a second stage, "combined" the two stages and removed the tumor. Luckily, Mao, in a good mood about Chou's diplomatic success with the US, acquiesced. Then, in June 1973 the U.S. and Russia signed the first Strategic Arms Limitation Treaty (SALT I). Enraged over China's isolation and second-rate status, Mao blamed Chou, calling him a revisionist, and ordered another self-abasement.

Meanwhile, the Watergate scandal was weakening Nixon and his ability to provide Mao with military aid. Mao, not familiar with a democratic system, couldn't understand what all the "farting" was about. Then, on August 9, 1974 Nixon resigned, signaling the end of Mao's dreams of superpower status, since his high-tech weapons program was only producing defective equipment. Mao took his frustration out on Chou, forcing his own subordinates to attack him to his face for his failures with the US.

In May 1974, Mao, intending to let cancer eat Chou to death, refused another entreaty by doctors to perform proper surgery. A month later, two years after the initial diagnosis, Mao finally relented. The delay made sure Chou died 19 months before Mao.

Then, in July 1974, the tables turned when Chou found out Mao had Lou Gehrig's disease and had only two years to live. Chou hid this information from Mao and was much bolder after this as Mao was starting to lose control over his own bodily functions.

Taking advantage of Mao's weakening condition, Chou formed an alliance with Deng Xiao-ping and army chief Marshal Yeh, the first time two or more top colleagues had been able to form such an alliance. Deng Xiao-ping, purged in 1966 for opposing the Cultural Revolution, was recalled after Mao lost Lin Biao's services and Chou came down with cancer. Mao put Deng in charge of the army since only he could guarantee its stability after Lin Biao's fall. Deng never moved against Mao personally, but did put his own reforms into action, in particular rolling back the worst aspects of the Cultural Revolution, Mao's proudest achievement, thus rehabilitating many cadres who had been purged.

Deng also tried to raise China's living standards. Under Mao, China's urban population had grown to 100,000,000, but budgets for urban improvement from 1965 to 1975 equaled only 4% of corresponding military budgets. Sometimes three generations of a family were crowded into one room. Reportedly, in some places, women were so poor they had no clothes and had to go naked. Mao knew perfectly well of these conditions, but did nothing about them.

In reaction to the alliance of Chou, Deng, and General Yeh, Mao had his main allies in defending the Cultural Revolution, his wife and a group known as the Gang of Four, wage media a campaign against Chou and Deng. Surprisingly, Deng gave Mao, nearly blind from cataracts, a piece of his mind and forced him to call off the campaign and admit he had "made a mistake", his first such admission ever. Mao even begged his colleagues not to overthrow him, saying they could do that to his wife and the Gang of Four after he died.

Mao's fourth and last wife, Jiang Qing (AKA Madame Mao), was one of the most notorious figures of the Maoist era. She started out in Shanghai as an actress with a somewhat shady past. As Mao's wife she was a fearsome creature whom everyone avoided. The only person she feared was Mao, who also couldn't stand her and had her banned from his quarters. However, she was useful to Mao as his attack dog during his purges. With so much blood on her hands she was extremely

paranoid about assassins. She had an intense fear of any strangers and unexpected noises, and got especially agitated at anything that would make her sweat, such as talking too quickly, too slowly, too loudly, or not loudly enough. This was the woman Mao was willing to sacrifice for his own safety.

In June 1975 the death of a purged Marshal, Ho Lung, led to a spontaneous memorial service by the army, which was taken as a huge snub against Mao. On July 23, 1975 a cataract was removed from Mao's left eye. Having regained his confidence, he launched a new media campaign against Deng. Once again, Chou confronted Mao who backed down again.

On January 8, 1976 Chou En-lai died. Mao quickly fired Deng and put him under house arrest. However, thanks to reforms made by Deng in 1975, news of Chou's death, but not his role in such things as the Cultural Revolution, were publicized. Public opinion was outraged at news of Chou's death, triggering a spontaneous demonstration of 1,000,000 people, which took Mao's absence from the funeral as a snub. This triggered popular protests all over China, using Chou's death as excuse to protest Mao's policies. Crowds in Beijing burned police vehicles and the headquarters of the Gang of Four's militia.

The demonstrations were suppressed with characteristic bloodshed, but Mao's regime had lost its edge of terror. Crowds praised Deng by hanging little bottles from pine trees around Tiananmen Square, since the Chinese word for little bottle is pronounced the same as Deng's name. Mao hauled Deng from house arrest to another part of Beijing, but didn't hurt him, fearing the army's reaction.

On July 28, 1976 a devastating earthquake leveled the city of Tangshen, killing an estimated 240,000 people. Many Chinese thought this presaged Mao's death.

When news of Mao's failing health was leaked, Deng asked for and got permission to go home. For Mao, it was only a matter of time.

On September 9, 1976, Mao Zedong died.

During and because of his twenty-seven year reign, over 70,000,000 innocent people also died.

After a brief power struggle, Deng Xiaoping defeated Jiang Qing and the Gang of Four.

He then set China on a new course of reforms that it has followed to the present day.

CHINA SINCE THE CULTURAL REVOLUTION

China since the Cultural Revolution. Gradually, the forces of moderation, led by Zhou Enlai and Deng Xiaoping, resurfaced and prevailed, especially after Mao's death at the age of 82 in 1976. After a brief power struggle against extremist elements led by Mao's widow and a faction known as the Gang of Four, the moderate and more practical Deng Xiaoping emerged as China's new leader. Since then, China has progressed in both the fields of foreign policy and economy.

In foreign policy, China's more moderate image led to its acceptance as a member of the United Nations in 1971. This put increased pressure on the United States to recognize the communist government in China. The Chinese communists, in turn, wanted better relations with the West to act as a counterbalance against the Soviets. In 1972, President Nixon visited China and started the long road towards normalizing relations between the two nations. A major stumbling block was America's support of the Nationalist government of still ruling the island of Taiwan. The communist government on the mainland insisted that its relations with Taiwan were an internal Chinese affair and that the United States should cut relations with and support for the government there. In 1978 the United States agreed to most of China's demands, although it informally maintained economic and diplomatic relations with the government on Taiwan. Other erstwhile enemies, notably Japan, also normalized diplomatic and economic relations with mainland China during this period.

Economically, Deng Xiaoping, instituted significant economic reforms known as The Four Modernizations (agriculture, industry, science and technology, and military) which provided farmers and factory workers incentives to work harder. Farmers were allowed to keep small plots for growing surplus food which they could sell, while factory workers could also do business on the side as long as they did not hire (and thus exploit) employees in the capitalist manner. To many hardliners, these reforms seemed too capitalistic in spirit. However, they helped lift China's economy dramatically in the following decades. As Deng put

it, he did not care whether a cat was black or white as long as it caught mice.

China's growing prosperity brought demands for more political rights and power for the common people, which Deng was not willing to grant. Unfortunately, this contrast between economic progress and the lack of corresponding political progress created tensions in Chinese society, much like the tensions in Soviet society caused by more political rights but the lack of economic progress. In 1989, massive demonstrations demanding more political rights spread across many Chinese cities. After several weeks of indecision, the aging leaders brutally suppressed the movement at Tiananmen Square in Beijing and reestablished a harsh and repressive rule.

Since then, China has rapidly emerged as a major economic force facing both new opportunities in economic and diplomatic affairs and challenges in its political policies at home. Much of what will happen hinges on what sort of new leadership would take the helm when the last of China's first generation of Communist leaders finally passes on.

DETENTE, YUPPIES, AND THE “ME GENERATION”: THE 1970S

Introduction: A decade of malaise and a decade of “me”. The more fragmented American society became, the harder it was to categorize it. Therefore, in one way, the 1970s were a decade of malaise and self doubt over the failures of either the right or left to win decisive victories after the turbulence and culture wars of the 1960s. American military might suffered a serious blow to its prestige, both at home and abroad, after the fall of South Vietnam in 1975. The Civil Rights movement lost much of its momentum and split between the more aggressive and peaceful wings of the movement after Martin Luther King’s murder in 1968. The counter-culture also lost momentum as our withdrawal from Vietnam eliminated a common unifying cause around which to rally and Baby-boomers got married and had jobs, mortgages and children to worry about.

On the other hand, the 1970s saw prosperity continue to rise for much of society. Many Baby-boomers, and even so-called “hippies”, became young upwardly mobile workers, sometimes called “yuppies”, cutting their hair stylishly long as they bought into the same materialistic mainstream values many of them had rebelled against a few years previously. As a result, the 1970s have been called the Me Decade for the materialistic and behavioral self-indulgence of many young adults. It was a time largely remembered for fancy cars, polyester pantsuits, upscale drugs such as cocaine, and sexual experimentation such as “swinging” (mate swapping between married couples). The wild experimental music of the 1960s gave way to more mainstream “corporate rock” as the music scene became more of an industry and the free-form underground repertoire of FM radio stations was replaced by “progressive rock”.

However, it was also a time of positive change. The Vietnam War did end, thus finishing an agonizing chapter in the histories of Vietnam and the United States. Most notably women made dramatic progress toward equality. It was also a time of technological change. Microwave ovens changed the way Americans cooked and ate. The cell phone was invented in 1973, while the computer microchip made its debut at the end of the decade, setting the stage for a revolution in communications

and information technologies that still hurtles along at breakneck speed.

Political changes took place in both domestic and foreign policies. Driving this at the start of the decade was the Vietnam War, which became increasingly unpopular over time as the mainstream media turned against the war and the Nixon administration’s policies. Early in 1973, President Nixon announced “peace with honor”, which was mainly a way for us to get out of South Vietnam and leave it to its fate. Two years later, Saigon fell and Vietnam was united under a communist regime that inherited a massive amount of American military equipment, making it the fifth largest military power on the planet. As it turned out, the Vietnamese would use this military hardware in a brief flare-up in late 1978 with Red China, the very power we feared would use the communist regime in Vietnam as its puppet to take over all South-east Asia. Instead, the Vietnamese followed a much older historical pattern of resisting Chinese influence. Luckily for them, they had American military hardware with which to do it.

However, Nixon had two major foreign policy triumphs, namely normalized relations with Russian and China. Ever since the Cuban Missile Crisis, which had taken the world to the brink of nuclear war in 1962, tensions between the U.S. and Russia had gradually been easing. A series of actions taken by the two superpowers had gradually stabilized the world: a direct line of communications (AKA the Hotline) between the White House and Kremlin (1962), a ban on atmospheric nuclear testing (1963), and a nuclear non-proliferation treaty (1968). In 1972 Nixon took the process a step further with SALT I (Strategic Arms Limitation Treaty) which limited the number of new nuclear weapons each side could build. While this did not stop the growth of each nation’s nuclear arsenal, it did slow it a bit and laid the groundwork of trust necessary for gradually freezing and eventually reducing the number of nuclear weapons. This new atmosphere of trust between the two nations was known as detente and would last until the late 1970s when growing Soviet military power alarmed many Americans and set the stage for the final round of Cold War hostility in the 1980s.

Even more startling was normalization of relations with Red China. Despite his heavy anti-Western

rhetoric, Mao Zedong of China was a shameless opportunist who favored better relations with America in the hope of getting American military aid. This was to discourage aggression by Russia, whose relations with China had seriously deteriorated in the previous decade. In fact shots were exchanged between the two in 1969 as mutual animosity reached fever pitch. Therefore Mao conveniently overlooked he was dealing with “capitalist imperialists” so he could get their weapons. Likewise, Nixon conveniently forgot he had been a leading anti-communist since the early 1950s so he could get an ally against Russia and divert public opinion away from the quickly unfolding Watergate scandal to a foreign policy coup.

Animosity between Nixon and the media escalated further during the 1972 presidential election with the Watergate scandal. On the surface, it shouldn't have amounted to much, since it started with the petty theft of documents from the Democratic Party headquarters in the Watergate Hotel in Washington D.C. What made it so serious was the growing effort by the White House to cover up this caper, causing it to explode into one of the biggest political scandals in American history. In August 1974 as Watergate spiraled increasingly out of control and Congress was on the verge of impeaching Nixon, he resigned in disgrace, the only president to leave office early without dying.

Two years later, American voters, disillusioned by Watergate and the bitter memories of Vietnam (although it was a Democratic president, LBJ, who had gotten us stuck in the quagmire of the war), elected a Democrat and Washington D.C. outsider, former governor of Georgia, Jimmy Carter, as president. However, despite Carter's best intentions, events abroad, a stagnating economy, and his lack of Washington experience seriously undermined his presidency. America's economic problems were tied heavily to rising oil prices, which were largely the result of events in the Middle East.

In October 1973 Israel's Arab neighbors launched a surprise attack during the Jewish holiday of Yom Kippur. At first, Israeli forces reeled from this sudden assault. However, thanks partly to aid from the U.S., they regained the upper hand and won the war. In retaliation, Arab oil producers reduced

supplies to the U.S. and raised the prices on what they did send. As oil prices and the cost of transporting goods rose, so did the price of nearly everything else. For the first time, Americans, who were used to cheap oil to fuel their big gas-consuming cars, faced the reality of the finite nature of world oil reserves. More fuel-efficient foreign cars from countries, especially Japan, that had always had to import most of their oil started to grab a bigger chunk of the market.

This also heavily impacted the Cold War, since Russia, an oil exporter, gained money from rising prices, while the United States, increasingly an oil importer, lost money. Thus the Soviet Union, with more money coming in, was able to rapidly increase its conventional and nuclear forces in the 1970s. At the same time, inflation and disillusionment with the military after Vietnam led to heavy cuts for the American armed forces. By the late 1970s the Soviet nuclear arsenal threatened to overtake that of the United States.

America's image abroad, especially with the Muslim world, suffered even more from a hostage crisis in Iran. In 1953, the United States had helped overthrow the legitimate government of Iranian leader Mohammed Mossadagh, replacing him with the corrupt and cruel regime of Shah Reza Pahlavi. For a quarter century, the U.S. continued to support the Shah's rule as long as he remained loyal to it and blocked Soviet pressure southward.

In 1978, a revolution led by the Shiite mullah, Ayatollah Khomeini, overthrew the shah and set up a radical Muslim regime that naturally blamed the U.S. for supporting the Shah and his oppressive policies. Making matters worse, when the shah contracted cancer, Carter, out of humanitarian sympathies, allowed him into the U.S. for treatment, despite warnings from Iran not to do so. The reaction in Tehran, the Iranian capital, was to storm the American embassy and hold fifty Americans hostage. After a disastrous rescue attempt where an American helicopter crashed from sand getting into its engine, the hostage crisis dragged on for the rest of Carter's administration, seriously weakening him in the process. The hostages were finally released the same day Carter's successor, Ronald Reagan, took office in 1981.

Relations between the two superpowers also deteriorated during the Carter administration. Another treaty between them in 1975, the Helsinki Accord, had a clause guaranteeing human rights. While the Kremlin felt the Americans would not make anything of this clause, Carter thought differently. Looking increasingly weak due to setbacks abroad and inflation at home, he put pressure on Russia to honor the human rights clause. Public attention especially focused on the treatment of dissident Jews, called *refusniks*, two of the more prominent being physicist Andrei Sakharov and Alexander Solzhenitsyn. This issue, plus Carter's pressuring the Soviets for greater verification controls on nuclear arms, led to rising tensions between the Americans and the Soviets, who reacted by deploying nuclear missiles able to hit Western Europe. Thus by 1980 rising Cold War tensions loomed on the horizon.

A changing society. While America's position in the world seemed to be crumbling steadily in the 1970s, its very social structure was undergoing radical changes. This was very much a continuation of the turmoil of the 1960's: much quieter without a major war to catalyze events, more fragmented than the turbulent youth movement of the previous decade, but reaching further in to the depths of American society as the Baby Boomers came of age and increasingly had more clout. One of these movements, discussed in the next reading and flowchart, would vitally concern an estimated 51% of the American population: women's liberation.

To many African-Americans, the decade after Martin Luther King's murder was a series of broken promises and shattered dreams, as the housing projects of LBJ's Great Society, built initially to help relieve poverty and horrible housing conditions, themselves became part of vast urban ghettos. Promises of better jobs and living standards rarely materialized, being replaced by a welfare system, intended to temporarily relieve suffering, but itself becoming a trap that seemed to encourage broken families and just working the system. The non-violent movement King had led fragmented into two parts.

One part, symbolized by the inner-city riots of the middle and late 1960s and seen on TV, was violent and angry. As Civil Rights opponents came to understand how dramatic media images of brutal

oppression in the South had only gained sympathy for the movement, they used more subtle tactics to block the movement, such as opening private schools and swimming pools to avoid public integration. The resulting slowness of change, especially compared to the relatively rapid progress of the early 1960s, naturally generated frustration. And the result of that frustration was the riots of the late '60s.

However, just as the police brutality seen on TV in the early '60s had gained the Civil Rights movement much sympathy with white middle class Americans, the inner-city riots of the late '60s, also televised, had alienated many of those same people. Not only that, but the riots had mostly burned down Black neighborhoods and driven out many of the businesses that had previously thrived there. Unfortunately, the violence didn't end in the 1970s, it merely fragmented and turned on itself in the form of gangs, crime, and drugs, causing the inner-city ghettos to deteriorate further, causing more violence, and so on.

Two TV sitcoms of the time illustrate much of the problem the African-American community faced: *Good Times* and *The Jeffersons*. *Good Times* was set in the housing projects of Chicago. While it did address many of the problems facing inner-city African-Americans, it was still a sit-com that made white people laugh and many of them think it must be fun to be a "negro" in the projects, so why worry about them?

The Jeffersons illustrated another side of African-American society: those who, through hard work and diligence, did make it out of the projects and became part of the American dream. By the 1980s the fastest segment of American society was the Black middle class, although it should be remembered it was starting from a tiny base. White viewers could ease their social guilt by watching a prosperous African-American family on TV headed by a man who was every bit as bigoted as opponents to the movement had been. However, many blacks, especially those still in the projects, got a far different view of America from *The Jeffersons*, namely that their best and brightest had sold out to white America and left them behind in the ghettos without leaders and without hope. The bitterness and, in many cases, sense of inadequacy this bred

only exacerbated the problems of inner city America.

However, beneath the surface and away from the TV cameras, there was second, more quiet movement, still largely led by ministers such as Jesse Jackson, that worked hard and peacefully for change on a broad range of fronts, both local and national. Programs such as Affirmative Action and Operation Head Start would open educational and job opportunities for millions of African Americans over the following decades. As stated above, there were more blacks raising themselves to middle class status. The election of an African-American, Barack Obama, as president by a still primarily white electorate in 2008 underscores the fact that progress has been made. However, there is still a long way to go, especially for those who still have to see that progress in their lives.

