German Castles:

CASTLES OF EUROPE

from Charlemagne to the Renaissance

German castles of the eleventh century.

Every powerful ruler in Germany from Charlemagne to Henry the Fowler had used a system of fortresses to repel invaders and to settle newly-won land to the east. The construction of these fortresses had, however, always been under imperial control and to build an administrative castle was to invite terrible penalties and the destruction of the castle. The strength of the Emperors, the part played by free colonists in the immense effort of clearing and settling vast stretches of land that brought civilization to large parts of Germany, and the close relationship between the Church and central government had all delayed the full arrival of feudalism—and therefore the building of private castles. Gradually in the eleventh century French influence creeping in from Lotharing caused many nobles to pay more attention to the fortification of their manor houses. Apart from those which incorporated Roman masonry, or consisted of a single defensive tower, the *Bergfried* (tall probably a descendant of the Roman frontier watchtower), most of these early German castles seem to have been made of wood; a fortress as important as the Wartburg, for example, had two wooden towers in 1080. The stone-and-bailey castle was not adopted generally, although there remain a few examples, such as the Hohenknapp, already described. More typical is the tower such as that shown in plate 61, the castle from which the Habsburgs take their name, now in Switzerland. But the fact that the Germans had built few castles and knew little of siegecraft is no sign of backwardness; it contrasts well with the anarchy of France and is evidence of a higher general degree of order.

Germany differed in many ways from France. There was a large number of free peasants, especially in Saxony, and land was frequently owned outright as an allodum or patrimonial estate (this in fact applied to parts of Aquitaine). There were few different owners to the problem of overpopulation; one was the large tracts of land within Christian Germany that, until the eleventh century, remained unoccupied and which now provided settlements for energetic peasants. Another was the prime to be won of the Slav and pagan lands to the east, an objective which was to be increasingly pursued in the next century but which had already begun with successes such as that of Bishop Bernhard of Halberstadt when in 1066 he captured and destroyed the great fortified temple of the Slavs at Rethra. The political importance of the Church was much greater than in France. The Church worked extremely closely with the Emperors, the authority of the bishops deriving from the vast ecclesiastical estates for which they did homage to the Emperor on consecration. It was the last point that caused the quarrel between Henry IV and Pope Gregory VII and it was during the resulting anarchy that the German-speaking lands, from possessing few castles, became thickly populated with them.

The Holy Roman Empire versus the United States: Patterns for Constitution-Making in Central Europe

ROBERT C. BINKLEY

FOR sixteen years, from 1790 to 1806, while the United States was beginning its one hundred and fifty years under its Constitution, the Holy Roman Empire was ending the one hundred and fifty years of its political life as organized in the Peace of Westphalia. United States was living under its Constitution, the American people lived under the shadow of the Holy Roman Empire or eight different political systems, proposed or operative. It was in the area of the United States, there was a fundamental of maintaining a federative society, balancing unity with and protecting security. But this area was unlike the United States and more like the world in its variety of languages and particularisms. In fact, sixteen of the thirty-two political of the world are spoken in the Central European area.

These eight Central European systems were: sixteen years of the Holy Roman Empire, eight years of Napoleon, thirty-three years of the German Empire, two years of revolution in 1848-49, the movement of the early 1860s, the Bismarck system, the projects of Friedrich Naumann during the World War, the triumph of Wilsonian principles at the Paris Peace Conference. Throughout this sequence of eight political structures

SICKINGEN'S FEUDS

Franz von Sickingen (1481-1523): Professional Feuding

Reinhard Scholzen

(Translated by Christopher Schönberger, Austrian Armed Forces Language Institute)

The transitional period between the Middle Ages and the Early Modern Period is girded with numerous important events and social changes. As examples could serve the American by Columbus in 1492 and the conquest of Granada that same year. The end of the Holy Roman Empire in 1453 marked another watershed as did the Reformation (with Luther posting his theses in 1517) and the 1524-1526 Peasants' War.

If this sea change is made the frame of reference, the concomitant shifts in the social structure of the German Reich are often given scant attention. These include the boom of the large cities, the rural exodus from many territories, the increasing power of the territorial princes, the rise of the nobility since the High Middle Ages, as well as the gentry's loss of power, apparent since the Late Middle Ages. The following will deal with the life of Franz von Sickingen (the "last knight"), who, in many ways, was an anomaly in that time of crisis.

When Franz von Sickingen was born not far from Bad Kreuznach, in Castle Ebernburg, on 1 March 1481, the knights' heyday was over. There were manifold reasons for the decline of the warrior caste which still had been indispensable in the High Middle Ages. The emperors' power had been on the decline since the 13th century, and the importance of the territorial nobility had been on the increase.

FRANZ VON SICKINGEN AND THE REVOLT OF THE IMPERIAL KNIGHTS, 1522-1523 Fred Christensen

In August 1522 the Holy Roman Empire was in turmoil. Throughout central and southern Germany, armed bands of Imperial Knights (the independent lesser aristocracy of the Empire) and *Landsknechte* (mercenary soldiers) were assembling. Franz von Sickingen, Germany's most famous mercenary commander, was preparing a military strike against the lands of the Archbishop of Trier, one of the Empire's senior princes. This move was intended to revolutionize Germany; it would restore the declining fortunes of the free Imperial Knights, shatter the power of the Catholic Church in favor of the new ideas of Martin Luther, challenge the authority of the territorial princes, and make Sickingen himself the most powerful of those princes—or perhaps something greater.

Europe's warrior aristocracies formed a turbulent and disorganized element in many lands during this era. Their role in society was threatened by new military developments (gunpowder, disciplined infantry, mercenaries), economic trends (middle-class urban wealth and values, rising prices) and political changes (monarchs and princes consolidating their power with professional bureaucracies and law courts). There was

Castles of Europe

William Anderson / Photographs by Wim Seeman

CASTLES

A castle is a private fort, distinguished from other fortifications by its primary purpose: the protection of a feudal lord, his family, and his loyal retainers.

Castles could serve many purposes:

- They arose in the early Middle Ages as a response to invasion and to private warfare.
- They could be centers of government and administration.
- They could provide defense in depth or be part of a strategic network, for a province or kingdom.
- They were a means of conquest and of consolidating the gains of conquest.
- They could contain the courts of rulers.
- They could be the seats of country landowners, members of a feudal aristocracy.

