

Distance, brightness & finding
things in the sky. . .

OLLI Week #2

A night sky photograph featuring the Milky Way galaxy. In the foreground, the silhouette of a person is visible, holding up a camera or telescope to capture the stars. The scene is dark, with the primary light source being the stars and the galaxy. The text is overlaid on the upper portion of the image.

 December 1st 7:00 PM
 December 15th 6:00 PM

Fall

Look for these with binoculars:

M-13 cluster in Hercules
 Pleiades cluster in Taurus
 Double Cluster in Perseus
 Andromeda Galaxy in Andromeda
 Milky Way star clouds visible from clear, rural skies

Jupiter and Saturn spend this autumn in the early evening sky. Venus spends the season skulking along the southwestern horizon. In December, Mars emerges from behind the Sun's glare into the predawn sky. Mercury's best appearances are late October in the early morning and late December in early evening.

Look up

Astronomers have discovered the largest known comet, and it's coming to a sky near you in 2031. That gives you plenty of time to track down a good telescope — you'll need it to spot this roaming celestial body.

Comet Bernardinelli-Bernstein, named for the astronomers who found it, is about a thousand times more massive than other comets and between 62 and 124 miles (100 and 200 kilometers) across.

The unusual comet has been making its way toward our sun for millions of years. It likely came from the Oort Cloud, the birthplace of icy, ancient comets and a place more distant from the sun than anything in our solar system. Just imagine what scientists will learn as they observe it for years to come.

Current magnitude: 20.3

Max magnitude: ~17

 charts 13, 14, B1 m_v 9.7 p.a. 162°

NGC 4303. A very bright, very large, face-on spiral; extremely bright center. The starlike nucleus is surrounded by a mottled, diamond-shaped inner core (O'Meara). Extends 70,000 ly; distance 41 million ly; Hubble class Sc. Paired with galaxy NGC 4303A.

M62

GC Op 17^h 01.2^m -30° 07' 10'
 chart 22 m_v 6.6

NGC 6266. High concentration of stars; large, very bright, and very well resolved. Waves of starlight seem to ripple out from the ruddy nucleus (O'Meara). Per NGC, a (!) remarkable object. Extends 60 ly; distance 22,000 ly; S-S class 4.

M63

DISTANCE!

Distance units

- ***“Astronomical Units”*** – good for solar system. Average Earth/Sun distance (93,000,000 miles)
- ***“Light Year”*** – good for star distances. Distance light travels in a year at 186,000 mps . . .about 6,000,000,000,000 miles!
- ***“Kiloparsecs”*** – good for galaxy distances. 1 kpc is 3260 light years.

“Astronomical Units”

- Mercury = 0.38
- Venus = 0.72
- Earth = 1.0
- Mars = 1.5
- Jupiter = 5.2
- Saturn = 9.5
- Uranus = 19.2
- Neptune = 30.1
- Pluto = 40
- Arrokoth = 44.6
- Eris = 68

“Brightest” stars?