Toward the 1980s. One other TV sitcom of the 1970s illustrates the feelings and plight of many white Americans, *All in the Family*. Interestingly, when it started early in the decade, it took a very liberal view, portraying its main character, Archie Bunker, as a bigoted fool. To the show's credit, in its later years it portrayed Archie in a much more sympathetic way, bringing out the ways many Americans were bewildered by the rapid changes that, in their point of view, were running out of control and ruining America. Archie was part of the so-called "greatest generation", those who had survived the Great Depression, fought World War II, and worked hard to build America and give their children all the advantages they never had. After all that they felt they were being tossed aside and left behind by an ungrateful nation. In addition, many conservative, white, heterosexual male Baby-Boomers felt blacks, women, and gays were in conspiracy with white liberal yuppies and threatening their positions in society. The result was a cultural and political backlash that was determined to restore to America the values that had made their nation great in the first place. Part of this was a growing religious right that sanctified America and equated its own values (e.g., anti-abortion, anti-gay, and anti-women's lib) with divine will. They would find their leader in a grade B movie actor who exuded to them all the values and self-confidence that had once made America great and would do it again. His name was Ronald Reagan.

Meanwhile, a tiny invention was being developed that would change America and the world in even more astounding ways than ever seen before: the computer microchip.

That 70s Malaise

President Nixon gives the V-for-Victory sign as he leaves Washington D.C., having just resigned from office (8/9/1974). Nixon's mental state of health was a matter of some concern in the latter part of Watergate and its aftermath. About a week after his resignation and return to California, he called his staff together announcing: "I've called you here to discuss an important topic. And that is, what are we going to do about the economy in the coming year?"

America after Watergate. Time magazine called Watergate the most traumatic political experience of this century," and indeed, it did transform American politics and the public's attitudes toward their elected officials. For one thing, corruption and indictments for corruption didn't stop at the White House or Washington. Starting in April 1973 two Maryland state legislators, two Chicago Aldermen, a former governor of Illinois, the chairman of the Securities and Exchange Commission and the chief judge of the U.S. Customs Court, along with two attorneys general, the mayor of Camden New Jersey, and the lieutenant governor of California had all been indicted or sentenced for corruption.

Corruption and scandals themselves were nothing new, but the pervasive media coverage of Watergate and the status gained by Bob Woodward and Carl Bernstein, the investigative reporters who uncovered the scandal, inspired journalists everywhere to try to uncover their own blockbuster scandals. Along with this were ambitious public prosecutors also anxious to make names for themselves. The feedback between these two groups created a virtual

media feeding frenzy in efforts to find the next big scandal. The frenzy never stopped.

While this now may seem like a normal day at the office for politicians, in the 1970s it was at first somewhat shocking, and then mind-numbing. Previously, the press had stayed clear of politicians' private indiscretions, thus the infidelities of Eisenhower, FDR, and JFK remained virtually unknown to the public. Schoolchildren were taught their national leaders were upright moral heroes without any human foibles. Therefore, this perception of their leaders as squeaky-clean left Americans open for a big shock when the bad news started pouring out in the 1970s.

Unfortunately, an even darker reality started coming to the light as revelations about the CIA's covert activities were revealed. In addition to the usual wiretaps, opening of people's mail, and break-ins, the public learned of mind control experiments using drugs like LSD, the use of exploding seashells, a poison dart gun called the "Nondiscernible Microbioinoculator," and assassination plots against Fidel Castro (in conjunction with the Mafia, using JFK's mistress, Judith Campbell Exner, as a go-between), Patrice Lumumba, Rafael Trujillo, and Chilean general Rene Schneider.

One sign of the times was the spate of movies involving conspiracies and cover-ups on a wide range of subjects: politics (*Executive Action*, *The Parallax View*, *Three Days of the Condor*, and *Chinatown*), police corruption (*Serpico*, *The French Connection*, and *The Godfather Part II*), corporate neglect (*The Poseidon Adventure* and the *Towering Inferno*), and even a fake Mars landing (*Capricorn One*).

Out of all this came extreme disillusionment with the government. According to one survey in 1975, seven out of ten people felt the nation's leaders had consistently lied to them over the last decade, while another survey a year later showed that only twenty percent of the American public trusted the government. Some of that

disillusionment was briefly alleviated by the new President who took over from Nixon in August 1974, Gerald Ford. By all accounts he was a decent human being with no skeletons in the closet. He was the first president since Eisenhower to share the same bedroom with his wife, Betty. While Ford seemed to restore some degree of normalcy to government, that quickly proved inadequate in itself to get the country back on the right track.

One thing hampering him, another legacy of Watergate, was a shift in the balance of power from the presidency back to Congress. An example of this was the joint resolution in 1973 by both houses of Congress, the War Powers Resolution, which sought to limit the president's discretionary use of military power without Congressional consent. A year later, the Budget and Impoundment Control Act challenged his authority over the nation's finances.

However, not only was the balance of power shifting in favor of Congress, the very nature of Congress and party politics was also radically changing. Whereas before, it was a hierarchy of politicians that had loyally served their party that decided from behind closed doors who would be nominated for upcoming elections, now that power lay in the hands of the voters in primary elections. Similarly, the winners of those elections were no longer so beholden to their parties and instead wanted to get things done, even if that meant sweeping away the old way of doing business in Congress. Replacing a few powerful committees and committee chairmen were 150 different subcommittees, each with its own chairman, budget, staff, and agenda. Between 1972 and 1978 the House Committee staff had more than doubled. Unfortunately, this meant that congressional politics fragmented into a bewildering number of single issue fights with little common ground for discussion or action, making it much harder to get working majorities for passing bills. Gone were the days of broad based coalitions that could get things done.

Single-issue politics had another unfortunate side effect: the proliferation of lobbyists, a swarm of them for every issue with its own subcommittee: gun owners, feminists, environmentalists, gays, farmers, and just about every industry in the land. By 1980, over five hundred corporations had lobbying offices in Washington. So much for cleaner, more transparent and honest government inside the Beltway.

The Swinging 70s

A great parody of the “Swinging 70s” was done on Saturday Night Live by Dan Aykroyd and Steve Martin who played two Czech brothers who had come to the U.S. with all sorts of distorted ideas of what a swinging place America is (e.g., the belief that U.S. Park Service personnel freely dispense birth control devices).

A popular impression of the 70s is that they merely saw orgies move from the squalor of hippie pads to the luxury of the yuppie suburbs. A recent TV series, *Swingtown*, played off this by showing a suburban culture heavily tinged with this behavior. As with hippie orgies in the 60s, a lot more people seem to remember these events than were actually there.

Granted, premarital sex was more prevalent and accepted than before, but, as in the 60s, it took the form of a series of monogamous relationships leading up to marriage much more than that of serial sex at orgies, whether on the floor or in a heated swimming pool.

In fact, looking at mail order catalogs (below), which reflected more of mainstream America than did *Swingtown*, it seemed that a secret Amish plot had taken over the lingerie industry, threatening to send the birthrate plummeting. (The birthrate did fall in the 70s, but not because

of nightwear that doubled as birth control devices.)

Yet, overall sex was much more a part of the mainstream culture than ever before. Nothing better illustrated this than the growth of the pornography industry. While soft-core magazines, led by *Playboy*, had flourished in the 1950s and 60s, it was the legalization of hard-core pornography in Denmark in 1969 that led to legalization across the Western world followed by a boom in the industry. Compared to new magazines like *Penthouse* and *Hustler*, *Playboy* seemed mild and was progressively left behind by the competition.

While Women’s Liberation and the growth of the pornography industry both owed much of their success to the liberal climate created in the 1960s, many feminists actively opposed pornography, claiming it encouraged violence against women and children. Although there was no conclusive evidence either way on this issue, the battle lines were drawn, as women across the country demonstrated against pornography. This raised the difficult question of whether controlling or outlawing pornography would be a violation of First Amendment rights and set a precedent that would lead to stifling freedom of speech for themselves and other groups.

Oddly enough, pornography created an odd convergence of interests between feminists and a growing conservative movement in mainstream America. Pornography, the divorce rate, the embarrassing end to the Vietnam War, women’s liberation, drugs, uncontrollable teenagers, and a myriad of other changes rapidly transforming society caused growing alarm for millions of Americans.

The “Dark Ages” of fashion

Was it the Women’s Liberation Movement or just a really bad hangover from the drugs of the 60s that inspired the excess of bad taste and deranged judgment that passed for fashion in the 70s?

Probably both. Women entering the workplace in greater numbers were faced with the dilemma of how to be taken seriously as good workers instead of being treated as sex objects in cute little mini-skirts, which largely describes the attitude of male workers in many companies until that time.

The answer was the pantsuit (top center), the female counterpart to the business suit. It was about as sexy as the unisex uniforms worn by Mao’s Red Guards. But it did send a message that a woman was there to work hard and be taken seriously as a human being. After a decade or so when women had gained more respect in the workplace, they could feel comfortable enough in their femininity to go beyond the unisex look.

A more realistic explanation might be that, just as big record companies got control of rock music, squeezed out much of its creativity, and homogenized it into a more marketable product for mainstream consumers, they did the same for (or to) fashion. The basic approach seems to have been to take the psychedelic look and make it look respectable. Not a good idea, especially for someone who was still high from the 60s.

So were women’s fashions really that bad in the 70s? Well yes and no. While it may have

seemed the fashion industry was conspiring to put an end to sex forever, that was only true for the workplace, where sex isn’t usually a good idea anyway. So pantsuits and frumpy dresses and skirts probably did help protect women from sexual harassment and pave the way for more equality. And the comfort and utility of those clothes carried over to leisure activities away from the office.

However, sex was much more out in the open at this time, so women’s fashions for going out on the town were designed to be both attractive while also not advertising the woman as “easy.” The screenshot (above) from *Swingtown* pretty much illustrate this point.

So what excuse did men have for dressing the way they did? For one thing, the leisure suit, as it was called, found a comfortable middle ground between the grungy hippy look of the 60s and the more respectable cleaned-up look yuppies needed for work in the 70s. As awful as it may have looked, it paved the way for Casual Fridays.

Also, many men did sympathize with the Women’s Liberation Movement, and adopted a somewhat unisex look in sympathy with it. By the same token, it helped free men from the more rigid gender roles in which they also felt trapped.

Along these lines, there were even matching his and her outfits.... even for bedtime.

Maybe it was something in the beer, but men still felt they had to be men. A popular song of the time by the (openly gay) group, Village People, even expressed/parodied the idea that “I want to be a macho man.”

Out of this developed a weird combination of flamboyant clothes (partly inspired by African American fashions) and an ultra-manly look of moustaches and shirts unbuttoned halfway down to reveal macho chests.

In the 70s, platform shoes were the latest attempt to make women look taller than they really were. However, some of these shoes seemed to be pushing women up to dangerous altitudes. In fact, several models, including Naomi Campbell, Agyness Deynnfell, and two models in one runway show in China have fallen from their shoes. Campbell's shoes had five-inch platforms and nine-inch heels.

With women growing so much taller, men had to keep up, so they also wore platform shoes.

And, as if cruelty to one's feet wasn't enough, how about trapping a live goldfish in the heel? Despite some doubts that real goldfish were used, apparently they were, at least in some cases.

What can you say except that it was a really rough decade for both men and women who struggled to define their new roles and identities in this period of rapid transition. The struggle is still going on today. Maybe it always will.

Bully magnet. That's the only way to describe what this poor child has been forced to wear, inviting violence from even the girls in the class.

Other Cultural Disasters

Unfortunately, bad taste didn't stop at fashion. Homes were also infested with vomit-inducing artifacts (e.g., shag carpets, furry toilets, and plaid furniture) that could easily convince an alien civilization to put us out of our misery as quickly as possible. They even had inflatable furniture, its main saving grace being that once deflated, it took up less room in a landfill.

Living room curtains matched the plaid furniture in bad taste, coming in various pseudo-psychedelic patterns. The question was whether such drapes did more harm as part of America's living rooms or good by hiding its contents from the outside world.

As if toilets, by definition, aren't already the epitome of bad taste, the 70s covered these receptacles of waste in soft plastic, pink carpeting, and fake fur turning them and the temples they inhabited (i.e., bathrooms) into cultural icons worthy of the decade that begat them.

Pet Rocks. Possibly the most successful fad/scam of the 70s was, the brainchild of Californian, Gary Dahl, who realized, despite the recession, Americans had too much money and needed help in finding ways to waste it. Thus was born the Pet Rock. For only \$3.95 (not adjusted for inflation) one could get a pebble from Rosarito Beach in Baja, California, along with a pet carrier (cardboard box with a handle and air holes) and a training manual so one could teach the rock simple commands such as “sit” and “stay” along with more advanced ones like “roll over” and “come”. Curiously, there were no feeding instructions. In the last half of 1975, Dahl (and imitators marketing cheap knock offs) made millions selling these lovely creatures. Sadly, after Christmas, everyone apparently had a rock and sales died.

Streaking is the act of running naked through a public venue to amuse, rather than shock, spectators. Although the first recorded incident took place on a bet in London in 1799, it reached its peak of popularity during an unseasonably warm streak of weather in February 1974 when thousands, if not millions, of streaks took place across the globe, especially on college campuses.

The author, who was delivering pizzas on the University of Illinois campus in Champaign-

Urbana, was in a particularly favored position to witness the rise and fall of this phenomenon over the course of less than a week. At first, there were isolated cases (or rumors) of individuals streaking short distances, such as between dorms. Day by day, reported incidents steadily grew.

By Thursday, large groups of people were taking part in various activities, including naked couples on motorcycles, an entire fraternity doing calisthenics on their front lawn, and another group of fraternity brothers running with their house flag down the street (all witnessed by yours truly). On Friday, a mass streak, involving an estimated 10,000 people, took place on the campus quad, the highlight being a naked skydiver landing in the crowd.

By Saturday, everyone was dressed again.

Warning: Since the 1970s, anyone convicted of streaking in the U.S. is labeled a “Sex offender.”

America goes metric (and then goes back). A map of the globe shows the U.S., Liberia, and Myanmar (Burma) as the only nations still holding out in the battle against global metric tyranny. Not that there haven't been efforts. In 1866, Congress authorized the official use of Metric along side traditional English measures, and the U.S. was an original signer of the 1875 Treaty of the Meter.

More recently, Congress passed the Metric Conversion Act of 1975 "to coordinate and plan the increasing use of the metric system in the United States". Metrication was not mandated however, and the U.S. Metric Board (USMB) lacked the power to enforce metrication. Despite public service announcements and road signs listing both miles and kilometers, the USMB had no real backing from Congress and was disbanded in 1982.

The Omnibus Trade and Competitiveness Act of 1988 mandated use of the metric system by government agencies before mandating private use. Every year, each government agency must file a report on its annual progress toward metrication. The military generally uses the metric system since it often has to coordinate actions with other militaries.

In 1998, the Mars Climate Orbiter was lost because, despite requirements that all sub-contractors use the metric system, Lockheed Martin provided thruster performance data to the team in pound force seconds instead of newton seconds. As a result, instead of orbiting at a height of 150 kilometers, it descended to 57 kilometers and burned up in the Martian atmosphere.

Textbook Wars and the Resurging Conservatism in America

Besides pornography, many conservative parents were worried about the books their children were reading in schools. Going back to a Supreme Court ruling in 1963 that banned school sponsored prayers in public schools, many people, Christians in particular, felt their ideals and views were being squeezed out of public education by what they called secular humanists. On the other side were people who felt school curricula should reflect the cultural changes in American society and the world.

Things reached the boiling point in 1974 in Kanawha County, West Virginia, when the State Board of Education mandated that books used in public schools reflect more multiracial themes. Along with *The Autobiography of Malcolm X* and Arthur Miller's *The Crucible* (written as a protest against the Red Scare on the early 1950s) their list included works by Beat Generation poet Allen Ginsberg, black rights activist

Eldridge Cleaver, and Sigmund Freud, the father of modern psychiatry.

When the local school board adopted these books, angry protestors acted, blocking highways, and throwing stones and Molotov cocktails at school buses. Violence escalated when 3,500 coal miners, defying orders from the United Mine Workers, went on strike to join the protests. A UPS driver was shot crossing a picket line, while a demonstrator was shot in the heart by a terrified janitor. Protestors firebombed two schools, dynamited another, and blew off fifteen sticks of dynamite under the gas meter at the school district's office, luckily at times when no one was present.

Left: Damage caused by a presumed dynamite blast at Midway Elementary School in Kanawha County, W. VA.

Right: A textbook protestor's car burned out by supporters of the new book list [Photos courtesy of Charleston Newspapers]

Not surprisingly, this generated a lot of media interest, with all three major networks (CBS, NBC, and ABC) sending news teams to cover the action. It also attracted several leaders from the Ku Klux Klan, as it did the Reverend Charles Quigley who prayed that God would kill the three school board members who had approved the books.

Although the books remained on the school board's list of books, the most controversial books were confined to school libraries and could only be checked out with parental permission.

Controversies of this sort and conservatism in general would only continue to grow over the following decades.

Childish Games over China

Believe it or not, there was an opera in three acts about Nixon's trip to China. Its initial performance in 1987 met with mixed reviews. It has been performed several times since.

Paving the way for Nixon with an old boot. The Sino-Soviet split led to ideological arguments bordering on the absurd or childish, especially over who was the real leader of the communist world. The Russians would say they were Marxist, and the Chinese would reply they were more Marxist. Then the Russians would say they were red, so the Chinese would retort they were redder. At one point, Khrushchev called Mao a *galosh*, which is Russian for old boot. Unfortunately, in Chinese, old boot can also mean old whore, which is how it was translated to Mao, not making matters any better.

Such nonsense did make things easier for President Nixon, since it provided the opportunity for a diplomatic coup by normalizing relations with China and driving a further wedge between Mao and the Soviet leadership. Since 1972 was also an election year, such a trip could help in his bid for reelection. To pave the way, he first sent his secretary of state, Henry Kissinger.

Kissinger in China: the drama. On Kissinger's initial trip to China to lay the foundations for Nixon's official state visit, there was great excitement about being the first Americans to officially visit Red China. One member of the entourage even moved to the front of the plane so he could say he was the first American official to actually *cross into* Chinese air space. Kissinger wasn't pleased. So when the plane landed, he shoved his way to the front so he could be the first American to *step foot in* China.

Taking his Lumps

In 1972, President Nixon, as part of *Détente*, scheduled a summit with the Soviet leader, Leonid Brezhnev in Moscow. However, as his trip to Russia loomed, he was faced with the dilemma of whether to keep bombing North Vietnam and thus jeopardize his chance to normalize relations with the Soviets. After considerable discussion with his advisors, he concluded that the Soviets would not throw away this diplomatic chance by canceling the summit over American policy in Southeast Asia. So he kept up the bombing and went to Moscow.

Soon after arrival, the Russians took their American guests to Brezhnev's country dacha, sat down with them, and proceeded to regale them with criticism of America's Vietnam policy. This went on for over three hours, the Soviets taking turns as if in some tag team wrestling match. All the while they carefully transcribed every word they said so they could send the script to the North Vietnamese to show them how much they supported them (in spite of the fact that they were negotiating with the United States). The Americans, understanding what was going on, just politely listened. Later, they all went to dinner and had a good time as if nothing had happened.