At approximately 2-3 million **man hours**, 2,700 men, working for one hundred 10 hour days, would take approximately 4 months to finish the entire fortress.

PLAN DU CHÂTEAU DE GUÉDELON

—The building materials are stone, clay and timber, usually found near the site.

—To split stones for the walls, quarrymen "read" the rock face to see the lines where it will fracture. They then drive a line of holes into the stone and then pound corners into the holes, which makes shock waves go through the stone and break it.

—Workers use horse-drawn wagons to haul the stones from the quarry to the building site.

—Stone masons then chisel the raw stone into blocks.

—Workers use man-powered cranes to lift the finished stones to the scaffolding on the castle wall.

—Other workers make mortar on the site from lime, soil and **water**. The masons on the wall fit the stones together and use the mortar to hold the blocks together.

—Castles generally took two to 10 years to build.

Warm recommendation!

We woke up early to make it before it was too hot for the fortress Yechiam. A beautiful fortress that left a lot of room for imagination. The children were excited about the trip to the remains of the fort, the climbing and reaching different rooms and spaces, and the landscape, oh the view! How fun to see all this green.

Spurlock Museum—

Medieval Warfare

The Chain Mail Suit

Made from interlocking metal rings and padded beneath with leather or quilting, chain mail offered excellent protection against most attacks to those few who could afford it. A single suit required more than 40,000 handmade, hand-riveted, iron links and hundreds of hours of skilled labor. Chain mail shirts and suits were widespread among men-at-arms until well into the 14th century, when pieces of plate armor gradually began to cover and then replace chain mail.

3. Mail Shirt (Haubergeon)

1400/50

Western European
Steel, iron, and brass

Lent by Laird Landmann, 28.2015

In use since before the 2nd century B.C., mail is designed to stop a sharp weapon or arrow from penetrating. Although it allowed for freedom of movement, its extreme flexibility did not protect against blunt force, and so padded undergarments were worn. For this reason plate armor was developed and used together with mail shirts like this from the 13th to the 15th century.

Arms Industry,

As a result, larger armies, and the rise of
armies fueled a growing arms industry. From
this time on, the shape of war
and the supply of arms, leading to
new production centers were clustered
around the Rhine, the Danube, and the
North Sea. The Rhine, the Danube, and
the North Sea were the main arteries
of commerce and trade.

I. Mail Shirt

1550/75

The Guard of the Electors of Saxony

The electors of Saxony retained one of the more extravagant bodyguard units in Europe, with over 100 men on horseback and on foot. Each succeeding elector ordered a new series of weapons ornamented with his personal device or coat of arms.

As the electors derived much of their wealth from Saxon silver mines, they equipped their officers with swords and daggers adorned with silver plaques (5, 6). The morion (1) is painted black with gilt etching to match the guard's black-and-gold livery, or uniform. Guards mounted on horseback carried a pair of wheellock pistols, or puffers (2, 3), while those on foot bore staff weapons such as this glaive (7) and halberd (8). The powder flask (4) features a carved figure of a Saxon guard from about 1600.

The Guard of the Dukes of Brunswick-Lüneburg

Dominating the case is a two-handed sword (2), no. 59 of over 290 ordered to arm the bodyguard of Duke Julius of Brunswick-Lüneburg in northern Germany. The crutch-shaped pommel on the hilt of the sword is inscribed with an acronym of the duke's name and personal motto (*O.H.B.M.N.M.D.S.L.V.E.*), which translates from the German as "Oh Lord protect only my soul, life, and honor."

Though similar in form to those used in battle, these swords were mainly intended to lead the duke in procession. The sight of several hundred men, swords pointed upward with cross guards supported on their shoulders, would have conveyed a clear message of wealth and power.

The infantry armor (1) was produced in Brunswick and could have been used by either a bodyguard or the duke's newly formed militia. Much later in date and purely ornamental, the two halberds (3, 4) demonstrate that the dukes of Brunswick-Lüneburg maintained the tradition of equipping bodyguards into the early 18th century.

The Papal Swiss Guards

The Swiss Guards have protected the pope in the Vatican for over 500 years and are one of the few Renaissance-era bodyguard units still in active service today. Although the cut of their costume has changed over the centuries, the coloring has remained bold and bright.

This cuirass (breast- and backplate) and pauldrons (shoulder defenses) (2) are strikingly ornamented with deep-blue and gold decoration and are part of a series of pieces likely dispersed from the Vatican armory centuries ago. A mark on the side of the breastplate appears to be the coat of arms for the Barberini family of the 17th-century pope Urban VIII. It is thought that plain cuirasses from the previous century were repaired and decorated for the papal guards during Urban's reign.

The helmet (1) features the portrait and coat of arms of Pope Julius III and dates to over 70 years earlier than the cuirass, but it may have set the precedent for its design.

Armor for Man and Horse

About 1520

South German; Nuremberg

Steel, iron, brass, leather, textile, and modern costume

Caught in the heat of battle with sword drawn, this figure does not represent a noble knight but a mounted man-at-arms. Professional soldiers like this were increasingly common in the 16th century. Squadrons of similarly equipped men were trained to charge the enemy in ranks head-on using lances and swords.

The armors for both man and horse were produced in Nuremberg, Germany. This city was known for its trade in high-quality munitions or common armor bought in bulk rather than fitted to a specific individual. Most of the pieces may have equipped a heavy cavalry fighting for the Teutonic order against the Poles from 1519 to 1521.

Armor for the Joust

About 1560

Italian

Steel, brass, leather, textile, silver-gilt thread, ostrich feathers, and modern costume

Jousting tournaments were splendid occasions in which members of the nobility showed off their finest horses, armors, and costumes. Originally intended as training for war, by the mid-16th century these tournaments were entirely about appearances and sport. Nevertheless, the events were still dangerous, and fatalities did sometimes occur.

This plain armor was designed essentially as sports equipment. The horse trappings, feather panaches, and elaborate embroidered base (skirt) emphasized the status of the wearer. Often these were more valuable than the armor. Just over a dozen examples of original horse trappings survive from this time; this reconstruction is based on these and several pictorial sources.