Looking Ferocious after Vietnam: The fall of Saigon and the Mayaguez incident

South Vietnamese frantically rush to board one of the last U.S. helicopters leaving Saigon before its fall to the North Vietnamese on April 30, 1975.

On April 30, 1975 the Vietnam War finally ended. That was the day North Vietnamese forces took Saigon and put a final end to the regime in South Vietnam. For most Americans, the war had ended two years earlier with the Paris Accord that allowed the U.S. to pull out its troops “with honor” while leaving North Vietnamese and Viet Cong forces still active in the South.

But for the Vietnamese, the real end came on that day in April 1975, as thousands of them stormed the U.S. embassy in Saigon, desperately trying to get on the final helicopter airlifting the last eleven (out of 6,000) Americans and a few lucky Vietnamese out of harm’s way. Although over 50,000 Vietnamese had been evacuated over the past two weeks (below), for those Americans present that day, no words could express their shame as they saw their South Vietnamese allies left behind to whatever fate awaited them at the hands of the communists.

Back in the States, many also felt such shame for abandoning our allies like that. Many others felt relief that it was finally over. Nearly everyone felt embarrassment for what was supposed to be the greatest nation on earth.

Henry Kissinger spun the whole episode as a successful, albeit costly (\$140 billion, 58,000 American and at least 2,000,000 Vietnamese lives), effort to keep communism out of Indonesia and maintain the American presence in Asia! But even he felt the need to redeem American honor. It came on May 12, 1975

(twelve days after the fall of Saigon) when the Cambodians seized an American merchant vessel, the *Mayaguez*, which had strayed into disputed waters.

Two days later, despite the fact that it was still unknown whether the 39 crewmen were still on their boat, the small island of Koh Tang, or the Cambodian mainland, President Ford, at Kissinger’s urging, ordered in the marines. Unfortunately, 15 marines and eight helicopters were lost storming Koh Tang, and the crewmen were neither there nor on the boat. While the navy was bombing Cambodian gunboats, the Americans were spotted on a small fishing boat and rescued. Despite having accomplished their mission, Kissinger ordered our jets to bomb the mainland so we could “look ferocious.”

Overall, thirty-nine Americans had been saved at the cost of forty-one marines (including twenty-three who had been killed in a helicopter crash during preparations for the mission. All this despite reports that the Cambodians were preparing to release the Americans anyway. In addition, the American captives had enjoyed their impromptu Cambodian vacation, the Cambodians having been very nice to them and fed them very well.

But America’s honor had been redeemed, and Ford’s popularity had jumped eleven points.

The Boat People

The aftermath of the fall of Saigon saw a purge of thousands of South Vietnamese deemed politically unreliable. Around a million were sent re-education camps, of which an estimated 165,000 died from abuse, torture and execution. This, plus the famine and poverty resulting from the war's destruction, led to some two million Vietnamese trying to flee the country. The Sino-Vietnamese War in 1979 led to thousands of ethnic Chinese to flee Vietnam out of fear of being targeted for violence.

Those planning to escape would have to contact people who could get them out, which commonly depleted their savings in buying fake IDs, food, transportation to a port, and passage on a fishing junks or trawlers that weren't suitable for long open sea sailing. The most common strategy was to head for major shipping lanes in the hope of getting picked up by larger ships and taken to Hong Kong, with the Philippines, Malaysia and Thailand as other destinations.

Those not lucky enough to be picked up might be stuck at sea for six months, all the while being decimated by hunger, thirst, and disease. Another problem they faced was robbery, rape and murder by pirates who knew the refugees had typically sold all their worldly goods for gold. Of the two million Vietnamese who attempted this journey, roughly one in four died.

Those who survived the voyage were put in squalid refugee camps in Thailand, Malaysia, the Philippines, Indonesia, and Hong Kong. Money was given to alleviate this humanitarian crisis, but most of it was siphoned off through corruption. Therefore, conditions in the refugee camps were miserable, made worse by the raping and beating of women and children. Thailand was supposedly the worst, with 77% of refugee boats leaving there being attacked.

Once in the camps, refugees might have to wait years before finding permanent asylum in other countries. Typically, children of GIs and Vietnamese women were given priority with their mothers, largely because they were discriminated against in Vietnam for their mixed ethnicity. Wealthier Vietnamese women would often buy the rights of passage from these mothers.

The countries taking in the most refugees were the United States (823,000), Australia and Canada (137,000 each), France (96,000), Germany (40,000), United Kingdom (19,000), and Japan (11,000). Those going to the U.S. often met with hostility, partly from bitterness about the war, but also because a serious recession, made worse by OPEC's oil embargo, generated resentment against any Vietnamese immigrants who got jobs. Below: Vietnamese refugees at Camp Pendleton, California.

The Killing Fields: Cambodia under Pol Pot (1975-9)

They said the Holocaust couldn't happen again. On April 17, 1975, two weeks before the fall of Saigon, the communist Khmer Rouge under Pol Pot took the Cambodian capital, Phnom Penh (below right), and proved everyone wrong by instituting the worst genocide since World War II.

Pol Pot was heavily influenced by Maoism, believing the true communist revolution must be carried out by the peasants. Taking this idea to the extreme, he emptied Cambodia's cities and sent their inhabitants to join the peasants in the countryside in forced labor camps, working them 12 hours a day on starvation rations.

But that was only the start of the madness. The Khmer Rouge closed down the country's schools, factories, hospitals, and entire banking and finance system. They abolished money, religion, and private property. The goal was to turn all Cambodians into "Old People" (i.e., farmers). Therefore, "New People" (teachers, merchants, and intellectuals) were murdered to eradicate their influence.

Their attitude toward "New People" was summed up in the slogan "To keep you is no benefit. To destroy you is no loss." Even having glasses could mark one for death as an intellectual. Ironically most of the Khmer Rouge leaders were from the educated middle class, Pol Pot himself being fluent in French and a lover of French literature.

Other "New People" from the cities largely starved, since they had no experience with agriculture and the "Old People" were afraid to be seen helping them. Even picking berries was seen as capitalist free enterprise and rewarded with execution. Families were broken up and anyone trying to establish contact with relatives was killed.

In addition, Pol Pot's regime committed genocide against non-Cambodians: Vietnamese, Thais, Chinese, and different tribal minorities. They also murdered Christians, Muslims, and Buddhists, although they did give some Muslims a chance live by forcing them to eat pork. (Similarly, Mao forced Chinese Muslims to raise pigs.) City dwellers who couldn't farm well were branded as "economic saboteurs" and killed.

Executions were often carried out using poison, bamboo stakes, shovels and pickaxes to save bullets. Even children and babies were killed by smashing their heads into trees so they wouldn't grow up to avenge their parents. One place where thousands were taken for extermination was dubbed the Killing Fields. Left: Skulls of victims completely fill this commemorative *stupa*. Even today, visitors come across random bones because victims were often forced to dig their own graves before being killed, and they were too weak to dig very deep.

The genocide in Cambodia triggered mass emigrations to neighboring Vietnam and

Thailand. Deteriorating relations with Vietnam led to a Cambodian invasion of Vietnam in 1978, which was repulsed. Vietnamese forces retaliated and took Phnom Penh, driving the Khmer Rouge into the countryside to carry on guerilla war until their final defeat in 1998.

Amazingly, most countries supported the Khmer Rouge keeping their UN seat, apparently seeing no difference between one communist government and the next.

However, since the Khmer Rouge followed a Maoist line of communism, China attacked Vietnam in 1979, resulting in a short indecisive border war (below). Luckily the Vietnamese had plenty of American equipment left over from the previous war to fend off Chinese aggression.

Because few accurate records were kept, estimates vary widely as to how many people were murdered by the Khmer Rouge, although reliable estimates hover around two million, which accounted for about one-quarter of Cambodia's population. A disproportionate number of those were foreign minorities, with over fifty percent of the country's ethnic Chinese being wiped out. As a result, Pol Pot has been referred to as the "Hitler of Cambodia."

In 1997, the Cambodian government asked the UN to start war crimes proceedings. It was 2006 before a combination of Cambodian and international protocols was established and judges were being sworn in.

Coming Home

A returning veterans is greeted by a joyous reunion with his family. Sadly, not all homecomings turned out so well for veterans returning from Vietnam.

Among the more tragic aspects of the Vietnam War was the fate of returning veterans. Instead of returning as heroes, they were often condemned as murderers, not to mention the perceived stigma of having been part of the first war America had ever lost. In fairness to them, that defeat was mainly due to lack of vision by the leadership and the will of the public back home.

It wasn't until 1982 that the sacrifices of those veterans were acknowledged by a memorial in Washington D.C.

The women's liberation movement hit veterans especially hard in two ways. For one thing, it had been happening while they were gone, thus seeming to be a sudden and shocking change added to all the other shocking changes that had occurred. Secondly, soldiers' wives had been forced to be more independent in the absence of their husbands and continued becoming so after they returned, wanting their own careers and lives. All this flew in the faces of men who not only cherished "traditional values, but had made great sacrifices to defend those values.

Suddenly caught in this strange new world, many veterans turned to drugs and alcohol, had trouble holding jobs, lashed out violently against their wives, and in some cases, just ended their own lives. Suicide rates were 24% higher than the rest of the population, while 38% of veterans' marriages ended in divorce within six months of returning home.

One of the more provocative actions angering veterans was the actress Jane Fonda's trip during the war to North Vietnam to show sympathy for its people.

Even the toy industry seemed to have turned against them. Military toys were deemed no longer appropriate, and were completely deleted from the Sears Catalog. G.I. Joe even grew a liberal looking beard before disappearing from the shelves in 1976. He would be re-launched in 1982, but reduced in size from 12" to 3.75".

The Apollo-Soyuz Test Project

The Apollo-Soyuz Test Project was a joint Soviet and American program that culminated with a Soviet Soyuz space capsule and American Apollo space capsule linking up in orbit over the earth on July 17, 1975. For forty-four hours the two crews visited each others' capsules and shared meals in what may have been the ultimate symbolic gesture of U.S.-Soviet cooperation during Détente. As a parting gift after separating, the Americans interposed their craft between the Soyuz capsule and the sun, creating an artificial eclipse so the Soviet cosmonauts could photograph the sun's corona.

Carter's Killer Swamp Rabbit

Jimmy Carter just couldn't win, even against rabbits, especially of the giant marine variety that swim in Georgia swamps. In 1979, Carter related he was in a rowboat on his fishing pond, when he saw a rabbit swimming toward him. But this wasn't a cute little bunny, but a big splayfooted creature sometimes referred to as a swamp rabbit. The president admitted to having limited experience with enraged swamp rabbits that gnashed their teeth and let out strange hissing sounds. What was clear to him was that it was headed for his boat with hostile intentions.

As Carter described it: *"I had a paddle in the boat, so when the rabbit got closer to me to recognize it, and I saw that it was going to attempt to climb into the boat with me, I thought that would be an unpleasant situation for both me and the rabbit. I did not hit the rabbit, I just splashed water toward him and he finally veered his course."* A nearby photographer even got a picture (above) clearly showing the President splashing a big swimming rabbit with his oar.

Of course, the media, blew the story out of proportion. *The Washington Post* and all the networks featured it. For a week, the President couldn't get away from questions about his encounter with a swamp rabbit, the subtext being he was such a weak leader that even rabbits weren't afraid of him.

There was even talk of suing for release of the photo under the Freedom of Information Act. Even after leaving office, Carter wasn't free of the story. In 1981, members of the Reagan administration stumbled across the photo and released it, maybe as a diversion from more important matters.

Blaxploitation: African-Americans and the Media in the 1970s

While the 1950s and 1960s saw African-Americans advance in the realms of civil rights, sports, and music, opportunities for serious roles in film and TV opened more slowly for them, although there were some gains for them in the later 1960s. Probably the first primetime role for an African American (Bill Cosby) was *I Spy*, which debuted in 1965. On one level, it was just another spy drama, a popular genre for the time. However, it paired Cosby with a white partner (Robert Culp). However, even such a pairing on equal terms was too much for many stations in the South, which banned airing it.

Two years later, racial mixing was taken a step further with *Guess Who's Coming To Dinner*, which delved into the even more controversial issue of mixed marriages. In 1968, *Julia*, the first primetime TV drama starring an African American woman (Diahann Carroll) aired. The main character was a widowed nurse raising her son as a single mother after her husband had been killed in Vietnam, something that certainly made her character more acceptable to mainstream America.

Except for *Guess Who's Coming To Dinner*, there was very little that tackled the issue of race in America head on. But as the radical hippies of the 60s transitioned into the liberal yuppies of the 70s, producer Norman Lear decided it was finally time to address the social issues still dividing America, such as racism and feminism.

The result, debuting in 1971, was *All in the Family*, a sitcom centered around a bigoted, middle-aged, and conservative white man named

Archie Bunker. Surround him with his stereotypically good-natured wife, feminist daughter, and liberal /radical son-in-law (aka Meathead), and watch the sparks fly.

Although much of Middle America (including President Nixon) identified with Archie, the show's slant was very liberal. Archie's prejudices would consistently be shown up and ridiculed by all the liberals surrounding him, with an episode consistently ending with a lesson about tolerance and diversity.

The first primetime African-American centered sitcom, *The Jeffersons*, was a spinoff of the groundbreaking *All in the Family*. The question was how to structure a show about African-Americans in a way that mainstream White America would watch it? Simple. Create a Black counterpart to the cranky and racist, but deep-down-inside decent, Archie Bunker: George Jefferson. Then surround him with "good" liberal "negroes" and white neighbors to promote the lessons of tolerance and diversity.

In the early 1970s, as African Americans became more visible in American culture and also a larger part of the movie market, Hollywood exploited that market with films set in urban ghettos and having plots involving crime, drugs, and corruption. Since the main characters were Black, this genre of films came to be known as Blaxploitation.

Catering to black audiences, such movies typically portrayed white people as drug dealers, pimps, prostitutes, and corrupt policemen and politicians. They were also referred to by such ethnic slurs as "Honkeys." Interestingly these films found a broader audience among white people too.

The first major Blaxploitation film was *Shaft*, starring Richard Roundtree as a stereotypically tough detective, except of course, he was black. Such groups as the NAACP, Southern Christian Leadership Conference, and National Urban League protested Blaxploitation films, saying they promoted negative stereotypes of African-

Americans. Subsequent support from various Black artists and publicity on this issue led to the eventual demise of the genre by 1980.

However, despite their somewhat lowbrow appeal and odd spinoffs, like *Blacula* (1972), Blaxploitation films had some long-term effects. For one thing they typically had soundtracks that featured and helped popularize funk music with its funky beats and heavy bass. The soundtrack for *Shaft* won a Grammy for Isaac Hayes in 1971.

They also gave black actors and film makers, such as Spike Lee and John Singleton, the exposure and opportunities to make more serious films, such as *Do the Right Thing* (1989) and *Boyz n the Hood* (1991), which also covered themes about conditions in the ghetto. Similarly, these movies' soundtracks helped popularize hip-hop music, taking African American culture further into the mainstream of American and global culture.

Another source of growing exposure and acceptance of Black culture into the mainstream was *Soul Train*, the "longest-running, first-run, nationally syndicated program in television history" (1971-2006). The creation of Don Cornelius, *Soul Train* featured R & B, soul, funk, and other genres of African American music along with the latest dances and fashions. Airing after school and following a format similar to that of *American Bandstand*, *Soul Train* provided both black and white kids access to African American culture.

THE WOMEN'S MOVEMENT II (1920- 92)

It was the summer of 1977. While my wife was at work, I stayed at home with the baby, changing his diapers, feeding him, playing with him, getting him to sleep, and straightening up the house. Of course, while I was at work, my wife filled in at home. Typically, whoever was at work, especially if it was an evening or night shift, got the car so we didn't have to get the baby out of bed, thus leaving the other parent stuck at home without a car. We had a small house with mortgage payments and the usual assortment of other bills. Nothing remarkable. We were the typical American family of the so-called Baby Boomer generation. However, this particular night it came home to me how different we were as a generation.

It was a particularly hot & sweltering night, and our house, which was tiny and had no air conditioning, was stifling. Therefore, in order to keep cool, I just wore a pair of shorts and the baby only had a diaper, which sometimes made things worse as I carried a hot sweaty baby up against my equally hot and sweaty body.

A friend of mine from work came by on his motorcycle. However, he didn't stay long, finding little of interest in hanging out and watching an eight-month old baby and his father sweat. I remember standing in the driveway, watching him leave on his motorcycle, that iconic symbol of freedom for the American male, and thinking, this isn't how my ancestors looking down from forty centuries of history lived, being tied down to a baby and housework. What would they say if they could see me now? How would I explain myself to them? But, deep down inside, I knew the answer, and it boiled down to one word: justice. How could I expect another human being to work and pay half the bills and also do all the housework and childcare, just because that other human being was female? Taken on that level, it was just that simple. But forty centuries of history made it far from easy. However, in spite of that, I knew what was the right thing to do, and I was determined to do it.

Meanwhile, my wife was at work, also haunted by forty centuries of ancestors telling her that her place was at home with the baby. For many of us, that was America in the 1970s.

Introduction: the "Second Wave" of the Women's Movement. People often think of the Women's Movement as coming in two distinct waves with little happening in between: the Suffrage Movement (1848-1920) and the Women's Liberation Movement starting in the late 1960s. While there is some truth in looking at the Women's Movement as coming in waves, it is inaccurate to see the period from 1920 to 1966 as an empty lull for women. To the contrary, the period 1920 to 1966 saw women, who now had the vote, taking their cause in new directions to gain equality at home and in the workplace. One of their more prolonged efforts, starting in 1923, was to push for an equal rights amendment that, among other things, would eliminate sexual discrimination in the workplace and in the application of various laws. Unfortunately, in 1982, after nearly sixty years of efforts, passage of this amendment fell three states short of ratification.

Margaret Sanger and the fight for birth control rights. While women had the vote by 1920, it was still illegal even to disseminate information on birth control. The woman who led the fight to change this was Margaret Sanger. One of the defining events in her life was watching her mother die in childbirth. Later, as a social worker, she was constantly coming across young women aged and worn out by all the children they had given birth to and the poverty resulting from all those births. As a result, Margaret made it her life's work to free women from such a fate, first by legalizing the spread of information on what birth control techniques were then available, and later working for the development of a safe and reliable birth control pill. In defiance of the law, she published numerous pamphlets on birth control (a term she coined), and opened the first birth control clinic in 1916. Five years later, she formed the American Birth Control League (ABCL) in an effort to gain support from the medical community and middle class so she could work through more mainstream channels. Finally, after years of hard work and multiple jail sentences for Margaret and other members, the ABCL got spreading birth control information through the mail legalized in 1936. Six years later, the American Birth Control League would become Planned Parenthood

World War II, “housewife syndrome”, and renewed activism (1941-66). The Second World War, even more than the first one, set momentous forces for change into motion. Its immediate impact was the need for women to fill the jobs left behind by the men gone to war. This brought millions of women into the workforce, giving them a sense of their own strength and worth, as depicted in the famous poster of Rosie the Riveter with the message “We can do it.” In 1943, women introduced the Equal Pay Act in the hopes of making the same wages as their male co-workers. It would take twenty years to get this bill passed.

As the war was winding down and the prospect loomed of millions of veterans coming back to their old jobs, government propaganda started preparing women to return to their pre-war roles as mothers and housewives. Although most women acquiesced in this expectation, a number found themselves attached to their increasingly independent status. Two decades later, they would be joined by millions of their daughters.

The post-war period saw Americans enjoying unprecedented prosperity as millions of couples got married, started families, and moved into their own houses in the suburbs. On the surface, it seemed middle class Americans were living in a dream come true. But for a growing number of these women in suburbia, that dream was becoming a nightmare. It even got a name: housewife syndrome. The basic problem was that they were not finding satisfaction and fulfillment with their supposedly idyllic suburban lives of doing housework, taking care of the kids, and making life as cozy as possible for their husbands. Adding to the problem was the fact that people didn't talk about such private matters with other people. Therefore, each woman thought she was the only one suffering such feelings, thus compounding her misery with guilt for even feeling such things. Some women saw psychiatrists or got prescriptions for anti-depressants, feeling that they were mentally ill, which only made them feel even more inadequate. Others turned to alcohol, which also made matters worse. Fortunately, one woman started writing.

Her name was Betty Friedan. She was a typical housewife and mother who also wrote articles on how nice it was to be housewife and mother for

women's magazines (which, by the way were all run by men). She also had a nagging feeling that not all was right with her life. However, being a writer, she had the opportunity to go out and talk to other women, unlike most housewives who were suffering at home alone in quiet desperation. During a class reunion at the women's college where she had graduated, she started getting the sense that other women were feeling frustrated and unfulfilled just as she was. Out of this and subsequent conversations and research came a book, *The Feminine Mystique*, published in 1963, that alerted women that their malaise was not abnormal and unique, but actually something being felt by millions of other housewives like themselves. *The Feminine Mystique* would come to be the virtual call to arms of the Women's Liberation movement, and Betty Friedan became one of the movement's godmothers.

Other forces were at work as well. For one thing, Margaret Sanger's crusade for developing and making available a safe, easy, and reliable form of birth control bore fruit when she and a researcher named Gregory “Goody” Pincus had developed the first oral contraceptive. In 1960 the FDA approved the use and distribution of the this oral contraceptive that, to a whole new generation of women whose lives it changed, would be known simply as The Pill. Secondly, the anti-war movement and counterculture created a reaction against the warrior ethic, opening the way to wider acceptance of gentler and more nurturing values associated with women. Also, there was the spirit of activism in the 1960s. Much like in the previous century, when women first got involved in various causes, such as abolition, to help other people, women in the 1960s took part in the Civil Rights and anti-war movements. And just like in the previous century, they came to realize that their own issues constituted just as worthy a cause. Catalyzing this was their treatment as inferior partners in these social movements. Things came to a head with the Civil Rights Act (1964), which, among other things, banned sexual discrimination in the workplace. However, frustration over the federal government's inadequate efforts to enforce this clause led in 1966 to the formation of a new organization: the National Organization of Women (NOW). The Women's Liberation Movement was born.

The Women's Liberation Movement (1966-92).

The first major public event of this new phase was a protest in 1968 against the Miss America Pageant for treating women as sexual objects. The protest took the form of an auction where women were sold as pieces of meat as in a cattle market. The legend is that women also burned their bras in protest. However, they couldn't get a fire permit, so no bras went up in flames. Much like the early suffrage marches, this protest met mostly derision, especially, but not exclusively, from men. However, NOW's street theater tactics got people's attention and started working their way into their consciousness.

While mythical bra burnings may remain as people's primary memories of the Women's Liberation Movement, progress was made through the more pedantic avenues of the courts and Congress. Out of these efforts came an onrush of laws and legal decisions that dramatically improved women's status and influence. In 1972, Title IX was passed, giving girls and women an equal number of opportunities to benefit from educational programs, including the right to play sports in schools. In 1973, in the *Roe vs. Wade* case the Supreme Court effectively made abortions safely and legally available to women, the main argument in favor of this being that women were getting illegal abortions outside the safe sanitary conditions of medical clinics, thus costing many of them their lives. Legalized abortion remains the single most controversial event coming out of the Women's Liberation Movement.

In 1977, the National Coalition against Domestic Violence was formed. Many of its early efforts were to call to people's attention the fact that domestic violence against women and children was much more widespread than most people realized, since previously such things were considered private matters, not to be discussed in public. Efforts to reduce domestic violence continue today.

Much of women's progress came in the workplace. In 1978 Congress passed the Pregnancy Discrimination Act, protecting women from losing their jobs because of pregnancy. Women were also breaking down barriers into various jobs previously considered men's exclusive domains. In 1981, Sandra Day O'Connor became the first woman to sit on the United States Supreme Court. Two years

later, Sally Ride became America's first woman astronaut. And the year 1992 would be called the "year of the woman" as a record number of women gained election to public office. However, in the midst of this there were setbacks, most notably the failure to get the Equal Rights Amendment ratified in 1982. And while women were making remarkable progress, there was a price to pay for these gains.

Trouble on the home front. Such rapid changes never come without putting stress on other parts of society and culture. In addition, altering traditional gender roles instilled by years of cultural conditioning inevitably would meet resistance from men. Not only did these changes threaten their privileged position in society, they also pressured men to act counter to what they had always been told was proper behavior. To most men and many women, such changes were unsettling, if not downright immoral. Therefore, the legal changes brought on by Women's Liberation to the workplace and public life created stresses and strains for both men and women in their private lives at home.

For men, there was additional pressure based on the theories of behavioral psychology in the 1970s that cultural conditioning, not biology, causes most difference between men and women. This led to the common assumption that traditional male behavior, especially aggression, could be tamed and that men could be conditioned to be gentler and more nurturing like women. This pressure to change led to problems for men from two directions. At home, criticism of and pressure to change traditional "male" values created frustration and anger. At the same time, men faced peer pressure to maintain traditional "male" values and patterns of behavior. Failure to do that, they were told and conditioned to believe, implied they were something less than real men. For men, who were conditioned to keep their feelings bottled up inside, their inability or unwillingness to verbally express their feelings often led to expressing it in the only way they knew how: violence.

While it is true that domestic violence has always existed, until now such matters were kept in the home and not reported. However, middle class women's greater sense of empowerment also allowed and encouraged them to talk about such

matters in ways that had been stifled since the isolation of the nuclear family and suburbia effectively cut their lines of communication. Now, not only were they talking about these things in support groups in the private sector, they also were gaining the political influence to make such discussions matters of public concern. Thus, while there was increased domestic violence, it was being reported like never before. How much more domestic violence there is now compared to before is impossible to determine, but the extra stresses caused by the radical changes taking place (including rejection of traditional rules of etiquette that previously had partially protected women from violence) certainly added to the problem.

Women faced their own set of new problems. One stemmed largely from the fact that status was still defined in “male” terms of successful careers instead of such things as parenting. Therefore, women often felt they had to downplay their traditional “female” qualities in order to be accepted and successfully compete in the business world. To an extent, this was reflected in women’s fashions with pantsuits as women tried to look the part of business executives. (By the same token, men wore something called leisure suits, a fashion I can find no excuse for whatsoever). Just as there was an underlying assumption that men could be conditioned to be gentler and more nurturing, there was a corresponding assumption that women could fulfill both the “male” role in pursuing careers as well as the “female” roles as mothers. For many career women, this was a necessity if their husbands refused to take on the less glamorous domestic chores of cleaning house and changing diapers. Out of this emerged the stereotype of the “supermom”, the woman who could take on both a career and raising a family.

However, this led to another problem. Not only did many women feel overwhelmed by taking on the daunting workload of both having careers and being mothers, they also felt guilty either for not being at home with their children or having forsaken having children altogether so they could pursue careers. Just as men felt centuries of ancestors were looking down upon them with disapproval for their taking on domestic and child-raising duties, women felt similar disapproval from centuries of their own ancestors for not being at home taking care of the children.

Another problem stemmed from the inauguration of the birth control pill and the resulting “sexual revolution” that began in the 1960s. Before this, sex was supposed to be something that only occurred within the context of marriage. While the Kinsey reports showed that people didn’t always conform to this standard of behavior, it was much more common for women to “save themselves for marriage”, if for no other reason than from the fear of getting pregnant and suffering the stigma of being single mothers. The Pill largely removed these fears, but the Sexual Revolution came with a price, especially for women. For one thing, the idea of sex without emotional commitment, while appealing at first to many women, wasn’t as easily attainable as it may have sounded. Many women engaging in what at first was casual sex often found themselves falling in love with their partners. While many men also fell in love, it was more common for men to take undue advantage of the freedom afforded by sex without commitment and move from partner to partner. They might even challenge women with the charge that, if they were truly liberated women, they should prove it by having sex with them. Many women fell for this faulty logic and were badly hurt as a result. This was especially true if they got pregnant, because the Pill didn’t always work, especially if a woman forgot to take it. Therefore, by the time the baby arrived, the father was often long gone, leaving many women left broken-hearted and with children to support.

There were other types of fallout from the women’s movement. One was in education. Previously, women wanting careers had very few choices, mainly as nurses, secretaries, or teachers. Since all these were seen as “women’s work”, they tended to be very low paying jobs. For public schools this meant that a disproportionate number of the best and brightest of half the population were being channeled into teaching at bargain prices. However, schools lost many of their best teachers when better and higher paying career opportunities opened up for women. To save public education, taxes would have to be raised to make schools more competitive in the market place.

Problems also emerged as more families had both parents working full-time. Finding good quality day-care for small children was one problem,

especially since this was, and largely remains, another area perceived as “women’s work resulting in low-paying wages. Older children would often come home from school to empty houses without any adult supervision. Such “latchkey” children, besides being at risk in terms of safety, were also more prone to get involved with drugs and crime.

Unfortunately, not all families stayed together. Along with more casual attitudes toward sex came more casual attitudes toward marriage and divorce. Therefore, either the fathers never married their children’s mothers or divorced them soon after getting married. Either way, millions of women were left to raise their kids as single parents. For them, working and raising a family single-handedly was not a choice. It was a reality they had to deal with by themselves. For those who got pregnant when they were young and inexperienced, this made it difficult, and in many cases impossible, to get an education to prepare them for a professional career. All that was left for them were low paying jobs that barely paid the bills, if that. The result was what became known as the “feminization of poverty”.

The “Third Wave” of the Women’s Movement (1992-). Having gained more legal equality in the home and workplace, feminists have turned their focus to such matters as violence against women, sexual harassment, and issues of race and class disparities among women in the West and across the globe. Some have even referred to this as the Third Wave of the Women’s Movement, since it reaches out to a broader range of women and deals with issues that are not as easily resolved through legislation. Rather, they deal with deeply ingrained cultural values that are just as difficult, if not more so, to tackle.

Housewife Myths

Part of an 8-page photo essay, entitled “Occupation: Housewife” from the September 22, 1941 issue of Life magazine. It was reprinted

in the New York Times in 2006 with one alteration: the picture of the woman’s grandfather was replaced with a picture of Betty Friedan, one of the founders of the Women’s Liberation movement.

World War II, even more than World War I, brought millions of women into the workforce, giving them a sense of their own strength and worth, as depicted in this government poster. However, as the war was winding down with the prospect of millions of veterans coming back to their old jobs, government propaganda started preparing women for a return to their pre-war roles as mothers and housewives. Although most women acquiesced to this expectation, a number found themselves attached to their greater independent status.

The pictures shown above were intended to show the life of a typical housewife in Kankakee, Illinois in 1941. When it was reprinted in 2006, the daughter of the woman in the picture sent the following letter to the Times:

To the Editor:

I agree that issuing marching orders to women today is “not helpful.” To try to label women is an act of futility, making them one-dimensional when in fact most women’s lives are complicated and change with time and circumstance.

But I was most taken with the photographs accompanying your article, because the woman portrayed cleaning her house was my mother, Jane LeValley Amberg.

As noted, the photo was taken by William C. Shroot for LIFE magazine and was originally published September 22, 1941, in a feature article titled “Occupation: Housewife.”

My mother was unhappy with the published article, because she was portrayed as a “typical” American housewife who cared only for home and family. Not mentioned was the fact that, with no college degree, she was also a voracious reader and a committed liberal

Democrat who cared deeply about national and international issues.

Our first TV was bought so that she could watch the Army-McCarthy hearings. Sixty-five years after the Life article, women still struggle with the rigid, one-dimensional labels of “stay-at-home moms” and “women who work.”

*Pamela Loewenstein
Lawrence, Kansas*

TV Moms. Unfortunately, this more nuanced view of women got lost in the greater shuffle of mass media in the 1950s and 1960s. In addition to articles in women’s magazines (that were owned and run by men) that scared women into domesticity with the threat of not being able to land a husband, there was the new medium of television, which especially emphasized the stereotype of the stay-at-home housewife.

Jane Wyatt was the first TV mom, although the show was entitled "Father Knows Best" (below). It was so popular in the 1950s that, when production ended, it continued to be shown in primetime for the next three years. Dad’s nicknames for the kids were Bud, Kitten, and Princess. Guess who was who.

Another popular TV mom in the early 1960s was Donna Reed (below). During the beginning credits she would hand out lunches to her kids and husband as they went out into the real world. One problem: Her husband forgot to kiss her goodbye. She’s so sad until, each week, he comes back just in time for the end of the credits and gives her a kiss to make her day.

Divorce Before 1970

While Protestant Christians had been able to get divorces since the 1500s, the stigma associated with it remained strong through most of the 1960s. In the eyes of the Catholic Church, divorce per se is still not recognized, though people can get an annulment based on the technicality that the marriage, for whatever reason, never took place.

White middle class society in America considered divorce a worse sin than infidelity. While infidelity was a matter between husband, wife, and God, divorce threatened the very fabric of society, especially in terms of its impact on the children and their upbringing.

Until the 1960s, divorce was only granted if one spouse was proven guilty of such things as adultery, abandonment, or being guilty of a felony. One spouse had to publicly testify and prove the guilt of the other in court before a judge, lawyer, and stenographer. If a judge found both parties guilty of one of these offenses, he would often deny them the divorce. Sometimes married couples were so desperate to split up that they would even stage a fake affair to get pictures as proof of infidelity.

Recognizing what shams many of these cases were, in 1970 California became the first state to legalize no-fault divorce. New York State was the last in 2010. Maybe it was only natural that California would lead the way in no-fault divorces. After all, Hollywood movie stars since World War II had been involved in growing numbers of high profile divorces. Although it’s impossible to quantify the impact of the constant press coverage of those cases, it certainly must have led to a skewed perception that divorce was more common in society overall, thus making it seem more acceptable as well.

Before Roe v. Wade

Abortions are not a new phenomenon. Safe and legal abortions are. Until the industrial revolution, high birth rates were essential to just keep a population's numbers stable for everything from getting the crops in to defending society against marauders. Therefore, abortions were seen as a crime against society as a whole. Further complicating the issue was the question of when life begins: at conception, at birth, or someplace in between. Most people believed it was conception, which made getting a safe and legal abortion was extremely difficult and dangerous.

For example, in New York State, a woman with some money could go before an obstetrics panel and apply for a "therapeutic abortion" on psychological grounds such as pregnancy being a threat to the baby or herself. However, it was difficult and expensive to get such a procedure. By the same token, reputable doctors and nurses were rarely willing to perform illegal abortions, since being caught would cost them their licenses and reputations.

Thus women desperate for abortions had to resort to unqualified and less than reputable people for illegal procedures, which could take two forms: surgery and abortifacient drugs that would induce abortion. Surgeries would involve sharp instruments, including according to some rumors, coat hangers. In addition to uncontrolled bleeding, the patient might also be treated with improperly sterilized instruments that could lead to infection. Another treatment was pushing a tube through the cervix and injecting Lysol into the uterus.

Ever since ancient times midwives and other abortionists have used abortifacient herbs, such as sylphium, rue, hellebore, and pennyroyal, to

induce abortions. Some of these, such as pennyroyal, can cause severe complications and even death. As recently as 1994 women have reportedly died from pennyroyal poisoning while trying to induce abortions.

Techniques to induce abortion without surgery or herbs were also prescribed since antiquity. They included strenuous exercise (in particular jumping up and down hitting the buttocks with the heels each time), pouring hot water on the abdomen, and lying on a heated coconut shell. Although generally safer than the surgical and herbal techniques, they were also less effective. Therefore women desperate for abortions were faced with some dangerous and scary options.

Women's Liberation 2.0 Takes Off

The Women's Liberation movement kicked off September 7, 1968 at the Miss America Pageant in Atlantic City. About 100 women, calling themselves the New York Radical Women, staged a protest outside the pageant center, running a mock cattle auction with themselves as the meat and throwing various "instruments of female torture," including make-up, high heels, Good Housekeeping magazine, girdles, garter belts and bras into a "Freedom Trash Can". The plan was to burn the contents, but they couldn't get a permit for public burning. However, the idea of women burning their bras (the female counterpart to men burning their draft cards?) stuck in people's heads, even though there were no documented cases of bra burnings, at least intentional ones.

You've Come a Long Way Baby

That night, the protestors succeeded in getting into the pageant gallery and hanging a protest banner. It was the first time the American public saw the slogan “Women’s Liberation”.

In the same year, 1968, the NAACP held a Miss Black America Pageant to celebrate the beauty of Black Women. The convergence of this event with the Women’s Liberation protest highlighted the dilemma Black women found themselves in during the 1970s: were they more committed to Black liberation or Women’s Liberation, which was largely a white middle class driven movement.

Unfortunately, it didn’t take long for corporate America, especially the tobacco industry to exploit the Women’s Movement for the sake of pure profit. In fact, Virginia Slims, the first cigarette specifically marketed to women, first came out in 1968. Using the slogan, “You’ve come a long way, Baby,” they helped make women more equal to men in rates of lung cancer and heart disease, a somewhat dubious distinction. According to a report by the Surgeon general of the United States, trying to link women’s empowerment with their cigarettes, Virginia Slims also contributed to higher rates of smoking in teenage girls.

Some other choice lines from Virginia Slim ads:

“If I ran the world, calories wouldn’t count.”

“Find your voice.”

“Pretty in pink doesn’t make you a pushover.”

“I’m a skyhigh pair of platforms in a closet full of flats.”

“I don’t necessarily want to run the world, but I wouldn’t mind taking it for a little ride.”

The caption says: “Why do we apply mascara at 55 mph? Because we can.”