George F. Harding Collection, 1982.2405a-q, 1982.2741, 1982.2608, 1982.3124

Cuirass with Mail Standard (Collar)

About 1480

South German or Austrian
Steel, brass, and leather

Sculpted with sleek rippled surfaces and decorative cut edges, this cuirass typifies late gothic German armor. A rare survival, it is fabled to have come out of a church in the Austrian Tyrol at the turn of the 20th century. It may have adorned a shrine figure of Saint George or hung over a noble's tomb.

The heavily pitted exterior attests to centuries of neglect, and a red-blistered area of the interior is evidence it was in a fire. The right side of the breastplate below the waist was carefully restored in London around 1917.

9. Crossbow with Goat's Foot Lever

1530/60

Spanish

Steel, iron, brass, fruitwood, bone, and hemp

George F. Harding Collection, 1982.3073, 1982.3074

While the rest of Western Europe largely abandoned the crossbow as a weapon of war, it was used for military purposes in Spain well into the first half of the 16th century. This example has a goat's foot lever, a device used to pull the

bow string back. The moderately sized steel bow, brass fittings, and square section tiller (stock) are distinctly Spanish features. Crossbows were particularly favored on sea journeys, where firearms and a supply of black powder might be difficult to maintain. Indeed, archeological remains of similar crossbows were found on a 1554 Spanish shipwreck off the coast of Texas.

OPPOSITE: *In a detail from an early sixteenth-century painting by Hans Holbein the elder, a soldier uses a claw and crank mechanism to pull back the steel bow of his crossbow. He will load his weapon with the bolt or quarrel he holds in his teeth. Military crossbows were both accurate and powerful, but slow to load, and their steel bows and complex crank mechanisms were expensive and difficult to manufacture. Firearms were simpler and cheaper.*

Armor for Field and Tourney with Reinforcing Breastplate (Plackart)

1550/60

North German; probably Brunswick
Steel and leather

George F. Harding Collection, 1982.2.103a-0, 1982.3031

Notable for its height and girth, this armor was intended for use on horseback in battle or in tournaments meant to simulate warfare. The additional breastplate (or plackart) displayed beside the armor provided the option of a second layer to protect against firearms or heavy hits from a lance. The bolts over the left shoulder guard (pauldron) and the two bolts below the neckline on the reinforcing breastplate were used to attach two further reinforces for the neck and shoulder that are now lost. The lower visor on the helmet is a restoration.

Composite Field Armor

1510/20

German

Steel, iron, and leather

George F. Harding Collection, 1982.2480, 1982.2407b-h, k-l. 1982.3039a-b, 1982.3028

Drawn from different armors from the same period, this composite represents a typical field harness intended for heavy cavalry armed with a lance and sword. The globular form of the breastplate, bellows-shaped visor, and fluted or rippled surfaces classifies it as "Maximilian" armor, so named after the Holy Roman Emperor Maximilian I, who popularized the style in the later years of his reign.

Infantry Armor and Targe (Shield)

1590/1600

Master L. P. F. (Italian)

Milan

Steel, gilding, brass, and leather

For service on foot noble officers wore elaborately etched and gilt half armors as clear markers of rank. Here the decoration depicts various labors of Hercules, a choice undoubtedly intended to associate the wearer with the strength and power of the ancient Greek hero.

Infantry armors were designed to protect the upper body and allow for rapid movement. Open-faced helmets were preferred for full vision and increased ventilation. For greater protection, the helmet was supplemented with the use of the targe (round shield), held close to the brim. The spike and petals at the center of the shield were intended to catch and divert an assailant's bladed weapon.

George F. Harding Collection, 1982.2.194a-m

5. Greave and Sabaton

15th century
 German
 Steel, iron, brass, and leather

The greave was the most common leg armor of the late 15th century. It was a simple, flat piece of metal that was shaped to fit the leg. The sabaton was a pointed toe cap that was made of metal or wood. It was worn over the shoe to protect the foot from blows and arrows.

6. Comb Morion

About 1570
 French
 Steel, iron, brass, and leather
 George F. Harding Collection, 1982.1258

The morion was the most common helmet throughout Europe in the 16th century. Its popularity owes to a design that was as stylish as it was practical. The pointed broad brim and comb were crafted to protect the open face, neck, and top of the head by trapping or sliding away an assailant's blows.

7. Matchlock Petronel

1570/80
 French
 Steel, iron, fruitwood, staghorn, and horn
 George F. Harding Collection, 1982.1263

Petronels were shot from the chest (their name comes from the French word for chest, *poitrine*). These crook-butted long guns were a popular stock design for a few decades at the end of the 16th century. They were soon supplanted by more practical shoulder stocks as the recoil resulted in chronic chest injuries.

8. Powder Flask Carved with the Parable of the Good Samaritan

Two Garnitures for Field and Foot Tournament at the Barriers

About 1575

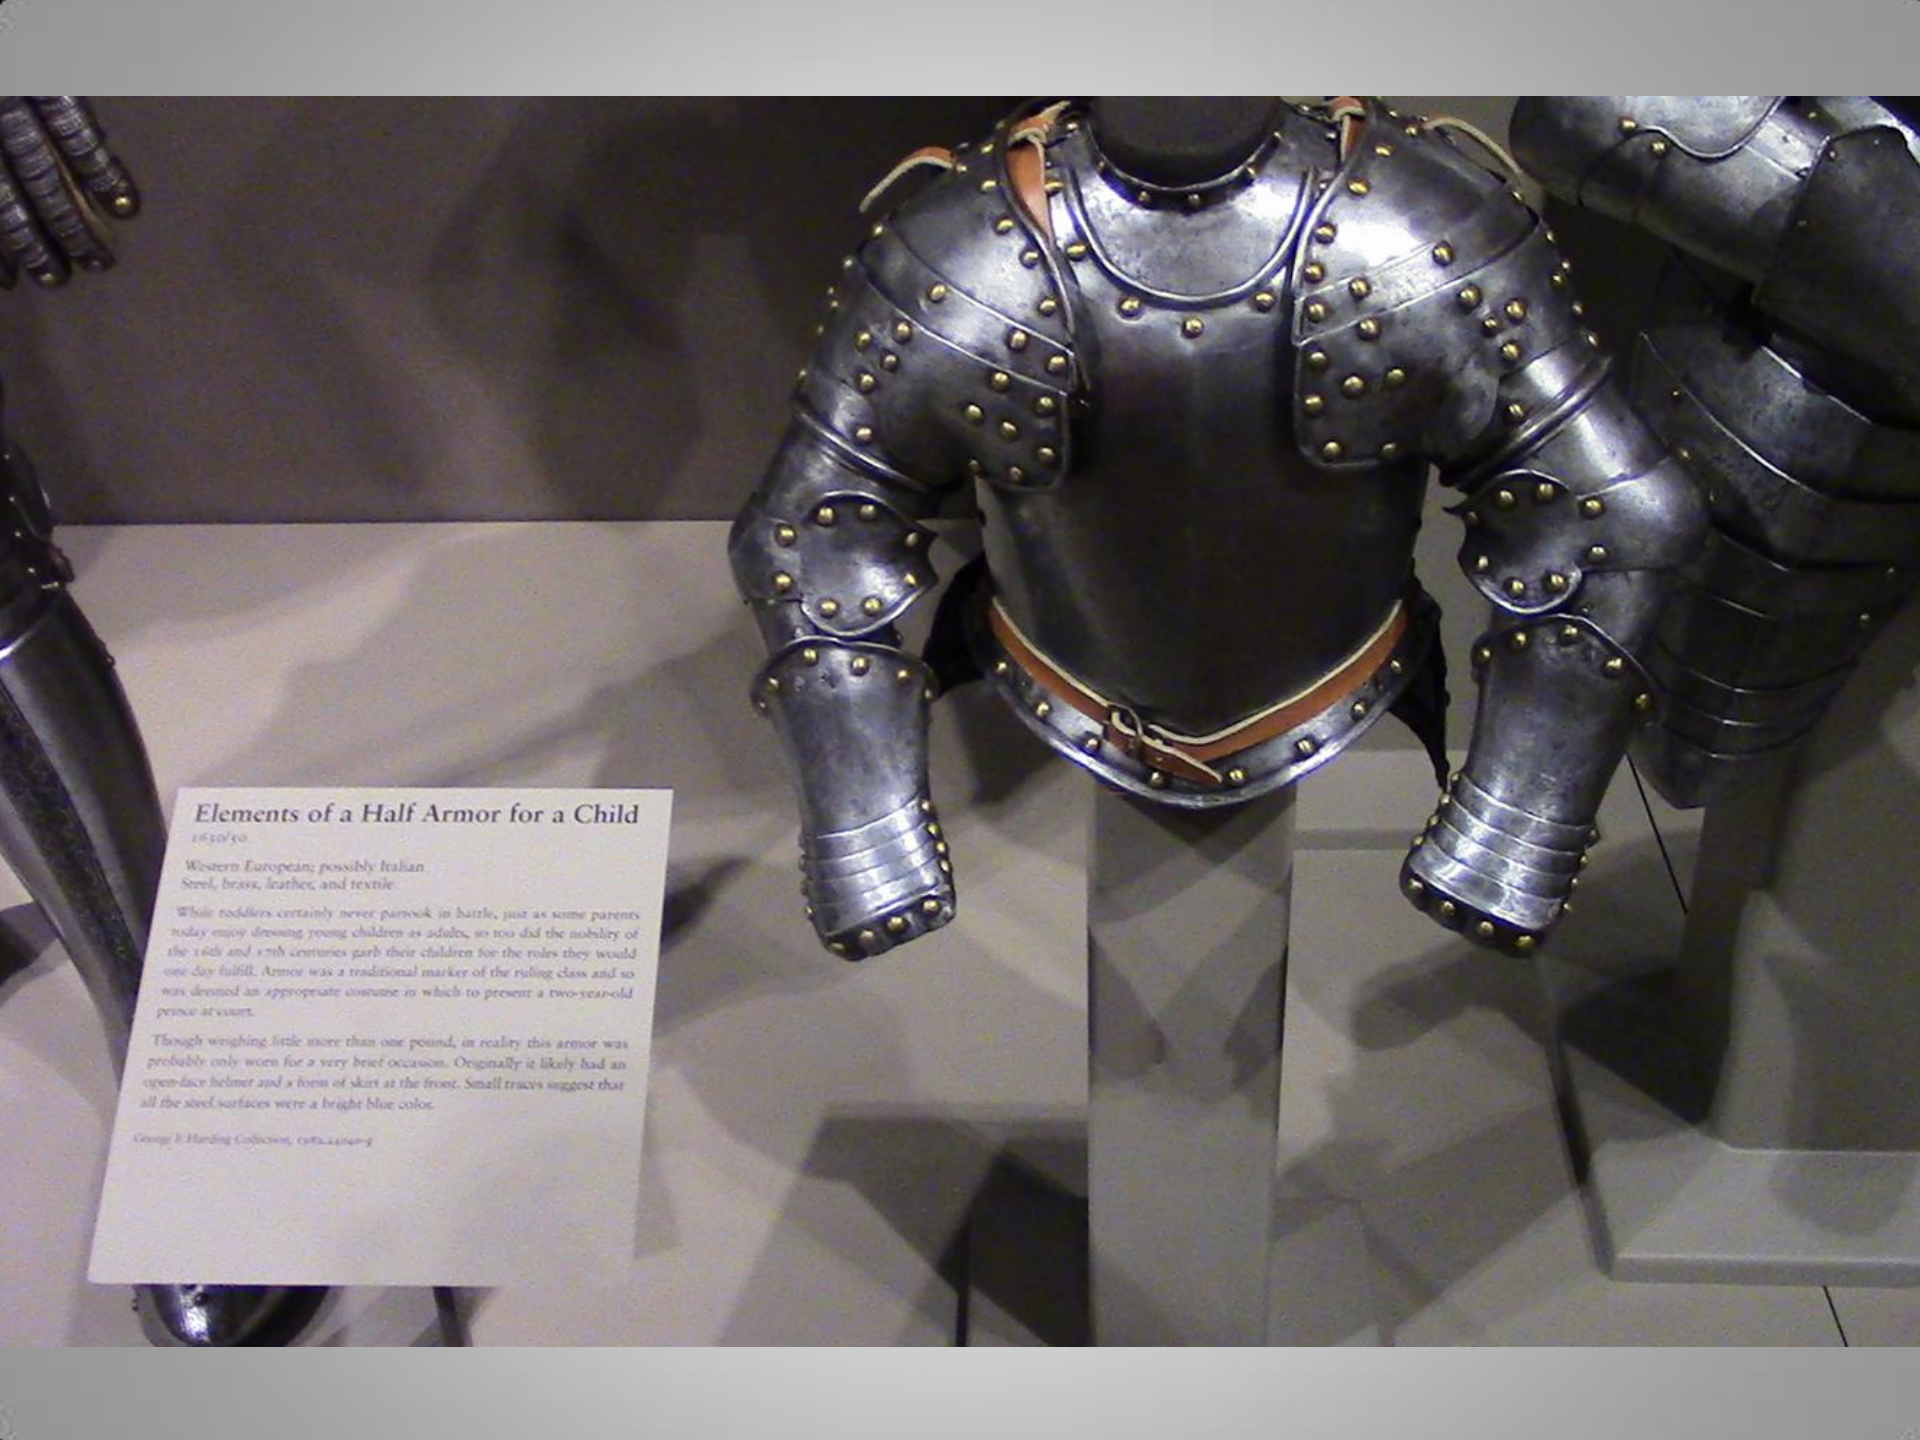

Italian; Milan

Steel, brass, gilding, leather, silk velvet textile, ostrich feathers, silver-gilt thread, and modern costume

These armors are part of two garnitures, groups of pieces with matched decoration that interchange for use in different forms of tournament or for battle. Here the armors are configured for the foot tournament at the barriers, a popular form of courtly sport in the 16th century.

Both harnesses were acquired in 1927 directly from the armory of the Marqués de Dos Aguas in Valencia, Spain. They are reputed to have belonged to the counts of Peralada and Albaterra, both of whose descendants married into the Dos Aguas family. In the 1570s, when these armors were commissioned, the production center of Milan was part of the Spanish Empire and served many of the nobles of the Spanish court.

George F. Harding Collection, 1982.2102b-g, i-l, o-p; 1982.2172c-e, g-o.