THE DESOCIALIZATION OF AMERICA SINCE 1945

In a society, such as the United States, that values the individual so much, it is easy to lose sight of the fact that we are a social species that has survived down through the ages because we have worked together in groups. We have increasingly lost touch with this basic fact since World War II for a variety of reasons. Two in particular were results of the end of the war: the corporate workplace and the suburbs.

America in 1945 was the ideal breeding ground for corporate capitalism, since it controlled 60% of the world's industrial production. Corporate regimentation was also well positioned to ease the transition for millions of young men straight from the regimented structure of the military to that of the office place trading their green uniforms for gray flannel suits. While this entailed a group mentality to survive, one of the frequent demands of corporate life, helped by the Protestant work ethic, was either being on the road away from family or being transferred to a new office in another part of the country away from relatives and friends.

Suburbia. After the war, there was a severe housing shortage for all the new couples and families being formed. Into the breach stepped William Levitt, a housing contractor who applied mass production techniques to building homes, thus inventing the suburbs. The immediate effect was for millions of people to move from their family and neighborhood networks in the city, where everyone was crowded together and had to get along. Instead, each nuclear family was isolated in its own home. Of course, people made new friends, but there were several features about the suburbs that made them different.

First of all, to keep costs down, Levitt and other contractors who copied him did not put front porches on their new houses. For many people, the front porch had been a primary meeting place for neighbors to visit, especially on hot summer evenings. This fostered an atmosphere where everyone in the neighborhood knew each other and their kids, and were expected to let parents know if their children were acting up. The African expression "it takes a village to raise a child" had meaning in America as well as Africa.

However, without the front porch, people in neighborhoods started losing touch with one another.

This was especially true as new homeowners started putting up fences or hedges along their property lines to mark their land from that of their neighbors. While there was generally no hostile intent in such an action, it did tend to cut neighbors off from one another more and more as newly planted hedges filled out and grew up with each succeeding year.

Accelerating this process was the growing popularity and affordability of air conditioning. Now, even if people did have a front porch, they were more prone to stay inside where it was more comfortable, but also much harder to socialize with neighbors. Adding to this was another remarkable invention that came into its own in the 1950s: the television. At first, when TVs were an expensive novelty, the whole family gathered together to watch such programs as wrestling, a mainstay before more professional programming took over. Whatever was on TV, people loved to watch, and that moved them indoors away from socializing with neighbors. They also could serve as electronic baby-sitters, freeing their parents for other chores and activities. And when more than one TV was in the house, even the passive togetherness of a family watching its favorite programs gave way to TV watching as an isolated one-on-one experience between the picture tube and the passive viewer.

Among the first notable casualties of suburban life was the housewife. Separated from her husband by the corporate demands of his job, from her relatives by distance, and from her neighbors by fences and hedges, a new phenomenon appeared: housewife syndrome, a sense of loneliness and being trapped by the very circumstances that many women had fantasized as the American dream. Granted, not all women felt this way. Many housewives socialized with neighbors and made new friends in the suburbs, but oftentimes even those friendships were fleeting as their friends' husbands were transferred to a new city. For many families, the suburbs were not a home as much as a temporary stopping point on the way up the corporate ladder.

THE END OF THE COLD WAR (1981-1991)

Certainly, the most dramatic event in recent history has been the demise of communism in the Soviet Union and Eastern Europe, in the 1980s. For nearly half a century, communist Russia stood as an apparently immovable object in the seemingly endless Cold War. And then suddenly the Soviet Union and the Warsaw Pact collapsed like a house of cards. Conservative pundits attributed this to the Reagan administration's military buildup that forced the Soviets, with a much weaker economy, to spend themselves into oblivion in order to keep up in the arms race. While this was certainly a factor, it was a combination of factors as diverse as the computer chip, oil prices, nationalism, and ethnic diversity that drove the Soviet Union under.

Three factors emerged in the early 1980s that together put extra pressure on the Soviet leadership. One was the invention of the computer microchip in the 1970s that led to the development of personal computers in the 1980s. This triggered a dramatic expansion in both the sophistication and availability of computers that began transforming the world almost overnight. It also presented Soviet leaders with a serious dilemma. Widespread adoption of personal computers to keep up with the West would also expose Soviet citizens to outside ideas and influences that could undermine loyalty to their regime. By the same token, failure to adopt this new technology would doom the Soviet Union to fall further behind the West. Weighing its options, the aged and conservative Soviet leadership of the early 1980s saw exposure to Western ideas as the greater threat.

A second factor was oil prices. In the 1970s, members of OPEC (Organization of Petroleum Exporting Countries) cut production and raised the price of oil. This hurt the United States, a net importer of oil, while conversely helping the Soviet Union, a major exporter of oil. However, in the 1980s, several members of OPEC broke ranks and lowered the price of their oil, forcing other members to do likewise in order to remain competitive. Now the tables were turned, with lower oil prices hurting the Soviet economy and helping that of the United States.

Finally, post-Vietnam disillusionment with the military combined with the extra drain on the American economy from higher oil prices had allowed the Soviet military to pull even with that of the United States by the late 1970s. Ronald Reagan used this perceived "window of vulnerability" and promises to remedy it to win the 1980 presidential election. Immediately upon taking office in 1981, he launched an aggressive rearmament program that built up both conventional and nuclear forces increasingly using the emerging computer technology. Even more alarming to the Kremlin, he proposed the Space Defense Initiative (SDI), also known as "Star Wars" after the popular movie of the time, which would shoot down any incoming missiles. Such a system, if it worked, would radically alter the nuclear balance of power in America's favor. Even though such a system was not feasible at that time, it terrified the Soviets who thought we might be able to pull it off.

The combination of America's arms buildup with its economic strength and exaggerated fears of American technological abilities drove the Soviets to try to keep up in the arms race despite their own much weaker economy. This meant that while 6-7% of the United States' GDP was going to its military, the Kremlin had to spend 15-20% of its GDP just to keep up. This led to soaring military budgets that especially hurt the Soviet economy as new and more expensive weapons systems kept being developed that Moscow felt it had to match.

In 1985, as the older more conservative generation of communist leaders was dying off, Mikhail Gorbachev took over as the new Soviet leader. Recognizing that major reforms were long overdue, he initiated changes in both domestic and foreign policies. His domestic reforms were known by the Russian terms *glasnost* (openness) and *perestroika* (restructuring). *Glasnost* encouraged Soviet citizens to openly discuss the issues and problems facing them. Gorbachev's idea was to get new ideas on the table, make people feel more ownership in the communist system, and to provide popular support for his reforms. This worked at first, but revolutions, which start out with moderate agendas to prevent alarm over radical changes, just keep raising people's expectations for more changes, so what may have started as a feel-good exercise quickly turned into growing criticism of

the communist system Gorbachev was supposedly trying to save.

Perestroika, the transformation of the artificially controlled command economy into one determined by market forces, was upsetting in two ways. Not only did it alarm Soviet leaders who saw economic reforms as a threat to their political power as well, it also scared many Soviet citizens who were used to a state managed economy, that no matter how mediocre the standard of living, it was seen as at least being safe.

Finally, Gorbachev clearly saw that spiraling military budgets stemming from the renewed arms race were a major source of the Soviet Union's problems. He also realized that the arms race was the product of mutual fears on both sides and that the only way to end that cycle of fear was for one side to make a unilateral gesture that the other side could not ignore. Therefore, he announced a major reduction of Soviet forces in Eastern Europe followed by calls for talks on reducing nuclear stockpiles. Reagan took up Gorbachev's challenge and the two powers were well on their way to negotiating a series of arms reduction treaties that defused much of the threat and fear of nuclear holocaust that had haunted the world for over forty years.

However successful Gorbachev may have been on the diplomatic front, his troubles on the domestic front were just beginning. At the root of his problems was the fact that revolutionary economic changes were bound to make things worse before they got better. All he could do was carry on with more reforms even though in the short run they only caused further deterioration, more reforms, and so on. Unfortunately, this vicious cycle had two other effects that fed back into it. For one thing, *glasnost* had exposed people in the Soviet bloc to the greater freedom and affluence of the West, thus making them increasingly impatient for positive change. By the same token, continuing deterioration only made Soviet and East European citizens more frustrated and anxious for change. In the meantime all Gorbachev could do was hold on until his reforms took effect. However, the Soviet system was so rotten to the core that it would take time for things to turn around. And Gorbachev was running out of time.

When the end came, it came with almost apocalyptic speed. In 1989, within just a few months, the various communist dictatorships in Eastern Europe fell like a row of dominoes. In November, the Berlin Wall, the most visible symbol of the Cold War, came down and East and West Germany were reunited the next year. In 1991 the Soviet Union followed suit, breaking up into Russia and a number of other independent states. Since then, all these nations founded on the ruins of the Soviet empire have struggled to adapt to the high-tech capitalist world that has emerged in the aftermath of the Cold War and continues to change at an ever-accelerating pace.

The Birth of the Personal Computer

By the end of the 1950's computers were no longer one-of-a-kind hand built devices owned only by universities and government research labs. The first commercially mass-produced computer was the famous UNIVAC computer (a contraction of "Universal Automatic Computer"). In the 1950's, UNIVAC was the household word for "computer" just as "Kleenex" is for "tissue". The first UNIVAC was sold to the Census bureau. UNIVAC was also the first computer to employ magnetic tape for data storage, since computers didn't have hard drives yet.

An example of one of IBM's mainframe computers before the microchip drastically reduced computers' size and increased their computing power by several magnitudes.

In the 1960s IBM was seen as synonymous with computers. With only 7 other companies producing computers, the eight companies were known as IBM and the 7 dwarves.” What dethroned IBM was its decision to farm out its software writing to a then unknown company known as Microsoft. By 2000, Microsoft’s value would be twice that of IBM’s.

There were two ways to interact with a mainframe computer. One was the Teletype, which electronically transferred what you typed to the mainframe which would then print its response (at the lightning speed of 10 characters per second) on a roll of paper. You typed a single line of text, hit return, and waited for the Teletype to begin noisily printing the computer's response. Since it’s easier to produce an answer in something that only had two states, on or off, binary code became, and remains the standard of computer programs today. The advantage of this system was that maybe 100 teletypes could be feeding into the mainframe simultaneously.

The other way to interact with the computer was *batch mode processing*, where the computer handled one person’s program at a time. To do this without monopolizing computer's full attention at run-time, you had to prepare your program ahead of time by generating a stack of punch cards on a keypunch machine.

Each card could hold only 1 program statement. To submit your program to the mainframe, you placed your stack of cards with your program in the hopper of a card reader. Your program would be run whenever the computer made it that far. You often submitted your deck and then went to dinner or to bed and came back later hoping to see a successful printout showing your results. Obviously,

a program run in batch mode could not be interactive.

A common cliché then was “Do not bend, fold, spindle, or mutilate”. If you committed one of these atrocities on one of your cards, it wouldn’t run and would have to be retyped. Another common hassle was to drop your stack of cards all over the floor, forcing you to reassemble your program card by card.

An early tape drive necessary for storing information since computers didn’t have hard drives then.

The first commercially available integrated circuit came in 1961 and was first used in Air Force computers and Minuteman Missiles. It was the size of a pinky finger and had only one transistor, three resistors and one capacitor. Now an IC the size of a penny can hold 125,000,000 transistors. One of Intel's 4004 chips still functions aboard the Pioneer 10 spacecraft, which is now the man-made object farthest from the earth.

In 1971, Intel (an acronym for “integrated electronics”) introduced the single chip microprocessor. This did the IC one better by putting all the components of a computer (central processing unit, memory, input and output controls) on one chip. It was 1/8” X 1/6” and had 2,300 transistors, giving it as much power as the ENIAC, which had filled 3,000 cubic feet with 18,000 vacuum tubes. Another big feature of the microchip was its ability to be programmed and reprogrammed by writing software to tell it what to do.

Intel didn't invent the computer, but it was the first to cram an entire computer into one microchip.

Space Invaders, one of the first really popular video games that came out in the 1970s, linking the population at large with the revolution taking place in electronics.

Intel priced its next microprocessor, the 8080, at \$360 dollars as a dig at the IBM 360 mainframe, which cost millions of dollars. This microprocessor was used to market the world's first personal computer, the Altair 8800. The problem was you had to build it from a mail order kit.

At this time a Harvard freshman, Bill Gates, left school to devote his time to writing software for the Altair 8800. Luckily for him, IBM had decided to standardize its Intel microprocessors for its line of PCs for 1981. This meant that any software Gates wrote was compatible for any and all IBM or IBM compatible PCs, which still control the lion's share of the computer market.

Intel's Pentium 4 used in today's PCs is still compatible with the Intel 8088 used in IBM's first PC.

In September 1975, IBM introduced the 5100 Portable computer. Available in 12 models providing 16K, 32K, 48K or 64K positions of

main storage, the 5100 sold for between \$8,975 and \$19,975. It was available with either APL or BASIC — or both — programming languages. Weighing approximately 50 pounds and sized slightly larger than an IBM typewriter, The price made it unavailable to the average consumer and was made with professionals such as engineers, analysts, statisticians and other problem-solvers in mind. If the size and weight of the 5100 seems huge by today's standards, compare it to its late-1960's IBM counterpart, a machine nearly as large as two desks and weighing half a ton.

IBM offered three Problem-Solver Libraries, contained in magnetic tape cartridges that provided over 100 interactive routines applicable to mathematical problems, statistical techniques and financial analyses. The cartridge had a 204,000-character capacity on 300 feet of 1/4-inch tape.

In 1981, the personal computer (top) made by IBM, first became available to the average consumer for \$3000. It had a 10MB hard drive and two 5.25" floppy drives, so that data could be copied from one disc to the other.

The first PCs had no hard drives, so everything had to be stored on floppy discs. The discs in the 1980s were 8" in diameter (top left, below). By 1990, they had been reduced in size to 5.25" discs (middle right) that could only store 256k of data. A few years later, the 3.5" disc (bottom right) storing 1.5MB in a hardened case replaced the 5.25" floppy.

Grizzly Bear or Paper Tiger: the Soviet Army in the 1980s

Soviet soldiers in Afghanistan

During the Cold War, Soviet armed forces were portrayed as a monolithic threat ready to invade Western Europe at a moment's notice. By the 1980s, an alternate view of it as an alcoholic monster with feet of clay also emerged. As usual, the truth was somewhere in between, it being a force capable of maintaining internal order and defending its borders, but little else, especially in an offensive capacity. Of course, much of its decay came after 1985 when Mikhail Gorbachev started realigning Soviet priorities toward the civilian sector of the economy, thus drastically cutting funding to the military. However, much of the Soviet army's problems were systemic, starting with conscription and basic training.

Schoolboys were conditioned to the idea of two years mandatory service (three in the navy) at the age of eighteen. Paramilitary and ideological training along with trips to military installations and World War II battlefields and monuments were essential parts of this conditioning.

Conscripts were drafted in two large clumps each year, one in the spring and one in the fall, which itself made it hard to absorb and train them. Since pay was low (about \$30 a month), only one percent would reenlist, leaving the Soviet army critically short of non-commissioned officers (NCOs), sergeants and master sergeants who form the backbone of any army. As a result, for training and discipline the army largely relied on a four-tier pecking order of Youngsters, Fishes, Candidates, and Bosses that is based on seniority where soldiers move up every six months until discharged. Such a

system was barely standardized and encouraged a lot of bullying, which in turn results in low morale and poor unit cohesion. Further impairing such cohesion was the multi-ethnic makeup of the army, many Soviet peoples being resentful or even hostile to Russian rule. Making matters worse, an estimated fifteen percent of Soviet recruits could barely speak Russian.

Conscripts were stationed long distances from their homes. This discouraged desertion and reduced empathy with the local population, which might prove useful if called upon to suppress any popular disturbances that could require shooting some of the locals. To further reduce such empathy, troops were stationed away from towns where they might get to know the local population. In addition, they were denied maps, especially if stationed in Eastern Europe where they might try to desert and even defect if they only knew where they were. In 1968, some Soviet troops sent to repress the democratic movement in Czechoslovakia thought they were in West Germany or even Israel.

Isolation also reduced opportunities for recreation and entertainment. Therefore, Russian soldiers drank a lot and had a high level of alcohol dependency. Given their remote stationing and low pay, even alcohol might prove difficult to get hold of and pay for. But where there's a will there's a way. For extra money, they would strip parts from electronic equipment, such as radar, and sell them for the money to buy alcohol. Besides the soldiers, this also made military equipment less functional, disabling up to half the Soviet armed forces' radar, which potentially created huge gaps in Russia's radar defenses.

When regular alcohol was unavailable, soldiers reportedly would decant it from other sources. For example, pilots would siphon off de-icer, claiming their planes were icing up, and then drink that. As a result, a number of soldiers died or went blind.

However, various factors largely prevented the sort of rampant alcoholism that could seriously

impair combat readiness. Upon induction, recruits had to surrender their civilian clothes and internal passports, making it virtually impossible for deserters to get work, shelter, medical care, or even alcohol, since liquor stores were under strict orders not to sell to men in uniform.

Living in a society where government surveillance was ubiquitous and strict rules and punishments were regularly enforced also helped discourage conscripts from even trying to break the rules. Minor infractions, such as intoxication, rudeness to officers, and going absent without leave (AWOL) brought a sentence of fifteen days in an unheated guardhouse where prisoners had to remain standing eighteen hours a day while on reduced rations, which under normal conditions were unappetizing and vitamin deficient. More serious offenses led to sentencing in the much-feared penal battalions, which were notorious for their brutality, forced labor, and starvation rations.

Without an adequate number of NCOs, training was narrowed to a few specific tasks and endlessly repeated. As one former Soviet sailor put it: “We were drilled and drilled and drilled, relentlessly.... I could undoubtedly do my job, even now, five years later, in my sleep.” Another former conscript related that they were constantly being detailed to painting their tanks and how one time they resorted to spray-painting the surrounding woods as well.

Partially alleviating these problems was a virtual class system within the military. More elite branches, such as paratroops, strategic rocket forces, combat ready units in Eastern Europe, and the navy, got the best educated and most reliable recruits, who in turn were given better living conditions, food, officers, and training. Less combat ready units got poorer quality recruits, while non-combat branches, such as construction and railroad troops, got the “undesirables”: former criminals and men not fluent in Russian and/or from politically unreliable groups such as ethnic Germans or Crimean Tartars.

Poor production and design standards also hampered Soviet military effectiveness. On the most basic level, combat boots were so poorly made that they were falling apart after only ten days of active service in Afghanistan. Soviet tanks also had their problems. For one thing, they were extremely cramped, which made extended service exhausting for their crews. Since most maintenance was done by crews, often after a long day of service inside the tanks, the crews were often too tired to do full maintenance, leaving the machines prone to breaking down. Cramped conditions also forced fuel to be stored in extremely vulnerable external tanks.

Soviet tanks had a history of problems with their loading and shell ejection mechanisms. Earlier models, like the T-55, were manually loaded, which was very slow. Even worse, when empty shells were often ejected at high speeds so they ricocheted around the inside of the tank to the great peril of its crew. The T-62 had an autoloader, but lacked safety features, so that crewmen’s limbs might get caught and severely injured. If a crewman’s sleeve got caught in its moving parts, his whole body might get dragged into the mechanism upon firing. Finally, the more sophisticated nature of later models of tanks made them much more likely to break down.

Soviet soldiers in chemical suits take part in a decontamination exercise in 1987.

How did this play out in combat, especially in foreign territories, as seen in Czechoslovakia in 1968 and Afghanistan in the 1980s? In both cases, elite paratroop units led the way and effectively secured the main military and political targets. In Czechoslovakia this was enough to cow the population. In Afghanistan it

was a different story, as various Tribes rebelled and a larger, less elite force had to be brought in for the long term. Eyewitness accounts of their performance when their convoys were ambushed on mountain roads relate that, instead of spreading out and moving up to outflank and engulf the enemy, they stayed huddled in their vehicles, ineffectively returning fire. One explanation of this behavior is that command and control was so tightly centralized, and many Soviet troops were so unreliable that officers didn't want to risk letting their men spread out away from their control and then desert.

Once discharged, Soviet soldiers remained on active reserve, and could be called up for three months of retraining at any time and always at some remote location. In 1979 the pool of reservists with recent active duty service who could quickly be reintegrated into the military was estimated at over 9,000,000 men. Thus, however poorly prepared most Soviet soldiers may have been individually, their numbers, when fully mobilized, would have given them a huge numerical superiority in men who had at least been conditioned to military service.

Star Wars and a New Arms Race

Ronald Reagan had won election to the White House in 1980 largely on a platform of getting tough with Communism. In a sense he was the last great Cold Warrior, labeling the USSR the "Evil Empire". In 1983, maybe after watching *Star Wars* one too many times he announced a new defense initiative named the Space Defense Initiative, but popularly referred to as Star Wars after the popular science fiction movie. The basic concept was to create a space and land based defense system to protect us from Soviet attack. SDI was denounced by the scientific community as technologically unfeasible at that time, since a single mistake in the million lines of code needed to program one of these weapons would cause it to fail. One of the early

experiments in 1983-4 was the Homing Overlay Experiment (HOE), basically a giant pinwheel 13' in diameter that would physically knock out an incoming missile-- if it could find it.

Artists' concepts of what these high-tech systems in space would look like were effective in exciting and/or scaring the public, but gave no realistic idea of what it would cost to make something like this work. While we never put an operational space defense system in place during the Reagan years, the program has continued ever since and, with increasingly sophisticated technology may bear fruit. Currently the U.S. is testing a scaled down version of SDI that could intercept a few rogue missiles launched by a terrorist state such as North Korea or Iran. Such a scenario is very unlikely, since we could trace the origins of such a missile and respond with overwhelming force. A more likely nuclear threat is that of a suitcase bomb smuggled into a US city, which would be much harder to detect or trace.

Of course, much of what prompted this surge in weapons development was the Soviet effort in the 1970s to close the huge nuclear gap with the United States. Unfortunately, that's not how politicians and the American public perceived it, seeing instead the specter of a huge Soviet advantage over the U.S. So after a brief period of Détente, the race was on again.

One weapon that scared us in the 1970s was the SS-24 Mod 1 ICBM, which could be launched from mobile railroad cars anywhere in the USSR, thus making it harder to target. The accuracy and survivability of these missiles deployed in the 1980's significantly increased the lethality of the USSR's intercontinental ballistic missile force. Our answer was the MX missile, which could also be launched from mobile railroad cars. What made such weapons feasible was much improved computer programming and GPS satellites.

Ironically, better targeting technology made nuclear war seem more winnable, since one could now just target enemy missiles away from cities. Of course, this raised the question of whether such a nuclear exchange could be limited to non-civilian targets.

The USSR's strategic nuclear forces included a growing number of new TYPHOON-class and DELTA IV-class strategic ballistic missile submarines deployed in the 1980s. These advanced submarines, fitted with the latest generations of nuclear missiles, could operate from bases with tunnels for protection.

Another weapon developed by the Russians in the 1980s was the BLACKJACK bomber, which could carry air-launched nuclear-armed AS-15 cruise missiles. This significantly increased the Soviet bomber force's range, weapons delivery capability, and survivability. For the first time, the Russians had a viable manned bomber force that, along with land and submarine based ballistic missiles, gave it a full triad of nuclear delivery systems to match that of the U.S.

While publicly opposed to the US Strategic Defense Initiative, the Soviet Union forged ahead with research and development of land-, air-, and space-based ballistic missile defenses. The Soviets had already deployed and tested ground-based lasers, supposedly capable of interfering with some US satellites.

A New Round of Nuclear War Films

As the arms race resumed in the 1980s, so did Hollywood's efforts to cash in on it. As a result, the last decade of the Cold War saw a spate of new movies reviving public fears about nuclear holocaust.

One of the most disturbing of these films was *Threads*, an update of the 1965 film, *The War Game*, also produced by BBC. However, unlike *The War Game*, the BBC decided to air this shocker to the public. *Threads* was even more horrifying and realistic than its predecessor. After all, since 1965 nuclear stockpiles, and with them, public fears about Nuclear War had multiplied several times over.

So had the ability of special effects studios to portray such horrors realistically.

As with most nuclear war films, *Threads* is mostly about the aftermath and its effects on the survivors. At the end of the film, the main character gives birth in a rundown "hospital" that has no beds, only bed springs. In the last shot, she is shown her baby (which we never see) and screams in terror. Then the movie ends. In my experience this is the most depressing and frightening movie ever made.

Not that the Russians didn't understand what sort of threat nuclear war was. In 1986,

Konstantin Lopushansky released *Letters from a Dead Man*, a more surreal post-apocalyptic film. Among the chosen few who get to survive in an underground bunker is a Nobel prize winning scientist who writes letters to his son who had died in the blast. Blaming himself for the accident that triggered Armageddon, he takes care of a group of children who are mute, either from radiation or psychological trauma. When he dies they go up above into the raging blizzard of a continuous nuclear winter. If *Threads* is the most depressing and scary movie I've ever seen, *Letters from a Dead Man* runs a close second.

Compared to *Threads* and *Letters From A Dead Man*, the American made-for-TV film, *The Day After*, seemed like a sunny day. In fact, the weather during most of it was sunny, providing a faint glimmer of hope that the gloomy weather of the other films totally lacked. However, *The Day After* was scary enough that ABC warned against children under age 11 watching it.

Note: the study that served as the basic script for the film was based on a government study of what would happen in such a scenario and can be read in 17.7A.

Meltdown at Chernobyl (1986)

The Chernobyl nuclear meltdown in April 1986 was the worst such disaster in history. Although the Fukushima I nuclear incident following the earthquake and tsunami that hit Japan 2011 was also a level 7 event, Chernobyl proved much

more catastrophic, largely because there was no containment dome to keep the radiation from spreading.

A basic design flaw in the reactor was the backup system of diesel generators to maintain the flow of water to cool the core in case of the main reactor shutting down. The problem was that the generators needed more time (one minute) than was acceptable (fifteen seconds) for powering up to prevent a meltdown. Three tests of using residual power from the reactor to bridge the time gap had failed. On April 25, a fourth scheduled test shutdown to see if the diesel generators could power up in time was interrupted by a request from another power plant for electricity. Thus the day shift crews brought in for the experiment were gone when the test shutdown resumed that night. Unfortunately, that was when things started going wrong and the reactor was powered down to dangerous levels.

Then a huge power spike in the core of Reactor Four triggered several explosions that released radioactive materials into the atmosphere and ignited the graphite moderator, which released more radioactive particles. Making matters particularly bad was the lack of a containment dome, so radioactive gases kept spewing into the air, spreading across the western parts of the Soviet Union and into Europe.

A number of workers were quickly exposed to lethal doses of radiation and died. Several firemen who arrived on the scene in essence sacrificed their lives in efforts to put out the fires. Authorities tried to cover up the seriousness of the incident, not evacuating the nearby city of Prypiat until the following day. Even then, they told people to just bring enough supplies for three days. Since the area was soon closed off and remains so, the rest of their belongings still lie in their homes.

Workers removing radioactive materials from the site

Soviet authorities didn't announce the disaster until April 28 after radiation levels had triggered alarms at a Swedish power plant in Sweden 1000 kilometers away. Even then, they tried to minimize its seriousness.

Eventually, over 190 tons of highly radioactive materials were released into the atmosphere. The people around Chernobyl were exposed to radiation 90 times greater than that released by the Hiroshima bomb. According to the UN, 9 million people, including 4 million children, have been affected by the disaster. Radiation specialists expect nearly 1 million people to develop cancer as a direct result of the accident. In Belarus, next door to Ukraine, almost 400,000 people have been forced to leave their homes and become environmental refugees as a result of the contamination left by the explosion.

Around 2,000 towns and villages have been abandoned and become a radioactive desert, overgrown with poisoned vegetation and fenced off by barbed wire. Twenty years after the disaster 99% of the land in Belarus was still contaminated, while 25% of Belorussian farmland was a nuclear wasteland. Thyroid cancer had increased by 2,400; congenital birth defects by 250% and suicides in the contaminated areas by 1,000%.

A hydrocephalic child born in the area affected by the Chernobyl meltdown

The Berlin Wall Comes Down (1989)

“Mr. Gorbachev, tear down this wall!” is the line that resonates in the popular memory in America about the end of the Berlin Wall. In fact, Reagan's trip to Berlin in June 1987 was largely an afterthought, the main trip being to the G7 meeting in Venice. And the challenge to Gorbachev was nearly deleted from the speech as being too cowboyish and likely to raise false hopes. But Reagan kept the line...and the Wall didn't come down for nearly two and a half years. But the speech helped bring down the wall in a way other than people have imagined.

By 1987, Gorbachev and Reagan had made giant strides toward disarmament and the end of the Cold War. Three summits (in Geneva in 1985, Reykjavik, Iceland in 1986, and Washington in 1987) had produced the Intermediate Nuclear Forces (INF) Treaty, which removed Soviet SS-20 and American Pershing missiles from Europe. By this time Reagan had concluded, with British Prime Minister, Margaret Thatcher's encouragement, that Gorbachev was trustworthy. However, hawks, like defense secretary Casper Weinberger, thought the eminent Cold Warrior had gone soft on communism. Therefore, the “tear down this wall” line, (although tempered with less remembered lines conceding progress by Gorbachev) was largely thrown out to calm down hawks in America while Gorbachev and Reagan tried to bring the Cold War down with as soft a landing as possible.

Much as East Germans fleeing to the West had caused the Wall to be built in 1961, East Germans fleeing to the West in 1989 helped bring it down. More specifically, East Germans started escaping through other Warsaw Pact countries where communism was coming unraveled, namely Hungary and then Czechoslovakia. Meanwhile, protests in East Germany were growing in size intensity, which caused a change in leadership, which sparked in turn more demonstrations for reform and access to the West.

The first major breach in the Iron Curtain came when Hungary dismantled the barrier separating it from Austria

Down comes the Wall. The immediate cause of the Wall coming down was an inadvertent gaffe by an East German official, Gunter Schabowski at a routine news conference on November 9, 1989. Schabowski had been out of town for several days when he was handed an announcement, without explanation, that East Germans would be entitled to passports, which they could apply for in the standard bureaucratic way the next day. That in itself was progress, but Schabowski, making the announcement cold, didn't read the second part about going through the usual red tape. When someone asked when this went into effect, Schabowski fumbled around and then said right away.

Immediately, the news spread like wildfire across Berlin. Crowds started gathering at the various crossing points. As their numbers swelled into the thousands, the thin wall of East German police confronting them were at a complete loss as what to do, having been given no warning or instructions. By 11 PM the crowds were chanting "Open up!" from the east side of the wall while thousands of West Germans were calling to them to "Come over!" When the ranking officer at one gate couldn't get hold of any members of the Politburo for orders, he ordered the gate opened and thousands of East Germans flooded across the border. The Berlin Wall was down.

A year later, an even greater dream of the German people became reality as the East and West German states were reunited as one Germany.

RISING GLOBALIZATION IN 1990s

Two events in the 1980s led to changes on a global scale in the 1990s. The first was the collapse of communism in Eastern Europe in 1989, followed two years later in the Soviet Union, which also dissolved into a number of new nations, Russia still being overwhelmingly prominent. Thus ended the Cold War, and with it the need to fund corrupt (and financially wasteful) regimes to gain or maintain political influence. The other, less heralded but at least as significant, event was the introduction of the personal computer. While it could be said about any previous decade of the last two centuries, the 1990s saw by far the most dramatic leaps in technology in history. According to a principle referred to as Moore's Law, computing capacity doubles every two years. For example, portable storage capacity has gone from 5.25" floppy discs introduced in 1976 and storing 250 kilobytes of information, to 3.5" discs (1982) with 1.44 megabytes, to zip drives in the late 1990s storing 250 megabytes to portable hard drives a decade later storing 500 gigabytes of information. These represent a jump in storage capacity of 4 million times.

Connecting more and more of these computers across the planet was something known as the Internet, which made possible instantaneous information sharing and business deals on a global scale. Out of this arose any number of multinational corporations that were more active globally than most nation states. Joining these corporations were millions of investors from across the globe, a phenomenon Thomas Friedman dubbed the "electronic herd". Very rapidly, larger and larger segments of the human race were logging, investing, and buying on the Internet. Together, the end of the Cold War and the computer revolution pushed companies to invest in other countries to get profits rather than political influence. As a result, profits soared, leading to new technologies, more profits, and so on.

However, countries wanting foreign investors had to meet two rigorous criteria. First of all, they had to let the Internet spread in their countries so business could be done efficiently. The problem was that people in general would have access to much more information about the world than repressive dictatorships wanted to allow, since it

might give those people ideas about freedom. Secondly, potential investors demanded transparency, meaning governments had to open their books to scrutiny of their ruling policies, liberalize their economic practices, and cut corruption.

As a result, developing countries in the 1990s tended to break down into two categories: the countries that made the necessary reforms to attract foreign investors to develop their economies, and those countries that didn't make such reforms and therefore got no investors or economic growth. Of course this put growing pressure on developing countries (both from outside investors & their own people) to liberalize their political systems and keep peace with their neighbors so business could carry on peacefully. The result of all these forces and pressures, plus the ongoing cycle of foreign investment and spread of industrialization, was rapid globalization, not just of economies, but also of cultures in remote areas of the planet that were increasingly being tied to the mainstream.

However, this was not good news to everyone.

Globalization met growing resistance from people in both developed countries and those with more traditional cultures. For many people in developed countries, foreign investment meant losing their jobs to workers in poorer countries with cheaper labor. There were also groups that feared unrestricted corporate greed was destroying the environment in poorer countries that had little or no environmental. Especially worrisome to growing numbers of people was the issue of global warming. Therefore, meetings of economic leaders in the World Trade Organization were often met with massive, and sometimes violent, demonstrations.

In developing countries, there were two, somewhat different, fears that both saw globalization as a threat. One fear was that they were being left behind by rapidly modernizing neighbors. At the same time, many people felt their traditional cultures and values were being overwhelmed by globalization. In each case, these fears were often expressed in terms of religious backlash and acts of terrorism. Thus as the new millennium approached, what looked to many as a bright new world dawning concealed some very real fears, conflicts, and dangers.

COLONIAL AND POST COLONIAL AFRICA (c.1870-2000)

Colonial rule (c.1870-1920). While it is virtually impossible to generalize about African cultures, it is much easier to generalize about how the European powers treated their African colonies. After establishing their rule by breaking up old tribes and throwing previously hostile ones together, the European home governments ran the colonies more through private investors than by direct rule. In fact, those investors often ruled indirectly through local tribal chiefs whom they might favor over other local rulers, such as the Belgians did in Rwanda, favoring the taller and more “European looking” Tutsis over the Hutus. The long-term price of such a policy could be disastrous. Over thirty years after independence, the Hutus carried out a genocidal campaign against the Tutsis that ended up killing between 800,000 and 1,000,000 people. Overall, misrule plus exposure to new diseases from contact with the outside world, such as the global influenza pandemic in 1918, led to drastic population decline in Africa. Colonial rulers preferred to point out the schools they established to educate (and indoctrinate) Africans with Christian and European ideologies. Indeed, many missionaries did admirable work in their efforts to help and educate, but they hardly balanced out the harm done by other policies.

The era of World Wars (1914-45). As World War I ground down to a stalemate on the Western Front, consuming ever larger amounts of men and resources, European colonial powers drew upon thousands of Africans, both to fill in the trenches in Europe and fight against other Africans ruled by different European powers. Africans, for instance, were among the victims of the first poison gas attack in 1915. Their reward after the war was a decimated world economy that resulted in falling prices and demand for African goods, a situation that only got much worse during the Great Depression of the 1930s. As a result, colonial powers cut both their involvement and investment in African colonies, slashing administrative budgets, selling off colonial assets to pay war debts, and subsidizing white settlers who took prime land from their African owners. At the same time, many missionary societies were closing their schools, churches, and hospitals. Then came World War II, and the European powers once again used African

troops on various fronts. However, Africans were starting to get more vocal in their demands for modernization and independence. Instead, they got a resurgence of colonial rule.

The “Second Colonial Invasion” and independence (1945-60). After the Second World War, there was a growing trend in Europe toward socialistic managed economies that corresponded with an economic boom and rising demand for African products. Therefore, the colonial powers renewed their interest in Africa, exercising more overbearing state intervention in African economies, especially in the intensification of agricultural and irrigation projects, and allowing white settlers to seize more lands from native Africans. The worst-case scenario occurred in South Africa where the brutal system of segregation known as Apartheid was imposed in 1948.

Even the more supposedly benign policies introduced by Europe were over-managed and inappropriate for African conditions, especially in agricultural programs where Africa’s soils and climate differ markedly from those of Europe. At last, the home governments gave up these expensive and ruinous policies and decided to give the colonies their independence after 1960.

The problems of independence. Most African nations have struggled with a mountain of problems since independence. One major problem is that these newly independent African “nations” won their freedom at different times from different powers and according to the arbitrary boundaries those powers had imposed in the 1800s, dividing some tribes and throwing previously hostile ones together. Instead of any natural cohesion, these nations have experienced powerful centrifugal forces pulling them apart, typically leading to military dictators to hold them together. These dictators’ rule was, if anything, worse than that of the Europeans, because they didn’t have the resources needed for economic development. This was largely because European corporations still owned many of the resources in Africa, only having to buy from corrupt regimes the right to exploit them for their own profits. By the same token, corruption and political instability scare off new foreign investors and make it nearly impossible for African nations to get the capital needed for development.