Elements of a Half Armor for a Child

1610/50

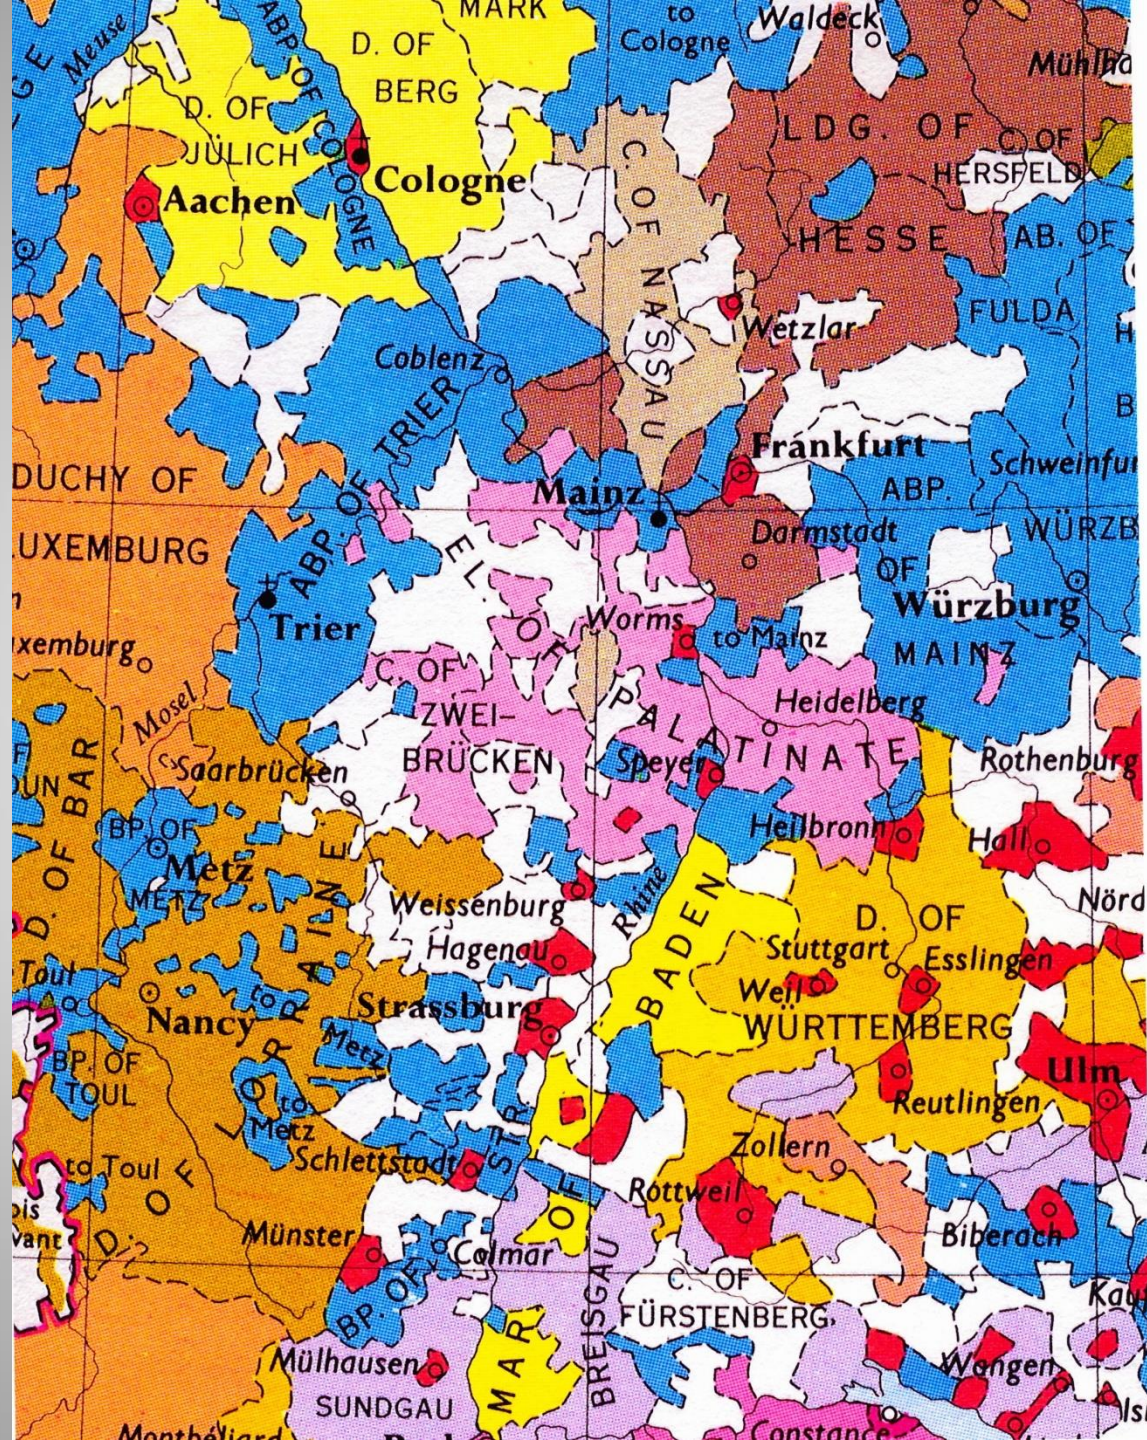

Western European; possibly Italian.
Steel, brass, leather, and textile

While toddlers certainly never paraded in battle, just as some parents today enjoy dressing young children as adults, so too did the nobility of the 16th and 17th centuries parlay their children for the roles they would one day fulfill. Armor was a traditional marker of the ruling class and so was deemed an appropriate costume in which to present a two-year-old prince at court.

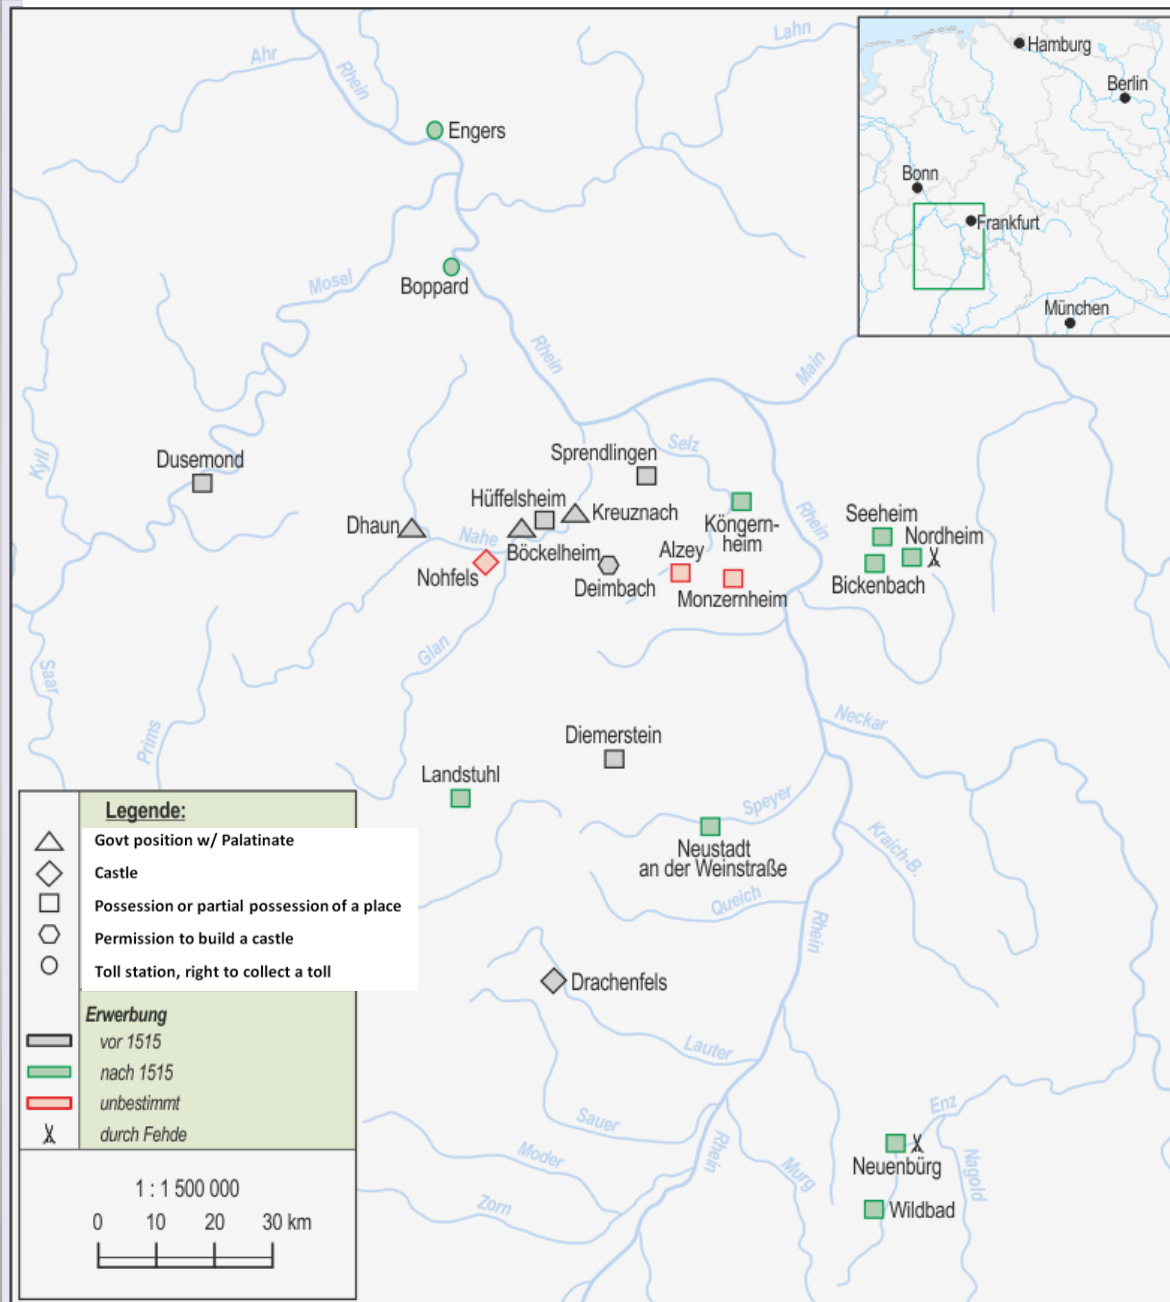

Though weighing little more than one pound, in reality this armor was probably only worn for a very brief occasion. Originally it likely had an open-face helmet and a hoem of skirt at the front. Small traces suggest that all the steel surfaces were a bright blue color.