An even more unfortunate legacy of colonialism has been the social instability caused by the rapidly expanding population, diseases, especially AIDS, which leave millions of orphans without adults to raise them, and the effects of modernization without anything stable to replace traditional tribal structures and values. Further aggravating these problems is a rapidly deteriorating environment, in particular desertification of large regions of Africa, which lead to famines and trigger wars and genocide as competition for dwindling resources grows more intense.

Biafra: a microcosm of post-colonial Africa

While it's dangerous to generalize about Africa based on one or two examples, what happened in Nigeria in the 1960s reflects to a large extent problems that affected the continent as a whole. Nigeria, like most sub-Saharan colonies that became "nations", was an artificial construct made up of a random collection of peoples who happened to live within the conveniently marked boundaries established by the colonial power, in this case Britain. Whatever ethnic divisions existed during the colonial period were overshadowed by the common desire for independence according to whatever boundaries that might mean.

The Nigeria that won its independence in 1960 was a very loosely federated collection of three main ethnic areas consisting of the Muslim Hausa and Fulani in the north, the Yoruba in the southwest, and the Ibo in the oil-rich southeast. Probably because of oil, the British had developed the southeast more. As a result, the Ibo were better educated, holding positions as merchants, teachers, and soldiers who were scattered across

Nigeria in their various trades. To other ethnic groups, they represented Nigerian nationalism and modernization. Being the upper class, they were also widely resented by other groups as being part of a conspiracy to make Nigeria a nation in their image and for their benefit.

Given the ramshackle nature of Nigeria, its experiment with democracy collapsed in 1966 in a series of three military coups, the first two headed by Ibo officers, the last one by major general Yakubu Gowon, who was not Ibo. This last coup helped trigger an anti-Ibo vendetta across the nation.

In the north, the poorer Hausa turned on their Ibo neighbors, slaughtering 40,000 of them. One eye-witness, Olu Oguibe, saw "whole families set ablaze by their neighbours in the middle of the night, children hacked to death in their sleep, women violated by men who only the previous day would have doffed their hats to them,...some men burnt at the stake, some decapitated, others hounded through the streets and stoned, while their adversaries gambled for their clothes." To the Western press and public, ignoring and/or ignorant of the colonial forces that set these events into motion, these massacres were just proof of African savagery.

Meanwhile, some two million other Ibo fled to their native lands in the southeast, and a Colonel Emeka Ojukwu unilaterally declared the southeast as the independent nation of Biafra. Gowon wasn't about to let an oil rich area such as that break away, so he invaded. The Biafrans were able to defeat Gowon's forces, but not before they had damaged much of the country's agriculture. Therefore, Gowon decided to starve Biafra into submission by seizing the delta of the Niger River & cutting off vital supplies inland.

What starvation and Gowon's soldiers didn't accomplish, other ethnic groups did while the soldiers watched them massacre the Ibo population.

In December 1968, the Red Cross reported that 14,000 Biafrans, mostly women and children, were dying each day.

The outside world wringed its hands in horror, but did nothing to help. Britain, which got 10% of its oil from Biafra, supported Gowon and supplied him with weapons to secure their oil supply. France, under the pretext of humanitarianism, supported Biafra hoping the breakup of Nigeria would help its smaller former colonies in the region. Both sides hired professional mercenaries, mainly from Europe, who also committed atrocities under the cover of it being war. All these measures did nothing but prolong Biafra's agony.

In January 1970 Biafran resistance finally collapsed, by which time two million Biafrans had starved to death.

Civil War and One-legged Beauty Contests in Angola (1975-2002)

Sometimes, newly formed African nations also got caught up in the Cold War between the United States and Soviet Union. Angola was one such country. As a Portuguese colony on the southwest coast of Africa, Angola gained its independence in 1975, one of the last African

colonies to do so. Almost immediately a three-way struggle broke out between with the U.S.-backed National Front for the Liberation of Angola (FLNA), the Cuban backed Popular Movement for the Liberation of Angola (MPLA), and the South African supported Union for the Total Independence of Angola (UNITA). Being in the aftermath of Vietnam, Congress wasn't about to pour money and resources into another war, so the Cubans succeeded in defeating both UNITA and the FLNA.

All this settled nothing, as civil war resumed, the MPLA being backed by the Soviets and Cubans and funded by control of Angola's oil fields. The opposition, UNITA, was backed by the U.S. and South Africa, using the country's diamond fields to pay for its war.

Since oil and diamonds represent an estimated \$2 billion in revenue per year for Angola, funneling these huge financial resources to buy weapons meant both sides were well-armed and able to continue the civil war for years. Oftentimes, the pattern in these wars was for the side that was losing to wage a guerilla war until it was rearmed and able to go back on the offensive. Therefore, as long as there was a market for oil and diamonds, both sides could fight almost indefinitely. Meanwhile, American corporations such as Chase Manhattan Bank and Gulf Oil continued business as usual.

In addition, between 5,000 and 8,000 underage girls had been forced into marriage by UNITA militants. Reportedly, they would be sent out to find food and, if they failed to bring back enough, they didn't eat. UNITA leaders were also rewarded for victories by being given women for sexual services and abuse. One girl from Uganda was kidnapped and given to a man in Sudan who had just murdered his wife.

By the official end of the war in 2002, half a million Angolans were dead, 4.28 million more (one-third of its population) were refugees, and preventable diseases were still killing one child every three minutes.

Miss Landmine of Angola is one of the more unusual beauty queen titles in the world. Contestants are women who have lost legs to some of the 15,000,000 landmines planted in Angola during its civil war. A total of 86,000 Angolans were casualties of landmines in the civil war, while only 43,000 mines had been removed by 2008, the rest probably not being gone until around 2020. Meanwhile every year 400 more local people are wounded or killed by hidden mines, many of them children who can be especially heedless of these hidden deathtraps.

Similarly, there are one-legged soccer games for landmine victims.

Trouble in the Congo (1960-2006)

For decades, the Belgian Congo had served as the poster child of how bad colonial rule could be. Even after replacing the notoriously vicious rule of Leopold II with its own in 1908, the Belgian government's rule proved little better. For one thing, the Congo was seen as a great place to go on safari and kill animals.

By 1960, the Belgians, like other colonial powers, were tired of ruling African colonies and were ready to give up the Congo politically, while

maintaining ownership of key assets in the country.

This would require a stable native regime to protect those assets. However, the Congo was a big country with a large number of tribal and ethnic groups whose only unifying factor was being under, and wanting to put an end to, Belgian rule. Once that was gone, the country would disintegrate, which was fine with the Belgians as long as things didn't get so out of hand they were a threat to their economic interests. If that happened, they would have to send in Belgian troops to "protect" the Congolese from themselves.

The one party with any hope of national appeal was the Movement National Congolais (MNC), since it drew its support from the large urban population that had flocked to the cities since 1940 and had lost many or most of their old tribal ties. In the first election, the MNC won 33 of 137 seats in the parliament, hardly a majority, but making it the single biggest party in the Congo.

Its leader was the handsome, intelligent, and charismatic Patrice Lumumba, who had personally suffered a lot under Belgian rule and was determined to create a nation out of this disparate collection of tribes and ethnic groups. He was also quite outspoken in his criticism of colonial rule, which raised red flags among the Belgians who feared he would cut them off from plundering the Congo's riches. At the same time, he was raising even redder flags among the Americans because of his frequent use of the term socialism in relation to his ambitions for the Congo and Africa overall. As a result, the Soviet Union was favorable to Lumumba's regime, which made him all the more frightening to the United States.

In addition, Lumumba was a very appealing leader to the emerging Civil Rights Movement in the U.S., even meeting with Malcolm X, which also made the authorities nervous. As Eisenhower privately expressed it, he wished Lumumba would fall into a river of alligators. Therefore, from the very start, Lumumba had three powerful sets of enemies: the Belgians, the Americans, and the various tribes that wanted to keep local power for themselves. One of the most serious threats came from the rich mining district of Katanga, which, with Western support/control, declared itself an independent country. Below: Mercenaries fighting for Katanga.

It largely came down to a race to see who could get to Lumumba first. After Eisenhower stunned his staff by essentially putting out a contract on Lumumba's life, the CIA sent an agent to Africa to poison Lumumba's toothbrush. However, the Belgians had the inner track, even beating Lumumba's dentist to the punch by arresting and torturing the popular leader in unsuccessful attempts to break his spirit. On January 18, 1961, a Congolese firing squad executed the deposed leader in the presence of four Belgian officers in Katanga. Later, his grave was dug up and his body hacked into pieces that were then dissolved in sulfuric acid to erase any trace his existence.

In the aftermath, Joseph Mobutu, who had the army's support, eventually seized power, presiding over a thirty-two year reign of terror (1965-97) that did keep the Congo under control with strong American support. In the eyes of many, the Congo reverted back to the status of a colony, more specifically an American one.

In 1970, Mobutu won election as president with 98.3% of the vote on a single party ballot by a margin of 10,131,699 to 157. The next year he renamed his country Zaire, banned the use of European names or attire, making all men wear a Mao-inspired tunic, the *abacost*. He also assumed a new name and title: Mobutu Sese Seko Nkuku Ngbendu Wa Za Banga, meaning "The all-powerful warrior who, because of his endurance and inflexible will to win, goes from conquest to conquest, leaving fire in his wake."

For his personality cult, the TV News would start with an image of him flying down from heaven through the clouds. While the nation's infrastructure rotted and public service workers went unpaid, Mobutu stole an estimated \$5 billion, stashing it in Swiss banks for safekeeping. He also owned a fleet of Mercedes Benzes and would privately charter a Concorde jet for shopping sprees in Paris.

The end of the Cold War in 1991 reduced Mobutu's value to the West. That plus growing economic problems led to growing opposition against his rule. What did him in, however, was his support in 1994 for the Rwandan Hutus and their attempted genocide of the Tutsis, many of whom had fled as refugees to eastern Zaire. In 1996, when he ordered the Tutsis to leave Zaire under penalty of death, they rose up against him in the first Congo War. With support from Uganda, Rwanda, and many locals, they took Kinshasa in 1997, overthrowing Mobutu (who was ailing with cancer), and renaming Zaire the Democratic Republic of the Congo (DRC). Unfortunately, the Congo's problems were far from over.

The new leader of the DRC, Laurent-Désiré Kabila, proved to be nearly as corrupt as Mobutu, and the Second Congo War (1998-2003) quickly followed the first.

This conflict, also called Africa's World War and the Great War of Africa, directly involved eight African nations and twenty-five other armed groups, and was the deadliest war since World War II, killing 5.4 million people, mostly from disease and starvation, and displaced millions more as refugees. Even after it was officially over, an estimated 1,000 people a day were still dying from hunger and disease.

With virtually no central authority, the Congo became a battleground between various neighbors and factions, some supporting Kabila's government (Namibia, Zimbabwe, Angola, Chad, Congolese militias from the Mai Mai community, and Hutu militias opposed to the Tutsi dominated regime in Rwanda), and others opposing it (the Movement for the Liberation of Congo (MLC), the Rally for Congolese Democracy (RCD), Uganda, Burundi, and Tutsi dominated Rwanda along with Tutsi militias.

The Rwandan presence further complicated the situation, as eastern Congo was home to thousands of Tutsi refugees fleeing the genocide being carried out by their Hutu rivals. Then the Tutsis regained power and Hutus fled to the Congo. The Tutsi regime had also supported Kabila in the First Congo War, but had a falling out with him afterwards. Therefore, Rwandan and Tutsi militias were operating in eastern Congo, treating it as occupied territory and alienating its people.

In 2001, president Laurent Kabila was assassinated and succeeded by his son Joseph. Over the next year he negotiated the withdrawal of Rwandan forces from the eastern Congo, while a multi-national agreement, the Pretoria Accord, arranged for a ceasefire and transitional government under Joseph Kabila until general elections in 2006. There were thirty-three candidates for president, reflecting the still

fragmented nature of the country. It came down to a turbulent runoff election between Kabila and Jean-Pierre Bemba. Kabila won and was sworn in as president in December 2006.

Blood Diamonds, Mercenaries, and Child Soldiers

Three factors that have especially prolonged many of Africa's wars (in such countries as the Congo, Sierra Leone and Angola) and made them so catastrophic are blood diamonds, foreign mercenaries, and child soldiers. What has been referred to as blood or conflict diamonds includes other minerals, as well, notably gold, and coltan (an ingredient crucial for producing cell phones, DVD players, and other electronic goods).

Collectively, both warlords and rebels in these conflicts have made billions in sales of these diamonds, which both fund their struggles and lead to more fighting to control the sources of the diamonds. Civil wars in countries such as Sierra Leone and Angola have cost an estimated 3.7 million lives and may have been funded by the rock sitting on your ring.

“Roland was a warrior from the Land of the Midnight Sun

With a Thompson gun for hire, fighting to be done

The deal was made in Denmark on a dark and stormy day

So he set out for Biafra to join the bloody fray

From '66' and '7 they fought the Congo war

With their fingers on their triggers knee deep in gore

Days and nights they battled the Bantu to their knees

The killed to earn their living and to help out the Congolese”

--Roland the Headless Thompson Gunner by Warren Zevon

Mercenaries in the African wars. Much of the most intense fighting in African wars of this era was done and led by Western mercenaries. While some were excellent soldiers devotedly followed by their men, others typically were deserters, men dishonorably discharged from other armies, ex-convicts, or men with no other prospects and looking for adventure. Of course, war is a risky two-way street, as Belgian mercenary, Marc Goosens (below), found out in Biafra in 1968.

All too often they were sadistic psychopaths who killed indiscriminately just for fun.

One exception to this profile was the German, Rolf Steiner. Born in 1933, he fought as a Hitler Youth during the last desperate days of the Third Reich. Apparently a sucker for lost causes, he fought in the French Foreign Legion at Dienbienphu in Vietnam in 1954 and later in Algeria. When he heard about Biafra, he signed on there and served with distinction but took no pay because he believed in the cause.

After that, he organized Anya-nya Christian forces in the Sudan (yet another losing cause). He was later arrested in Kampala, Uganda, flown to Khartoum, Sudan, where he was imprisoned, beaten and sadistically tortured for three years, before he was finally released thanks to pressure by the West German government. In the 1970s he wrote an autobiography, appropriately entitled *The Last Adventurer*.

Unfortunately, he was the exception to the rule.

Much more typical was Costas Georgiou (alias "Colonel Callan") (1951–1976), a Greek Cypriot mercenary who was tried and executed for war crimes in the war for Angolan independence. He served with distinction in the British army in Northern Ireland, although he supposedly fired 26 shots into the crowd on Bloody Sunday when a number of civilians were killed. Although not charged with that, he was court-martialed, convicted, and dishonorably discharged for robbing a post office.

From Britain, he went to Africa. Although he never officially rose above the rank of corporal or had any officer's rank in the British army, he was able to pass himself off as "Colonel Tony Callan" in the wilder, less structured, environment of Africa's post colonial wars. He adopted the name Callan from a fictional espionage agent and signed on with the U.S.-backed National Front for the Liberation of Angola (FLNA) to fight the more heavily armed Cuban forces supporting the Popular Movement for the Liberation of Angola (MPLA).

Callan and his small band of comrades fought well, but were heavily outgunned, defeated, captured, and then tried for war crimes by the victorious MPLA. More specifically, he was accused of executing fourteen of his own men (Angolans) after, in the confusion of combat, they accidentally fired on their own trucks. He was also charged with shooting villagers who resisted his men plundering their homes, and torturing civilians for information.

As a CIA agent John Stockwell, described Callan *"He turned a couple of incidents around very dramatically and we were very impressed. And then almost instantly it turned out he was humiliating Zairian paracommando leaders. He would strip their clothes off and have them beaten publicly. He was executing people."*

Callan was also wanted by Scotland Yard for executing several British mercenaries in Angola. He was convicted and executed in 1976 along with three others, one of them an American who had been in the field for only three days and claimed he had never fired a shot. His main crime had been advertising his services in *Soldier of Fortune* magazine.

Child soldiers are another issue still plaguing Africa. While this is a worldwide problem, it is especially prevalent in Africa with an estimated 120,000 children serving in government and/or rebel forces in Algeria, Angola, Burundi, Congo-Brazzaville, the Democratic Republic of Congo, Liberia, Rwanda, Sierra Leone, Sudan and Uganda.

Who are these children and how are they recruited?

Many are orphans, their parents being killed in the wars in which they are now forced to take part. Others are kidnapped from their families. Every afternoon during Uganda's civil war, children would flock in from surrounding villages to the cities to escape "recruiters," spending the nights in makeshift shelters or on the streets and returning home in the morning.

Once captured, young recruits would be transformed into desensitized killers by forcing them to kill other children while being plied with drugs and alcohol to further distort their thinking. In one case, a sixteen-year old girl, under threat of death, was forced to kill a boy from her village with a stick.

In Algeria, a young woman and the sole survivor of the massacre of her village, watched as a bunch of boys, probably no older than twelve, decapitated a girl and played catch with her head.

Of course, at such a young age these children could not mentally or psychologically appreciate the finality of their actions. By the time they were old enough, it was usually too late. Children unable to keep up or stay healthy, along with those trying to

escape or fight back, would be killed. Even those successfully escaping the warlords might still be executed if captured by the government for their previous role in the revolt. In January 1995 the Ugandan government executed five children on those charges.

16. PRE-COLUMBIAN AMERICA TO C.1500 C.E.

Introduction. What if a bunch of Cro Magnons (i.e., our species 30,000 years ago) were dropped onto another planet with the same basic conditions and ecology as earth? Being isolated from any other cultures, would they develop civilizations comparable to those that developed in the eastern hemisphere? To answer that question, we need look no further than the Americas, because civilizations did develop there most likely without any outside cultural contacts.

However, the civilizations that developed there lagged significantly behind those in Eurasia and North Africa, largely because of four environmental factors. First of all, the Americas, like Africa, are aligned along a north-south axis, unlike the civilizations in Eurasia and North Africa, which are aligned along an east-west axis. The significance of this is that being in roughly the same latitudinal zone with similar cycles and amounts of daylight, civilizations in Eurasia could more easily share crops with one another. By contrast, in the Americas it was harder to spread cultivation of crops such as corn from Mexico because it took a long time to adapt them to regions with different amounts of sunlight. Secondly, corn, the main domestic crop, was originally a grass that was much harder than other crops, such as wheat and rice, to develop into a plant yielding enough food to sustain large populations, one of the primary requirements for developing a civilization. Third, the two main centers where civilizations developed in the Americas, Mexico and Peru, were cut off from contact with one another by jungles and mountains, which minimized their ability to share new ideas and technology. In fact, they seem to have been unaware of each other's existence when Europeans arrived. Contrast this with Eurasia, where all sorts of ideas and technology did spread between civilizations. Early China borrowed quite a bit from the Middle East, and later became the source of much technology used in the West, such as the compass, which allowed the Europeans to reach the Americas and effectively destroy the civilizations that were developing there.