SICKINGEN'S RISE 1515 to 1521—

His feuds and military raids

- A) Raised considerable amounts of money.
- B) Spread his reputation among mercenary commanders and soldiers as a man worth serving under and a good paymaster.
- C) Convinced rulers including the French King and the Emperor that it would be far better to have Sickingen as a friend and client than as an enemy.

against Duke Ulrich of Württemberg)

How did Sickingen get away with all this?

—Careful timing! He chose his victims carefully. He made use of the many rivalries among the German states, and was an expert at exploiting weaknesses of his opponents.

—He was always “not quite” worth the effort of a unified attempt at suppression, and “just barely” worth consideration as a useful ally. This worked....until 1523.

Francis I

Portrait by Jean Clouet, c. 1530

King of France

Reign 1 January 1515 – 31 March 1547
 Coronation 25 January 1515
 Predecessor Louis XII
 Successor Henry II

Once the King had an actor whipped for satirizing his court, but behind his back contemporaries still called Francis "Le Roi Grand Nez." Despite his long nose, the King was very vain of his good looks. Clouet's portrait shows him splendidly arrayed in a feathered bonnet and a robe of gold brocade with immense puffed sleeves.

MARTIN LUTHER

1483–1546

- Basic Tenets of Lutheranism:
 - Salvation by faith alone
 - Bible is the ultimate authority
 - Baptism and Communion are the only valid sacraments
 - The clergy is not superior to the laity
 - “priesthood of all believers”
 - The church should be subordinate to the state
- Excommunication (1520)

Worms.

Aus: Münster. Cosmography. Basel 1574.

Johannes Tezelius Dominicaner Mönch/mit seinen Römischen Ablafkram/welchen er im Jahr Christi 1517. in Deutschenlanden zu markt gebracht/wie er in der Kirchen zu Piren in seinem Vaterland abgemahlet ist.

D ihr Deutschen mercket mich recht/
Des heiligen Vaters Pappstes Knecht/
Din ich/vnd br ingeuch ist allein/
Zehn tausent vnd neun hundert carein/
Gnad vnd Ablaf von einer Sünd/
Vor euch/ewer Eiter n/Weib vnd Kind/
Solein jeder gewepret sein
So viel ihr leg e ins Käffelein/
So bald der Gilden im Becken klinge/
Im huy die Seel im Hime! springt!

Als Pabst Leo der zehend genandt/
Nu mehr fast vnmöglich befand/
Das er das Römisch Jubel Jahr
Erlebet/hat er die faule wahr/
Des Ablafkrams in Deutschenland/
Durch seine Kramknecht ausgefandt/
Dazu sich denn ohn all verdrieff/
Johann Tezel gebrauchen ließ/
Der was ihr kaum dem Hencker entlauffen/
Als er wegen Ehebruchs solt ersauffen/
Weniche der from Fürst Friederich/
Seiner het angenommen sich/
Vnd beim Keyser Maximilian/
Ein gnedigste Fürbit gethan/
Hierbey es aber so nicht blieb/
Aus eim Ehebrecher wurd ein Dieb/
Welche durch vermeint gewalt vnd macht/
Viel Goids vnd Guts zu weg gebracht!

Als er die blinde Welt bered/
Das er den Hime! feil tragen thet/
Wenn man nu Gelt genug gebe dar/
Hets mit den Menschen kein gefahr/
So bald der Grosch im Käffen klinge/
So bald die Seel in Hime! sich schwingt/
Durch diesen Teuffelischen Landt/
Hat er betrogen sein Vaterland/
Bis ihn Gott hat ins Spiel gesehen/
Durch Doctor Luthern seligen/
Welcher ihm seinen Kramertisch/
Gewaltiglich zu Boden stieß/
Daher/Gott lob/bis auff die zeit/
Der Ablafkram zerstrewet leit/
So bleibet nun Christi verdienst/
Einig allein vnser Bewinst/
Des Tezels Kram vnd Pappstes Verrug/
Findet bey vns kein recht noch fug.

Aug—Nov. 1521: Imperial campaign against France;
unsuccessful siege of Mézières.

Sickingen was appointed co-commander of the Imperial army along with Count Heinrich of Nassau. The campaign failed due to quarrels between the two commanders, and vigorous French resistance led by the heroic Pierre du Terrail, Chevalier de Bayard.

The **Siege of Mézières** (1521) took place during the **Italian War of 1521–26**. An **Imperial** army besieged the city (now part of **Charleville-Mézières**), which was defended by French troops under the command of the **Chevalier de Bayard** and **Anne de Montmorency**; the siege was unsuccessful, and the determined French resistance gave **Francis I** time to concentrate his forces against **Charles V**.

Bayard embodied the highest chivalric standards of the age. He was known as the “knight without fear and above reproach.”