The fourth factor was largely man-made, namely excellent hunting technology and techniques that wiped out horses and camels, which did exist in the Americas when humans first arrived. This had two major effects. First, it left Native Americans with

no large draught animals for pulling plows. This severely reduced the amount of land one person could farm and the amount of food available to sustain extra populations in cities and civilization. Secondly, since large herds of domestic animals have been the primary source of communicable diseases from which humans suffer, the lack of such animals made the Americas relatively free of such diseases. In the short run this helped Native Americans. However, having had no prior exposure to such diseases as smallpox and measles, they had virtually no resistance when first exposed to them by Europeans. Some estimates of Native American population loss between 1500 and 1600 run as high as 94%. As stated previously, civilization in the Americas developed independently in two primary locations: Central America, especially Mexico, in the north and Peru in the south.

Philosophy and Purpose of this app

For years, I've taught world history using flowcharts as a means to get students to understand the long-term causes and effects of history. Recently, I have worked with my colleague, Dr. Bill Sutton, on designing flowcharts and readings covering American history in a similar way.

However, it became apparent that one can only truly understand American history within the broader context of world history in which it has taken place. As a result, it seemed only appropriate to include the corresponding flowcharts and readings on the history taking place in other parts of the world at the same time as events in American history.

Therefore, this app (or document, if you prefer) is designed to function as both a U.S. History app and Modern World History Since 1500 app as well as a cross-referenced combination of the two.

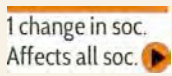

(Below is a section describing the philosophy and design of historical flowcharts.)

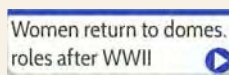

Timelines. To keep you oriented in terms of time, each flowchart has an illustrated timeline to give an overview of the important events going on at the time covered by that flowchart. Some events are specific to that flowchart, while others are not, thus helping to put everything in context.

How to use this app

This is a big document, with over 1200 pages. However, it's designed to help you navigate quickly and easily from one historical era to the next and back again using several features I've built in.

Links. The following types of boxes, when clicked, take you to other parts of the document as described.

 1 change in soc.
Affects all soc. → A text box with an orange stripe on top and arrow in the lower right corner links to the world history flowchart indicated by that text.

 Women return to domes.
roles after WWII → A text box with a blue stripe on top and arrow in the lower right corner links to the U.S. history flowchart indicated by that text.

Index This links to the master index for U.S. history flowcharts, and the unit index for world history flowcharts (e.g., Renaissance or Industrial Revolution).

Prev. This links to the previously *viewed* flowchart. This is particularly useful if there is no specific link back to the box you previously viewed. Note: This works on the computer, but seems to have difficulty on tablets and phones, taking you instead to the previous slide.

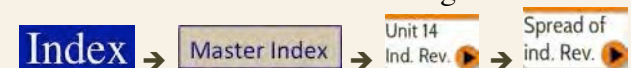

Flowchart Reading This takes you to the reading for the flowchart and any related essays (many of them illustrated) that aren't specifically discussed in the flowchart. For example, there are nineteen such essays at the end of the flowchart reading on the rise of Hitler, covering such topics as Hitler's love life, Nazi math, and the Hitler Youth. The first and last page of each reading have a link taking you back to the flowchart so you can easily navigate between the two.

Back This takes you to the preceding slide in the document.

Next This takes you to the next slide in the document.

The master index is page 1. It lists all the U.S. history flowcharts and units of world history covered in this document. The index for each unit has links to each flowchart in that unit. There is a link to the master index on every unit index page.

Using these links, you can go from any flowchart to any other flowchart in four or less clicks. The worst case scenario being from two world history flowcharts without a direct link and in different units. For example, going from the flowchart on the Italian Renaissance to the Spread of the Industrial Revolution would involve clicking:

 **Index** → **Master Index** → **Unit 14 Ind. Rev.** → **Spread of ind. Rev.**

The Design and Use of Flowcharts

The flowchart is a mnemonic device to help students organize sophisticated concepts into an intelligible and digestible form. Therefore, they should be fairly simple and sparse in design to provide a basic framework on which students can hang the more detailed information provided in an accompanying text organized parallel to the flowchart. The flowcharts are also cross-referenced to help students find relevant information on events both leading up to and coming out of a particular historical event, thus providing a unified concept of history.

A good flowchart should be aesthetically pleasing to view and create an immediate visual impression that makes the material more dynamic and accessible for students while capturing their attention and interest. This includes dividing it into boxes of discrete and digestible amounts of material, arrows that dynamically show how those discrete chunks of information fit together, the use of color to indicate such things as feedback models (red fields), more detailed information about a heading (blue fields), and cross-referencing with other flowcharts (blue outline). Symmetrical design also serves as a useful mnemonic device.

Flowcharts provide a middle ground between over-analyzing and over-simplifying the crucial issues in history without trivializing them. Their graphic nature gives students a sense of cause and effect in history without either over-burdening them with too many facts and arguments or insulting their intelligence.

To help students learn effectively through flowcharts, I constantly stress understanding over memorization. And since an entire flowchart can look pretty daunting at first, I encourage students to just look at it one box at a time, constantly asking themselves if they understand the simple statement in that box and why it leads to the next one. The beauty of flowcharts is that they are logical in the relationships they show and thus easy to remember, as long as the student is not just trying to memorize them in their entirety. Students must understand that by seeing the logical relationships that the flowchart by definition promotes, they are learning it more deeply. Therefore, if they forget a particular

part, they can logically reconstruct it from the other parts they learned. What this promotes is a more sophisticated level of critical thinking. Surprisingly, the most common feedback I get from former students is how they take notes for classes besides history in flowchart form.

Beyond individual flowcharts, students also learn to see an even bigger picture of recurring historical patterns. Therefore, when reading about the Russian Revolution, they should see the patterns they had read about in the English and French Revolutions. In order to facilitate this sophisticated level of learning, I constantly repeat very simple slogans as hooks on which students can hang more detailed. For example, Napoleon's saying, "Great powers die of indigestion" serves as a perfect lead-in to discussions on how societies as diverse as Babylon, Rome, the Ottoman Turks, most of China's dynasties up to the twentieth century, and the USSR went into decline. This, in turn, helps students gain deeper insight into contemporary issues and how to solve them

While I have developed and used the flowcharts for my 10th grade honors level modern history course, I've received feedback from teachers on their successful use in mainstream 8th grade classes.

Any questions and comments are welcome and should be directed to cbutler@flowofhistory.com

Fifteen Lessons of History to Remember

In order to make history something manageable and meaningful for my students, I have tried to distill it into a few basic lessons about life as well as history in general. I make no pretense of claiming this is a definitive list, but I hope that you, the reader, may find some or all of these of some value.

1. *My pain hurts worse than your pain.* We each view the world from inside our own skins and only truly feel the pain inflicted upon it. Of course, everyone else experiences the world in the same way from inside their own skins. History helps us look at both sides of a problem from a detached point of view where we can appreciate the pain on both sides equally. Keeping in mind that everyone in that historical situation was only feeling their own pain, we can see how things have turned out so badly so often. By the same token in our own personal lives, learning to empathize with others and feel their pain can go a long way toward resolving personal conflicts. On a larger scale, it could save the world.

2. *The Rubber Band Effect: Everything is connected.* Think of society as a bunch of marbles enclosed by a rubber band. Each marble represents one aspect of society (social structure, political structure, technology, the arts, etc.). If one marble starts moving, it puts stress on the rubber band, causing the other marbles to move in sync with the first marble. If that marble encounters resistance from other marbles, the rubber band keeps stretching as the marbles are more removed from one another. If the first marble doesn't stop moving or the others don't catch up, the stress on the rubber band eventually causes it to snap, signifying a revolution or systemic breakdown of society.

Along these lines, the old sci-fi TV series, *Star Trek*, had a principle known as the Prime Directive that recognized the Rubber Band Effect, dictating that a technologically superior civilization should never tamper with a less technologically advanced culture.

3. *No one goes against the flow of history.* "At least I am not so arrogant as to assume that the

likes of us are able to make history. My task is to keep an eye on the currents of the latter and steer my ship in them as best I can."—Otto von Bismarck (1869)

Until the 19th century when more complete records and statistics started being kept, what is sometimes referred to as the Great Man school of history was how most people studied and interpreted the past. In other words, they saw history as being driven by a few great men (and much fewer women), such as Charlemagne, Caesar, and Alexander who did great deeds, all too often at the point of a sword.

But this approach made sense to the extent that the few written records that were made, copied, and survived were about such people (who often commissioned such writing). Similarly, artifacts that survived were generally rich treasures or works of art belonging to the great and powerful.

On the other hand, day-to-day details of people's lives, (e.g., clothes, toys, what they had for breakfast, used for toilet paper, etc.) were either irretrievably lost or buried waiting for someone in the future to find and appreciate them as historical artifacts as valuable as Charlemagne's scepter or Caesar's funeral mask.

Even when people, such as Heinrich Schliemann at Troy, started digging up ancient sites, it was typically in a desperate treasure hunt for gold that destroyed the more mundane artifacts that got in the way. For example, when the lease ran out for treasure hunters digging up Indian burial mounds near Spiro, Oklahoma, they dynamited what was left of the mounds since they couldn't have what they contained.

4. *History is often a process of old mentalities running up against new realities.* While change has always been taking place, this is especially true since the industrial revolution in the nineteenth century. And every day it becomes truer than the day before. A prime example was World War I when nineteenth century style human wave assaults were used with disastrous results against modern killing technology such as the machine gun protected by trenches. Unfortunately, generals are often planning for the last war. Therefore, the

French in particular planned for World War II to be another war of trenches and machine guns. Meanwhile, the Germans recognized that the rapidly advancing technology of tanks and airplanes would transform the next war. The result was the Blitzkrieg that overran much of Europe in 1939 and 1940. Of course, that war ended with an even more advanced and devastating technology, the atomic bomb (followed only seven years later by thermonuclear weapons) that has forced us to totally reassess how and if we fight another total war, given its likely catastrophic results.

5. *The Butterfly Effect: History as the intersection of the infinitely great and infinitesimally small (or close to it).* The significance of big events like the world wars or a comet hitting the earth hardly needs explanation. The importance of more apparently innocuous events, such as Kaiser Wilhelm's breech birth in 1859, does bear discussion. Or just imagine the effects if an X chromosome were substituted for a Y chromosome and Julius Caesar became Julia Caesar.

6. *Two things about human nature that never seem to change are greed and our capacity for self-delusion or "If it seems too good to be true, it probably is."* How else can we explain the ridiculous sums paid for tulips in the 1630s, dot.com stocks in the 1990s, and houses in the 2000s?

7. *We are a social species prone to herd behavior.* This is both good and bad news. It's good because it's been our collective will and efforts that have allowed us to survive as a species and societies. But it's been bad when our collective will has been turned into a panicked stampede behavior and wrongly directed. Luckily, there are always individuals who dare to think differently and set us back on the right path. Even when, as all too often happens, they are forced to drink a cup of hemlock or get nailed to a cross, there will be others who are listening and willing to take up the standard.

8. *Ideologues and the rest of us.* There are certain people in history I call ideologues (e.g., Cromwell, Robespierre, and Lenin) that are largely remembered as evil dictators and lumped together with history's other truly evil dictators (e.g.,

Napoleon and Stalin). I draw the distinction between what drove these two types of men. Unlike the truly evil dictators, who were primarily driven by a hunger for power, ideologues seem to have been driven by an idea that assumed total importance in their lives to the exclusion of anything else, including people's (and their own) basic human needs. For Robespierre that idea was his Republic of Virtue enforced with the Reign of Terror; for Lenin it was Marxism enforced with the Red Terror. Both these men used power ruthlessly to promote their agendas, but the fact that they lived fairly Spartan lives rather than exploiting power to pad their own nests indicates that personal power and wealth were not the driving factors.

The fact that they also targeted people who were no real threat to their personal rule but were seen as a moral threat to their ideas (e.g., prostitutes) also suggests their motives went beyond personal power. While it's risky to speculate on the psychological makeup of such historical figures as Robespierre and Lenin, their behavior seemed more consistent with a one-track, almost autistic, obsession with a single idea and inability to empathize with the basic human needs that primarily concern most people.

This isn't to say such men are not dangerous. In fact they can be more dangerous than your typical dictator, since they aren't concerned with such things as own personal comfort or safety, and thus drive themselves and their countries to the point of self-destruction. This also isn't to say that their ideas and the rule they inspire aren't also evil. Hitler would probably be the most salient example of this last point.

9. *Politics, like chess, is a game for control of the center of the board.* If we divide people along the spectrum from extremely radical to extremely conservative, the vast majority of them will cluster in the center. Instead of being obsessed with some radical or conservative ideology, they're mainly concerned with getting by on a day to day basis: being able to pay the rent, buy groceries, keep a job, educate their kids, etc. Therefore, while most people might characterize themselves as conservative, liberal, moderate, or whatever, they're first concern is paying the bills. And it doesn't matter so much whether their officials are

conservative or liberal, as long as they keep things running smoothly.

Therefore, the common wisdom is that people “vote their pocketbooks.” That is, they vote for whoever they think will be best at running the economy). Or as the Chinese reformer Deng Xiaoping said: “It doesn't matter if a cat is black or white, so long as it catches mice.”

As a result, in the battle for public opinion, each side wants to paint the other as lunatics who will wreck the economy with their extremist policies. Whoever beats the other in that game generally wins public support.

10. Revolutions follow a somewhat similar and predictable long-range pattern that can take century or more to resolve:

- Revolutions start when people have something and want more, not when people have nothing and want something. After all, people who have nothing don't have it in their experience that they could have something. Only when they have something do they get it in their heads that they could do even better.
- Revolutions are long-term processes that are as evolutionary as they are revolutionary.
- Revolutions start out moderately and may not even be recognized as revolutions, which evade the attention of authorities until they have had time to grow and become truly revolutionary.
- Revolutions succeed against weak-willed regimes (e.g., Louis XVI of France and Tsar Nicholas II) that fail to react decisively until it is too late.
- Revolutions are like getting a new football coach or cleaning your room. Before things get better, they get worse, leading to frustration from expectations that things would immediately improve.

- Revolutions become progressively more radical as things get worse, eventually leading to a crisis stage as

conservative reactions from within and foreign intervention from without combine to make things even worse.

- Revolutions go from arbitrary power to arbitrary power. The initial arbitrary power is the weak-willed regime the revolution replaced. The second arbitrary power is much more hard-nosed and ruthless in pursuing and preserving its goals. Typically it is also highly ideological in nature (e.g., Oliver Cromwell, Robespierre, and Lenin). Oftentimes, this may go to a third arbitrary regime with a less ideological and more pragmatic and power-hungry leader who betrays the aspects of the revolution that stand in his way while keeping and using those ideals that he can manipulate while seeming to uphold them (e.g., Napoleon and Stalin).

- Revolutions, if successful, culminate with a “Napoleon III” phase (named after the French emperor who ruled France from 1851 to 1870) characterized by a combination of strict autocratic rule with market reforms that eventually lead to a moderate sustainable democracy a generation or so down the road. More specifically, an improving economy leads to a more broadly based middle class that can afford education for its children. And those children have a tendency to ask a lot of questions that, if not adequately addressed, lead to more substantial challenges to the authorities. Currently, China and Russia are entering these phases and should be interesting to watch in the coming years.

11. *The fatal flaw of dictators* is that they only listen to what they want to hear and that increasingly is bad advice. This is the result of a vicious cycle that starts with the dictator clawing his way to the top and convincing himself he is there because of his own genius. However true that may be, it also encourages him to feel superior to everyone else (since he is on top), the natural corollary to that being that anyone who disagrees with him must be wrong. Therefore, he gets rid of

anyone with differing opinions and surrounds himself with sycophants and yes-men who only tell him what he *wants* to hear instead of what he *needs* to hear. That, in turn provides him with faulty information upon which he bases increasingly disastrous decisions. However, his inflated ego convinces him that those disasters are the result of inferior or traitorous subordinates, whom he purges and replaces with even more submissive yes-men, and so on. Classic examples include the invasions of Russia by Napoleon and Hitler, Stalin's Five Year Plans and collectivization of the agriculture, and Mao's Great Leap Forward and his Cultural Revolution.

12. *The Blame Game or "Not It"*. In addition to starting riots against their enemies, the Fascists played a game I call "Not it". Just like the children's game of Tag where the last person to say "Not It" is "It", so it goes in politics. A common political tactic is for one side to blame the other side for its own crimes and faults, because, whatever the truth of the matter, whoever gets blamed first is in a weakened position by right of having to defend itself. Even if it justly counter-blames the other side, it looks like it is only copying the other side, making it look unoriginal and guilty, since the other side first has already put it into people's heads that the innocent side is guilty. Hitler and the Nazis would copy Mussolini in this and various other tactics.

13. *We are basically prehistoric beings that are less and less biologically adapted for in a progressively technological environment and the primary thing we have to fear is fear (tactics)*. One of the most important examples is the amygdala, the primitive part of the brain that triggers a fear response to any unexpected sound or motion. This served us well for millions of years when a sudden noise or motion could signal a fatal attack by a predator. However, in this relatively orderly thing we call civilization, we are rarely ambushed by tigers, while the biggest threat to our individual existence, moving automobiles, usually stay off sidewalks and stop for traffic lights.

Unfortunately, political leaders with nothing positive to contribute typically focus on negative things, and this often involves scare tactics to

conjure up fears about imaginary threats or exaggerate minor ones, thus exploiting the amygdala's fear response in inappropriate ways. The classic case of this is when Hitler and the Nazis stirred up hysterical fears about the Jews that led to the Holocaust. Not that this was the first time the Jews were made the scapegoats of real or imaginary problems people couldn't understand. Medieval Christians also carried out purges and massacres, notably during the First Crusade and Black Death. And just to be fair to Christians, they were the victims of similar actions during the Roman Empire.

14. *Soldiers' riots*. Normally, the culture of killing inherent in armies is restrained by military discipline to be used only against other armies. However, when the restraints of that discipline are relaxed, raw and uninhibited violence is unleashed, causing even normally civilized humans to engage in unspeakable acts.

In 1099 that became Jerusalem's story when Crusaders stormed its walls.

In 1631 it became Magdeburg, Germany's story as Christian troops stormed its walls to kill other Christians in the name of God.

In 1937 it became Nanjing's story when Japanese soldiers took the Chinese city of Nanjing and massacred an estimated 300,000 helpless civilians.

In, 1968 it became the story of a small Vietnamese village named My Lai.

Rather than being extraordinary acts committed by extraordinarily cruel humans, these were extraordinarily cruel acts committed by normal humans in extraordinary circumstances. War does that to even the best of us.

15. *Finding a middle path between aggression and appeasement (which encourages more aggression) to avoid a catastrophic war*. This was the primary challenge facing diplomats during the Cold War (1945-91) when total war between the superpowers could have led to nuclear annihilation for us all. The answer was a one requiring a *nuanced balance* between being too provocative and too passive.