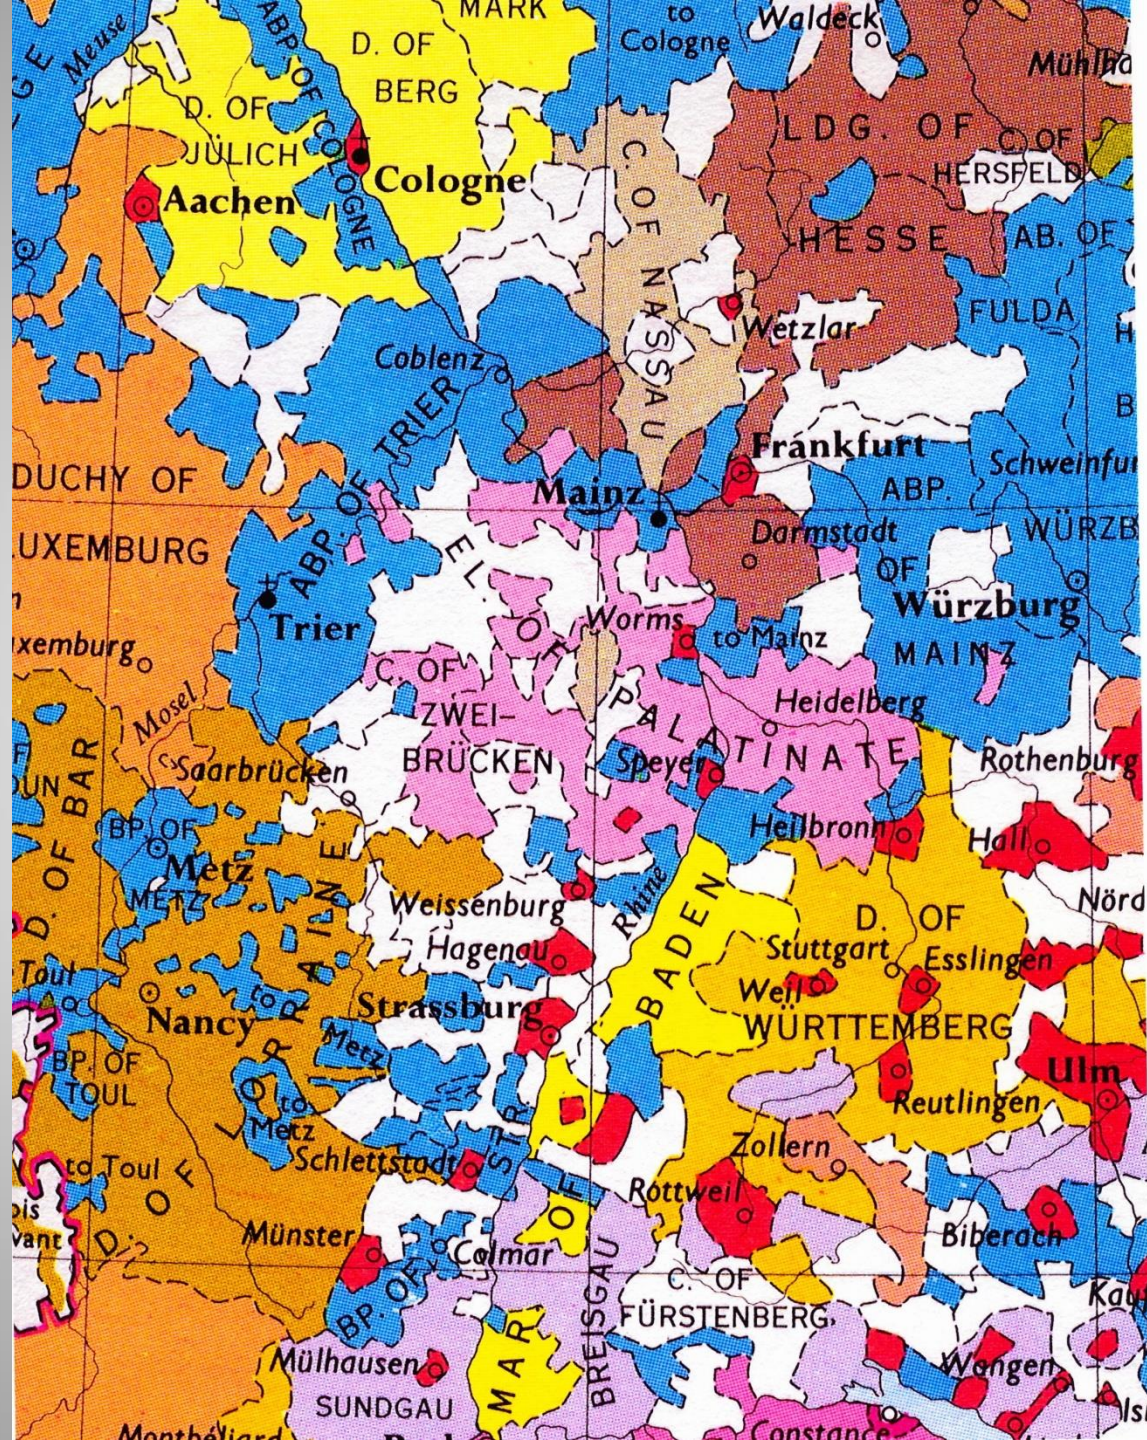

Bayard

Franz von Sickingen
(Medaille von Joachim Deßlers 1521)

The imperial campaign against France in 1521 was a failure. Sickingen quarreled with his co-commander Count Heinrich of Nassau; their forces were defeated at the siege of Mezières and retreated in disorder. Even worse, Sickingen's financial reputation as a reliable paymaster of mercenaries was threatened. He had loaned over 96,000 gulden to the Emperor who was unable or unwilling to repay the amount. Before this, Sickingen's fortunes had prospered through a series of risky gambles; now he would stake everything on the biggest and riskiest gamble of all.

perhaps 10-12,000 total)

A historical map of the Rhine region, showing various territories and cities. A red line indicates a military route starting from the south and moving north towards Trier. Two text boxes provide details about military forces. The map includes labels for cities like Aachen, Cologne, Mainz, Trier, Metz, and Nancy, as well as regions like the Palatinate and Baden. A river labeled 'Mosel' is also visible.

Castles
of Europe

William Anderson / Photographs by Wim Sijm

CASTLES

A castle is a private fort, distinguished from other fortifications by its primary purpose: the protection of a feudal lord, his family, and his loyal retainers.

Castles could serve many purposes:

- They arose in the early Middle Ages as a response to invasion and to private warfare.
- They could be centers of government and administration.
- They could provide defense in depth or be part of a strategic network, for a province or kingdom.
- They were a means of conquest and of consolidating the gains of conquest.
- They could contain the courts of rulers.
- They could be the seats of country landowners, members of a feudal aristocracy.

At approximately 2-3 million **man hours**, 2,700 men, working for one hundred 10 hour days, would take approximately 4 months to finish the entire fortress.

PLAN DU CHÂTEAU DE GUÉDELON

—The building materials are stone, clay and timber, usually found near the site.

—To split stones for the walls, quarrymen "read" the rock face to see the lines where it will fracture. They then drive a line of holes into the stone and then pound corners into the holes, which makes shock waves go through the stone and break it.

—Workers use horse-drawn wagons to haul the stones from the quarry to the building site.

—Stone masons then chisel the raw stone into blocks.

—Workers use man-powered cranes to lift the finished stones to the scaffolding on the castle wall.

—Other workers make mortar on the site from lime, soil and **water**. The masons on the wall fit the stones together and use the mortar to hold the blocks together.

—Castles generally took two to 10 years to build.
